BORAX—Receipts the past week aggregate 220 centals. The market is steady at unchanged quotations.

TIN—Imports the past week aggregate 45,474 boxes, and exports by sea 4320 lbs. of plate to Victoria, and 11,000 lbs. to Liverpool. Our market is reported dull, as large consumers are not disposed to buy much even at the present low parity of spot prices. For shipment no orders are obtainable, owing to buyers not having confidence in the stability of the market abroad. Our last cable advices gave a stronger market.

COPPER—The market is virtually unchanged. It is very difficult to obtain reliable information regarding the situation abroad, but that obtainable points to an early and satisfactory agreement between all disputing interests, yet even with a final settlement it is not the intention to advance prices.

IRON—Imports the past week aggregate 100 tons of pig from Irondale and 1537 tons from England. The market is quite active, with supplies going into consumption quite rapidly. The outlook promises higher prices, based on further advances abroad.

The following are the latest comparative quotations f. o. b. at Glasgow:

F. o. b. Glasgow.	Sept. 25, '89.	Oct. 4, '89.

" Glengarnock	60s 6d	60s 6d
" Dalmellington	50s 6d	53s

COKE—Imports the past week aggregate 2327 tons from England and 125 tons from Tacoma. For prompt shipment, English coke is higher. The local market is reported strong under an active consumption and supplies well held. The shipment from Tacoma is the first for a long time. As the capacity for the output has been increased by the company at Tacoma, regular shipments are now among the possibilities.

COAL—Imports the past week aggregate as follows: Seattle, 2340; Departure Bay, 2400; Liverpool, 3055; Coos Bay, 1500; Australia, 12,641. Total, 21,936 tons. For shipment, Australian is quoted still higher, owing to a further advance in freights, now quotable at about 18s to this port. In the local market stocks are light, which goes to show that the heavy imports have gone into consumption as fast as received. It is stated that large consumers in the interior who had been holding off, expecting lower prices, have either stocked up or are stocking up. The same remarks apply to a very large number of consumers in this city. Retail dealers are beginning to carry more in stock, owing to families and other small consumers buying their winter supplies.

Mining Share Market.

The mining share market the past week continued of the same mixed and unsatisfactory character that has prevailed for the past two months. The fluctuations have been small, but it was the every little while "going-all-to-pieces" nature of the market that has demoralized outside dealers and thrown considerable quantities of stock into the hands of the pool. By reference to the weekly ranges of prices given in another column, it will be seen that the Comstocks have not fluctuated on an average of ten per cent since the 11th day of last month, yet outsiders at each shading in prices, after a small upward turn, were badly demoralized, believing that the long-talked-of break was at hand. The market acts very much as if it is oversold. It has not been helped by the levying of several assessments with more to follow soon. In outside stocks Eureka had quite an upward move under reports of higher assays and bullion shipments. Experienced operators are fearful of this stock and are confident of lower prices before long. The Tuscaroras had a small advance, but at the close appear to be on the down grade again. The Quijotoas were barely steady. The Bodies sold slightly higher, probably owing to Capt. John Kelley's presence in the city, but at the close are weaker. It is claimed that a successful deal cannot be run in these stocks until the spring months unless an ore development is made.

The news from the Comstock mines continues of the most favorable character, particularly from the Gold Hill and Middle groups. The Gold Hill mines will soon be ready for crosscutting on the various levels running down from the 500-foot to the 1300-foot levels. Official letters received yesterday indicate that the drifts have been so far advanced as to admit of several new crosscuts being started any day. In Yellow Jacket work is underway to tap the rich ore deposit from which they were driven by fire several years ago. Just before the fire the company on ore-showing declared a dividend, but on the fire breaking out, it was rescinded. The ore, if we mistake not, averages over $60 a ton. In Crown Point they have started a west crosscut from where the 400 south stope connected with the 300-foot level. This crosscut, at last advices, was in ore. Last year the stock was sent to about $10 a share on the "finding" at that time. With better connection, the ground can be better prospected and the ore taken out. With the return of Roger Pendergrast to the Comstocks it is stated that more active and interesting work will be started in the Chollar, Potosi, Bullion and Alpha. The west crosscut No. 2, on the 800-foot level of Crown Point, is out about 70 feet. This crosscut is run to cut the downward continuation of the ore found above. The new work in Confidence and Challenge has not been commenced yet. On the 1550-foot level in Con. Virginia they have run into very rich ore, yet the stock went down on the development. In Ophir another crosscut has been started. From the other North End mines very little news is obtainable—probably it is kept back for stock speculation. In Justice it is thought that a new ore development will be run into on or about the 25th of this month. From Best and Belcher and Gould and Curry nothing important is at hand. From the outside mines continued good news comes to hand from the Quijotoas, Silver King, Mt. Diablo and Tuscaroras. The Bodies report more active work on the upper levels in Bodie and Mono. On the former the old east drift on the 900-foot level is being cleaned out preparatory to resumption of explorative work on that level.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

IDLEWILD G. M. Co., Oct. 7. Capital stock, $1,000,000. Directors—E. S. Chester, W. E. Straub, W. S. Chapman, H. H. Brown and E. W. Chapman.

PACIFIC FIRE ALARM Co., Oct. 8. Object, to conduct a general business in fire-alarm apparatus and supplies. Capital stock, $500,000. Directors—John I. Sabin, P. T. Morgan, J. C. Cebrian, W. G. Oliver and F. W. Eaton.

CALIFORNIA MORTGAGE LOAN Co., Oct. 9. Capital stock, $100,000. Directors—Rolla V. Watt, Robert D. McElroy, Alexander Mackay, Elijah S. Pierce, William W. Bishop, James A. Watt and Henry W. Snow.

THE pay-roll of Stanford's ranch at Vina, Butte county, amounts to $17,500 a month.

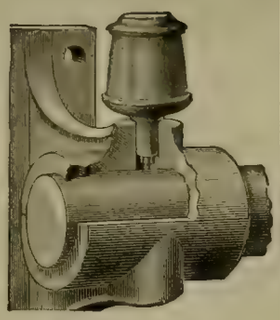
We quote shipments since our last, and shall be pleased to receive further reports:

Cons. California and Virginia, Oct. 5, $59,582; 6, $111,111; Occidental Con., 5, $7000; Eureka Con., 8, $25,000; Hanauer, 2, $2250; Justice, 5, $4614; Utah, 5, $6072; Hanauer, 4, $3100; Crescent, 4, $4000; Hanauer, 5, $2550.

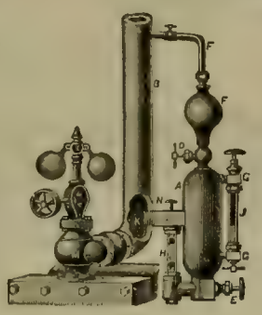


Successful Patent Solicitors.

As Dewey & Co. have been in the patent solicitating business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

BLOCK 13 in East Oakland, Alameda county, has been bought by F. M. Smith and others, who will establish borax works there at an early day. The buildings will occupy almost the entire space, and the capacity of the works will be about 100 tons a week.

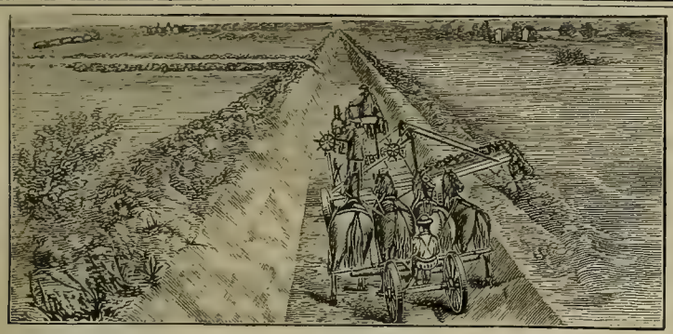
ALBANY
Lubricating Compound and Cups.



1868.
Manufacture commenced at Albany, New York.

1876.
Introduced by us on Pacific Coast.

1889.
Cheap imitations having had time to show that they are the most expensive in the end, the Sales of the Genuine Albany Compound are Larger than ever before.



England, Belgium, France,
And other Foreign Countries are now Large Consumers.

We are also Sole Agents for the
Albany Cylinder Oils,
Albany Spindle Oils, Etc.

FOR SALE ONLY BY

TATUM & BOWEN,
Sole Agents for the Pacific Coast,
Dealers in Improved Woodworking Machinery,
Sawmill Machinery, Engines, Boilers, Ironworking Machinery, Supplies, Etc.
Sole Agents for Hoe Chisel-Tooth Saw, Gardner Governor, Schultz Leather Belting, Etc.

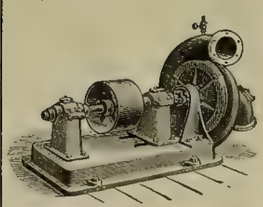
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.
KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:
1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List. MARSHUTZ & CANTRELL.

VAN CLEVE'S
English and American Mechanic

NOW READY.

The English and American Mechanic. Comprising a collection of over 3000 Receipts, Rules and Tables designed for the use of every Mechanic and Manufacturer. By B Frank Van Cleve. Illustrated, 283 pages. 12mo.

Price $1.50, by mail, free of postage, to any address in the World.

Among the contents of this valuable and useful book are: Explanation of diagrams for sheet metal work; Contents in gallons of different vessels; Weights of Pipes, Tin-plates, Oil Canisters, with the quantity of tin required; Diameters, Circumferences and Areas of Circles and the content of each in gallons at one foot in depth; Arithmetic; Practical Geometry; Mensuration; Slide Rule; Steam and the Steam Engine; Belts; Limes, Cements, Mortars and Concretes; Artificers' Rules and Tables for computing the work of Bricklayers, Well-Diggers, Masons, Carpenters, Joiners, Slaters, Plasterers, Painters, Glaziers, Pavers and Plumbers; Sewers, Arches and Abutments; Flour-Mills, Saw-Mills, Wood-working Machinery; Water-Power; Solders; Fusible Compounds; Fluxes for Soldering or Welding; Strength of Materials; Weights of Materials; Wheel Gearing; Gauging; Alloys and Compositions; Rare and Valuable Receipts for Mechanical Purposes.

A circular, 4 pages, 4to, showing the full table of contents of this important book, will be sent free of postage to any one in any part of the world who will furnish his address.

Our New Revised Descriptive Catalogue of Practical and Scientific Books, 84 pages, 8vo, and our Catalogues of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, sent free, and free of postage, to any one in any part of the world who will furnish his address.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

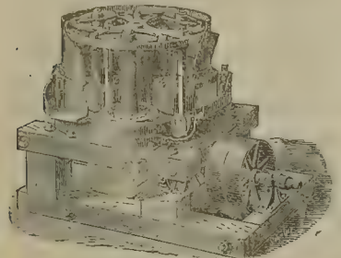
PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

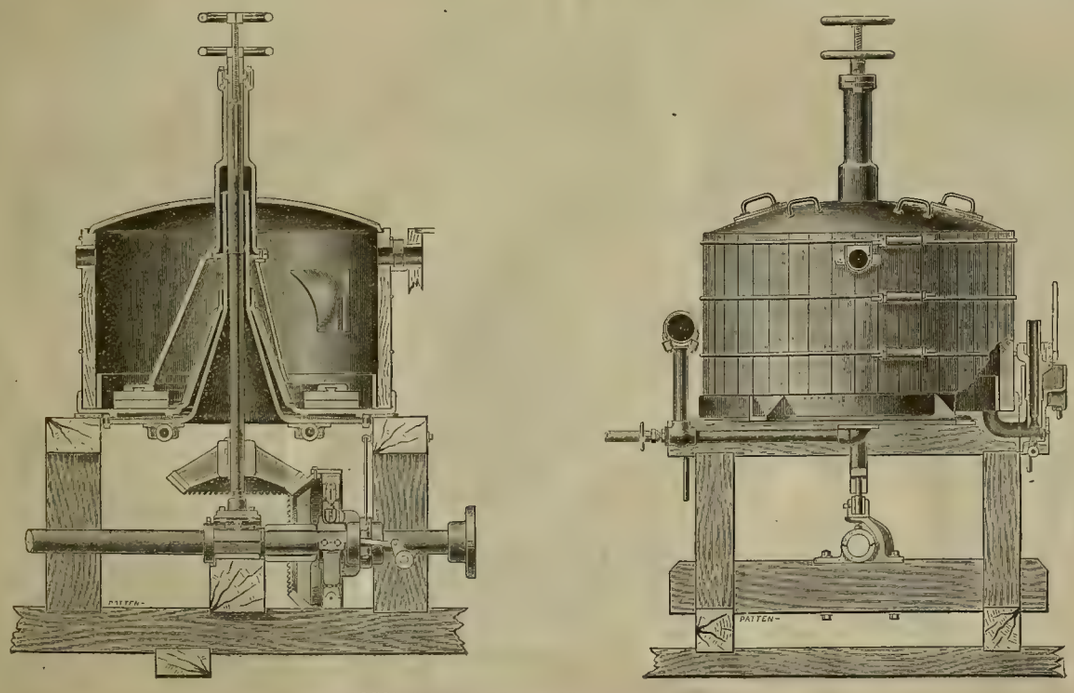
SPECIAL GRINDING PANS FOR CONTINUOUS PROCESS.

STANDARD SETTLER.

Standard Pans and Settlers.

Mr. M. P. Boss, whose continuous process for working ores has been so successful, is also the inventor of special pans and settlers to be used in continuous-process mills, as shown in the engravings herewith. The special grinding pans grind all the pulp after coming from the battery, thus relieving the amalgamating pans of this duty. These pans are made four feet in diameter, and have solid ring shoes and dies slotted for a short distance from their inner edges to better admit the pulp between them. The pulp is introduced at the center of the pan; and, as a joint is made with a rubber gasket between the shoe ring and muller-plate, it is all obliged to pass between the shoe and die before being discharged. The cut shows one pan placed below the other, receiving and regrinding the pulp as it comes from the first, and is the arrangement made for two grinding pans receiving the pulp from ten stamps.



The Standard amalgamating pan is also shown in the cuts. It is made heavier in proportion than other pans and provided with a wearing ring inside of staves, and also with a sleeve for protecting cone.

The steam bottom extends up into and around the cone, and at its top carries the bearing for the pan spindle. By this arrangement an increased heating surface is obtained. A rust-joint is made between the cone on the steam bottom and the main pan cone, while the steam bottom proper is bolted to the pan bottom in the usual manner. Exhaust steam is used for heating. The steam is admitted on one side of the bottom and exhausted on the other, a valve being provided for regulating and shutting off. The pan spindle step is carried on a bracket on the main driving shaft box, and permits the removal of the shaft without disturbing the spindle. The friction ring through which the pan is driven is bolted to gear, so that it can at any time be replaced independently of other parts.

One of the cuts of the pan shows in section the quicksilver bowl with pan siphon in position for draining the pan of quicksilver and amalgam when in need of repairs. These pans are four feet two inches inside diameter and weigh 8500 pounds.

The Standard settler shown in the cuts is also designed for use in continuous mills. The muller arms and driver are cast in one piece, to which the muller-plate is bolted. The friction

BOSS' STANDARD AMALGAMATING PANS.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

The Mines of Placer County.

EDITORS PRESS:—This section has been written up for the PRESS lately, and in consequence it is not necessary to go into an extended description. The success attending the working of the Hathaway has infused new life into the district. Now that it is proven beyond a doubt that the ores of the section are not only rich, but that the contents can be saved, it will be but a question of time, and a short time at that, until Ophir will see greater activity in her quartz-mining interest than at any previous time. The Hathaway had been worked for the gold contents of the ore. The antimonial silver ore was not recognized, but thought to be galena. Mr. D. P. Price and his able millman, Mr. H. C. Haupt, took hold of the property for the owners, Messrs. Valentine Bros., and soon had the ores under control. The Frue, Woodberry and Victor concentrators were set aside and the Garnier put in place. This concentrator is a canvas-belt machine, with a motion similar to hand-panning. The machines have the merit of being low-priced as well as successful. At first some difficulty was experienced with the concentrators, but Mr. Haupt has overcome that, and to-day the mine and mill are a decided success, the silver value of the rock equaling that of the gold. As depth is attained, the rock is more heavily mineralized. Some of the richest of the ore is sacked and shipped to Argo, Colorado, for treatment. Next in value to the high grade of the ore is the fact that the pay is continuous throughout the entire length of the workings on the vein and growing richer. The shaft is down 250 feet, with drifts run 1005 feet, showing a vein of an average width of three feet in granite walls. Unlike many mines, this property has opened up and in reserve sufficient ore to keep the 20-stamp mill running steadily for a year. Developments are kept ahead all the time, and in consequence the ore reserves are constantly being added to. It is hardly necessary to add that Messrs. Price and Haupt (formerly of the "Nevill's," Angels) are the right men in the right place.

Roseville.

At Trap Ravine, Blair & Morgan sunk through the hardpan and discovered the old channel underneath. This pays, as far as prospected, 5c. to the pan. A ditch four miles in length has brought in water, and the property looks promising. The area is about one-fourth of a mile wide by one-half mile long.

Penryn.

The 10-stamp mill of the Phœnix is running steadily. Surrounded on all sides by orchards, the Phœnix is apt to be passed as idle, but such is not the case. The shaft is now down 320 feet on a ledge averaging 2½ feet, though 20 feet in width in places. Drifts have been run 300 feet, proving the average value of the rock to be $7 a ton in free gold.

The Julian is closed and its surface covered with golden fruits of every description. It is a question whether the old Julian mine in its best days was ever as profitable as the Julian fruit ranch is to-day.

Kendall Cement Mines.

These are located six miles northwest of Newcastle on Badger ravine. The ores, or cement, is crushed in the mills of the president's invention—the Kendall. Just how rich the cement is, I was not able to ascertain. The survey of the operations would lead one to suppose that it was not only "a good thing," but "a big one."

At Colfax, the Rising Sun mine is closed on account of litigation. The mine has produced over $2,000,000.

Forest Hill.

All along the ridge mining is quiet, with the exception of a few big mines. The Grey Eagle mill is closed, while a drain tunnel 2700 feet long is being driven to cut the vein 417 feet deep.

The Mayflower

Is the mine of the section. The old surface gravel was worked off with a hydraulic, realizing a vast amount of gold. When the mine was closed down by the debris decision, a shaft was put down 500 feet and the blue gravel found under the basalt. To work this a tunnel 5200 feet long was driven. This cut the channel on an average eight feet below its bed. From this gangway upraises are made to the gravel. An average of eight feet of the gravel next the bedrock is worked. The drifts have been run north 888 feet and south 975 feet, the channel running nearly north and south. In this blue gravel the value is $2 to $20 a car. In working the blue-gravel cement a cross channel of quartz gravel was struck running east and west. This is free from cement and the three feet worked very profitably. This quartz gravel lead is quite an addition to the wealth of the section. Its presence was not known until it was drifted into. As it is entirely blind, it does not show on the surface. Everything about the Mayflower shows good management. The 20-stamp mill crushes the cement freed from the boulders. Immediately below the batteries are grinding-tables or polishers which polish the gold and catch all amalgam escaping from the batteries. The gold is coarse and shaped like a flax or pumpkin-seed. A large air-compressor furnishes power for the drills and air for the ventilation of the mine. One hundred and thirty-five men are employed at this mine. The product of the mine since December, 1888, has been $267,000.

Dardanelles.

This valuable property is closed for the present. From the upper channel $3,500,000 was taken out. A shaft costing $250,000 was then put down and the blue-gravel lead of the Mayflower struck. All this property wants is a bedrock tunnel.

The Mountain.

On this mine the tunnel was run too high, and the mine was closed down until another tunnel can be driven. This is the condition of the other locations on the lead, all wanting bedrock tunnels. Once they are opened up, Forest Hill will be a more prosperous camp than in her palmy hydraulic days. The gravel is now known to be there and to be rich. Time will see it worked and that extensively. I did not go beyond Forest Hill, so could not give anything but hearsay knowledge of it, which is not desirable.

E. H. SCHAEFFLE.

Mercurial Minerals and Their Associates.

[Written for the MINING AND SCIENTIFIC PRESS]

Minerals containing mercury are but few; nor do they occur in many localities.

Certain unusual conditions must exist before a metal having the great specific gravity of mercury can be transferred from subterranean depositories to the earth's surface and placed within reach of man.

The following list embraces practically all the species and combinations known. For convenience they have been arranged alphabetically a numbered.

1. Amalgam.

This rare mineral is a mechanical alloy or amalgam of mercury and silver. Its color and streak are silver white. It is brittle, like very hard artificial silver amalgam, and like it, cuts with a grating sound. It is wholly soluble in nitric acid, and if heated in a closed glass tube mercury sublimes in the cold part, and may by simple inspection be recognized as such. If rubbed on a clean surface of metallic copper it imparts to it a metallic coating of silver whiteness.

Hardness, 3 3–5; specific gravity, 10.5; contains from 64 to 73 per cent of mercury.

This mineral has been found sparingly in Chili, Spain, Sweden, Hungary, and in unusually fine crystals in the Palatinate where veins of silver and mercury intersect.

The name amalgam is derived from a Greek word meaning a poultice, or soft substance, which it was thought to resemble. Arquerite, another form of the same mineral, was first found at Arqueros, near Coquimbo, in Chili, whence the name. It has recently been found in the bed of Vitelle creek, British Columbia, with native copper, both in the form of flattened rolled nuggets from the smallest particles to pieces an inch or two in length.

Artificial crystals of amalgam form not infrequently during the amalgamation of silver ores. The following analysis of a sample is given in the MINING AND SCIENTIFIC PRESS, Vol. 45, Folio 360:

Mercury	75.04
Silver	24.18
Gold	.77
Total	99.99

2. Barcenite.

Is a mineral of doubtful composition and probably a mechanical mixture, containing besides mercury, antimony, sulphur lime, oxygen and water, mercury about 21 per cent.

Hardness, 5-5; specific gravity, 5 343; color nearly black, streak ash-gray, luster, dull, earthy and opaque. It was found at Huitzaco, State of Guerrero, Mexico, was exhibited at the Centennial Exposition at Philadelphia in 1876, and described in the American Journal of Science and Arts, Vol. 16, 1878, Fol. 306.

The name was derived from Sr. M. Barcena, a Mexican mineralogist. It somewhat resembles Livingstonite, found at the same locality.

3. Bordosite.

This mineral seems to be a double chloride of silver and mercury as follows:

Chloride of silver	31.23
Chloride of mercury	45.53
Oxide of mercury	22.70
Total	99.46

It is considered by Bertrand, who described it in 1874, to be a mechanical mixture. He named the oxide, which he considered foreign, *Hydrargyrite*, and the chlorides, *Bordosite*, which combine as follows:

Chloride of silver	40.69
Chloride of mercury	59.31
Total	100.00

Dana considers both species very uncertain. The mineral, which is of rare occurrence, was named from the locality, Los Bordos in Chili.

4. Calomel,

Called also *horn-quicksilver*, is rather a rare mineral. It is a chloride of mercury, containing when pure 84.9 per cent of mercury; occurs in crusts, granular concretions, and crystals; sectile; hardness, 1.5; specific gravity, 6.48; color, yellow and gray to brown. It is wholly volatile at a red heat, insoluble in water but decomposed by acids. It is found only in mines of quicksilver associated with cinnabar and other minerals. In the Palatinate it is met with in fine crystals. It occurs also in the mines of Almaden and Idria, and in Bohemia; not known in California, but probably exists, and would be found if sought for.

"Calomelus," from which (according to Perrira) the name calomel is derived, is from two Greek words, *good* and *black*, and was used in the first part of the 17th century by Sir Theodore Torquette De Mayenne, because he had a favorite negro servant who prepared it artificially with skill, or because it was *good* for *black* bile. According to Dana the meaning was "beautiful," and "honey," "*Mercurus Dulcis.*"

5. Cinnabar.

By far the most abundant mercurial mineral known is cinnabar, which exists in two forms, the red and the black. The latter, which has the same composition but differs in appearance from cinnabar, has been named Metacinnabarite, and it bears the same relation to the former that ethiop's mineral does to vermilion.

The name cinnabaris is of very early origin. Among the ancient Romans it had several meanings, and the terms Dragon's blood, cinnabar and minium were interchangeable. The word minium is now applied to native red oxide of lead.

Pliny, B. XXXIII, Chap. 38, mentions this confusion of terms, and writes of ships painted with rubrica (red ocher) in the days of the Trojan war. "The Greeks call this red substance Miltos, and to Minium give the name Cinnabaris. Hence the error caused by the two meanings of the same word, this being properly the name given to the thick matter which issues from the dragon when crushed by the weight of the dying elephant mixed with the blood of either animal."

In B. VIII, Chap. 12, he describes the fight between the elephant and the dragon. This dragon's blood (Sanguis draconis) was a gum which still retains the name, then as now brought from the East Indies. It is used at the present time in coloring varnishes, but not in medicine. Pliny calls cinnabar, minium, B. XXXIII, C. 37.

The ancient name for cinnabar, Minium, by evolution became the modern word mine. The Italian term mineria was intermediate.

When prepared artificially by chemical union of the elements, not as described by Theophrastus, it is called vermilion, which is fully described elsewhere. The word is quite a recent one, being taken from the French "vermeil," from "vermiculum," a term applied in the Middle Ages to Kermes, the Arabic name for an insect from which a red dye is obtained. The literal translation of Kermes is "little worm;" hence the name "vermiculum" and "vermilion."

The following names, ancient, modern and alchemistic, have been given to Cinnabar:

Alzemafor, Ammion, Ammo Gabriel, Anthrax, Aremaros, Azemaros, Bergzinober, Cinnabar, Cinnabaris, Coral Ore, Cynabar, Graecorum, Minium, Minium nativum, Mercur blende, Schweifelquecksilber, Vermilion.

It has been shown that cinnabar was first known in history at Ephesus in Asia Minor. It was afterward discovered in Spain, at what is now Almaden. After the latter locality was known, the mines at the former were still worked, but the Romans monopolized the trade and consumed the entire product. Vitruvius wrote as follows: "The shops established in Ephesus for the manufacture of cinnabar have been removed to Rome, that mineral having been found in Spain, from which country it is carried in the rock of the city, from which the workmen prepare the color."

The above quotation refers to the locality known in the days of Theophrastus. In Pliny's time it was brought principally from Almaden in Spain. He has informed us in his works that cinnabar was found in Carmania in Ethiopia, but none from these localities was brought to Rome; nearly all came from Spain, and most of this from Sisapo (Almaden). The importation being part of the revenue, the mines were locked and the keys kept by the Governor of the Province, and could only be opened by order of the Roman Emperor, to be closed again when the prescribed quantity was taken out.

"There is nothing guarded with a more constant circumspection, for it is not allowable to reduce or refine the ore on the spot, it being brought to Rome in a crude state under seal, to the amount of about 2000 pounds per annum. At Rome the process of washing it is performed, and in the sale of it the price is regulated by statute, it not being allowed to exceed 70 sesterces per pound" (about $2.80).

"The ancients used to paint with (dragon's blood) these pictures of one color," etc. "They painted also with minium of Ephesus (cinnabar), but the pictures being harsh and hard to keep, rubrica (red ocher) was substituted."

What was written by Theophrastus concerning cinnabar has already been quoted.

Herodotus, a still more ancient writer, mentions the use of vermilion at least twice, but whether the word vermilion in the English translation was really cinnabar, is a question of considerable doubt. In the book Melpomene, Chap. 191, may be found the following: "They (the Maxyes) let the hair grow on the right side of the head, and shave the left, and bedaub the body with vermilion." In the same book, Chap. 194: "All these paint themselves with vermilion and eat monkeys which abound in their mountains."

In more modern times, vermilion was imported into Europe and China. Cramer, "Art of Assaying Metals, 1764," writes: "There is in London plenty of the purest cinnabar, imported from China by the East India Company."

Mineralogical Description of Cinnabar.

Color and streak, scarlet red. Specific gravity, 8.99; hardness, 2.5; wholly volatile at a high degree of heat; gives B. B. in a closed glass tube, a sublimate of nearly black color and an odor of sulphur. When heated in the same manner but with the addition of dry carbonate of soda, metallic mercury sublimes and condenses in globules in the cold portion of the tube; when pure, cinnabar contains 86.2 per cent of metallic mercury. It is nearly always crystallized; a mass which appears amorphous, when examined microscopically, is seen to be an aggregation of crystals.

There is a specimen in the State Museum, No. 1728, from the Almaden mine, Santa Clara county, in crystals.

Magnificent groups of crystals of cinnabar and metacinnabarite were quite common in the Redington mine in Lake county; they were shoveled into the furnaces like the most ignoble ores.

In Mariposa county, near Coulterville, cinnabar was found in the wall-rocks of a gold mine; it was in small but distinct transparent crystals.

At the Paris Exposition of 1878, splendid crystals perfectly terminated were shown, from the Almaden mine of Spain; also a mass of nearly pure cinnabar weighing several hundred pounds. At the Pacific Coast Mineral Exposition of 1883, on the occasion of the Triennial Conclave of the Knights Templar of the United States, held in San Francisco, Mr. J. B. Randol exhibited a mass of cinnabar from the New Almaden quicksilver mine, which weighed 290 pounds.

Properties of Cinnabar.

Cinnabar is far from being a permanent mineral; on the contrary, it is continually undergoing change. When placed in a mineral cabinet and protected with the greatest care, signs of decomposition soon become manifest; a peculiar odor is the first indication; the sulphur begins to oxidize to sulphuric acid, which stains the woodwork of the cabinet and changes the color of blue paper to red if any chances to be near; hydrosulphuric acid is generated, which blackens silver and other metals; the new minerals deliquesce, which accelerates the decomposition, and the finest crystallized specimens too frequently disintegrate.

In the quicksilver mines of California similar changes are continually taking place, which may be best observed at Sulphur Creek, Colusa county, and at the Sulphur Bank, in Lake county.

The ancients were well aware of the poisonous qualities of cinnabar, for Pliny informs us that "persons employed in the rooms where cinnabar is prepared, protect the face with masks of loose bladder-skin to avoid inhaling the dust, which is highly poisonous," and cites an instance of a physician who administered mineral vermilion (minium) instead of Indian cinnabar (dragon's blood), owing to the confusion of terms mentioned elsewhere.

The artificial preparation (vermilion) is a brilliant scarlet substance, heavy and finely pulverized, much used as a pigment; when pure, it is wholly volatilized at a red heat. As metallic mercury is generally reduced from cinnabar, so is vermilion prepared from metallic mercury, the process being reversed.

Varieties of Cinnabar.

The varieties of cinnabar and other mercurial minerals were not known or studied until quite recent times. Cramer, after describing quicksilver, thus discourses of cinnabar: "There is but one single ore of mercury known, called cinnabar, of which you will find very good specimens in every druggist or apothecaries' shop under the name of native cinnabar. It is of the finest scarlet color, and when broke appears striated with small parallel furrows. Besides, it is very heavy and soft and consists of mere sulphur and mercury; in such manner, however, that the quantity of the mercury is commonly about six times greater than that of the sulphur, and that the beauty of the color of the cinnabar depends on the abundance of it, as the regeneration and chemical *analysis* of cinnabar shows. Hence the reason is likewise evident why this ore is so very volatile in comparison with other ores.

"Mercury and its ore cinnabar is more seldom found than any metal, so that, according to the calculations of Dr. Hoffman, there is fifty times more gold got every year out of the mines than mercury or its ore. This indeed is very true, but it seems to be no less certain mercury and its ore offer more frequently than we think, but are not known to us. This will appear probable to any that consider that metallurgists try the minerals unknown to them in a strong open fire, only making with them scorifications, copellations and various melting preparations, and neglect, or perhaps are ignorant of those operations that are made in close vessels, because they hardly ever think of mercury except when quicksilver itself or the scarlet color of its ore offers it to the eyes. Besides, the color, weight and figure of cinnabar (which is nevertheless most easily distinguished from other minerals when pure) are altered to such a degree by other minerals mixt with them that

can never be detected by the mere outward view and without making an experiment."

"Coroll: You will indeed find in the works of chemists several experiments mentioned by which they say that mercury has been fetched out of minerals; but all these experiments are here of little service to us. For (1) these minerals are not exactly described, so that they could not be distinguished if they should offer us; and if they have been called by a name, the same is also common to many other things or the signification of it known to none but the author himself. (2) The particulars necessary in the relating of experiments have been almost entirely omitted, * * * and no other mineral, especially sulphur, can be in the case, for the latter may be mixt with mercury by a bare trituration or even by heat, and with it makes a black powder called the *Ethiop's Mineral*, which being agitated by a strong fire in a high, narrow, close glass or earthen vessel, is sublimed, produces that kind of cinnabar which is called *Factitious Cinnabar* because it is like that native ore of mercury which goes by this name."

D'Argenville; l'Oryctologie, 1755, writes of natural and artificial cinnabar. The former is described as being heavy, globular, striated internally, red externally and crystallized.

Cronstedt (System of Mineralogy 1760) thus describes the varieties of cinnabar:

"*Cinnabaris nativa* of a red color and Sp. Gr. 7 5.

"Loose or friable cinnabar, *Cinnabaris Friabilis*, which looks like red ochre.

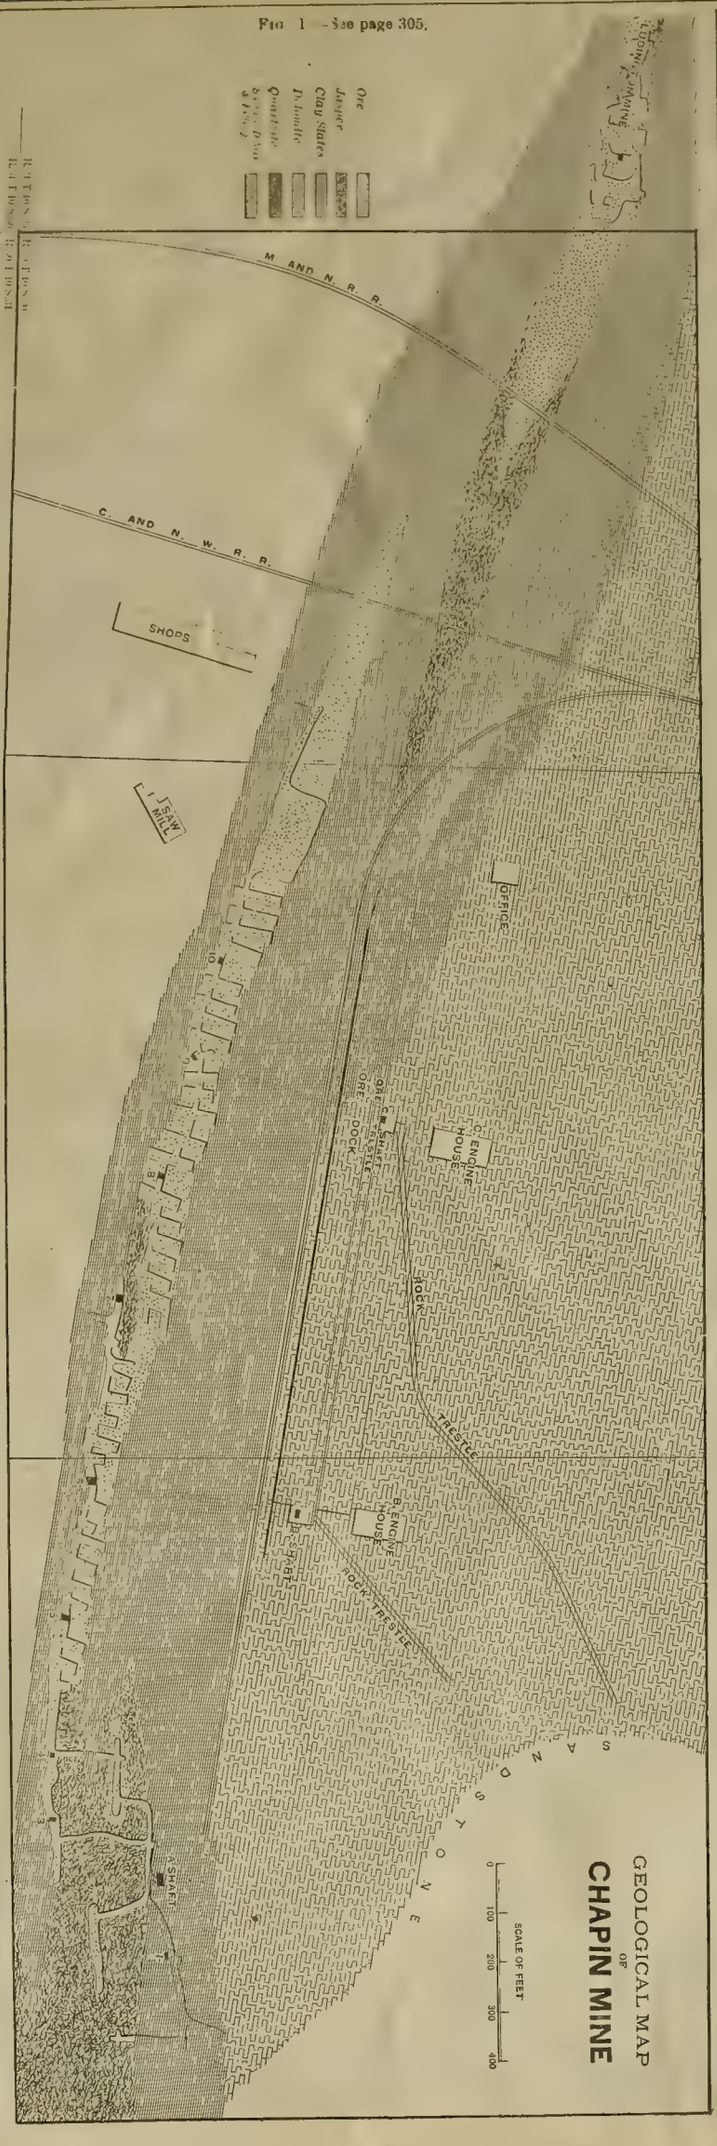
"Indurated *Minera Mercurii Indurata*, solid cinnabar, is of a deep red color which occurs 1, steel grained; 2, radiated; 3, composed of small cubes or scaly; 4, crystallized."

The following is the result of a microscopical study of a number of specimens of cinnabar selected somewhat at random, from the cabinet of the writer:

A—A mass of botryoidal pyrites from Lake county, on which may be seen a thin incrustation of cinnabar. With the exception of a few minute quartz crystals, the minerals are amorphous.

B—Cinnabar in chalcedonic quartz, Manhattan mine, Lake county. This is a piece of chalcedony evidently deposited by water in concentric coats or shells. It is rose-colored, from cinnabar dimly seen through the translucent quartz. Although an interesting specimen, it is not a beautiful one.

C—A specimen of high-grade ore from the Bradford mine, Lake county (technically called "liver ore"). Color, indistinct red, almost liver-colored, covered with shining points. Streak scarlet. Hardness of the mass, 4, but the crushed mineral scratches glass. Specific gravity, 3 25. Without optical aid, seems a mixture of several minerals, and the specimen so examined was provisionally labeled "Cinnabar and Metacinnabarite." But on placing it under the microscope it was found that no metacinnabarite or similar mineral was present, and that the liver color was illusory. But a still more interesting association of minerals was revealed. The dark-colored mineral was recognized as chalcedonic quartz, and its solfataric origin could scarce be doubted, for it had evidently been deposited by the action of hot water. The bright points were scarlet cinnabar, imbedded in the gray, almost blue, chalcedony. With these were occasional crystals of pyrite and stibnite, neither, however, in any considerable quantity. Some of the chalcedony was colored rosy-red by the cinnabar, not imbedded nor directly in view, but so placed that the reflected light was warmly tinged.



Other forms resembled raspberries, and, magnified, seemed the same in size and color. Crystals were the exception, most of the minerals being in the amorphous state; the chalcedony assumed several forms, hyaline, cavernous, concretionary, mammillary, botryoidal and granular. The Phœnix mine, in Napa county, produces specimens which are, in reality, what these appeared under the microscope.

D—This is a mass of chalcedony. As a hand specimen it somewhat resembles a pile of raspberries; so seen it is not especially interesting, but under the microscope it becomes an aggregation of semi-crystallized quartz, coated with powdery amorphous cinnabar. There are some interesting features in connection with the deposition of the cinnabar, but hardly worthy special description.

E—A specimen showing blotches of red on a grayish field. The microscope showed it to be a mass of exquisite crystals of cinnabar and beautiful doubly terminated but minute crystals of quartz. One fissure was crossed from side to side by fibers and films of a mineral resembling cobwebs. As a whole, this formation resembled a cartilage, but was crystalline. Nothing could exceed the beauty and perfection of the quartz crystals.

F—The Oat Hill mines in Napa county produce a peculiar association of minerals differing in some particulars from any others in the State. A hand specimen seems a piece of pink, almost gray, sandstone which may be crumbled between the fingers to a rather fine powder. When ground in a mortar, a brilliant powder results. When crushed by the fingers it becomes under the microscope a collection of crystals of pure, semi-transparent cinnabar associated with a clear white amorphous powder which appears to be silica; it has an almost vitreous luster. Most of the cinnabar crystals are free, but some are imbedded in the white mineral while others are attached to it. Most of the crystals are broken; beautiful faces and angles

Fig. 1.—See page 305.

may be seen and admired. The smallest fragments measured with the micrometer were found to be .002 inch, and the largest, .0215; average, .005.

G—Specimen from the Redington mine, Lake county. This was a mass of pyrites and quartz splendidly crystallized, on which had been deposited a thin coating of amorphous cinnabar.

H—Specimen from Steamboat Springs, near Virginia City, Nevada. This is solfataric matter stained faintly scarlet by amorphous cinnabar. When magnified 100 diameters, it is still amorphous and uninteresting. Some parts are nearly white, showing only a blush of color, but distinctly stained by cinnabar. In general appearance it resembles the Utah mineral. R.

I—A specimen from the Redington mine, Lake county. The general appearance of this specimen is glimmering red points in a grayish gangue. Under the microscope it is seen to be chalcedonic, cavernous, milky quartz, with metacinnabarite and clusters of the most perfect and beautiful crystals of cinnabar; some needle-shaped, others curved, all more or less perfectly terminated. A broken crystal revealed the cause of the varying shades of color that the cinnabar assumed, at first quite puzzling. This tell-tale crystal was thinly plated on one side with nearly transparent quartz, on the other with milky chalcedony. None of the quartz was crystallized, but assumed interesting botryoidal and stalactitic forms. Some of the cinnabar crystals had been broken and faultily recemented.

J—Specimen from the Redington mine. This was an aggregation of rather large individual crystals of cinnabar superimposed on a mass of cockscomb pyrites. The color of the crystals was intense crimson with steely tarnish caused by a thin coating of other minerals; they were not transparent, but translucent. Where accidentally broken, the fragments were scarlet.

K—This was a specimen of breccia cemented by cinnabar, also from the Redington mine. The cinnabar seemed to have been sublimed through a loose mass of angular broken fragments of chalcedonic and solfataric rocks; crystals were rare, a few of pyrite and gypsum, and drusy crystals of quartz were seen under the microscope. A similar rock has been found in Douglas Co., Oregon.

L—This was a specimen of pyrolusite from Sulphur Creek, Colusa county, on which was a thin scale-like deposit of cinnabar. The manganese mineral had the general appearance of black lava and was in part indistinctly fibrous, the fibers being in wavy lines. Other surfaces were mammillary and coated ice-like, with chalcedony or hyaline quartz. The cinnabar coating was intensely scarlet and perfectly amorphous, even when highly magnified.

M—This was lately received from Mr. J. H. Smith of Little Stony, Colusa county. There were several specimens, the extreme beauty of which could not be known without the aid of the microscope. One was a fragment of fine-grained sedimentary rock, upon which had recently been deposited a thin stratum of crystallized minerals, the most distinctly seen of which was gold. When casually examined as a hand specimen without optical aid, the gold seems to be in mossy patches without special character; the other minerals, not all of which were visible, seemed hardly worth critical examination. But on being placed under the microscope the drusy gold became a mass of crystals, the beauty of which could not fail to excite admiration. Not content with this exquisite work, Nature has dotted the gold with minute but perfectly terminated crystals of other minerals. This extraordinary association shows that solfataric agencies are still actively at work at the locality.

The following species could be clearly identified: Bitumen (idrialite or aragotite). Cinnabar. Calcite (nail head spar). Electrum. Gold. Metacinnabarite. Pyrite. Quartz. Stibnite. The bitumen was in cavities and fissures and was amorphous; the cinnabar was seen as an incrustation and was crypto-crystalline and dull in color; the electrum was in minute amorphous particles attached to the gold which was crystallized in arborescent and dendritic forms but lusterless; the pyrite was in two forms, the cockscomb variety and in cubes; the metacinnabarite was amorphous; the quartz, amorphous hyaline and chalcedonic; all varieties were stained with imbedded cinnabar; the stibnite was in minute needles, brilliant and with highly metallic luster.

The gold was exquisitely crystallized, not with brilliant planes like crystallized gold found elsewhere in the State, but a mossy, dendritic, plumose, arborescent matte. Globular and radiated crystals of cinnabar and an occasional perfect double terminated crystal of transparent quartz could be seen nestling in the golden fern leaves. At Sulphur Creek, near the locality of these very interesting specimens, there is a gas-jet which has been burning for years. On the sides of the fissure from which the gas escapes, sulphur and cinnabar have formed. Mr. George Senn informed the writer that out of curiosity he once scraped these accumulations away, and that returning in two months they had been renewed. With similar experience it is no wonder the alchemists were led to believe that Nature was continually employed in creating metals and tried to imitate her.

N—Two varieties of cinnabar from the New Almaden mine, Santa Clara county—one dark and the other a light-colored variety.

(*To be Continued.*)

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

Iron Mine.—The Angels *Record* says: While on a trip through the county recently, we visited the iron mine of Mr. Alexander Thompson, about four miles north of Murphys. The developments are sufficient to show a heavy and permanent body of ore. It has been found that this ore is of a good quality or grade, and is readily converted into pig iron. Herein we are compelled to regret the fact of there being no railroad traversing that section, as quantities of iron ore could be shipped, not only from that mine, but others along the route. Calaveras county has many iron mines, which if a railroad were here, could and would be profitably operated, thus contributing to the benefit of this county, and generally to the State's prosperity. And not only would the iron industry be established, but large quantities of gypsum would be shipped, a vast body of the latter named, being in close proximity to the above mine.

Mokelumne Items.—The Calaveras *Chronicle* says: While but few mining operations are at present going on, the outlook is good for something stirring in the course of two or three months. Just at this season is always the dullest time every year, and more especially this, on account of the unusually long dry season through which we have passed. Several enterprises in the immediate vicinity are now passing through the preliminaries and they promise something substantial in their consummation. We have already made mention of several of those which have reached an advanced stage of completion, which means, of course, that they are "a go." In these cases the meteorological conditions, it must be allowed, will set the time for the commencement of active operations. At Sandy Bar, on the Mokelumne river about two miles from this place, there is promise of activity in the near future, from the fact that there are several valuable quartz locations centering there. The Sandy Bar Mining Company, with Col. W. T. Robinson as superintendent, is making preparations for the erection of a quartz-mill at that point. Thirteen men are now employed doing preparatory work. The Pellaton gravel mine is promising well. The shaft down to the gravel is over 100 feet in depth. The gravel bed, so far as explored, averages about four feet in thickness, and rich with coarse gold, pieces of three and four dollars in value being found to the pan, while frequently small pieces of gold can be picked from the face of the drift which is being run on the channel from the bottom of the shaft. The drift has yet been run but a very short distance and no cross-cutting yet done, therefore the extent of such gravel is not known, but there is sufficient knowledge of the ground upon which to base the belief that there is good pay there for some time to come.

Union Copper Mine.—Stockton *Independent*, Oct. 13: Colonel H. D. Ranlett of Oakland, manager of the Union copper mines for the Eastern owners, passed through the city yesterday on his way homeward, after an inspection of the work being carried forward at Copperopolis. The mine-owners are expending a vast amount of money to increase the facilities for properly working the mine, and will soon have roasting and leaching works in operation and expect to smelt 130 tons of ore daily. Colonel Ranlett had charge of the mine 19 years ago, when it became necessary to shut down because of the low price of copper and the expensive system of working which made it necessary to ship the ore to Europe. When the price of copper advanced about two years ago the mine-owners consented to carry out the Colonel's plans and open the mine with a view to making improvements to work the ore at a profit when the bottom should fall out of the market. While reopening the old mine the manager shipped the ore as it was handled 20 years ago when Meader was a local copper king, and carried forward his plans to improve the property. About 60 men are now employed in and about the mine, and the manager expects to be able in a short time to work from 150 to 200 men. The work of putting in new machinery is being rushed and the leaching works are about completed. Colonel Ranlett hopes to handle 400 tons of ore daily when all of his plans shall have been carried out. Copper is now very low, at 9¾ cents, but it is claimed that the Copperopolis mine can be made to pay with copper selling as low as 8 cents. Many of the mines of the West cannot be worked profitably with copper at the current price, but the manager says the Copperopolis mine can be worked cheaper than any other, and will now be kept open.

Inyo.

Keeler Notes.—The Independence *Index* says: Forty-five men constitute the pay-roll of the Inyo Development Co. at the Keeler Soda Works. The majority of this number is at present taking up the soda crop. Between 1400 and 1500 tons is the estimated quantity of crude soda to be lifted this year, being far in excess of last year's crop, and a much superior article.

Union.—Ore is being regularly shipped from this mine, a weekly average of 60 tons going out by rail. About 50 men are employed in and about the mine at Cerro Gordo, and things are slowly assuming shape. Owing to the steep road from Keeler to Cerro Gordo, transportation of the heavy mining timbers is slow work. We all have great faith in Cerro Gordo.

Nevada.

San Jose Mine.—The Grass Valley *Tidings* says: The developments at the San Jose mine show that the recent strike there will be permanent. The gravel is of very fine quality, and, from present appearances, is extensive.

The Hartery Mine.—The Grass Valley *Union* says: The pumping works of the Hartery mine were started up on October 8th, and the machinery worked smoothly. It will not take many days to pump the water out of the mine, when the work of cleaning out and reopening the lower drifts will be commenced.

The Manzanita Mine.—The Nevada City *Transcript* of Oct. 8th says: The rainstorm of Monday had a disastrous effect at the Manzanita drift mine just north of town. A large section broke off the face of the 500-foot bank. It will take nearly, if not quite, two weeks to remove enough of the dirt that has already fallen, so work can be resumed in the mine without danger. If the bank breaks again meantime, as it may do, the delay will be lengthened.

Gold Point Mine.—Supt. Bennallack of the Gold Point mine, Nevada City, states that a Pelton wheel for hoisting purposes is to be put in and a 20-stamp mill erected.

Paying Mine. — White Pine *News*, Oct. 12: A five-ton lot of low-grade ore shipped by Thomas Rockhill and W. R. Thomas to the Selby Smelting Works in San Francisco for trial, gave the following result: Silver, per ton, $23; gold, $3; lead, 42½ per cent. The freight by team and rail was $109 and the lead alone netted $135, being in excess of both freight and working expenses of the lot. Ore of this grade shipped to Salt Lake would have brought the shippers out in debt. The price allowed for the lead was 3⅞ cents per pound. Messrs. Rockhill and Thomas at the same time shipped a lot of high-grade ore to the same works which gave very satisfactory results.

Omaha Mine.—Grass Valley *Union*, Oct. 15: The shaft of the Omaha mine is now being sunk for the No. 10 level, and the ledge in the shaft is showing well in free gold, which gives good encouragement for the opening of the new level. The mine is looking well throughout, and is yielding handsomely. There are now over 100 men on the pay-roll, and no tribute work is being done in the mine.

Gravel at the Loami.—Grass Valley *Tidings*, Oct. 15: The pipe clay in the new perpendicular shaft on the Loami Company's claim, one-fourth of a mile west of the old incline, was cut last night. Only a few pieces of gravel were obtained, however, a strong volume of water pouring in and forcing immediate cessation of operations. The miners are positive that they have struck the channel, and an old drift miner declares that the formation is identical with that in the San Jose Co.'s mine, Washington district, where rich gravel was struck two weeks ago. The shaft on the Loami is down 70 feet. It is probable that a pump will be temporarily rigged up to enable the prospecting of the find—if "find" it proves.

Mono.

Bodie District.—The following official letters were placed on file Oct. 16: Bodie M. Co.—During the past week the east crosscut from shaft 1000-foot level was advanced 50 feet. Upraise from south drift, same level, was down 20 feet. Are stoping out ore above the 900-foot level. Mono M. Co.—The south drift 1000 level was advanced 33 feet. West crosscut No. 2 from same was down 39 feet. Bulwer M. Co.—The last crosscut from north drift 100-foot level was extended 10 feet. Are cleaning out and repairing main lateral drift 200-foot level. Put in switch in main lateral drift 200-foot level and laid track in crosscut No. 3 to raise No. 5 and started on same and extended it 11 feet.

Placer.

The Eclipse Mill.—The Placer *Republican* says: Supt. Patterson has all the machinery for the Eclipse mine at Ophir now on the ground and the workmen are busy framing the timbers for the new ten-stamp quartz-mill. There are two Pelton wheels, one for the mill and one for the hoisting works of the old shaft. It is expected that the latter will be in operation in about a week. The new east shaft is down about 100 feet, and a whim is to be at work on this shaft.

Shasta.

Mining Notes.—The Redding *Democrat* says: Tom Cummings came down from the Gladstone mine yesterday. He says the mill is running full time and the mine looking better than it ever did. George Bassett has resumed development work on the Crœsus mine on Squaw creek. He is running a new tunnel which is expected to tap a rich chute of ore. We hear a report that three prospectors very recently discovered an immense body of rich gold quartz near the head of East Fork of Trinity. The find is about seven miles a little south of west of Southern's. There was quite an excitement in Old Diggings last week over the strike in the lower tunnel in the Old Mammoth. A rich body of ore was uncovered, much of which will mill way up in the thousands a ton.

The Old Diggings.—The Redding *Free Press* says: The extraordinarily rich strike in the lower level of the Mammoth mine last week has excited a great deal of interest in the Old Diggings and among mining men in general. Every one who has seen it remarks: "It is the finest I have ever seen." Messrs. Panter and Young ground out about $60 in a hand mortar in less than two hours last week. Work done in the tunnel since the discovery was made indicates that it is not a "pocket," but the beginning of a very rich pay chute. This proves one thing—that the mines in the Old Diggings do go down. Hart & Fleming, Walker Bros., the Mammoth and the Central have always found rich rock as fast as they went down, and this is certainly encouraging to go still farther. Walker Bros.' new mill started up this week, and it is a credit to Shasta county. A new feature introduced by Supt. Rippets is "sizing the pulp," and it works like a charm. As the Walker Bros. are wealthy and influential mining men of large experience, and are spending lots of money in the Old Diggings for the development of their properties, it is naturally assumed that they know what they are about. Mr. Rippets says their mine looks better than ever. That old mining men like R. G. Hart and F. P. Saterlee, who were engaged in mining in the Old Diggings years ago, have returned to make their fortunes, is a suspicious sign. Mr. Saterlee is still running the Central mill with ore from the Mammoth dump, showing that there is money in it. Mr. S. is a practical millman and understands his business.

Slate Mine.—Redding *Free Press*, Oct. 12: At the Bank of Shasta County, and at Judge Bell's office in the courthouse, can be seen samples of the slate from F. M. Whitlow's slate mine at Delta. Judge Bell owns a third interest in the mine, which he considers valuable property. The ledge is 60 feet wide, and there is a mountain of it close to the railroad track. The only slate mine in operation in the State is the Chili bar mine, located on the south fork of the American river, five miles from Placerville. From this mine there is shipped a carload a week, for which the company receives $7 per square foot. A great deal of the slate is used by the railroad company for roofing purposes, it making the most desirable roofing. The Chili bar mine is located some distance from the railroad, and the cost of transportation to the cars must be quite an item, one that can be avoided by the happy location of the Whitlow mine.

Siskiyou.

Yreka Items.—Yreka *Journal*, Oct. 16: The Hegler boys and Bruce Aldrich started up their quartz-mill on Humbug last week, the late rains having furnished sufficient water for their batteries to keep the steam engine and mill in operation day and night. Boyle & Co. are now moving their 25-horse power engine from forks of Humbug to their quartz mine on north fork of the Humbug, and next week Mr. B. intends going to the Bay City to secure a new quartz-mill of large capacity. Charlie Abbot is still working occasionally on his ledge at Greenhorn, to ascertain if his find is not something more than a mere pocket. Wademan & Heckathorn have also been prospecting on Greenhorn to discover the full extent of their ledge, in seeking to find whether it is a permanent lode and extensive. They have now shut down operations until spring opens, when they can work to better advantage. The Quartz Hill Co. at Scott River are making great preparations for extensive work during the coming season, and have ordered considerable lumber from sawmills, for improvements in the mine, and will also fix up the mill in good running order. The miners on Little Humbug are fully prepared for extensive operations the coming winter. If favored with rain and snow to furnish water, they expect to realize a good yield of the glittering ore, this little stream being one of the richest in Siskiyou.

Trinity.

Taylor's Flat Notes.—A correspondent in the *Northern Advocate* writes as follows: Everything lively in the quartz mines. There are three 10-stamp mills going up on East Fork, and the right kind of men can get plenty of work. One of the most promising camps is expected on Canyon creek, where they are finding some fine ledges. Two men, Geo. Bailey and Grant Fowers, have three fine ledges on one location, one three feet, one six feet and one four feet, and the rock assays from $40 to $60 a ton, and if it will mill a quarter of that it is one of the best mines in the State. The tunnel company has some fine ground in the bed of the river, but they cannot expect to work much longer, as the early rains will drive them out till next summer; but they are also owners of the Taylor Flat property, and intend to put a force of men to work fixing up the flume, rebuilding the mill, and fitting up the claim. All the drift and river claims are doing well on the river, and the way they ship gold dust shows they are working good ground.

NEVADA.

Washoe District.

Belcher M. Co.—Official letter Oct. 15th reports as follows: No. 1 east crosscut on the 1200-foot level is out 71 feet, and having reached the hanging-wall, has been stopped. No. 2 east crosscut is out 64 feet. The face is in soft porphyry. Have started No. 3 east crosscut, 50 feet south of No. 1. The west crosscut on the 1000-foot level is out 88, and has reached the footwall. Have started No. 1 east crosscut on 1000-foot level, 50 feet north of the south line. It is out 17 feet in porphyry and streaks of quartz. The 850-foot level, south drift, is out 148 feet. The face is in porphyry and streaks of quartz. The 200-foot west crosscut is out 376 feet. The face is in low-grade quartz containing a little moisture.

Con. Imperial Mining Co.—Official letter filed Oct. 15th, reports that the west crosscut from the 300-foot level north drift is being repaired, and the east drift from the winze on the same level is still being driven ahead toward the Imperial new shaft for ventilation.

Challenge M. Co.—Official letter Oct. 15th, same as the one received from Confidence.

Hale & Norcross.—Official letter Oct. 15th, reports as follows: On the 300-foot level the west crosscut was advanced 25 feet, making its total 140 feet. Face is in vein porphyry. No. 3 west crosscut was advanced 35 feet, making its total length 110 feet. Face has reached the west clay wall. This drift exposes 85 feet of low-grade quartz. On the 100-foot level they are still retimbering the main west drift. On the 500-foot level east drift was advanced 20 feet. Face is in porphyry and low-grade quartz. On the 700-foot level west crosscut No. 2 was advanced 30 feet, its total length 132 feet. Face of this drift is still in low-grade ore. On the 1200-foot level the ore encountered in south drift is holding out very well. They are retimbering the 1300-foot station, and have men employed at necessary repairs at the different levels.

Savage M. Co.—Official letter Oct. 15th, reports as follows: On the 300-foot level west drift from the station was advanced 27 feet, making its total length 342 feet. Face is in clay and porphyry. On the 400-foot level have started a south drift from top of upraise; have also resumed extracting ore from north drift on this level. On the 500-foot level north drift from upraise continues in ore of good quality.

Crown Point M. Co.—Official letter filed Oct. 15th, reports as follows: The 300-foot level No. 1 west crosscut is out 20 feet. The face is in low-grade quartz. The No. 2 west crosscut (25 feet south of No. 1) is out 17 feet. The last 4 feet have been in fair-grade ore. Have started a crosscut from the 9th floor 400 south stope. The 600-foot level north drift is in 60 feet. Have stopped it and started a raise from the main east drift to connect with the 600-foot level stope for ventilation. The 700-foot level south drift is out 472 feet from the shaft or 300 feet south of No. 1 east crosscut. We are preparing to raise to the 600-foot level on the quartz 50 feet back from the face. Have stopped the 800-foot level No. 2 crosscut (which is out 83 feet), and are cutting out a wing station on the west side of the south drift between the two crosscuts. Have cleaned out the 900-foot level south drift 430 feet.

Confidence M. Co.—Official letter filed Oct. 14th, reports as follows: The Confidence, Challenge and Imperial north drift on the 500-foot level is now in 1027 feet from the Yellow Jacket shaft. Face still shows quartz and porphyry. The east crosscut from this drift is now out 192 feet. The face is in a mixture of clay and quartz.

Overman M. Co.—Official letter filed Oct. 12th, reports as follows: East drift at winze has been extended 19 feet. Formation, porphyry, clay and quartz. Upraise from 250-foot level has been advanced 37 feet on a seam of quartz. South drift on 520-foot level is in 27 feet past west crosscut, on a seam of fair-grade ore. At a point 43 feet south of west crosscut No. 4 are cutting out and timbering preparatory to sinking a winze. The material, quartz, of a fair grade. Upraise from Lambert tunnel has been extended 23 feet. No. 2 has been extended 18 feet. No change in formation. Caledonia west crosscut No. 2 has been extended 18 feet. Material, porphyry and clay.

From the Virginia City *Chronicle* the following is obtained: The strongest evidence that the ore resources of the Con. Cal. & Va. mine are showing no signs of exhaustion is the fact that extensive repairs to the California battery and pan-mills are in progress and have been throughout the past summer. The foundations under all of the batteries have been entirely renewed, the foundation under each battery being renewed separately, thus admitting of the constant dropping of 70 out of the full complement of 80 stamps. Both the battery and pan-mill are now in first-class order. Appended will be found a summary of operations in the principal mines on the Comstock lode, obtained from the official reports of superintendents during the week ended October 12th.

East Sierra Nevada.—The 520 level south drift is out 120 feet and continues in porphyry.

Utah.—On the 600 level the north lateral drift from the main west drift is advanced 725 feet; formation porphyry and quartz. The southeast drift is advanced 30 feet from the shaft station.

Occidental Con.—During the week extracted and milled 300 tons of ore showing an average assay value of $17 per ton. Bullion valued at $5621.30 shipped to Carson Mint. Concentrates on hand valued at $11,200.

North Occidental.—Continue stoping ore from the 450 level and from the winze below the 400.

Best & Belcher.—On the 550 level, east crosscut No. 1 is extended 57 feet; formation porphyry and clay. On the 1000 level the northwest drift is extended 320 feet; formation porphyry.

Gould & Curry.—On the 200 level, at a point 420 feet from the shaft, in west crosscut No. 1, a southwest drift is advanced 25 feet; formation porphyry with streaks of quartz. On the 400 level west crosscut No. 1 is extended 389 feet; formation porphyry.

Scorpion.—The 520 level south drift has entered porphyry.

Sierra Nevada.—On the 520 level from the main east drift, 1185 feet from the shaft station, a south drift is advanced 263 feet; formation porphyry with some water.

Union Con.—On the 1465 level the north lateral drift is advanced 496 feet from the south line, continuing in porphyry and clay.

Mexican.—On the 1465 level the north drift from west crosscut No. 1, 200 feet in from the lateral drift, is advanced 471 feet, continuing in porphyry and streaks of quartz with some water.

Ophir.—On the 1300 level the east crosscut from the shaft station, to connect with the top of the raise above the 1465 level east drift, is extended 200 feet, face continuing in porphyry showing some quartz.

Con. California & Virginia.—The usual quantity and grade of ore is being extracted from the various openings on the 1435, 1500 and 1600 levels. On the 1650 level—The stopes on the seventh and eleventh floors above this level continue to yield the usual quantity of ore of fair quality. Also continue stoping ore from upraise No. 2, carried up above the north drift from the bottom of the winze 60 feet below the end of the south drift. At the end of the northwest drift from the southwest drift from the main west drift from the C. & C. shaft an upraise is carried up 88 feet, and connected on the east side with the seventh and eleventh floor stopes opened on the west side of upraise No. 1. During the week 1065 tons and 1440 pounds of ore were shipped to the Morgan mill, 1645 tons to the California. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $28.25.

Andes.—Quartz is still showing in 350-level explorations.

Savage.—Continue to extract ore of good quality from the 500 level. The 400 level south drift from the Gould & Curry has connected with the Savage north drift.

Chollar.—The 754 and 850 level north drifts are in hard porphyry. The 650 level west drift is in clay and porphyry.

North Gould & Curry and East Best & Belcher.—Usual progress reported in advancing the northwest drift to connect with the North Gould & Curry workings.

Potosi.—The 850 level south drift continues in hard porphyry.

Ward Combination Shaft.—The 1050-level shaft station is completed and a west drift started.

Alpha.—The 500 level west crosscut continues in low-grade quartz. The shaft is down 80 feet below the 500 level.

Exchequer.—The 382 level east crosscut continues in porphyry.

Yellow Jacket.—The 500 level west drift is out 710 feet. Daily ore shipments average 50 tons.

Seg. Belcher.—The 1100 level east crosscut is in 320 feet, and is in soft porphyry streaked with quartz.

Silver Hill.—The 160 level northeast crosscut continues in quartz and porphyry. No change in formation in the 260 level northwest drift.

Baltimore.—Encounter occasional bunches of ore in 338 and 225 level explorations.

Caledonia.—West crosscut No. 2 is in 52 feet, and has entered vein porphyry.

Justice.—Crushed 220 tons of ore of the usual assay value.

Alta.—Crushed 300 tons of ore, assays showing a value of about $30 per ton.

New York Con.—Ore still showing in the raise above the 800 level west crosscut. Have a large area stripped ready for extraction.

Candelaria District.

Probable Purchase.—Mining prospects are looking up at Candelaria. The English company, which owns the waterworks and a 30-stamp mill, is negotiating for the purchase of the Holmes mining property. There is strong probability that the sale will be made, and if it is the camp will soon boom again. Candelaria is far from being a dull camp. As it is, about 170 miners are employed there, and that means a good deal of business.

Mt. Diablo Mine.—The official letter from the Mount Diablo Mine, Candelaria district, for the week ending Oct. 10 is as follows: There is hardly any ore showing in the stope between the fifth and

sixth levels. The north crosscut from the east drift in this intermediate is in 11 feet, and shows a few inches of $50 ore. The main stope between the fourth and fifth levels is giving a little ore of fair grade. The west stope between the third and fourth levels shows a few inches of $40 ore. The east stope on the third level shows a bunch of $70 ore, about three feet wide. The winze between the second and third levels west is down 42 feet, and shows a little ore in the bottom. The winze between the first and second levels, east of the shaft, is down 11 ft., and has connected with the east drift on the second level; there are bunches of $50 ore showing nearly all the way down this winze. The east stope above the second level shows a foot of $40 ore. We have started a south crosscut in the west intermediate between the first and second levels, and are now in 22 feet. The intermediate above the first level east is giving considerable $50 ore. The mill has been running steadily during the week.

Jumbo District.

TO START UP. — The Virginia City *Chronicle* says: The new stamp-mill at the Wild Goose mine in Jumbo district will soon be started crushing ore. The water for amalgamating purposes will be obtained from the water company's flume.

Golconda District.

GOLCONDA MINES.—The success of the Adelaide company in developing that copper mine at Golconda has stimulated the management of other equally promising locations in that district to resume operations. The Great Republic and New Star have a force of six men employed, and the prospects are promising that these mines will soon be producing copper and silver bullion.

Pioche District.

REDUCTION WORKS.—The Pioche *Record* says: The force of men employed at the reduction works is now large, and progress, though steady, is slow. The great drawback now experienced is the grading which is necessary for roads, etc., immediately in the rear of the works. The smelter addition is practically finished, and work on the stack is now being pressed. The brickwork is into the second floor. At the present rate of progress, the smelter will be in operation by Oct. 25th. Coal and ore are being put in in quantities, and a successful experimental run is expected. A new building to be used as an assay office is in course of erection between the works and the present assay office on the summit. The starting of the furnace is an event eagerly looked for, as it is generally recognized that on the result much of our future prosperity depends.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Oct. 12: The west crosscut on the 250-foot level is extended 12 feet.

NORTH BELLE ISLE.—The shaft has been sunk and timbered 13 feet; total depth below the 400-foot level, 148 feet. The rock continues very hard and the water-flow is about the same.

NORTH COMMONWEALTH.—The joint crosscut on the 225-foot level is extended 16 feet. A drift has been started south from this crosscut 215 feet from the shaft. The face shows some good ore. South drift on the 100-foot level is extended seven feet.

NAVAJO.—The crosscut from the south drift on the 350-foot level is extended 10 feet. The upraise at the south end of the same level is extended eight feet. The mill will start in a few days on ore from the mine and custom ore.

DEL MONTE. — A crosscut has been started east at the end of the north drift on the 225-foot level and extended 10 feet. The joint crosscut on the same level is extended 16 feet. East crosscut No. 2, on the 100-foot level, is extended 15 feet. The face continues to show high-grade ore.

GRAND PRIZE.—On the 400-foot level a winze has been started in the east drift from the north crosscut in the ore showing in the bottom of the drift. The ore continues good in size and quality. A stope has been started in the south drift for the extraction of concentrating ore, and is looking well. The 500-foot levels are being cleared out and put in shape generally. Work on the concentrator is being pushed and is rapidly nearing completion.

COMMONWEALTH. — The hoisting engines have been repaired during the week and put in first-class order. The engines being stopped has retarded the work. Started hoisting Tuesday. The upraise from the north drift has been extended up 14 feet, passing through very high-grade ore. The top of the raise is still in vein formation. The east crosscut from the north drift has been advanced four feet, all in ore. The north drift from No. 5 east crosscut has been extended 10 feet. The south drift from No. 15 chute is advanced 16 feet; total, 43 feet. Fifty feet of the north drift on the 100-foot level has been retimbered.

ARIZONA.

OLD DOMINION CO.—The Globe *Silver Belt* says: The Old Dominion Copper Co. has purchased a new water-jacket furnace, to replace one that recently gave out. The new furnace will reach Globe very soon. Operations at mine and smelter proceed with accustomed regularity.

PHŒNIX MINE.—A New York telegram of Oct. 10th says: The stockholders of the Phœnix mine of Arizona met yesterday and listened to the report of the Reorganization Committee which was appointed in December last. They empowered the trustees to make such additions to the plant as they might deem necessary, and instructed to begin the work at once. Over 300,000 shares of the mine were represented at the meeting.

QUIJOTOA MINES.—Official letters report as follows: Weldon—The progress has been fair during the week in shaft No. 4. The vein in the bottom shows no change, with the exception of considerable more copper stain, without any change in grade. Crocker—Ore of fair-milling grade continues to be extracted from the various stopes on the different levels, some of which show strong, and others continue to be considerably mixed with country and talc, which requires sorting. During the week, the repairs on tramway being completed, commenced moving ore to the mill, which will start up as soon as some repairs to the machinery are completed. Peer—Twenty-one feet has been made in the north drift from west side tunnel during the week, making 96. No change of importance since last report. Face in vein matter of low grade. Peerless—Eleven hundred level west lateral drift from No. 1 crosscut south, total length, 30 feet, advanced 22 feet. No. 1 crosscut north, total length, 28½ feet, advanced 3½ feet. Twelve hundred level west drift, total length, 78 feet, advanced 18 feet. East drift, total length, 250 feet, advanced 5 feet. No. 1 crosscut north, total length, 7 feet. A portion of the week men have been taken from the mine to do other work. Formation of a favorable nature is being encountered in bottom of shaft and crosscut No. 1 north on the 1200 level.

ROGERS DISTRICT.—Florence *Enterprise*, Oct. 12: Mr. Charles Ceslinger arrived this week from the Rogers district, about 15 miles northwest of Silver King, in the Superstition mountains. He is employed, with several other miners, in developing a group of six mines belonging to Judge J. D. Reymert. The work is being done under the supervision of Mr. Atchison, who recently arrived in camp with his family from California. The developments now being made are designed to exploit the ore body with a view to the ultimate erection of a mill. The former owners of these properties shipped considerable rich ore which netted handsome returns, notwithstanding the distance from the railroad shipping station. The two shafts upon one of the group have caved in and become dangerous from the heavy rains of the past season, and work is being done only in the tunnel, which is now 300 feet long. The ore is free-milling chloride and carbonates, in granite formation, and the lowest assay yet had from the pay streak, which runs from six inches to three feet, is 100 ounces in silver. From this value it runs way up into dizzy figures. Mr. Ceslinger is of the opinion that a very important mining camp will spring up at this group of properties and that it will prove one of the best and richest in the Territory.

GOLD CANYON MINES.—Silver City *Enterprise*, Oct. 11: Mr. Harris, surveyor from Kingston, with a corps of assistants, is at Clifton, Arizona, surveying the Gold Canyon group of mines, locating mill-site, water-flume, etc. W. C. Tonkin has gone to Chicago on business connected with the development of this property. A test run recently made by the Gold Mountain mining company, in a five-stamp mill, of 34 tons, gave them 24½ ounces bullion, 850 fine, or about $18 per ton on the plates. This property is on the same big veins and adjoining the Gold Canyon company's properties.

PRESCOTT MINING NOTES.—*Courier*, Oct. 14: The different ledges around Dosoris are contributing considerable high-grade ore. The rain will enable managers of Crowned King, Oro Bella and Ryland mills to keep them going. It will also set several placer mines to producing. Supt. W. A. Farish thinks he can work 300 tons of Vulture tailings every 24 hours. Yuma Copper Co., whose properties are on the edge of the desert, have artesian boring machinery on the ground. Prospector McNary thinks he has discovered plenty of cinnabar ore in Copper basin, 12 miles south of Prescott. Sterling Co. of Tombstone has made a shipment of 3000 ounces of silver.

BRITISH COLUMBIA.

NELSON NOTES.—Kamloops, B. C., *Sentinel*, Oct. 12: The Hall mines have sustained their reputation by a return of over $300 per ton for a shipment of 40 tons of ore. A tunnel lately run in at a low level on their property struck the ledge according to calculations. Well-defined walls were found and a streak four feet in width of ore of very high grade. They are now picking ore for another shipment. The Eagle Gold Co. are making preparations for treating gold ore on a large scale. According to assay, their ore is very rich. Part of their machinery has arrived and they have on hand about 70,000 feet of sawn lumber for roofs, ore-bins, sluices, etc., the walls of their principal buildings being of logs.

COLORADO.

IDAHO SPRINGS MINING NOTES.—The Colorado *Mining Gazette* says: Over six feet of ore has been uncovered in the lower workings of the Oneida mine. A contract to sink the shaft an additional 100 feet has been let by the operators of the Anglo-American. Some very fine gold-bearing quartz is being taken out of the shaft of the Falcon mine, on Ute creek. The ore shipments from the Lamartine for the month of September exceeded those of any previous month. The new plant of machinery for the mine is being hauled by Ed Moscript under contract. The Ben Harrison in its recent rich strike is another illustration of the necessity for systematic development in the prolific Ute creek country. A recent run of ore from Black Prince, Brown gulch, netted 220 and 122 ounces silver according to class. Morganthau has 130-ounce ore in the Diamond tunnel. The Everett management will erect a concentrator. The Coin lode in Brown gulch is looking well. The Mint is working quite a force of men. Ore nets from 200 to 300 ounces silver. Stevens working steadily and holding her own. Runs high in lead, low in silver. Total gross output of Mendota mine to date, $410,000. Other aggregate total outputs of Mendota group, $200,000.

DAKOTA.

NEWCASTLE COAL.—Deadwood *Pioneer*, Oct. 9: The Deadwood Central is experimenting with Newcastle coal. Day before yesterday two and one-quarter tons were received, and enough more to make an even 20 tons will arrive as rapidly as teams can be secured to haul it. The company proposes to practically test the heating powers in its locomotives. For this purpose 20 tons are deemed sufficient. As the *Pioneer* has before stated, the coal is the best ever mined in the west. It will doubtless prove satisfactory to the railroad company, and will probably be adopted as fuel.

TO TREAT REFRACTORY ORE.—Deadwood *Pioneer*, Oct. 9: Since the subject of pyritic smelting has been agitated, and the assurance is given that a large plant to treat refractory ores by the process will soon be built in Deadwood, numerous inquiries have been heard as to where the necessary pyrites for fluxing will be obtained. An answer presents in the statement that the Homestake and Caledonia mines alone furnish upward of 150 tons per day, which would be sufficient for the purpose of keeping one plant of large capacity in unceasing operation. The supply, however, is not confined to the mines named. City creek locations can furnish a quantity sufficient to flux 1000 tons per day for years to come. If success of the enterprise depended only upon the quantity and quality of ore obtainable, the question would have been solved long ago. Needed capital has been all that is lacking, and this it is generally believed will be forthcoming in a very brief while.

IDAHO.

MINERAL CITY NOTES.—A correspondent of the Baker City, Oregon, *Democrat* writes as follows: The mines of the camp are large, containing extensive ore bodies; the ore is base. The precious metal is principally silver, from a trace to $3 or $4 in gold. The chief bases are manganese, sulphur and iron with antimony, arsenic with some lead carbonate, the latter very scarce. The formation or country rock principally porphyry with some trace of lime and slate. There is one mill in operation, the Egan. The method of treatment is dry crushing, chloridizing, roasting, leaching and precipitating with some modifications now called the Russell process. There is every reason to believe that the process will treat the ore successfully. Prof. Lang's smelter will, we understand, start up on the first. It will also be a success, but may possibly be a little more costly than other methods of treatment. Our belief is that the proper and most profitable method of treating the ores of this camp will be calcining and matting.

OWYHEE DIAMOND-FIELDS. — Boise City *Statesman*, Oct. 12: Secretary Curtis has among the archives of his office certain documents relating to the discovery of diamonds in Owyhee county, which fully establish the fact that a considerable number of diamonds, some of them of great value, were found in the Owyhee diamond-fields in the summer of 1865. Among these documents is a correspondence between Caleb Lyon of Lyonsdale, then Governor of Idaho, and a Mr. Russell of New York City, a well-known dealer in diamonds and other precious stones. Secretary Curtis passed a week with Gov. Lyon in examining the field and was present when Gov. Lyon made the selection which was sent to the New York dealers. This correspondence, with extracts from the message of Gov. Lyon to the third session of the Idaho Legislature, showing the importance of the discovery, will be published in a future number of the *Statesman*. Gov. Lyon had traveled extensively in Europe, Asia and Africa, and he told Secretary Curtis that the Owyhee diamond-fields gave indications of containing richer deposits of diamonds, opals, rubies and other gems than any other source of precious stones that he had examined.

MILL FOR THE TIPTOP MINE. — Wood River *Times*, Oct. 9: Ole Rorem got back yesterday from Salt Lake City, where he had been for the purpose of securing capital with which to put in a mill for the Tiptop mine. He succeeded. The mill, which is of the Huntington pattern, will be set up in the Wiswell mill building, on the Donovan group of mines, the Idaho Gold Mining Co. having leased the building to the Tiptop people on condition that they make a few test runs of Donovan ore during the winter. Next spring, if the tests have proved satisfactory or demonstrated that the proposition is a paying one, both companies will either unite in building a mill that will have a daily capacity of 150 tons, or put in enough Huntington mills to crush that quantity. The mill now to be purchased by the Tiptop people will have a daily capacity of 15 to 20 tons. It is of a make which is rapidly superseding stamps, because it does better work and at less expense. The Tiptop is not at its first test. Several tests of its ore have been made, and one of these at the Sullivan mill on Deer creek. Nineteen tons crushed there this summer yielded over $14 per ton in free gold, and the concentrates yielded at the rate of $337 per ton. As to the ore, there is an enormous quantity in sight. To begin with, there are over 1200 tons on the dump, by actual measurement and reckoning 20 cubic feet a ton. On the 100-foot level the ore vein shows from four to five feet in width and over 300 in length, and a winze already proves the continuance of the ore for a depth of 20 feet below, anyway. This winze is about to be sunk 100 feet, and a drift will be run from the bottom, which, when connected by a drift 300 feet long with another winze sunk at what is supposed to be near the further extremity of the ore body, will show up a block of ore sufficient to keep a mill of 60-ton daily capacity crushing steadily day and night for a year. And if the test alone referred to is a reliable indication, this block of ore would have a value of over $300,000.

NEW DISTRICT.—Caldwell *Tribune*, Oct. 2: T. H. Callaway confirms the various rumors afloat this summer concerning the strikes made near the head of Ten Mile and various other creeks in Western Elmore county. He prospected several of the most important leads himself and says they are immensely rich, and that one lead for which $2500 was refused for a one-third interest before any development work was done, runs from $60 to $300 per ton in gold. This lead is from 10 to 20 feet wide and is the largest yet struck. It has been located for two miles. A number of others of equal richness have been found. Placers that return 25 cents to the pan have also been discovered, but these, unfortunately, lie too high to be worked advantageously. Mr. Callaway also states that he has made a location on South Boise that prospects way up; that this region bears the best indications of mineral of any he has ever seen and has no doubt that it will be the scene of great mining activity in a few years. The new mining district has for years afforded summer range for Boise Valley stock and a large number of our cattle men have doubtless ridden over the rich quartz veins thousands of times. Mr. Callaway says that what development work has been done tends to strengthen the belief that there are some good properties in the new district.

LOWER CALIFORNIA.

ALAMO DISTRICT.—The *Post* of this city says: W. J. Sheridan, the well-known mining expert, has just returned from another visit to the new Alamo district in Lower California. He is inclined to take a more favorable view of the camp than he did before. It has assumed, he says, a more permanent appearance. All work is now confined to quartz mining, and ore is being extracted from several of the claims. The principal locations are the Princessa, Ulysses and Telemacho, which are owned and worked by the International Co. The latter claim has the largest and best defined vein exposed at present. The shaft is down about 50 feet, showing the ledge to have a width of 7 feet at that depth. The ore is very rich in sulphurets, causing the owners to put in concentrators, which are now in course of erection, near their Huntington mill. Two other claims, the El Paso and Texas, are owned by a Texas company. Their formation is very promising, the ore showing free gold. This company is erecting a first-class 10-stamp mill. There are four small mills in operation at present, with an aggregate crushing capacity of from 30 to 40 tons per day. As several prospects have given out at a short depth, it will be necessary to sink at least 50 feet below the present deepest workings before any reliable opinion can be ventured as to the permanency of the ledges. Owing to the stringent mining laws of the country, which compel owners of claims to employ six men daily for six months in the year, the poor prospector has little chance to take up claims. The revenue laws also militate against the prosperity of the camp and cause considerable annoyance to merchants and shippers. All books and accounts must be kept in Spanish and every article of merchandise must be stamped with local stamps. There is also what may be termed an inter-municipal revenue law, which works a great inconvenience to travelers. Governor Torres extends every courtesy to all who come in with the intention of developing the resources of the country. Were this camp on the other side of the line, there would be over 1000 people there to-day. If the ledges go down, it is generally believed that there will be a lively boom in this district by next spring.

MONTANA.

THE MOUNTAIN QUEEN.—The Butte *Inter-Mountain* says: The Mountain Queen is shipping considerable ore into this city, going about $1100 in gold and silver per ton.

THE CUMBERLAND MINE.—A correspondent of the Butte *Miner* says: The Cumberland is breaking the record in turning out bullion. The smelter is 40 tons capacity and it has turned out as high as 21 tons of bullion in a day. It is running about $50,000 a month now and will clear at least $15,000 per month. We now talk of building a 60-ton smelter in the spring and will build it at the mine. We think that with a smelter on the ground and a few other advantages that we will have next year we can make about one-half of the output clear—it is now about one-third clear. We now think we will begin working the mine next spring and continue it right along. It takes about 30 teams, 10 horses to the team, to haul the bullion to Livingston as fast as we can make it. That is 300 horses, and there are fully 50 more hauling ore, wood and coal, so you can see it is starting quite a business.

A BIG PLACER DEAL. — The *Inter-Mountain* says: John F. Cowan and wife have sold to the Silver Bow Hydraulic Mining Co. all their right, title and interest in the following placer claims and water rights: The Washington, Adams, Madison, Monroe, Jackson, Van Buren, Harrison, Tyler (lots 384 and 503 of the latter being excepted), the O'Neill, South Placer and East claims, the Weibold water ditch and Pioneer ditch, together with their water rights; the consideration of said purchase being 300,000 shares of the capital stock of said company.

NEW MINING CO.—The High Tariff Mining Co. has been formed in the Oro Fino district. The capital stock is $1,000,000 in 500,000 shares at $2 each. The principal office of the company will be at Champion. The company's property is the High Tariff mine, adjoining the Champion mine on the northwest. At 40 feet the assays show 60 ounces silver, and the pay streak is 3½ feet wide.

NEW MEXICO.

HILLSBORO ITEMS.—The Kingston *Weekly Shaft* says: The Thompson & Galles mill at Hillsboro is now dropping 20 stamps on ore from its own mines, and is cleaning up about $15,000 per month. The company is putting in place an additional 50-horse power steel boiler. As soon as the connections are made the 20 stamps will be started up, as also the copper slimer. The Daily & Chandler mill at Hillsboro started up Tuesday on ore from the Animas Peak Mining Co.'s, and it is thought that an eight-months' supply of ore has been secured.

A BIG STRIKE.—Silver City *Enterprise*, Oct. 11: F. Bellm, of Central district, has made a gold strike which lays all others in the shade. He has fourteen feet of a dry talcy ore which runs into the hundreds in gold. A large portion of the lead will run several thousand dollars to the ton. There is no question as to quantity. Mr. Bellm and his partner worked this mine many years ago, and although they made money rapidly, they did not get along well together. The "partner" brought several hundred dollars in gold into this city and squandered it in a single night, so disgusting Mr. Bellm that he refused to have anything more to do with him. Finally he left the country and the workings on the mine caved in. For several years past, Mr. Bellm has been hunting for the lead, and has spent $1100 in finding it. His fortune is now assured beyond a question.

OREGON.

THE BUFFALO MINE.—The Pendleton *East Oregonian* says: Wm. Conklin, an employe of the Buffalo Mining Co., is in the city from the scene of operations on the Buffalo ledge. He says they are getting out some very rich ruby silver and gold ore up there, preparatory to shipping a carload to Denver for reduction. The ore sent is expected to average $350 to the ton. The object of the Buffalo mine-owners is to fully develop their ledge and lay bare its riches. With this purpose in view, a tunnel to tap the ledge at a point 380 feet below the surface is now being excavated.

UTAH.

THE WOODSIDE MINE.—Park *Record*, Oct. 12: Operations are going on merrily at the Woodside, both in the vicinity of the leasers' old workings and at the new shaft. The hoisting plant is a model of completeness and promises to do effectual work. It is expected that the machinery will be started up the latter part of the coming week, after which developments will proceed faster than ever. Ere long the Woodside's ore shipments will rival the heaviest producers in camp as formerly. The payment of dividend No. 1 has, as might be expected, increased the market value of the stock.

MECHANICAL PROGRESS.

Hints on Hammering.

A correspondent of the *American Mechanic* furnishes that journal with some very interesting notes on the use of the hammer on shafts, rivets, etc. We collate as follows:

The particular manner in which a piece of metal yields to a blow depends upon the hardness, the weight, and the speed of the thing with which the blow is struck. A machinist straightens a shaft by striking the high side with a heavy, soft hammer; he straightens the same shaft by striking the low side with a light, hard hammer. The heavy, soft hammer acts more as a slowly applied pressure, or like a screw press, and takes out a bend by bending in the opposite direction. The light, hard hammer dents, or penes, and in consequence lengthens the low or short side, which straightens the shaft. Now a shaft can be straightened with a heavy, hard hammer, if it be heavy enough to bend the shaft more in the direction that it strikes than it tends to pene the shaft in the opposite direction. For any given shaft there is a size of hard hammer that will pene in one direction as fast as it will straighten in the other, and without a change in tendency, a man may hammer the shaft and his lifetime away and accomplish nothing.

Hammer Riveting

Is merely a series of dents. The particular manner in which pieces are riveted depends upon the weight or pressure, and the speed of the thing that does the riveting. Before riveting machines were made, hand-hammers were used, which were often more effective than the operatives were efficient. Two blows of a 4-ounce hammer would shorten a rivet so it would be nearly or quite even with the piece that it was supposed to hold, but it would not be right, because its body would be enlarged the whole length and be only slightly tapering, a little larger at the end, but not enough larger to hold. Some experiments were reported to the correspondent by Mr. C. H. Norton, the inventor of a riveting machine, in which the inventor tried light hammers, weighing about 1½ ounces each, which formed heads on rivets of some sizes without enlarging the bodies; but these hammers were still too heavy for the smallest rivets. Some of the 1½-ounce hammers were cut off at each end, leaving them one ounce, which proved to be light enough; but the operatives did not like to have them so light, because so many blows had to be struck to form a rivet head. When Mr. Norton was not near, the heavier hammers would be used by some operatives and the riveting would be worthless. Such stimulants to morality as are kept in workshops for cases in which a lack affects the employer, were administered. Reward was offered to informers, discharge was threatened to bad riveters. Another trouble came, not so much through lack of morality as through lack of skill. Among the pieces to be riveted one to another were many eccentric washers, called glass clamps, for holding glass plates, the edges of which were placed under the clamps while riveting. A wild blow, uneven hammering, or too much hammering, would break a plate.

The riveting machines afforded relief from all these troubles so far as the employer thought that his interest was concerned, though they did not, essentially, advance the operatives either in skill or in morals.

Before a successful machine was made it was found that the helve must be neither too stiff nor too heavy, but that it must yield somewhat when the cam strikes the lift. If the lift does not yield enough, it will wear away the cam almost as quickly as if turned in a lathe. One cam was destroyed in less than ten minutes.

If the helve and the hammer are too heavy, and, in addition, the helve is too stiff, the hammer, by one stroke of the cam, will be thrown so high that it will not come down before the cam has made several turns. If the hammer is not light enough, it will not answer to the spring quick enough to strike a blow that will do the work. Mr. Norton learned the curious fact that, within certain limits, the lighter the hammer the more work it will do It is the quick blow of the hammer pulled down by the spring that does the work; if the hammer be too heavy, its inertia will be too great to be overcome by the spring quick enough to do any work in the fortieth part of a second. It would appear that, though the hammer is heavier than a hand-hammer for doing the same work, the blow is largely taken by the cam, and in consequence the work done upon the rivet is like that of a small hammer. A solid metal helve that was stiff enough was too heavy. A wooden helve worked well while it lasted, but it was soon splintered. The thing that finally answered every purpose was a piece of gas-pipe about seven-eighths of an inch in diameter. The length of the strike of the hammer should be from one-eighth to one-quarter of an inch.

HOW ELECTRIC WELDING MACHINES ARE PLACED ON THE MARKET.—A recent issue of the Boston *Herald* stated that the Thompson Electric Welding Company believes it has passed the experimental stage and has now begun to do business for direct revenue. Its career has been brief, and dates from April, 1888. It was only in January of this year, when it became settled in its new factory, that the company settled down to work. It has now some 75 welding machines built and in use or in process of construction. Not a single machine has been returned to the company for failure to accomplish what it was expected to do. The company builds the machines and leases them for a price to equal their cost. It then charges a royalty for each set of welding, and the machines are self-registering. It has taken some months for the company to determine the basis of royalties, and for obvious reasons. The general principle established is that the company shall receive 33 per cent of the saving of this method of welding over the old methods, but this method being entirely new, it could not be told without experiment what the gross saving was. Until now the company has made little effort to place its machines. It will now set agents at work and cultivate the field systematically. What the revenues will be cannot be told exactly, but they promise to be large.

English Versus American Axes.

An English gentleman who has for some time past been traveling in Australia calling on the principal hardware firms, writes to the editor of the Sheffield *Telegraph* to know why English firms cannot produce an ax equal to the American. The English editor answers that there is no comparison between English and American axes; that he had personally seen them tested by a blacksmith, who with each ax struck several blows on a bar of Derbyshire iron. He says the steel of the American ax was soft and "crumpled up" when brought in contact with the bar, whereas the English ax retained its edge intact, and made its mark cutting into the iron.

The *American Manufacturer* says that Pittsburg ax manufacturers are inclined to smile at such statements as those made above. They admit it is quite possible that the English ax is more of a success at chopping bars of iron, but the reason for its superiority on this point is very apparent. It is much heavier than the American article, and by its wedge-like form is calculated to stand such severe tests, owing more to the characteristics mentioned than to material or workmanship.

It seems, however, that a woodman's verdict on the merits of woodmen's tools, is after all the most correct, rather than that of a smith, however well-informed the latter may be in his own way. The American ax is made with a view to practical results, not to take the place of a cold chisel or to be used as a combination of the two, but as a wood-cutting tool, and for this purpose it is superior to the English make. To get the English ax into a shape where its efficiency would be equal to the article turned out here would require a great deal of grinding, for the American tool when it leaves the factory is ready to be taken into the woods and put to work without any preliminaries. Whether its work is satisfactory or not is a question which is best answered by the number of sales made by our manufacturers.

The inquiry of the English traveler indicates the preference of the Australian consumer, but does not show what is equally true, that the American ax has taken the lead in the Australian market, where it is given the precedence on account of the great efficiency and its superiority in style and finish. This lead it has maintained for some years and still holds. Pittsburg axes are now sent to Australia in greater numbers than ever before, and the trade is constantly growing.

THE ENGLISH COMPOUND LOCOMOTIVE.—The advent of the English compound locomotive in America has had the effect of stirring up considerable thought and some action in the matter. At least two locomotive works in the country are each building a compound for trial purposes. This is what is needed for a satisfactory comparison of compound with simple engines, as these engines will be of the American type, with the exception of being compound. Discussing the subject further is of little use; nothing but a fair trial can settle the question. If it is demonstrated that the compound locomotives will do the work with less fuel, and otherwise work satisfactorily, there are parts of the United States where the cost of coal would make their use a matter of a good deal of importance. Engineers will be strongly interested in an impartial trial of the two systems.

ALLEGED IMPROVEMENT IN CASTING PIPES.—A Wakefield (English) foundryman's patent is said to abolish sand in casting pipes. "In superheated steam or gas-jacketed metal molds," pipes are cast which are uniform, sound and true, as if turned or bored by a lathe. The pipes so cast are not porous, and they have other excellent qualities, it is affirmed.—*Glasgow Engineer.*

A HINT ON BELT MANAGEMENT.—It looks as though a hint should be taken from the way a dynamo is set up. The belt is made to run as tight as may be desired by screws that crowd the machine to one side, and instead of a loose pulley the belt is slacked up enough to be supported on a frame that slips over the shaft pulley.

MACHINERY IN TURKEY.—In order to encourage manufacturing industries, the Turkish Government has decided to admit all machinery and tools free of duty for the next 15 years.

IT is stated that there are 5000 steam boilers in use in San Francisco.

SCIENTIFIC PROGRESS.

Underground Waters as Mineral-Formers

The mode of formation, or, as Buffon said, the genesis of minerals, is one of the most interesting questions of their history. But the problem could not be approached until geologists had furnished precise data on the conditions of their bearing. Satisfactory solutions have recently been obtained in the case of a certain number of mineral species. Synthetic experiment, placing itself in the circumstances that seem to have presided at their formation, has succeeded in reproducing them, with their crystalline forms and all their essential characteristics, and has thus completed the demonstration of their origin. By means of this method of demonstration we have been able to ascertain that many minerals are due to the action of subterranean waters. From the most ancient epochs these waters have circulated through the crust of the earth, where they have left, at a multitude of points, signs revealing the part they have played and the course they have taken, even more clearly than contemporary phenomena have done.

The sedimentary beds, formed like the deposits which the sea spreads every day in the bottom of its basin, are often distinguishable from one another, even at first sight, by certain exterior characters. The differences are for the most part produced by the action of subterranean waters, as is demonstrated by the animal and vegetable fossils, which were for a long time designated as petrifactions, or rather by the chemical changes which these fossilized bodies have evidently undergone.

Here shells and corals, showing forms perfectly preserved down to their slightest details, are no longer composed of carbonate of lime, as they certainly were during the life of the animal to which they belonged, but are essentially different substances, quartz having entirely taken the place of the calcium carbonate. There are also other minerals, such as pyrites and sulphate of baryta, which have penetrated and crystallized within the cavities which the bodies of these invertebrates occupied.

A Theory in Regard to Steam.

Prof. J. F. Elson recently communicated to the *Iron Trade Review* a very interesting theory in regard to steam, from which we collate as follows:

If one takes a beaker full of water and mounts it on a tripod above a flame and suspends a thermometer in it, it will be observed that the water gradually gets hot. Suppose we begin with water as a melting point of ice, that is to say, 0° C., its temperature, as evidenced by the thermometer, will gradually ascend until the boiling point of water, viz., 100° C.= 212° Fahr. When this point is reached the temperature will refuse to go higher, and to all intents and purposes, the water refuses to receive any additional heat. Notwithstanding this the heat keeps pouring from the flame as before, and still the water receives none of it, at least it gets no hotter. At last, however, a point is reached when the water suddenly springs into steam; then, and not till then, the temperature will again begin to ascend and arise from degree to degree as the flame below warms it. But what became of the heat from the flame from the time the water reached the boiling point until these gases began to escape is really of more importance to steam-users and steam-buyers than what becomes of the treasury surplus of this nation.

When heat has raised a quantity of water from nothing to the 100°, it then ceases to make itself evident in the ordinary way of affecting temperature, and takes effect by doing the work of separating the particles of the water and bringing them into the condition they are in, in the form of steam, an invisible gas, until cooled off by the surrounding atmosphere. The steam once produced, as it can be brought into no more attenuated condition by work in the form of heat, is immediately affected thermometrically by heat and then gets hotter and hotter as thermal increments are applied to it; the heat which, when it enters the water makes it no hotter, but affects it by doing work on its particles, is recognized by engineers as latent heat; the ordinary variety of heat (not that there are more than one kind of heat existent in any objective way, the effects only of the one thing being of two kinds), namely, that which when entering into the water causes it to get hotter in proportion as it is applied, and is denominated by engineers sensible heat.

The great point, then, wherein the modern steam engine, even of the very best type and most skillful manufacture, falls very short of a perfect machine, utilizing more than the merest fraction of the merits of heat represented in the fuel consumed, is, that the whole of the heat of the steam used in it is thrown away and lost, and notwithstanding the fact that heat must be constantly applied at one point of the engine, namely, where steam is generated, yet, at the same time, heat is being continually gotten rid of and thrown away at another point, namely, at the exhaust pipes.

When steam, say of 60 pounds' pressure, is generated in a boiler, the water it is produced from is first raised to 100° at a great expenditure of fuel, and then an enormously greater amount of heat is required to be passed into it before it can be made to assume the gaseous condition. On acting in the cylinder, the steam loses its energy and falls from 60 pounds' pressure to that of the atmosphere, and then is thrown away, with all its heat, into the air, or, at last, has its sensible heat retained by condensation, while the whole of its latent heat is thrown away with every stroke of the circulating pump.

Some time ago I stated in an address delivered to a society of steam engineers, that "it is apt to be taken, a priori, as an impossibility to recover or utilize the heat of exhaust steam, or in any way to plan an engine in which all the heat or potential energy of the steam shall find its way back, in one form or another, to the boiler. However, there are thinkers and experimenters of authority who hold there to be no inherent impossibility in the matter, and, in all probability, a time will come when a solution of the problem will be lighted on by some one. It only needs to be said that a fame and a fortune, second to none that the century has brought forth, awaits the happy inventor when he does appear.

"Various attempts have been made from time to time to solve the problem under notice. The principle of the injector seems, on the first view of it, to be one by which the steam in a boiler can be made, by its own energy, to force in vapor against its own pressure. However, the real rationale of the injector's action is that of merely condensing a portion of the steam in a boiler, and throwing a feed-water to take its place. To inject feed-water at a higher temperature than is consistent with its condensing the steam it is brought in contact with, is an impossibility, unless extraneous forces are made use of, in which case as much work will inevitably be destroyed as it is sought there should be recovered.

"It is argued by some that the steam engine has been brought to such a state of perfection, and has already attained to such a ne plus ultra condition, that very little more is possible to be done to it by any one. But so far is this from being the hard, cold fact, that were the problem I hinted at but solved (and it is not a visionist's wild vagary to say it will be some day), a steam engine would then be possible which would be to the present engine what Watt's engine was to Hero's Eolipile. Am I not correct?"

HOW CAN THE EARTH BE WEIGHED?—One way is to place a pair of scales in the top of a tower and attach to each plate a wire which passes through a long tube to a point about 60 to 100 feet below. To the lower ends fasten other scale plates, within, say three feet of the ground. Under one of these lower plates put a ball of lead about three feet in diameter. To prove that a body weighs more when near the earth than when farther away, it is weighed in one of the upper scale pans with the weight in the opposite lower one; and then the weight and body are changed in place and weighed against each other again. Then the weights are taken with the ball of lead taken away. This shows the influence of the ball of lead at a given distance; from this there can be determined the attraction of the earth alone; and taking diameters and distances, it may be ciphered out what the earth weighs in tons; also, what its average specific gravity is. This method was devised by Jolly, who calculated the mean density to be 5.692, which agrees quite closely with other determinations, especially that of Bailey, which is 5.67.—*Ex.*

SUNSHINE.—The aggregate number of hours during which the sun is above the horizon during the year at the Greenwich Observatory, in England, is 4465. The record during the year 1888 shows that only 1068 hours were sufficiently clear for observations. The hours which are sufficiently clear for night observations always average less than by day. From these statistics it would appear that less than one quarter of the hours of both day and night are available for astronomical observations at that observatory. We are not aware that any reliable statistics of hours suitable for observations have ever been published in regard to Mount Hamilton, but it is safe to say that the facts are the reverse of those of Greenwich—that less than one-quarter of the hours are so obscured as to render observation impossible, instead of more than three-quarters as at Greenwich.

DISSOLVING STONE.—From St. Paul, Minn., comes the statement that Angus Boorfried, a Bohemian stone-cutter residing in that city, has discovered a combination of chemicals by the use of which the hardest stone can be dissolved and cast into any desired shape, the casting being as hard as flint, translucent and capable of taking on a brilliant luster. It varies in color according to the stone used, and can be had from a bright red to a beautiful azure blue. While in the fluid form, it can be used for coating anything having a stone or glassy surface. Mr. Boorfried will start for the East in a few days to secure the backing of wealthy capitalists.

FOR SCIENCE.—Emperor William of Germany has given the amount of 30,000 marks to the expedition under Dr. Henson, to explore the submarine fauna and flora of the ocean. The east coast of Greenland is to be the first cruising ground.

IN order to make the quick time that the fast steamers are now making across the Atlantic, 400 tons of coal per day are consumed.

GOOD HEALTH.

The Bulging Brow.

It Does not Have Anything in Connection With Intelligence.

"That man has a fine forehead," I said to-day to a friend on the street, as a person with a perpendicular forehead of great amplitude passed us. But my friend, who was a physician and something of a phrenologist, remarked: "Humph! not necessarily. There is not a more groundless fancy abroad in the land than that about fine foreheads. Any man of ordinary reading and observation, if he will reflect for a moment, will see that a perpendicular forehead is not an invariable accompaniment of great intellect, and that a narrow or retreating forehead is not always a sign of mental weakness. Some of the greatest men that ever lived, whose genius and force of character have exerted the greatest influence on history and civilization, have had these low or retreating brows, which are popularly called weak foreheads. The list of them includes Alexander the Great, Frederick the Great, Savonarola, Sir Thomas Browne, Calvin, Bunyan, Darwin, Emerson, Gambetta, Lafayette, Washington, and even Lavater himself, the founder of phrenology, who says that perpendicularity of the forehead indicates coldness of temperament and a want of capacity, while a retreating forehead is a sign of originality, brilliancy of conception and moral courage." As I was not ready to dispute my friend's theory, and indeed had no interest in doing so, I merely passed my hand proudly over the upper end of my physiognomy and bade him good-morning. —*Chicago Journal.*

POISON RINGS were formerly often resorted to to put enemies out of the way. In Italy the poison ring was carried to the perfection of a malicious imagining. The "Anello della morte" was occasionally resorted to as a means of putting an enemy out of the way. A hollow point in the bezel, worked by a spring, communicated with the receptacle behind for the poison in such a way that its villainous wearer could, in giving his adversary a hearty grasp of the hand, inflict a mortal scratch. The point was fashioned to look like an ornament. So deadly and enduring was the poison contained in these rings that some 20 or more years ago death was nearly occasioned by handling one unwittingly. A curio fancier was turning over gems in a shop in Paris, when he fell fainting, and was with difficulty restored. It was found he had been wounded by a poison ring. This instrument of destruction was also worn in perilous times, in order that the owner might commit suicide rather than fall into an enemy's hands. Another kind was furnished at the back with a slide, which could be slipped back by the wearer, who would drop the poison into the wine he offered to a hated guest. This kind was affected by Cæsar Borgia, whose own signet ring bore an inscription little suited to his character: "Fais ce que dois, aviez que pourra." Another form of poison ring was the one which had for its bezel the key to a casket. The wearer would hand his ring in a confidential manner to a visitor, and desire him to hand him some article from his jewel-box. The key, in being turned in a somewhat stiff look, would give the unwary confidant a prick, which had for him fatal results.

WORKING WITHOUT WORRY.—One meets few unworried people. Most faces bear lines of care. Men go anxious to their day's duties, rush through the hours with feverish speed, and bring hot brain and tumultuous pulse home at night for restless, unrefreshing sleep. This is not only a most unsatisfactory, but is also a most costly mode of living. The other night the train lost two hours in running less than a hundred miles. "We have a hot box," was the polite conductor's reply to some impatient passengers who begged to know the cause of the long delays at stations. This hot-box trouble is not altogether unknown in human life. There are many people who move swiftly enough and with sufficient energy, but who grow feverish and are thus impeded in their progress. A great many failures in life must be charged to worrying. When a man worries he is impeded in several ways. For one thing, he loses his head. He cannot think clearly. His brain is feverish, and will not act at its best. His mind becomes confused and his decisions are not to be depended upon. The result is that a worried man never does his work as well as he should do it, or as he could do it, if he were free from worry. He is apt to make mistakes. Marks of feverishness are sure to be seen somewhere in whatever he does.

SHALL SUSPENDERS BE WORN?—Here comes another point that the freeman must consider. Shall he wear suspenders or not? That depends. Upon what? Upon three things, says the Cincinnati *Enquirer*. First, upon his size and shape. If the man is stout, with a generous girth of waist, he should unhesitatingly stick to his suspenders. If he is slender, with a fair width of hips, he can go braceless with impunity. Second—Does he intend to wear a waistcoat? If so, suspenders may or may not be worn, depending upon the freeman's preference. If he discards his waistcoat, he must let his suspenders go too—if he can. Third—Will he buy his trousers ready made? Then let him buy a pair of suspenders also. Suspenderless trousers must be made to order. They must fit the hips snug and close. If suspenders are discarded, a belt of narrow silk should take their place. This may be concealed by a broad belt of folded silk, but this is no cooler than a waistcoat, and while it lends to the wearer the picturesque appearance of a stage pirate between the acts, any sensible freeman will discard it without a moment's hesitation.

VIRTUE IN PEACH LEAVES.—Italian women, both at home and abroad, make much use of peach leaves as a condiment and medicine. The New York *Herald* of a late date says that Italian women have been collecting peach leaves in South Brooklyn during the past few weeks, their object being to concoct out of the dried leaves a tonic, which may be used either with food or as medicine. These women hail from Naples and other parts of Southern Italy, and retain in this country the many quaint old customs which make them so interesting a study to the historian and antiquarian. Among those customs is that of gathering peach leaves for medicinal purposes. "I don't know how old this custom is," said Mr. L. Brigandello, an Italian interpreter, to me yesterday, "but it is certain that many generations of Southern Italian women have practiced it. In almost every country there are persons who believe in the curative powers of certain roots and plants, and in Southern Italy especially such believers are, and have always been, very numerous. As to the peach leaves, I don't know exactly how the medicine or tonic is made out of them. As to the peaches themselves, I may tell you that in Southern Italy a good deal of prussic acid is extracted from the kernels." From other sources I learned that these Italian women make many strengthening drinks and drugs from various roots and plants, and are thus ready at a moment's notice to administer a dose of home-made medicine to any members of their families who may be in need of it. It naturally follows that they seldom invoke the assistance of regularly licensed Italian physicians. "Indeed," said an Italian editor to me, "a physician finds it hard to make his living among these people, and this fact largely explains why many Italian physicians in this city find it hard to make both ends meet."

IS LEPROSY CONTAGIOUS?—There seems to be much difference of opinion among physicians in regard to this question, and the death of the Catholic Father, who went among the lepers at the Sandwich islands to look after their spiritual welfare, has been referred to as a strong proof of the affirmative of the question. Quite recently, however, it has been stated, on apparently good authority, that the lamented Father Damien attributed his leprosy to the inoculation of an abrasion in the scalp through the agency of flies.

USEFUL INFORMATION.

Water Filtration.

John A. Caldwell in a late number of *Science* furnishes the following useful information in regard to water filtration:

Probably at no time has the condition of the water supply of our cities and our towns received more attention than at present, and perhaps no one thing has conduced to this state of affairs more than the discovery that certain salts contained in the earth act as renovators of all so-called "spring" waters, purging them, so to speak, of the foul matters held both in solution and in suspension.

Up to the time of this discovery it was thought that the earth acted merely as a filter or strainer on a large scale, and that each grain or atom of earth acted its part toward opposing or arresting impurities in the passing water—in other words, that only mechanical straining or filtering took place and nothing more.

Multitudes of filters have been made and put in operation in all ages and countries with the expectation of seeing the water emerge from them as pure and sparkling as from a good "spring," and the greatest surprise has been manifested at the failure to secure the same results when apparently every condition was supplied. The question remains: "Was every condition supplied?" Modern science answers, "No."

The peculiar action of the salts above referred to upon the portion of impurities said to be held in solution is well illustrated by the effects produced by dissolving soap in a water of great (so-called) hardness. The white flakes that almost instantly appear are composed not alone of dissolved soap (for soft water would not show such individualized flakes), but a mixture of soap and some substance hitherto held in undisturbed solution in the water, but now withdrawn from that condition and floating about in mechanical suspension. It will be plain that if this soap-treated water was now poured into the earth at one point, and made to emerge at another some distance off, it would be found purged of not alone the soap it contained, but also of the modicum of foreign matter held in its embrace, and which went to make up the quality of hardness spoken of.

This subject is so little (generally) understood that it seems necessary to use the above illustration for the benefit of the casual reader, although to the chemist 100 different applications of the same law will suggest themselves. Indeed, it is noted here for the purpose of calling more emphatic attention to the simple fact that water may contain impurities in absolute (chemical) solution, and that such impurities, by the addition of another substance, may be rendered tangible and capable of withdrawal from the water by purely mechanical means.

Equally clear and understood should be the statement that water may contain impurities in a state of fine (mechanical) suspension—so fine that they would flow wherever water would flow—and these, by the addition of another substance to the water, be made to flock together into groups, a thousand or two into one (as clouds are condensed into drops); and that one, with its fellows, be tangible, and easily removed from the water by purely mechanical means.

It follows, that if the earth contains in abundance this "substance," which has the dual property of disengaging matter held in solution, and rendering the same tangible, and also of curdling together matter held in so fine a state of division as to almost elude the senses into a state of perfect tangibility, we at once get at the secret of how nature makes the true spring-water, so wonderfully pure and sweet to the taste, as well as brilliantly clear and inviting to the eye.

What is this substance or substances? Usually some combination of lime, iron, potassium, aluminum, etc., with other bases, such as sulphur or carbon—all existing naturally in the great mother matrix, the earth.

The almost universal diffusion of the aluminiferous earth (red clay) makes that substance take a more prominent place among the agents above alluded to. Water cannot flow far in any part of the world without encountering in its course the coagulating or curdling effect of this single element. Some of these clays are more heavily charged or freighted with aluminous compounds than others. Waters fouled by such are more quickly subsided. In this fact we have a clue to the explanation of why it is that of two different waters showing the same degree of turbidity from clayey impurities such impurities will subside quickly in one, while in the other they may not subside in months. As proof that the quick subsidence is due to the presence of these salts, we have only to add a minute proportion of such (usually aluminum sulphate) to the other water to produce the same effect. Hence, when water issues from the earth in a very clear and perfect state we may always be sure that it has encountered somewhere on its travels a body of earth or mineral containing a suitable coagulant, the action of which coagulated upon the water accounts for its wonderful purity aside from and entirely independent of the mere filtering effect of the earth.

It has remained for the present decade to apply the above knowledge to the *art of filtration of water*, and for the first time produce results equal to nature.

As this industry extends it will become a common thing to see "spring" water issue from our city faucets, as is already the case in a few American cities, notably Atlanta, Long Branch and Newport.

The study of this subject furnishes a striking example of nature's exhibiting, in the humble wayside "spring," the results of her perfect handiwork for the observation and admiration of man throughout all ages and countries, only to deliver up her secret to the pale student of this century of science.

ARE WATER-FILTERS USEFUL?—Concerning this subject, the following article will be found well worth consideration: Dr. G. T. Swarts has placed before the Rhode Island Medical Society the results of a series of experiments with water-filters, the gist of which ought to be given wide publicity. It is quite common belief that a domestic water-filter, the operation of which will produce clear water, is a valuable acquisition. But the doctor's experiments show that most filters, when first used, remove part of the organisms from the water, but in their continued use the filtered water comes to be much worse than the unfiltered. It appears that the germs remaining in the filter multiply with great rapidity, and that, instead of removing the danger from them, the filter increases this danger enormously. Dr. Swarts tried many simple means of cleansing filters, but found in every instance the filtered water was at a disadvantage as compared with the unfiltered. An interesting point in regard to this is the operation of the large filters used to filter the entire water supply of a town. It is to be hoped that the doctor will continue his investigations by determining the effect upon the water of some of those that have been in use for two or three years. It may be found that the wise plan is to go far enough to get a supply of comparatively pure water rather than to depend upon any filtering process. Reasoning from analogy, it looks, in the light of Dr. Swarts' experiments, as if the filtering process, with a view to furnishing wholesome water, was worse than useless. But it is a subject that will bear further investigation.

HINTS ABOUT FIRE.—A steamer in unloading the ashes it had made in a trip across a fresh-water lake, found the coals all bright and lively and ready to burn, after laying out in a heap all winter. A spark in a bale of cotton has mulled away for years and at last set the storehouse on fire. Those who have a forge fire to look out for during the day should throw on a handful of sawdust to assist in starting up easily, as the coal that is used nowadays lets the fire all out as soon as it lies idle for awhile.

ENGINEERING NOTES.

The English Channel Tunnel.

It is well known that Mr. Gladstone is an advocate of this project and that M. Leon Say is the chief of a French company that has already spent $400,000 for the preliminary work of piercing the tunnel.

It is more than probable that M. Leon Say will soon again play an important role in the political affairs of France. Baroness Althea Salvador writes to the *Call* of this city as follows: When M. Gladstone shall be Premier in England and Leon Say at the head of the Cabinet in France—an event possible in the year 1890—we may see Dover and Calais approaching each other by a submarine railway. This tunnel is not a new idea, for 25 years ago Queen Victoria and Prince Albert hoped that England and France would in this way be united. At that time French engineers began the work and immediately the results were satisfactory. Examination of strata under the channel proved the existence of a bed of Rouen chalk deep enough to offer a sure quarantine against infiltration, and through this it was found that a perfectly dry gallery could be perforated. The work of digging near Calais was accomplished at the rate of 30 meters in 24 hours, and never had a similar operation succeeded so well. At the Simplon only five or six meters were finished in one day, and it was natural that the company thought the way prepared for ultimate success. The French Parliament passed a law by which the company had permission to use the tunnel for transportation of passengers and freight during 99 years; that is, one-half of the tunnel (ten miles) would belong to the French company, one-half to the English company.

At first public opinion in England favored the enterprise and two rival syndicates were formed to study on the English coast what had already been proven in France. The same stratum of Rouen chalk was found, and in order to make success certain the rival companies united.

Then came fear. Lord Wolseley spoke of the dangers for British safety, from a military point of view, were there a tunnel under the channel, and as this speech was everywhere echoed in England, there was a veritable panic. Not long after the British company was forbidden to continue its work, and affairs remained in statu quo. Although every effort was made to win the consent of the authorities, when the bill was brought before the House of Commons it was defeated.

The French people watch with interest all debates in England referring to the tunnel; but it seems that more than ever the English wish their country to remain an island, more than ever do they fear an invasion from the French, should the submarine railway be made.

In vain does Mr. Gladstone tell his compatriots that during ten centuries France was many more times invaded by England than England by France; the bills are always rejected.

The French ask what they shall do—wait until their neighbors become sensible, or follow M. de Lesseps' advice, who said: "I received no authority to work on the Suez canal, but the day it was finished the concession was granted. Make your tunnel, and when it shall be finished the British Parliament will authorize you to begin work!"

A GREAT ENGINEERING FEAT.—One of the most astonishing engineering feats of modern times will be the railroad to the summit of Pike's Peak. The final surveys have been completed and construction will be commenced shortly. The route will be about 9¾ miles long, and will follow the old trail a large part of the way. The road will be built upon the same principle as the one that ascends the Rigi in Switzerland. It is calculated that the ascent and descent will each occupy about 1½ hours. It will be run entirely for the accommodation of tourists, and there is no doubt but that it will be crowded to its full capacity during the summer season, as the view from the summit of Pike's Peak is probably unequaled in America.

THE HUDSON RIVER TUNNEL.—There are 250 men constantly employed at the great tunnel under the Hudson river, and within the next 15 months it is calculated that people who are in a hurry to reach Jersey City from New York will enter a hole in the ground, to be excavated somewhere in the vicinity of Washington Square—the terminus on the New York side—and be shot under the Hudson river to their destination in a twinkling.

CANALS VS. RAILROADS.—The Washington *Star* says that people living along the line of the Chesapeake & Ohio canal could buy coal for $2 50 per ton when the canal was in operation; now it comes by rail, and they pay $5. There is the same advance in all kinds of transportation rates. It is a wise plan to hold on to the canals.

INCREASE OF OUR MACHINERY TRADE IN MEXICO.—According to Minister Ryan, the people of the United States furnished Mexico with machinery valued at $462,384 in 1880, and $4,000,000 in 1887.

THE PANAMA CANAL.—It is stated that the Government of Colombia will not renew the De Lesseps grant when it expires in 1892.

TABLE OF CONTENTS.

EDITORIALS.—Standard Pans and Settlers, 297. Passing Events; The National Silver Convention; Mineral Character of Land; Mining Progress; Assessment Work, 304. Working an Iron Mine, 305.
ILLUSTRATIONS.—Boss' Standard Amalgamating Pans, 297. Geological Map of Chapin Mine, 299. The Rock-Filling System Applied in Place of Timbering in Mines, 305.
CORRESPONDENCE.—The Mines of Placer Co., 298.
MISCELLANEOUS.—Mercurial Minerals and their Associates, 298.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 300-1.
MECHANICAL PROGRESS.—Hints on Hammering; English Versus American Axes; The English Compound Locomotive; Alleged Improvement in Casting Pipes; A Hint on Belt Management; Machinery in Turkey, 302.
SCIENTIFIC PROGRESS.—Underground Waters as Mineral-Formers; A Theory in Regard to Steam; How Can the Earth be Weighed; Sunshine; Dissolving Stone; For Science, 302.
GOOD HEALTH.—The Bulging Brow; Working Without Worry; Shall Suspenders be Worn; Virtue in Peach Leaves; Is Leprosy Contagious, 303.
USEFUL INFORMATION — Water Filtration; Are Water Filters Useful; Hints About Fire, 303.
ENGINEERING NOTES.—The English Channel Tunnel; A Great Engineering Feat; The Hudson River Tunnel; Canals vs. Railroads; Increase of our Machinery Trade in Mexico; The Panama Canal, 303.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 312.

Business Announcements.

Passing Events.

The rainy season appears to have set in in earnest, for our advices at this writing report a general rainstorm in the valleys and snow on the mountain ranges. The snow deposit gives assurance of a bountiful water supply for mining purposes.

On Oct. 15th over seven inches of rain fell at Encinitas within the short space of 20 hours. This is the heaviest rainfall within the recollection of the oldest inhabitant.

At Ogden natural gas was struck on October 12th, while boring an experimental well for gas.

A large steel stem for the new cruiser San Francisco was successfully cast the past week at the Pacific Rolling-Mills. The stem weighs about eight tons. It will be put into the San Francisco some time during the coming week. The casting was witnessed by Lieutenant-Commander F. P. Gilmore and Lieutenant G. M. Stoney of the United States navy (who have, on behalf of the Government, charge of the steel work done at the Pacific Rolling-Mills), Superintendent Noble, and several others.

THE warship Pensacola sailed from New York Oct. 16th, having on board the scientists bound to witness from the west coast of Africa the total eclipse of the sun next December.

The National Silver Convention.

The National Silver Convention, which is to meet at St. Louis on November 26th, is attracting widespread interest, but not more so than its importance deserves. The convention will most unquestionably draw to it the more prominent bimetallists of this country, whose advocacy of free coinage of silver should throw more light on the subject of bimetallism. That silver is a leading product of the United States does not admit of a doubt, and as such should be protected, particularly when by that protection neither the financial nor business interests of the country are injured, but, on the contrary, would be greatly benefited. In previous editorials the MINING AND SCIENTIFIC PRESS presented an array of facts and figures which are convincing to the most skeptical of the wrong perpetrated by the demonetizing of silver. It was conclusively shown that when, about 17 years ago, the United States joined the knightly crusade against the white metal by demonetizing it, it was made possible for a few London brokers to work an injury upon this and all silver-producing countries that it will take years to overcome. These brokers were given the power by this country's action to dictate from day to day the price of silver, and the lower they sent it, the larger their gains. From above par they have succeeded in sending the price down fully 25 per cent. In their endeavors they have been ably supported by both England and Germany, the former by reason of its securing cheaper food for its artisans and cheaper raw material for its manufactories, and the latter owing to the financial stab its hated enemy, France, would receive through the depreciation of its principal metallic currency.

The protection of silver is not only demanded on its own merit as a product of this country, but also to protect from unjust competition in the world's market many leading products of the farm, particularly that of wheat and cotton. To such an extent has the decline in the price of silver depreciated the value of wheat in the U. S., by allowing Indian and Russian wheat to be landed in the European demand markets at very low prices, that only in exceptional years is wheat farming profitable. This is well illustrated by an editorial in a recent number of the Philadelphia *Record*, in which it is stated that the New Hampshire State Commissioner of Immigration officially reports the abandonment of 887 farms in that State, owing to their owners finding them to be unprofitable. Commenting on this very unpleasant fact, the Salt Lake *Tribune*, Oct. 13th, tersely says that "by giving the English, through the demonetizing of silver, power to pull down the price of the metal, Congress gave them also the power to dictate the price of every other production of our country, and so everything has fallen in precisely the ratio that silver has. Even cotton has fallen in the same ratio, though our people have increased 48 per cent since then, the people of Europe having increased by 20,000,000 souls, and cotton manufactures have increased 50 per cent, while the production has increased but 25 per cent. Through this the price of farm products have fallen so low that there is no longer any profits left to the farmer, hence the abandonment of the farms."

Probably no more auspicious time could have been selected for holding the National Silver Convention. We have visiting us leading representatives from sister American republics and nations—all having a silver currency. A strong and more decided movement looking to the remonetizing of silver will knit them to us in bonds of stronger friendship, and if we go still further and adopt an international silver currency, this friendship will be the more secure, and their principal trade attracted to us. But looking from this country to Europe, we find that the time selected for holding the convention is well chosen, for in both England and Germany bimetallism is being more freely discussed, and any light thrown on the subject while being discussed during the convention, will be eagerly caught up and disseminated by the friends of silver in those two countries. There is no question but the sentiment abroad toward silver is undergoing a radical change. We find in England leading financial papers advocating the Bank of England holding a certain percentage of its reserve in silver. Not only are they avowed advocates of this, but they go still further and favor the issuing of smaller certificates than five pounds sterling against the silver so held. Leading papers in Scotland are also advocating the policy of allowing their banks to issue certificates of smaller denomination against silver. Perhaps one cause of the change of heart is to be found in the fact that India, in manufactures and manufactured goods, is not only becoming independent of England, but is taking much of the trade heretofore enjoyed by the latter. The jute bags of Scotland have given place to the jute bags of India, while the Indian cotton fabrics are making fast inroads into the trade controlled by English manufactures. Again, in several English colonies silver is being mined, and as no country looks with more careful consideration after the general welfare of its people than England, the growing feeling in favor of silver can in part be attributed to the fact that many of her subjects are directly interested in the industry.

Mineral Character of Land.

Because some surveyor has returned land as agricultural, or some surveyor-general has it marked on a map as agricultural, it does not follow that it is too late to prove it to be mineral, provided it is found to be so. The Commissioner of the U. S. Land Office himself once, in commenting on the unreliability of some of these reports, gave a list of 35 mines, the lands embracing which were returned on the official township plats as agricultural in character. The existence of mines there was not made known to the Land Office until after the receipt of applications for the mining titles. The Commissioner said: "With the kind of returns furnished, it is totally impossible to determine whether any given tract in the mineral district is properly agricultural within the meaning of the law or not, or whether this office could, with a due regard to the execution of the law, proceed to patent such agricultural land without further investigation."

The returns of the surveyor are not conclusive as to the character of the lands, for the Commissioner of the General Land Office in carrying out the policy of the General Government in the disposal of the public lands, allows affidavits as to the character of the lands to be made, or impeachment of the returns of the surveyor. In a ruling made by the Secretary of the Interior, in 1879, he uses the following language: "Section 2318 of the Revised Statutes provides that in all cases lands valuable for mineral shall be reserved from sale, except as otherwise expressly directed by law. Whether or not the lands entered by Culver were such lands is a question of fact to be determined by proofs, and it is immaterial that they had been previously borne on the official records as agricultural lands."

Another Secretary of the Interior also said: "If the lands were, in truth, mineral, I think the fact that they had been previously borne on the official records as agricultural lands was immaterial."

In a recent ruling in March of this year, the Commissioner of the General Land Office said: "The fact that these lands were returned by the Surveyor-General in 1865 as agricultural does not conclude anything. The functions of that officer are purely ministerial, not judicial. Issue having been joined upon the correctness of the return, a hearing has revealed the fact that certain portions of the tract are mineral, thus showing the return to be erroneous."

Of course it is necessary in cases like this to bring proof of the mineral character of the land. The trouble is, that unless some one is directly interested, patents issue to such lands on ex-parte statements, and thus more or less mineral land is placed out of reach of the prospector. But because land is classed by officers as agricultural, it will be seen by what has been said it does not necessarily prevent any miner from having an opportunity to prove to the contrary.

OUR FOREIGN TRADE.—Foreign imports at this port during the first nine months of the year were $39,599,000, against $37,617,000 during the corresponding period of 1888. The foreign exports were $28,786,000, against $27,732,000 last year. Our imports this year were $10,800,000 in excess of our exports. The specie imports by sea during the first nine months were $4,871,000, against $3,018,000 last year.

Assessment Work.

There is a certain class of miners who grumble at our mining laws because they compel a certain amount of work to be done every year. This provision was only grafted on to our general laws in 1872, when it was found to be a necessity. Before that the matter of expenditures was left entirely to the miners of each district. But evils grew out of that system which it was necessary to do away with and the "annual expenditure" feature was introduced into our laws.

This feature has worked well. It prevents men holding on to a lot of ground for years without doing any work. Now, to hold a claim legally a man must work it. Of course there are ways by which the law is evaded, by practical abandonment and relocation, but there is more or less danger of losing the claim in this way.

Every year when this annual expenditure is made, we hear of numbers of "strikes," which in itself would go to prove the wisdom of a law that enforces work. The Government gives these claims to miners for them to work, not to speculate with, and it is much better for the country and for the mining industry that the claims should be developed.

The laws have not yet been changed as to the date for annual expenditure, the first day of January still being the period set. It behooves miners who still have the work to do to begin it at once and not wait until the last moment. A heavy storm on the mountains might add greatly to the inconvenience of working such claims as are at high altitudes.

Mining Progress.

Quartz mining in this State is now conducted in a much better and more systematic manner than ever before. There is no longer any careless extravagance in carrying on operations as a general thing. It is recognized as a legitimate business and not so much of a speculation as formerly. We know more about gold-quartz mining and have things down to finer points than we used to. Rock is now mined and milled for one-quarter the sum it was 25 years ago, and the percentage saved is much greater.

The milling processes are highly improved, which is greatly due to the improved appliances in vogue. The concentrates are saved carefully and utilized, no good mills now being without improved concentration.

But above all is the fact that the old days of extravagance are gone by. When money is spent the company knows what it is spent for. The superintendent is a man who understands his business and not some pet of a prominent stockholder.

Some of the Eastern companies still suffer from this plan, however, though we Californians have long ago found that this kind of superintendence was of the worst. There are now plenty of skilled mining men in charge of mines and mills, and who make it their steady business, not taking it up as a mere speculation to make all they could out of a company in a year or two.

Altogether our quartz-mining industry in this State is in a very good condition. This season we have suffered somewhat for lack of water, but this will be remedied with the advent of winter.

Standard Pans and Settlers.

(*Continued from page 297.*)

gear and arrangement of spindle step are the same as on the pans. The shoes are worked close to the bottom, but do not touch it, and on account of the angle at which they are placed form a strong undercurrent which sweeps the bottom, thus saving wear and tear. Quicksilver bowls are provided the same as in pans. The settlers are fitted with heavy wrought iron sides and are connected together near their tops in a similar manner to the pans. The cone is cast with the settler bottom and is made very wide at its base with the shoes working close up to it, thus preventing accumulation of settled pulp on the bottom with the clogging and breakage liable to ensue. The entire surface of the bottom between the base of the cone and outer groove is swept by the shoes. These pans and settlers are part of the outfit of the Boss continuous-process quartz-mill made by the Fulton Iron Works of this city.

Working an Iron Mine.

The "Felling" System Instead of Timbering.

The Chapin iron mine, Lake Superior, was first opened in 1880 and has since yielded almost 2,000,000 tons of soft blue hematite from three separate lenticular deposits. The largest of these is 2500 feet long and 130 feet wide in the middle, from which it gradually narrows to the pointed ends. As this main deposit pitches away from the eastern part of the property, it is replaced by another lens, containing ore of the same quality. It is separated from the extreme east end of the main deposit by about 30 feet of clay slates.

The ore was first moved by "steel stoping," a method quite common in the Lake Superior hard-ore mines; but it was very soon found that this way of mining was impracticable, both on account of the great width of the ore deposit and also on account of the soft nature of the surrounding rock and of the ore itself.

Another method was then adopted, which was called "the modified Nevada system." The shafts were still kept in the ore and protected by heavy shaft pillars, and the excavations were made secure by timber, though in a different manner. After mining had been carried on for three years, and 750,000 tons of ore raised, part of the mine commenced to show signs of crushing, and it became apparent that it would not be safe to open new rooms at a greater depth, so the modified Nevada system was abandoned. Mr. Per Larsson of Iron Mountain, Mich., describes the system in use in this mine in a paper read by him before the American Institute of Mining Engineers.

It was decided to adopt one or two of the old standard filling systems that had been successfully employed in similar European mines for a great number of years. One consideration that helped bring about the change was that the supply of heavy timber near the mine was becoming exhausted.

To make the change, new shafts had to be sunk, and new arrangements made for handling the ore. Two new shafts "B" and "C" were started 300 feet from the ore in the solid dolomite on the hanging-wall side, and crosscuts were driven from the mine to meet these shafts.

In order to keep the standing room pillars in place, and thereby prevent new caves, the drift on top of the ore was excavated and dumped into the rooms through small shafts sunk into the "back" of each room. This work was successfully completed except in the west end of the mine, where three room pillars gave way and let in the roof. The other pillars are now being mined under the filling system. Fig. 1, page 299, shows a general geological map of the mine; Fig. 2 is a longitudinal section showing workings on the main deposit; Figs. 3 and 4 illustrate the filling systems; and Fig. 5 illustrates cross-sections showing geology.

In opening new ground, two of the different methods of mining, where rock-filling takes the place of the ore, have been employed, viz.: Longitudinal back-stoping with filling (the *Firstenbau* of the Germans) and transverse back-stoping with filling (*Querbau*). Fig. 3 illustrates the first of these methods, and Fig. 4, the second.

The work preparatory to stoping is about the same in both these methods. From the shafts sunk in the hanging or footwall, crosscuts are driven to the ore and connected by drifts running some 20 or 30 feet from the ore, either in the hanging or footwall rock. Owing to the regularity of the Chapin ore deposits, these drifts can be run perfectly straight for long distances, at a nearly uniform distance from the ore. In regard to the location of these main drifts, it has been found necessary in the Chapin to place them on the footwall side of the ore. An attempt to locate them in the hanging-wall failed. The rock that takes the place of the ore yields somewhat under the weight of the hanging-wall, whereby heavy layers of the latter are broken off from soapy slips running with the stratification. No timber can be put in strong enough to resist the pressure caused by this movement of the ground. The footwall drifts have not shown any signs of crushing.

At the time the main levels are driven, smaller drifts are run in the ore, and from time to time connected with the rock drifts for ventilation.

If the ore is firm and not over 20 feet wide, which seldom happens, the full width is mined lengthwise on the trend of the deposit. As the stope advances, filling is trammed from a temporary chute at the bottom of the rock winze in small cars, and dumped near the breast of the stope. In this way shoveling is avoided. To accomplish this the filling must be kept at least five feet from the roof, or far enough to allow the trammers to pass under with their cars.

Where the ore is wider than 20 feet, the filling must be kept close to the back. The miners then proceed in the following manner: On the first stope different parties commence to work 50 feet from each other in the ore drift run parallel with the main level, and make cuts about eight feet high and nine feet wide clear across the ore. If the ground is weak, props or sets of light timber are put up as the cuts advance.

These openings are then filled with rock, either before or at the same time as other cuts of the same size are made, alongside of the first

THE ROCK-FILLING SYSTEM APPLIED IN PLACE OF TIMBERING IN MINES.

ones. A third slice is then taken off, and the second is filled in the same manner; and so on, until the whole first stope is mined out. As the filling must be kept close to the back, in order to prevent caving of the ore, it is necessary to shovel most of it. It should, however, be borne in mind that, as solid ore is mined and loose rock takes its place, and as the specific gravity of the ore is at least 1½ times greater than that of the rock, it is not necessary to handle more than four tons of rock for every ten tons of ore mined. As soon as the filling is put in, it is planked over.

Before work is commenced on the second stope, ore chutes and rock winzes must be prepared. Raises to be used for ore chutes and ladder-ways are made from the side of the main level to the top of the second stope, and crosscuts are driven into the ore. The ore chutes are placed 50 feet from one another, and the rock winzes are sunk 100 feet apart from the next higher level.

The first thing to do on the second stope is to connect the rock winze with the crosscut leading to the ore chute, after which the ore will be taken out and filling brought in in the manner above described. A third stope is then prepared and mined in a similar way, and so on until the whole lift is mined out. On account of the soft character and the great width of the ore, it sometimes cracks off and settles down on the filling.

If a block of loose ore is met with, it is necessary to put up drift sets and drive laths, in order to keep the ore from running.

The ore chutes are cribbed up for the first 20 feet, large enough to hold about 50 tons of ore, and then narrowed up to a size of 2½ feet square. From this point they are built circular 2½ feet in diameter, by means of wedge-shaped blocks of wood. Care is taken in dumping the ore into the chute that it is not allowed to accumulate and rise in this circular part. Ladder-ways are cribbed up on the side of each ore chute.

The rock mined in drifts and shafts is, of course, used to fill the excavations in the ore. If, however, this rock is not sufficient, suitable material for filling is obtained from a sandstone quarry near by. This sandstone is trammed to a hoisting shaft and lowered to the level next above the lift where the ore is mined. From the shaft it is trammed on this level to one of the rock winzes and dumped. It is then drawn from a temporary chute built at the bottom of this winze and trammed to its destination.

The International Congress.

Trade is aggressive; it is the vanguard of the mighty army of civilization. In its path follow law, order, religion, schools and culture. It was not the lust of conquest or a desire to teach school that sent the British merchants to India, but to secure a better market for Manchester sheetings and Birmingham hardware. Robert Clive and Warren Hastings made the printing press and missionary a possibility. Trade, like water, is hard to confine; it will make leakages, dig new channels, and sometimes gather such a force as to sweep away all the dykes and dams of a stern, restrictive legislation. It will have an outlet, if it has to climb mountains, bridge seas, shiver in arctic ice or sicken with the malaria under a torrid sky.

So we may conclude, in spite of all our fine sentiment and chivalrous courtesy, that trade is the mainspring and impelling motive that has brought together the present Pan-American Congress. History presents no grander sight than the delegates of seventeen American Powers, representing, in the language of Secretary Blaine, a region of country "whose northern limits are touched by Arctic waters for thousands of miles beyond the Straits of Behring; whose southern extension furnishes human habitation farther below the equator than is elsewhere possible on the globe," coming together, not to adjust the balance of power or to carve a helpless State between them, but to talk of the peaceful arts, the laws of thrift and prosperity and study the resources of their respective lands.

But it may be well for us not to let our hopes of immediate gains fly too high. Ever since the age of Queen Elizabeth the unknown wealth of Spanish America has acted like a spell upon the imagination of the English merchants, and to this day they have practically enjoyed a monopoly of this trade. These Spanish countries are in close contact with Europe by numerous steamship lines; they possess cheap fare, cheap transportation, and have established customers in all the markets of the Old World. The commercial habits of hundreds of years cannot be broken up by fine phrases and a few resolutions. Then let us not forget that this body of men possess no legislative power; to resolve and advise is all they can do. It may be some time before we sell an additional plow or paper of pins as the result of this deliberation.

Still this agitation will ultimately be of great benefit. Already there is a fluttering of weather-vanes and a promise of success. In 1884–85 a commission appointed by the Congress of the United States visited the most of the South American countries and came home laden with a large amount of valuable information. Since then the newspapers and magazines have had the material to keep the matter before the public. More has been said and written during the last four years on the advantages of an international commerce and political reciprocity with our South American neighbors than during all the rest of our history. The result has been seen in the fact that our mail-bags to these lands have been steadily growing heavier and the number of drummers increasing.

The immediate effect of this Congress will be, in the language of Secretary Blaine, "to draw the people of all the American nations into a closer acquaintance with each other." It is amusing what amount of ignorance exists in regard to our Latin neighbors. Not long ago a Cabinet official in a speech in New York spoke of Buenos Ayres as the capital of Brazil. Ask the first man you meet what language is spoken in Chili, and most likely he will be nonplussed. It is doubtful if there is a teacher in the public schools of this city who could answer off hand whether the Argentine Republic is a unit or a confederation of States, though a war was fought some years ago to settle the question. Speaking of the inexcusable ignorance of most of our geographers, a writer in the *North American Review* says: "The graphic and illustrated description of the wild horses roaming ownerless over pampas, which delighted the sense of the picturesque three generations ago, still remains on the pages they have always adorned, although it would be quite as appropriate and truthful to apply them to Iowa or to Illinois. The Englishmen who want to run over to New York for a little buffalo-shooting are no more ignorant than the writers of some of our standard geographies."

The condition of things in South America we may easily infer must be worse; a large mass of the people barely know that we exist, and the better classes think we are a nation full of brag and bluster, sharpers at trade, given to arrogance and bumptuousness over the Monroe doctrine, which they are inclined to resent, as, for instance, in the case of Chili during the Peruvian war. So the first thing is to get acquainted with each other; all international friendship and confidence hang on that, and were these delegates now traveling through our country studying its resources, its mechanical and industrial arts, its schools and charitable institutions, to go home without ever meeting in Congress and passing a resolution, still the visit cannot be otherwise than a great gain in social relations that will ultimately ripen into reciprocal business habits.

The Marshall monument has been accepted by the commissioners. It will be unveiled next May under the auspices of the Native Sons of the Golden West. The commission has made many improvements about the place, including fine roads. They will also erect fountains. Some of the old cannons and anvils which were used in Sutter's fort, will be placed in position about the monument and the grounds will be beautified.

The joint directors of the Comptoir d'Escompte and Societe des Metaux (French copper syndicate) have been condemned by the courts to pay to the liquidators of the bank 12,000,000 francs, to the bank directors alone 6,000,000 francs, and to the censeurs 1,000,000 francs.

Food and Overcoats. — Professor Paul Wiegert, a distinguished German, figures that seven cents' worth of food will keep a strong man in good form from day to day, and that we would all be healthier without underwear or overcoats.

The people of Oroville do not take much stock in the reported failure of the Big Bend tunnel enterprise.

A "Rubber Trust" has been organized in Boston.

The Wood Worker.

Furniture Making in Chicago.

It is not generally known, says Mr. Alexander H. Revell, that Chicago is the greatest center of furniture manufacturing in the world. It is a fact, however. Even London, with its 5,000,000 of inhabitants and all the British Dominion as an outlet, does not compare with our own city. What is more, I don't believe there is a city in the world that offers such prospects to the retail dealer in furniture. The geographical position of Chicago doubtless accounts for the development of the manufacture, and the amazing growth of the city is the secret of the retail trade.

The furniture made in Chicago is designed to catch the trade of the masses, and, consequently, is of the medium and lower grades. The average citizen does not want expensive goods. As a rule, people are buying better furniture, but still not more than five per cent of the people now buy anything that may be called expensive. Probably $35 is about the average price paid for a bedroom suit of three pieces, and $75 would not be far out of the way for the average price paid for parlor suits of six pieces. These figures, you see, are moderate, and since manufacturers in putting their goods upon the market cater to popular demands, prices tell a pretty straight story of the circumstances of the people.

"The great trouble with our furniture is not that it is machine made—all the goods on the trade are, for that matter, and the prejudice against machine work is fast disappearing—but because the lumber is not thoroughly seasoned before being made up. The green lumber is shoved into a kiln for a day, and then is put upon the market as chairs, tables and the like. A hundred green logs to-day are transformed into a thousand bedroom suits to-morrow. Shrinking, warping and cracking are inevitable, and the durability of the furniture is consequently impaired. So far as machines are concerned, many of them do work equal to first-class hand work and at a vastly lower cost.

"The profits of the furniture business are hard to estimate. On higher-class goods the margin of profit is fair, since the influence of competition is not strong in articles of fine quality. On all poorer goods, however, the dealer's gain is pretty well minimized. Net profit would not run more than from 5 per cent to 10.

"The bulkiness and awkwardness of furniture can be readily understood, and cannot help but whittle down profits. We practically sell nothing that we do not have to send one or two men to deliver. To illustrate the difference between different kinds of business, a dry-goods clerk will sell a lace handkerchief for $18 or $20, and the lady will take it home in her satchel; we sell a bureau or sideboard for the same price, but at a lower rate of profit, and have to send it out by a couple of men and a horse and wagon."

Wood-Bending as an Industry.

There are comparatively few persons outside the carriage and boat-building interest that know to what an extent the wood-bending business is carried and the management that is necessary in carrying on a well-arranged wood-bending establishment. Few know that the fine carriages they ride in are very largely made of bent wood. The felloes of all their wheels are bent, and are made in two parts. The framework of coaches and heavy carriages is nearly all made of bent stock. They are not only better made, but are more cheaply made. The frames of most of our pleasure boats are bent, and so are many of the frames of some of our finest sailing yachts. Furniture of many kinds has bent frames. All the celebrated Thonet chairs, which for comfort and beauty are not excelled in the world, are entirely of bent wood. The object of bending is twofold, saving of time and stock, and stability and strength of the work when put together. We ought to add another—beauty of form. Bent carriage shafts are almost, if not entirely, used now instead of the old-fashioned, clumsy sawed ones.

It is a business that needs to be well understood, however, to make a success of it. Simply the forms to bend on and the steam box to soften the wood in do not make a success in wood-bending. We must know perfectly the stock to be bent, for stock is so variable that no two pieces bend alike. The length of time to be steamed, also, has much to do with the success in bending. Heavy work needs special care to make it come out in fine shape. The selection of stock, also, must be closely attended to.

Simple as the work seems to be, yet it is full of little details which must be strictly attended to, else the result is a miserable failure. The small number of places where wood is bent as a business makes it an industry in which there is little competition, and if it is well understood and the necessary details strictly attended to, it will make good returns for money invested.—*Woodworker.*

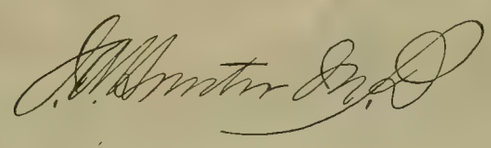
The Sash and Door Trade.—It is probable that the sash and door trade will be immensely developed on the North Pacific Coast during the coming five years. The cedar of that region is admirably adapted to the manufacture of such goods. It is wide, clear and easily worked, but its chief recommendation for sash and doors is its integrity when put in place. It never warps, and shrinks and swells but little. It is now largely used for the home demand, and manufacturers already have their minds set on extending their markets so as to reach remoter parts of the country. There is no reason why their anticipations should not be realized. Sash and doors are mill products that can be shipped long distances at a profit, and an energetic pushing would place North Pacific factory output in any part of the country.—*Northwestern Lumberman.*

Black Birch for Inside Finish.—Black birch for doors, wainscoting and other interior work is being introduced to a considerable extent in new buildings, and it is certainly one of the handsomest of the many varieties of woods that are being introduced into new houses in the Eastern States, while the cost is much less. Black birch is a close-grained wood and is as easy to work as walnut, and is much cheaper than either walnut or cherry. There is great difference in the quality and color of birch, that growing upon high and dry land being hard and susceptible of good polish, while the growth on swampy land is soft, and therefore not well suited for the purposes the upland product so admirably fills. The writer in constructing a new house last year had birch folding doors introduced against the protest of his architect, who had never heard of birch wood being used for that or any analogous purpose. The result is most satisfactory to all parties, and to none of us more than the architect, who preferred the use of walnut or cherry. Possibly the builder took especial care in the selection of his material, so as to convince the architect of his error, and his (the builder's) superior knowledge; but, however that may be, the black birch doors, which in texture resemble satin wood and in color dark cherry, are the admiration of every one who has seen them. Birch grows in our northern latitude and the trees attain considerable hight and size in localities, and there is a species of bird's-eye birch which is well calculated for furniture. It resembles bird's-eye maple, and when polished it possesses that sheen which renders satin wood so pleasing to the eye. We predict for black birch an important place among the fancy woods for house finishing and furniture. —*Ex.*

Our Furniture.—American furniture, owing to the superior modern design and artistic finish, is fast obtaining a foothold in foreign countries, and American woods, which have very little recognition at home, are coming into prominence in Europe as very desirable both for the manufacture of furniture as well as for interior house finishing. One of the most flourishing, profitable and important branches of American industry is the manufacture of furniture. Not only do our factories supply the needs of 53,000,000 of people, but scarcely a ship sails from our ports without carrying among her cargo specimens of this class of manufactures. The American-made furniture is preferred in several foreign countries for many reasons. The taste of the American artisan is refined and elegant, and the work he turns out is light and symmetrical as well as strong and durable. While the English, French, and German manufacturers still cling to their antiquated fashions and old methods, the Americans are constantly inventing new styles, or improving on the old, and are thus in this branch of industry, as well as in many others, far ahead of their transatlantic rivals. Notwithstanding the excessive and in many cases prohibitive import duties that obtain in a majority of Latin-American countries, furniture of American manufacture is gradually becoming more and more fashionable.—*Woodworker.*

Woods Used in Canes.—No one need complain on the score of variety in the woods used for walking-sticks, says a cotemporary. About everything procurable and at all suitable has been pressed into service. Most of the woods are from foreign climes. Among the conspicuous sorts are the whangee-sticks. They are Chinese products and prized because of the regularity of their joints. The orange and lemon sticks are always more or less fashionable. The orange has a beautiful green bark and odd-looking markings which run the length of the cane. The lemon is rougher, and has prominent knots at regular intervals. Algeria supplies us with myrtle-sticks, which are carried by those who admire odd effects. Other imported sticks are ebony, palmetto, rosewood, thorn, cactus, hairwood, partridge and lots of other woods whose names are already well known and need not be repeated here. A peculiar stick we get from a species of palm grown in Borneo, and is called rajah; but the most celebrated of all palm canes is malacca. It comes from a species of calamus, a slender-growing palm. The strangest part of it all is that it does not hail from Malacca, but from a small place on the opposite coast of Sumatra. We do not know why it is called malacca.

To Ebonize Mahogany, apply acetate of iron, French stain, with a brush before polishing, when it will be seen that it strikes well into the wood and takes a fine finish. Unless a large quantity of the stain is required it is cheaper to purchase it. Several good recipes for its preparation are to be had in the books.



Dr. James A. Hunter.

THE Scientific Press presents this week to its readers an excellent portrait of Dr. James A. Hunter, the eminent specialist in throat and chest diseases, one of the representative medical men of the world. Dr. Hunter is a British subject, but long residence and intimate association with French and Americans has obliterated many of the distinctive characteristics of his nationality. In other words, he is a thorough cosmopolitan. He is a gentleman of courteous and pleasing manners, but positive and decisive in tone, about 45 years of age, well preserved, and looking even younger, and his visage and physique clearly indicate that he has lived a temperate and intellectual life.

Early in his professional life Dr. Hunter became impressed with the great prevalence and fatality of diseases of the lungs, and the inadequacy of the usual means employed by the profession in combating them. He thought he saw in the various processes of the inhalation of remedies, greater possibilities of benefiting and curing this class of invalids, and turned his attention especially to this method of therapeutics. He has closely devoted all the years of his active professional life to working out problems of more successful treatment of ailments of the organs of respiration, and achieved such success and reputation as place him not only in the front ranks of the pulmonary specialists, but far ahead of most of his competitors.

But while he has been cultivating and practicing his chosen specialty with so much assiduity and zeal, he has not ignored the study, at least, of general medicine and surgery. We have been permitted to copy the numerous diplomas conferred upon him by some of the foremost medical educational institutions of the world. They show that while he is best known to the world as a specialist in pulmonary, catarrhal and aural diseases, and to many only as such, he is a man of thorough and profound information in all branches of medical science and surgical art.

Translations and Copies of some of Dr. J. A. Hunter's Diplomas and Certificates of Professional Qualification.

ROYAL COLLEGE OF SURGEONS, EDINBURGH.

[*Translated from the Latin.*]

By these presents, do we testify that the skillful practitioner, JAMES ALBERT HUNTER, after a thorough course of the studies prescribed in our Curriculum, has undergone an examination and so answered the questions proposed, as to show that he is fully qualified to perform the duties required of him in SURGERY AND PHARMACY.

Given at EDINBURGH, on the sixth day of April, one thousand eight hundred and eighty-three.

WM. TURNER, President.
JAS. D. GILLESPIE,

ROBERT MACNAIR.

SURGEONS' HALL, EDINBURGH, April 6, 1883.

IT IS HEREBY CERTIFIED that JAMES ALBERT HUNTER, who this day received the diploma of the Royal College of Surgeons of Edinburgh, was duly examined in Midwifery, and found competent to practice it. WM. TURNER, President.

R. M. CUNYNGHAM, *Senior Examiner.*

ROYAL COLLEGE OF PHYSICIANS, EDINBURGH.

[*Translated from the Latin.*]

At the earnest request of the Honorable President and Members of the aforesaid College, we declare to whomsoever these presents may concern, the skillful physician, JAMES ALBERT HUNTER, to be hereafter ranked among the number of licentiates of this institution, and to justly claim a right to the privileges which such a degree entails.

In faith of which his Honor, the President, and his Secretaries of the above-named College, have issued, under their seal, this Medical Diploma.

Given at Edinburgh, at a meeting of the members, on the sixth day of April, in the year of our Lord eighteen hundred and eighty-three.

[SEAL] GEORGE WILLIAM BALFOUR, *Pres.*
JOHN WYLLIE, *Sec'y.*

ROYAL COLLEGE OF PHYSICIANS, EDINBURGH.

It is hereby certified, Edinburgh, April 6, 1883, that JAMES ALBERT HUNTER has been duly examined in Midwifery, and found competent to practice it.

GEORGE BALFOUR, *Pres.*
JOHN WYLLIE, *Sec'y.*

UNIVERSITY OF BRUSSELS, BELGIUM.

[*Translated from the French.*]

FACULTY OF MEDICINE.—The medical Faculty of the University of Brussels declares that JAMES ALBERT HUNTER has sustained before them, in a satisfactory manner, the trials (examinations) prescribed by the regulations of the University, and accordingly he has been proclaimed Doctor of Medicine, Surgery and Obstetrics.

This diploma will entitle him to the enjoyment of the rights conferred by regulation and custom.

BRUSSELS, June 16, 1883.

The Professors of the faculty of Medicine:
DR. THIRY,
DR. J. CROCQ,
DR. GUILLERY,
DR. PIGEOLET,
DR. JOS. DESMETH,
SEAL DR. TH. HAUBEN,

ENDORSATION OF THE BELGIAN MINISTER.

CONSULATE OF BELGIUM, in New Orleans, La.

I am authorized by his Excellency, the Minister of Belgium to the United States, at Washington, D. C., to certify that the Degree of Doctor of Medicine and Surgery conferred upon James Albert Hunter, by the University of Brussels, entitles the said James Albert Hunter to practice Medicine and Surgery in all Belgium, and that the said University of Brussels is the highest scientific credit and standing in the Kingdom of Belgium, and all of its diplomas are of equally good repute.

Given under my hand and seal this fifth day of December, 1883. A. J. R. LANDAUER,
Consul de Belgique.

FROM THE U. C. MEDICAL BOARD.

Toronto, January 7, 1865.

At a meeting of the Medical Board, held this day, MR. JAMES ALBERT HUNTER appeared, and having been examined touching his qualifications to practice Physic, Surgery and Midwifery, the Board find him fully qualified to practice these several branches, and grant him their certificate accordingly.

EDWARD M. HODDER, M. D.,
F. R. C. S. [L. S.] President of Board.
JAMES THORBURN, M. D. EDIN. [L. S.]
JAMES ROSS, M. D., [L. S.]

Certified true copy.
EDWARD SANGEVIN,
Under Sec'y of State, Canada.

STATE DIPLOMA, CANADA.

To all to whom these presents shall come, or whom the same may concern— {SEAL.}

GREETING:

WHEREAS, pursuant to the fortieth chapter of "The Consolidated Statutes for Upper Canada," entitled "An Act Respecting the Medical Board and Medical Practitioners," JAMES ALBERT HUNTER hath been examined by the Medical Board in and for Upper Canada, and hath been found duly qualified to practice Physics, Surgery and Midwifery, as appears by the certificate of six members thereof bearing date the seventh day of January, in the year of our Lord one thousand eight hundred and sixty-five:

Now know ye, that reposing confidence in the loyalty, integrity and good morals of him, the said JAMES ALBERT HUNTER, I do hereby, in virtue of the power and authority in me vested by the said Act, license and authorize him, the said JAMES ALBERT HUNTER, to practice Physics, Surgery and Midwifery within that part of the Province of Canada called Upper Canada.

Given under my hand and seal at arms, at Quebec, in the said Province, this eighth day of April, in the year of our Lord, one thousand eight hundred and sixty-five, and in the twenty-eighth year of Her Majesty's Reign.

MONCK, *Governor General.*

By command: A. MEREDITH, *Assistant Secretary.*

Recorded, April 12, 1865, Lib. I. K., Fol. 293.
GEO. H. S. —— (Illegible), *Deputy Registrar.*

COLLEGE OF PHYSICIANS AND SURGEONS.
ONTARIO, CANADA.

Be it known to all men, that James Albert Hunter, having given proof that he has complied with all the requirements of the Ontario Medical Act, has been duly registered as a member of the College of Physicians and Surgeons of Ontario.

In testimony whereof we have hereunto affixed our signatures and the seal of the said College, this eleventh day of November, in the year of our Lord MDCCCLXXX.

W. ALLISON, *President.*
D. BERGIN, *Vice-President.*
ROBERT ALLEN PYNE, *Registrar.*

QUEEN CHARLOTTE'S HOSPITAL.

PATRON—HER MAJESTY, THE QUEEN.

These are to certify that James Albert Hunter, M. D., M. C. P. S., O., has attended twenty cases of labor in Queen Charlotte's Lying-in Hospital to my satisfaction.

WM. CHAPMAN GRIGG, M. D., *Physician.*

Dr. Hunter's Return to San Francisco.

Dr. Hunter lived in this State from 1876 to 1880, and conducted such a large practice that his health failed and he was compelled to seek relaxation. Going to Europe in the latter year, he made a tour of the leading hospitals of Great Britain, France and Belgium, and ultimately settled down to steady, regular work in St. Thomas's Hospital, London, one of the largest and finest in the world. Here he made most of his preparation for the examinations of the Royal Colleges of Physicians and Surgeons, Edinburgh, and the University of Brussels, Belgium.

Returning to this country in the fall of 1883, he decided to go to New Orleans for the benefit of its mild climate, as his professional work in Europe had prevented him from entirely recovering his natural vigor. In the Crescent City he soon become famous in his specialty. It was always his intention to return to California, but not until now did he feel that he could tear himself away from a community in which he had found so much of social pleasure and professional success.

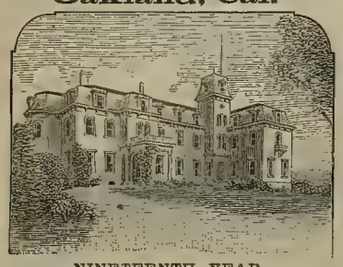
It is a satisfaction to know that the advantages of Dr. Hunter's skill and experience have not been lost to the people of this coast, and we are pleased to learn that he has been welcomed here most cordially by his hosts of old friends and patients, and that he is likely to make his home here.

Dr. Hunter has resumed the practice of his specialty—throat, chest, nasal and aural diseases—at 324 Sutter Street, nearly opposite his former residence, where he has fitted up a most complete office for the administration of Oxygen and medicated Inhalations, which he has found so valuable in this class of ailments.

A TESTIMONIAL

—FROM—

Nearly One Hundred of Dr. Hunter's Patients, Including Some of the Most Eminent Citizens of New Orleans and Vicinity.



NEW ORLEANS, LA., December 24, 1883.

We, the undersigned, having *personal* knowledge of Dr. James A. Hunter's many and eminent qualifications in his profession, his character as a gentleman, his long experience and skill in his specialty, and the great merits and success of his methods of treating diseases of the Throat and Lungs by INHALATION, recommend him to those suffering from ailments of these parts, satisfied that he possesses superior skill in their treatment.

HUGH McCLOSKEY, President of the Produce Exchange.

One 4-ft. Single Screw Stoping Bar.
One 8½x13 ft. Air Receiver.
The above are in first-class condition and will be sold cheap. For price apply to the PAYMASTER MINING CO., Yuma, Arizona Territory.

—THE—
JOSHUA HENDY MACHINE WORKS,
Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.
The **best form of Feeder ever devised,** and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:
N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
WE ARE MANUFACTURERS OF THE
"CHALLENGE," "STANFORD," 'TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

FRISBEE WET MILL.
This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS
And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.
OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.
FRISBEE-LUCOP MILL COMPANY.

The Celebrated H. H. H Liniment.

The **H. H. H. Liniment** is for the treatment of the Aches and Pains of Humanity, as well as for the ailments of the beasts of the fields. Testimonials from importers and breeders of blooded stock prove its wonderful curative properties. No man has ever used it for an ache or pain and been dissatisfied.
H. H. MOORE & SONS, Stockton, Cal., Proprietors.
FOR SALE BY ALL DRUGGISTS.

THE ROLLER ORE FEEDER
[Patented May 28, 1882.]

THIS is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.
Golden State and Miners' Iron Works,
Sole Manufacturers,
227 First Street, San Francisco, Cal.

Smelter For Sale or Exchange.
One 60-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 23, Elkhorn, Montana.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING OCT. 8, 1889.

412,454.—COUPLING KEY BOARD FOR ORGANS—C. Blomquist, Pescadero, Cal.

412,321.—CLAY REDUCER—W. Burkman, Los Angeles, Cal.

412,464.—ELECTRIC IGNITING DEVICE FOR LAMPS—Carranza & Tinoco, S. F.

412,381.—LINK ADJUSTER FOR CAR COUPLING—Gilham, Eckert & Gilham, Beowawe, Nevada.

412,705.—FIRE LADDER—H. T. Hayes, Oakland, Cal.

412,390.—TOOL HANDLE—J. S. Jaquith, Sierra City, Cal.

412,638.—AGRICULTURAL MACHINE—G. H. Little, Los Angeles, Cal.

412,712.—BOOK-STAPLING MACHINE—Jos. Lyman, San Jose, Cal.

412,407.—DISTILLING APPARATUS—P. Napoles, Napa, Cal.

412,434.—CONCENTRATOR—Jas. Tullock, Angels Camp, Cal.

412,577.—KNITTED UNDERSHIRT—F. Wilcomb, S. F.

10,342.—DESIGN—F. S. Butler, S. F.

The following brief list by telegraph, for Oct. 15th, will appear more complete on receipt of mail advices:

California—George H. Wright, San Francisco, signal device for cable railway crossings; Erlich Schmidt, Marysville, weed-cutter; Michael S. Roderique, San Francisco, elastic socket for pen-holder; Edwin B. Mastick, Alameda, automatic sewer-flu hing tank; John Knight, San Francisco, adjustable cone center for lathes; Joseph Kaiser, San Francisco, necktie frame; Randall Hunt, San Francisco, fastening foundations of structures to piles or other materials; George W. Haines, Stockton, header and thrasher; James B. Freeman, Los Angeles, ore separator; Frank S. Fox, San Francisco, car-coupling; R. M. Edwards, San Francisco, fender-guard attached to cars.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable prices, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TOOL-HANDLE.—Jonathan S. Jaquith of Sierra City, Cal. No. 412,390. Dated Oct. 8, 1889. This invention has relation to that class of tool-handles or stocks in which the outer or blow-receiving end is provided with a cushion, both for the protection of the handle or stock and the avoidance of injury to the mallet. The novelty of this invention lies in the peculiar construction and arrangement of the cushion, and consists essentially in fitting a threaded band to the handle, screwing a hollow nut upon said band, in the outer end of which is carried the cushion block, and placing between the inner end of the cushion block and the end of the handle a bearing plate. The end of the cushion block projects beyond the end of the nut and receives the blow.

LINK-ADJUSTER FOR CAR-COUPLINGS.—Thos. H. Gilham, William C. Eckert, and Leroy Gilham, all of Beowawe, Nevada. No. 412,381. Dated Oct. 8, 1889. This link-adjuster, as its name implies, is for the purpose of accurately moving and adjusting the coupling link so that it will readily enter into the opposing drawhead. It consists of a swinging piece or block, having a central bed or plane surface for holding and guiding the link, and upwardly flaring side flanges for centrally adjusting it, this block being carried by an arm on a rock shaft under the car end, and operated from either side of the car, as may be desired. By rocking the shaft, the adjusting block is brought up under the link, and by reason of its peculiar construction, the link is accurately moved and adjusted to the central perpendicular plane, no matter in what position it may be lying on each side of said plane, and it is lifted to and held in the proper plane or position, whereby it is guided accurately into the opposing draw-head.

ORE CONCENTRATOR.—James Tullock of Angel's Camp, California. No. 412,434. Dated Oct. 8, 1889. This concentrator belongs to what is known as the class of endless belt concentrators. Its novelty rests in the mounting of the frame, the means for imparting a laterally rocking motion to it, and the belt which it carries, and the means for imparting to said belt what is known as its up-hill travel. The belt frame is mounted upon rockers, like those of a cradle, and a crank-shaft at one side is connected with it by a rod or link, whereby as the shaft is rotated, the table is vibrated on its rockers. The up-hill travel of the belt is a periodical one, instead of being continuous, as is usually the case, and is obtained by a pawl and ratchet mechanism and intervening gearing deriving its power from the rocking movement of the frame.

COUPLING KEY-BOARD FOR ORGANS.—Carl Blomquist of Pescadero, California. No. 412,454. Dated Oct. 8, 1889. The object of this invention is to do away with the usual footkeys of an organ by providing a simple, convenient and effective means for coupling the keys of the main key-board in octaves by hand, whereby when notes are joined, the keys of which are separated by a distance too great to span, the proper keys may be operated conveniently by means of the supplementary key-board of the coupling device. The coupling mechanism consists of a supplementary key-board adapted to be attached to the organ face above a portion of the main key-board, the keys of the supplementary board being attached each to an axially movable tube, said tubes being arranged in concentric series, and each tube having connected with it an arm or lever, which lies over and is adapted to move down into contact with the key of the main key-board which lies under it, whereby said key-board is operated.

Assessment Notices.

Lapanta Consolidated Mining Company.

Location of principal place of business, San Francisco, California. Location of Works, Hawthorne Mg. Dist., Esmeralda Co., Nevada.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 2d day of October, 1889, an Assessment, No. 2, of Two Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, Room 56, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of November, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 2d day of December, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room 56, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Gray Eagle Mining Company, Location and principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 16th day of October, 1889, an Assessment, No. 15, of Six (6) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, Room 11, No. 303 California St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of November, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 10th day of December, 1889, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.

J. M. BUFFINGTON, Secretary.

Office, Room 11, No. 303 California St., San Francisco, California.

JAMES LEFFEL'S
Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 17, 1889.

With rainy weather during the week at different parts of the coast, with a general rainstorm reported at this writing, there is a more hopeful feeling regarding outlook for a good trade, Iron-workers and machine men in general express themselves very confident of the future. Their faith is grounded on every prospect that we will have a wet winter, something we have not had for all of three years, and with an abundance of water all mining industries will be revived throughout the coast. The local money market is reported easy; remittances are coming in more freely, while the call for funds to send East is less pronounced by reason of the growing ease in the English money market, and consequently more ease in New York. Speculation with us is lifeless, but present appearances indicate a revival at an early day.

MEXICAN DOLLARS—The demand for shipment by the steamer leaving to-day for China has been quite active, keeping the market strong at 75¾ to 76 cents.

SILVER—The European market advanced the past week to 43d and the New York market to 93⅝ cts., while in our market 94¾ to 94⅞ cts. was the range, with a sale made as high as 95 cts. to fill a special urgent order. At the close to day the London market is quoted at 42⅞d and New York 93¾ cents. With us there is a continued scarcity of bullion, notwithstanding fair receipts from Omaha, which compels buyers to bid well above the European parity to have their wants met. The present rains ought to start up the mills on the Carson river, Nevada, and increase, to some extent at any rate, our silver supply from that source, although the ore to be milled is said to contain a larger percentage of gold than heretofore milled.

QUICKSILVER—Receipts the past week aggregate 463 flasks, and the exports 305 flasks to Mexico. The market is quiet but steady, An improved demand is expected to set in owing to more water for mining purposes.

LIME—Receipts the past week were light, only aggregating about 2993 bbls. The demand is falling off, but the price is unchanged.

BORAX—The exports the past week aggregate 65,010 lbs. to New York and 100 lbs. to Mexico. The market is strong, with a continued good demand ruling from the East.

TIN—Exports the past week aggregate only 1075 lbs plate to Nanaimo. The market is dull but strong. It is claimed that when buyers enter the market again they will have to pay an advance after two or three consignments are cleaned up. The European market is strong, with the pool standing under it.

ANTIMONY—The market is very strong. New York mail advices report supplies light. It is stated that smelting-works are to be built in this State to turn out antimony, which can be mined with a profit for less money than now quoted.

LEAD—The market is without essential change. As usual, with the approach of the rainy season, the demand is not so pronounced, while the canners are not in the market and not likely to be under two months to come.

COPPER—The market shows a fair degree of firmness. The consumption in this country is said to have increased most wonderfully so far in this year, yet it is the policy of mine-owners and others in interest not to advance prices so as not to in any way restrict the consumption.

COAL—Imports the past week aggregate as follows: From Nanaimo, 4225 tons; Seattle, 4068; Tacoma, 1660; Australia, 5383; Departure bay, 5312; Comox, 4000; Coos bay, 1500; total, 26,148 tons. The market is very strong under a continued free consumptive demand. Coast coals for household purposes are coming in more freely, but it is claimed that all received goes into consumers' hands about as soon as it comes to hand.

The coast collieries' output is slightly increased. From Australia the tonnage on the way to and to load for this port is as follows: New castle, N. S. W., 40,806 tons register and Sydney 16,348 tons register. Total, 57,154 tons register, with a carrying capacity of about 82,000 tons. As the tonnage in Australia is scarce and asking high charters, the prospects for a decided increase for this port is at present poor.

IRON—Imports the past week were only 40 tons of pig from Portland, Oregon. The market for merchantable bar is higher, in sympathy with better prices at the East. Pig is very strong, with a fairly free consumption reported. The European and Eastern markets were at last mail advices still tending up.

Mining Share Market.

The mining share market the past week was decidedly mixed—some stocks advancing, some going down, and others flopping around like a fish out of water. The Alta group had quite a setback, closing barely steady. The other Comstocks set back under a bear raid on Con. Virginia, which caused many holders to let go of their stocks, but with that stock steadying up the general line strengthened, yet the public are skeptical about much of an improvement soon. The large majority look for lower prices soon. The bulls think the market ought to rally some, owing to the Sutro Tunnel and Con. Virginia scare being over, and about all the necessary assessments have been levied. In outside stocks, trading has been more active, under the leadership of Eureka Con. This stock has been made quite lively, bobbing up and down at a lively rate. The Quijotoas shaded off, but at the close are slightly higher and stronger. The Tuscaroras have a very strong undertone, as if the manipulators are preparing for a deal. The Bodies, like a whipped dog's tail, lagged, although Bodie made a slight upward move yesterday (Wednesday), only to fall back again at the close. The pending assessments on Bodie and Mono are at present a drawback to these stocks.

From the mines we give under "Mining Summary," late official letters from all the Comstock and Bodie mines. The letter from Crown Point is not only quite interesting but important, as are those from Hale and Norcross and Savage. The official announcement that the Gold Hill group of mines is to be pumped out down to the 2800-foot level is the most important information lately given out. The managers of the Gold Hill mines, it is said, will drain their mines through the Belcher shaft and also the Yellow Jacket shaft. In sinking the Yellow Jacket shaft it is affirmed by experienced miners that below the 2700-foot level very rich ore was struck. Its extent and richness was kept secret, when the shaft, for reasons best known to the three managers, was abandoned. The Belcher shaft was sunk to the 2800-foot level and a north drift started which struck a very rich body of ore. From the 2700-foot, or thereabout, level a north drift was started to skirt the ore lode. This was run into Alpha and some say into Exchequer, when a body of hot water was struck which flooded all the Gold Hill mines, compelling them to abandon the lower levels. But since then Crown Point and Belcher, and also Yellow Jacket, have been connected with the Sutro Tunnel, while the Ward shaft is to be connected with the tunnel at an early day. With these connections, the mines can be speedily drained and work resumed on the lower levels of the mines drained. In running the north drift from the 2700-foot level of Belcher, the drill was used at intervals its entire length up to and in Alpha, and those in position to know, affirm that high-grade ore was drilled into as well as hot water tapped. From the outside districts, good news comes from the Quijotoas. The Peerless mill was to have started up yesterday on Crocker ore. From the Tuscaroras, we are advised that the Commonwealth and Grand Prize concentrators will be ready to start up some time in next week. From the Bodies, our advices are unimportant.

TO RECONVENE THE TRIAL BOARD.—Secretary Tracy has approved the recommendation of Chief Engineer Melville and Chief Constructor Wilson, that Commodore Benham be instructed to reconvene the board on the trial trip of the Charleston to prepare a new report of the trip. The board is then requested to report simply on the trial of the Charleston, whether or not the plans and specifications of the contract have been carried out, and whether the vessel should be accepted. They are also requested to confine themselves to the trial and not to make new suggestions as to changes.

Mining Personals.

Wheeler & Booth of Sacramento own the Arizona mine at Unionville.

Superintendent Dennis of the Mountaineer mine, Nevada City, is visiting at San Jose.

President Warner Van Orden of the Plymouth Consolidated has returned from a visit to Europe.

Max Greenberg, president of the Bituminous Rock Company of San Luis Obispo, is visiting in this city.

Jas. Sutherland, who recently resigned his position as superintendent of the Niagara mine, is stopping in Shasta.

D. B. Lyman, superintendent of Con. Cal. and Virginia and other Comstock mines, left for Virginia City on Oct. 17th.

Richard Troeger, superintendent of the Bonanza group of mines, near Hillsboro, New Mexico, has returned from California.

Ex-Governor Perkins, Millen Griffith and A. Hasley, the purchasers of the New Albany mine, have returned from a visit to the mine.

In Montana Comstock miners are preferred to those from any other locality. It is estimated that 4000 Nevadans are employed in the mines there.

The *Silver State*, Winnemucca, Nevada, says: Superintendent Wheeler of the Arizona mine in Unionville left Friday on a brief business visit to California.

Charles Stocks, for a long time foreman in the Empire and North Star mines, has been appointed superintendent of the Pittsburg mine, Grass Valley.

The Homer *Index* says: Superintendents Capt. John Kelly and A. Pettibone are both in San Francisco, presumably for the purpose of engineering a deal in Bodie stocks.

Archie Farrington, the well-known mining man and superintendent of the Reno Reduction Works, has been examining the Humboldt Queen mine, near Rye Patch, with a view to purchasing the same.

The Sonora *Democrat* says: Mr. A. E. Davis of San Francisco, one of the owners of the Buchanan mine, arrived in Sonora on Wednesday on his way to the mine. He is accompanied by Mr. Keith of the Keith Electric Motor Co. Arrangements are now being made to put an electric plant on the mine in place of the steam-power now used. The results will be watched with much interest by the mine-owners of this section.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Alice, Oct. 5, $25,728; 5, Butte and Boston, $22,896; Hanauer, 3, $3100; 14, $2550; 5, $2525; 7, $3100; Justice, 15, $3866; Alta, 15, $30,356.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

DUTCH IMMIGRANTS.—Merced is expecting some hundred families from Holland—represented as industrious and frugal people—to come this winter and make their homes in that county.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

The Pittsburgh Boiler Scale Resolvent.

☞This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained We have tested nearly all Compounds presented to us, and this one **is the only good thing we have ever used.** Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as **sulphate of lime, carbonate of lime, mud, and everything that is bad.** Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern; Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }

FOR SALE ONLY BY

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

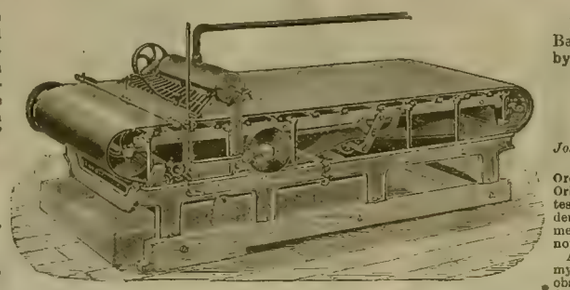
THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

(PATENTED.)



The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co, Cal

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

—BUILDERS OF—

MINING MACHINERY.

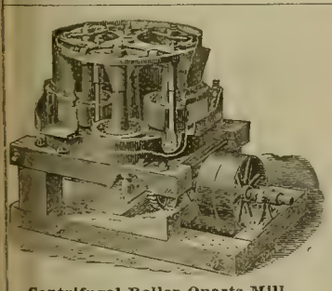
GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

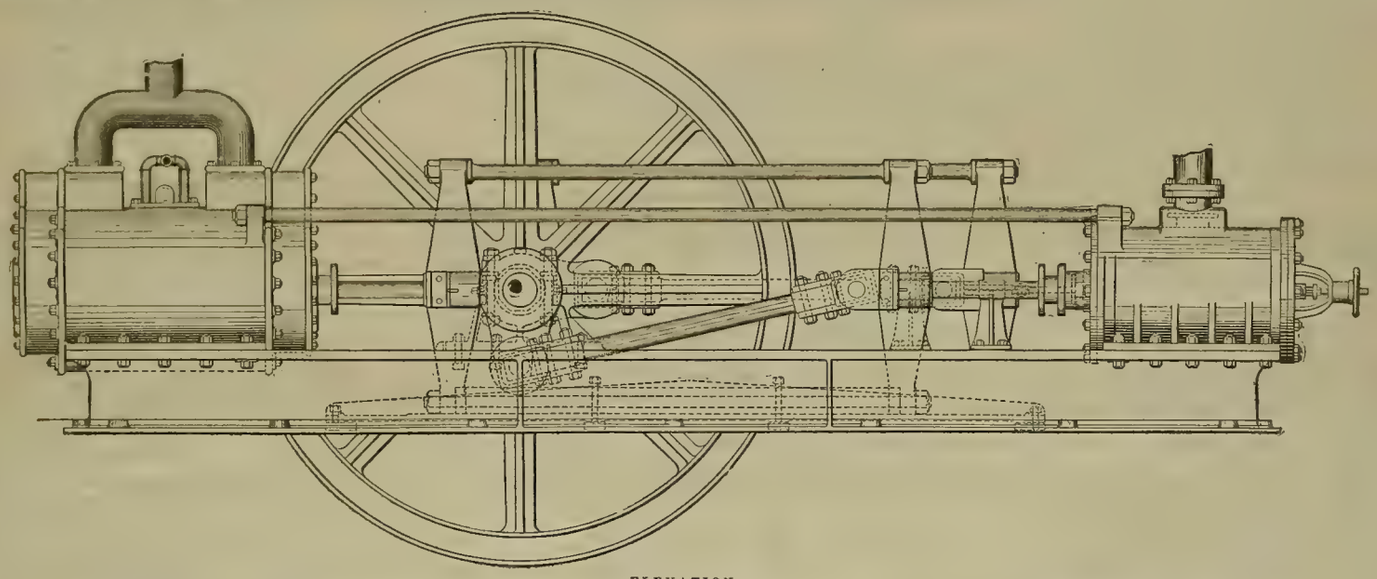
The Clayton Air-Compressor.

When we stop to consider the vast number of uses to which compressed air is put, and how every day some new experiment, rendered successful by employing compressed air, is turned to the practical benefit of some branch of trade, it is strange that we find but one establishment devoting their whole time and attention, the entire capacity of their works, and the brains of experienced men, to the development of a machine that will meet this growing demand for a perfect air-compressor.

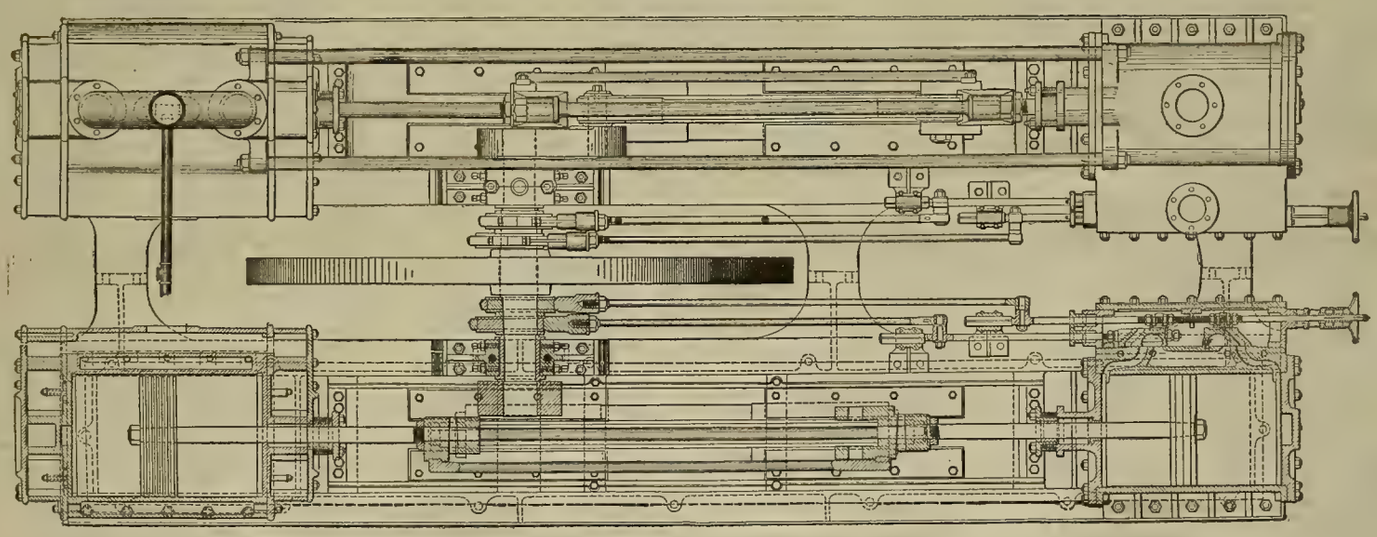
The first Clayton air-compressor was built in 1873, to run the tunnels in New York City for the sunken tracks of the Harlem railroad, and so successfully did this one work that in a few years Clayton air-compressors were in use on almost every important engineering work in the country, and the excellence of their design made them recognized throughout the profession.

Mr. James Clayton, foreseeing the immense field there would be for a perfect machine of this kind, gradually withdrew from the manufacture of hydraulic machinery, and labored solely to improve his air-compressor—strengthening here, altering the design there, and steadily patenting his improvements. Our illustrations show the ground plan and side elevation of a perfected Clayton air-compressor. In this improved form an air-compressor is produced which will furnish a given amount of air, under high or low pressure, at a minimum first cost, maximum efficiency, few repairs, and great accessibility, should they become necessary.



The following is a brief description of the important points of this machine, which render these results attainable:

The patent connecting-rod arrangement is a combination of the slipper-guide, vertical cross-heads and connecting-rod, which admits of the placing of the latter between the steam and air-cylinders, the tops of which are tied together with heavy brace-rods, thus preventing the bed-plate buckling with the strain of the compression, which comes in a direct line with the bed-plate and the brace-rods at the same time. By this arrangement, a much stronger machine can be built with less gross weight and with a saving of considerable floor-space over the compressors built with fly-wheel (or wheels) on the end of the machine. The fly-wheel is placed in the center of this compressor, thus obviating any danger or personal injury through coming in contact with it, and there is no necessity for removing it to get at any part of the steam or air-cylinders. It will also be noticed that the shaft and air-cylinders are not exposed to the heat of the steam-cylinders.



The patent safety suction valves have seats which are firmly screwed into the heads, and the valves secured by two nuts, safety stems, and a spring cotter, preventing them from ever becoming loose and getting inside the cylinders. The "cages" for preventing the valves falling into the cylinder (common in other compressors) are dispensed with, the safety stems answering their purpose, and, therefore, the piston travels the full length of the cylinder, there being no lost space at either end of the stroke. The valve faces are protected by a slightly elastic composition disc which prevents any hammering and consequent leakage. These discs can be renewed at any time at slight expense, and the valves and seats on the larger compressors can be inserted or removed from the outside by means of the tools furnished with the compressor.

The air cylinders are bolted to the bed-plates in a line with the steam cylinders, but at the greatest distance from the heat thereof, and are surrounded by water-jackets, the design of

Mercurial Minerals and Their Associates.

(Concluded from last issue.)

[Written for the MINING AND SCIENTIFIC PRESS.]

O—Some dark-colored specimens from the Phœnix mine in Napa county, supposed for that reason to contain metacinnabarite, were found when examined microscopically to owe their color to a purple or amethystine quartz, in which the scarlet cinnabar was imbedded. Rock sections of this variety make very beautiful and interesting objects.

P—Cinnabar in a disintegrated condition when examined microscopically is, as a rule, more interesting than otherwise. A specimen so examined showed the cinnabar to be in broken fragments and individual crystals; the quartz was hyaline and in perfect doubly terminated crystals and clusters and tufts of radiated and scarlet cinnabar. Gypsum, floss ferri and other minerals were observed.

Q—Concretionary masses of pure cinnabar resembling pseudomorphs after globular and radiated pyrite, have been found in the California Coast Range of mountains, in Kern county, and recently at Los Burros, Monterey county, with gold and stibnite. Being generally found in the beds of streams, this variety is called "Stream Cinnabar."

R—Specimen of Cinnabar from the Camp Floyd Mining District, Utah, 55 miles southwest of Salt Lake City and 8 miles from the Mono mine.

This is an orange-red mineral, rather heavy, rugose, cellular and rather uninteresting.

Examined microscopically it was found to be an amorphous solfataric rock mineral, rather soft and perfectly white; covered with an incrustation of cinnabar, also amorphous.

The microscope reveals numerous pipe-like channels through which, without doubt, jets of steam issued while the solfatara was active. No clew was discovered that would account for the peculiar color of the cinnabar; an assay yielded 5.5 per cent of mercury.

6. Coccinite

Is a doubtful mineral found at Casas Viejas, Mexico. It is an iodide of mercury, possibly a mechanical mixture. An artificial iodide of mercury, mentioned elsewhere, is sometimes used as a pigment, under the name iodine scarlet.

7. Colordoite.

This rare mineral is a telluride of mercury, from Boulder county, Colorado, described and named by Prof. Genth in 1877. It occurs massive, granular, color iron-black, luster metallic, fracture uneven. The exact composition is not known. In a glass tube it decrepitates, fuses and yields a sublimate of mercury and oxide of tellurium, leaving behind a residue of iron. It is found in several tellurium mines at the locality, associated generally with gold. Specimens exhibited in San Francisco in April, 1877, were very rich in the precious metals. A description of them may be found in the MINING AND SCIENTIFIC PRESS, Vol. 34, Folio 232.

8. Gold Amalgam.

This rare mineral, as the name indicates, is an amalgam of gold and mercury, containing also a small portion of silver. It was first found in Colombia, South America, with platinum. It is said to exist in California near Mariposa, but the writer has never met with it. Nothing more is known except that it is found in small grains and crumbles easily.

9. Lehrbachite,

So called because it has been found at Lehrbach in Germany, is a rare selenide of mercury and lead. It is supposed to be a mechanical mixture of clausthalite and selenide of mercury.

10. Livingstonite

Is thought to be a double sulphide of mercury and antimony. It is found only in Huitzuco, State of Guerrero, and at Guadalcazar, both in Mexico. It was named after the celebrated African traveler.

In May, 1874, Mariano Barcena described this rare mineral in *El Minero Mexicano*, from which it may be learned that it resembles stibnite, and occurs in thin prisms in columnar groups. Specific gravity 4.81, fuses at first touch of the blowpipe flame, and emits copious fumes of antimony; decomposed by hot nitric acid, in which a white insoluble portion remains; hydrosulphuric acid causes two precipitates, one yellow and the other black; an assay shows the presence of about 10 per cent of metallic mercury. The mineral occurs in a matrix of calcite, gypsum and valentinite, and is associated with sulphur, cinnabar, stibnite, and other minerals. A more recent analysis gives the following result:

Sulphur	29.08
Antimony	53.12
Mercury	14.00
Iron	3.50
Total	99.70

Mr. Andrew Rocca, superintendent of the Great Western Quicksilver mine, near Calistoga, Napa county, recently presented the writer with a fine specimen which he brought from the locality named above. A study of this specimen showed that it is impure. The following results were obtained:

Color nearly black, streak powder aurora red. If rubbed on a porcelain plate, the same colored streak was obtained. If this was partly removed with a dry rag, a scarlet streak remained. This led to the suspicion that the mineral was a mechanical mixture, but the closest microscopical scrutiny failed to prove this to be the case. Hardness, 2; specific gravity, 3.75. In a closed tube alone, a black sublimate forms near the assay, and a yellow one of sulphur beyond. This experiment repeated with addition of soda, a sublimate of metallic mercury rises, which condenses into distinct globules in the cold part of the tube. On charcoal the mineral fuses very easily, gives off white fumes and leaves a considerable nonmagnetic, infusible, residue.

Nitric acid acts slowly and weakly on the mineral in the cold, and does not wholly decompose it; addition of hydrochloric acid causes energetic action, by which it is wholly and quickly decomposed to a yellow solution, and a considerable insoluble residue. When the solution is largely diluted with water, no precipitate falls. Hydrosulphuric acid immediately throws down an orange-yellow precipitate, and an immersed plate of copper, a precipitate of metallic mercury. The insoluble residue was found, on examining it microscopically, to be mainly silica, including some small but well-formed quartz crystals.

11. Magnolite

Is an uncertain telluride of mercury, supposed to result from the decomposition of coloradoite No 7. It was described by Prof. Genth in 1877. The specimens were from the Keystone mine, in the Magnolia mining district, Colorado. It is a white mineral occurring in minute acicular silky crystals, which are blackened by ammonia. The composition is supposed to be telluride of mercury and oxide of iron.

12. Mercury.

It has been shown that native mercury was known to the ancients, and that the Romans called it "argentum vivum," in contradistinction to "Hydrargyrum," the same metal produced by artificial means. From that time to the present, it has been found in considerable quantity at the principal quicksilver mines of the world. It differs in no respect from the metal reduced from the ores. We frequently find it mentioned in old works on minerals and mining; the following are examples:

Museum of Francisco Calceolanus the Veronese, by Andrea Chiocco, Verona, 1622, Fol. 439: "Quicksilver mineral is a fragile stone inclining to dusky redness, being equal in weight to lead itself, in the whole mass of which little drops of quicksilver are scattered, here and there, fossil cinnabar of Dioscorides, and less of other minerals; hence they extract quicksilver of the metallic kind from Mount Hydra not far from Goritia." 440: "The quicksilver mineral of Saucensi is a hard stone heavy in weight, the whole body of which is stained lead color not without some luster. The stone being violently shaken, does not give forth the quicksilver from itself, but reduced to a powder by baking, by the power of the furnace quicksilver of the true color is brought forth." * * *

Cramer, 1764, Fol. 159: "*Native* fluid, *quicksilver*, called *virgin mercury*, most commonly lies concealed in an ash-colored soft stone easy to be cleft; in which it may be detected by the naked eye or by means of microscopes under the form of small drops. It is found in great quantity, especially about *Idria*, so that sometimes little drops of it running together out of the *matrix* may be gathered in small vessels."

Cronstedt, System of Mineralogy, 1772, Fol. 208: "Quicksilver is found native or in a metallic state, *mercurius nativus virgineus*. This is found in the quicksilver mines of Idria or Friuli in the Lower Austria in clay, or in a black slaty lapis ollaris out of which it runs either spontaneously or by being warmed even in the hands. It has several times been found at Herr Sten's Bottn in the mines of Salberg in Westmanland, and sometimes also amalgamated with native silver."

Nicholson's Chemistry, London, 1795, Vol. 2, Fol. 598: "Mercury is found in a native state sufficiently distinguishable from any other metallic substance, by its fluidity in every ordinary temperature of the habitable parts of the globe. Bergman doubts whether it be ever found incontaminated by any other metal. It is found in the quicksilver mines in small brilliant globules disseminated in different gangues. Mongez asserts that it is mostly in a state of great purity. Sometimes it is collected in the cavities of rocks as at Idria, in Spain, and in America, and in other instances it is disseminated in the earth, in clays or adherent to quartzose stones, potstone, mica, or else mixed with the different ores, as the white or red silver ores, galena, white arsenic or cinnabar. * * * M. Sage in the *Journal de Physique* for 1784 mentions a Calciform ore of mercury of a red-brown color, difficult of fracture, presenting a granulated texture more red than externally. It frequently contains running mercury in its interstices. By distillation the mercury is obtained in the proportion of 91 parts in the centenary. It contains a small part of silver and comes from Idria."

The presence of native mercury in the Idria mine led to its discovery in 1497. A cooper whose shop stood near by, one day placed a tub or cask he had just finished under a small falling stream to ascertain if it was water-tight. Going soon after to remove it, he found it unusually heavy, saw metallic mercury in the bottom, and the great Idria mine was discovered.

The early workings of this mine were wholly for metallic mercury, as will be fully described elsewhere.

The MINING AND SCIENTIFIC PRESS, Vol. 26, Fol. 232, states that in N. W. Guatamala there is an intermittent spring of quicksilver; the stream is the size of a quill, but not uniform; the cause is thought to be volcanic heat.

Native mercury is not uncommon in California. The Rattlesnake mine, Sonoma county, is an unusually prolific locality, where it occurs with cinnabar. The mercury is disseminated through a soft-grained clay like rock. It is related that on one occasion when a quantity of ore had been placed in a sack, on lifting it, a pool of metallic mercury was found beneath. Up to 1873 the ore was worked in old-fashioned rockers by which the mercury was concentrated.

The Rattlesnake when first discovered was known as "The Native Quicksilver Mine," and pools of that metal settled on the floors of the tunnels.

Mercury is found disseminated in globules and collected in pockets in quartz geodes at the Pioneer mine in Solano county with cinnabar and bitumen. Six pounds of metal were once taken from a single cavity.

It is also found in the Uncle Sam mine, Lake county, and in the Altoona, Trinity county. The Wall Street mine, in Lake county, is also a noted locality of native mercury; cinnabar has sublimed unchanged in the lower levels, while near the surface metallic quicksilver permeates the claylike formation.

The New Almaden also produces native mercury, but rarely; a specimen in the State Museum, No. 1729, shows an association of native mercury with cinnabar in vein stone.

Native mercury occurs in the Oceanic quicksilver mine, San Luis Obispo county, in blue sandstone.

Dr. S. M. Mouser informed the writer that in 1863, in an open cut made by the Spring Valley Water Company on Market street, San Francisco, native mercury was found in the rocks.

The presence of native mercury in a California quicksilver mine is not considered a good indication by the miners. They much prefer to find cinnabar, even if the ores be very low grade, although when questioned on the subject they seem to be at a loss to give a good reason for this opinion.

13. Metacinnabarite.

This is a rare mineral which is of more frequent occurrence in California than elsewhere.

When first observed it was thought to be onofrite, because the blowpipe examination revealed at least traces of selenium. Mr. E. G. Moore was first to discover its true composition and describe it as a new mineral. His very elaborate paper, including the study, analyses and description of the mineral, was first published in the *Journal Fur Prakt Chemie*, in 1870, which was copied into the *American Journal of Science and Arts*, third series, Vol. 3, 1872, Fol. 36, to which the reader is referred. At that time the mineral was only known in the amorphous state, but Mr. F. E. Durand of San Francisco discovered crystals which were described and figured in a paper read by him at the regular meeting of the California Academy of Sciences, April 15, 1882 (Proc., Vol. 4, 1873, Fol. 219).

Since that date elaborate figures and measurements of crystals have been made and published, both in America and Europe, by mineralogists of note. It is a curious fact that metacinnabarite is not really a new mineral as supposed, but was known in 1758, for in Cronstedt's System of Mineralogy, second English translation, London, 1772, Fol. 209, foot note, may be found the following notice:

"It is said that there is also found in Idria a black cinnabar that retains its color in the sublimation, which seems to indicate an abundant phlogiston in the sulphur; but this requires, however, farther examination."

Metacinnabarite is like cinnabar in composition, but differs in color streak, specific gravity, and luster. It corresponds to the black sulphide of mercury obtained by mixing the elements artificially, while cinnabar conforms to the red sulphide obtained by sublimation.

Hardness, 3; specific gravity, 7.7; luster metallic, in closed glass tube black sublimate. With soda yields metallic mercury, has an odor of sulphur when heated, and sometimes emits a faint smell of selenium. On platinum foil at a red heat is wholly volatile.

The color of metacinnabarite is grayish, not intensely black. The streak is also black, but as it generally occurs with cinnabar, an unexpected red streak is sometimes obtained. The specimen under examination should be first carefully examined under the microscope.

The following is the mean of two analyses by Moore:

Sulphur	13.82
Mercury	85.79
Iron	.39
Quartz	.25
Total	100.25
Corresponding to	
Sulphide of mercury	98.92
Sulphide of iron	.83
Quartz	.25
Total	100.00

Guadalcazarite and Laviglianite are thought to be varieties of metacinnabarite.

Metacinnabarite was first discovered in the Redington mine, Lake county, California, where it was a common and rather abundant mineral. It was afterward found in several other mines with cinnabar and other minerals, but is still considered a rare species.

The known Pacific Coast localities are the Redington and Great Western mines in Lake county, the California mine in Yolo county, and the Bonanza mine, Douglas county, Oregon. Specially fine crystals are credited to the Redington and California mines, in which, however, it is far more abundant in the amorphous condition.

14. Onofrite.

This rare mineral is a variety of tiemanite, No. 16. It was first found at San Onofre in Mexico, whence the name. It occurs also at Clausthal in the Hartz and at Marysvale in Utah. It has the following composition:

Mercury	75.3
Selenium	24.7
Total	100.0

Hardness, 2.5; specific gravity, 7 62; always massive, compact, granular, luster metallic, color steel to blackish lead gray, streak shining, has no cleavage.

Before the blowpipe on charcoal emits the characteristic odor of selenium and forms a white incrustation.

Brush assumes an isomorphous series, including metacinnabarite and tiemanite.

15. Spaniolite,

Called also hermesite and schwatzite, is a variety of tetrahedrite containing mercury. Specific gravity, 5—5.6; color, gray to black. It contains sulphur, antimony, copper, iron, and mercury in varying proportions, the latter from 2.7 to 16 69 per cent.

Cronstedt, 1772, Fol. 209, describes a sulphide of mercury and copper: "*Mercurius cupro-sulphurato mineralisatus.*"

16. Tiemanite.

This is a rare mineral, a selenide of mercury, having when pure the following composition; analysis by Rammelsberg:

Mercury	74.5
Selenium	25.5
Total	100.0

It is amorphous, opaque; color, steel gray; hardness, 2.5; specific gravity, 7.10, 7.37. In a closed tube with soda gives a sublimate of metallic mercury; on charcoal, volatilizes and emits an odor of selenium.

It occurs in Clausthal, Hartz, and is said to be found in Utah with onofrite and barite in seams in limestone in the Seveer mine, near the Lucky Boy mine, Marysvale.

17. Tocornalite

Is a chloro-iodide of mercury, of which very little is known. It has been found only in Chili, and was described by Domeyko. It is pale yellow in color and contains about four per cent of mercury. It is a very rare mineral.

Associate Minerals.

(1) *Ammonia* and ammoniacal salts occur in thermal waters that issue from fissures near quicksilver mines in California; notably in Lake county near Clear lake. The water of a hot spring analyzed by E. G. Moore (Geological Survey of California, Geology, Vol. 1, fol. 99) shows 107.76 grains of bicarbonate of ammonia per gallon. The water of Clear lake gives decided reactions for ammonia, and all the waters of the solfataric regions of the State contain enough ammonia to be considered decidedly bad were its presence owing to organic decomposition.

(2) *Aragotite*, a new mineral (for description see Fourth Annual Report State Mineralogist, 1884, fol. 289), is found in the New Almaden and New Idria mines of California, but is of rare occurrence. There is a specimen, No. 1275, in the State Museum, from the New Idria.

(3) *Borax* and boracic acid (sassolite) occur in the waters of quicksilver mines, and especially so in Lake and Napa counties, at the Sulphur bank, and in Borax lake in this State.

(4) *Bromine* in traces has been found in the mineral waters of the quicksilver region.

(5) *Calcite* is a common mineral associate of cinnabar in California and elsewhere. It occurs in the quicksilver mines of Guancavelica in Peru.

(6) *Carbonic Acid.*—This gas is so common in many of the California quicksilver mines, that expensive machinery to remove it from the shafts and workings is required, without which, work in the deep levels would be impossible. Small animals have been asphyxiated at the mouth of the shaft by the overflowing gas. In the beds of small streams flowing near the mines, bubbles of carbonic acid gas are continually rising.

(7) *Coquimbite* occurs in the surface matter of the Sulphur Bank quicksilver mine in considerable quantity.

(8) *Electrum.*—This mineral is found in small particles attached to gold at Sulphur creek, Colusa county, California.

(9) *Epsomite* occurs in the Redington quicksilver mine in Lake county with cinnabar; and in several other mines in California. Fine fibrous curved specimens come to us from the Buckeye quicksilver mine in Colusa county.

(10) *Galena.*—This mineral occurs with cinnabar and other minerals in the great Guancavelica mines in Peru. (Bonycastle, Spanish America, Vol. 2, fol. 134.)

(11) *Gypsum* in several forms is found in California quicksilver mines, and also at Guancavelica, Peru.

(12) *Gold* occurs at Sulphur creek, Colusa county, with cinnabar. Specimens have been described under cinnabar. According to a

writer in the MINING AND SCIENTIFIC PRESS, Vol. 15, fol. 18, gold is found in several quicksilver mines near the New Idria, Fresno county, and the same writer says it occurs in the New Almaden mine, all in California.

(13) *Hematite*, according to Bonycastle, is found with ores of mercury at Guancavelica, Peru.

(14) *Idrialite.*—Bitumens are abundant in California quicksilver mines, so much so that they interfere greatly with reduction. It is thought that this mineral is generally idrialite, but it has not yet been so proven. (See Petroleum and Aragotite.)

(15) *Iodine* is found in mineral springs near California quicksilver mines. The thermal spring near Clear lake, referred to before, contains iodide of magnesium. A mineral spring containing iodine is situated at the mouth of Grizzly canyon, Lake county, about six miles from Wilbur springs.

(16) *Magnetite* occurs in the quicksilver mines of Guancavelica, Peru; such mineral association is not known in California.

(17) *Mineral Waters.*—Mineral waters are found at or near all the quicksilver mines of California. The Etna springs, which have attained merited celebrity, issue from the old shaft of the Valley quicksilver mine, now filled to overflowing. The writer has often been at the bottom of the shaft while the mine was in operation. So universal is this fact that wherever mineral springs are known, the quicksilver miner goes to prospect. The same solfataric action which produces the mineral water, places the quicksilver minerals in the fissures.

(18) *Natural Gas.*—Carburetted hydrogen, which issues from the accidental fissures in the rocks at solfataric vents in several localities in California, on being ignited, continued to burn for a considerable period. Hydrosulphuric acid and sulphurous acid gases resulting from subterranean decomposition, also issue at the surface and are absorbed by waters to which they impart peculiar chemical characteristics. They are known as sulphur springs.

(19) *Obsidian.*—The remains of extinct volcanoes are common at the quicksilver mines. Among the minerals produced by past volcanic energy, obsidian is frequently met with.

(20) *Orpiment.*—This is not an unusual accompanying mineral in quicksilver mines, but is unknown in California. In Hungary, mercury is extracted from orpiment. At the Paris Exposition of 1878, specimens of the mineral and the resulting mercury were shown. Bonycastle, Spanish America, 1818, Vol. 2, Fol. 135, thus refers to the presence of orpiment in the great Santa Barbara mine at Guancavelica, Peru: "The mine was opened in September, 1570. It was divided into three stores, named *Brocal*, *Comedio* and *Cochapata*, the last of which the Government forbid to be worked, the bed containing red and yellow sulphureted arsenic or orpiment, which was the cause of many deaths."

(21) *Petroleum.*—In or about the year 1869, in sinking a shaft in the Redington mine, the workmen came to a deposit of liquid petroleum. There was more than 50 gallons; half that amount was skimmed from the pump-water and saved.

(22) *Potassium.*—Potassium salts, generally the chloride, are found in the waters of California quicksilver mines.

(23) *Pyrite.*—This is a very common mineral in the quicksilver mines of California. It occurs also elsewhere in similar mines.

(24) *Pyrolusite* occurs with cinnabar at Sulphur creek, Colusa county. It has been referred to before.

(25) *Quartz.*—This mineral in various forms is almost invariably found in the quicksilver mines of California. It is also a common associate in other quicksilver mines the world over.

(26) *Realgar* occurs with Orpiment, which see.

(27) *Soda.*—The salts of sodium, generally the chloride (Halite), bi-borate (borax), and sesqui-carbonate (trona), are found in the mine waters and mineral springs in the quicksilver region of California.

(28) *Selenium* has never been found isolated in California, but the peculiar smell of that element frequently observed at the quicksilver furnaces, leads to the supposition that it exists in the ores in some form, but the minerals are so diffused that they have so far escaped notice.

(29) *Stibnite* is frequently associated with quicksilver minerals in California. It is also found in a like union in the quicksilver mines of Borneo and Mexico.

(30) *Sulphur* is a universal associate of quicksilver ores, both in California and at other localities in the world. It is generally combined with different bases, but is sometimes free as at the Sulphur Bank, Lake county; the Mud Volcanoes, San Diego county, and near Kern lake in Kern county.

Cinnabar occurs in the Barcelona mine, Nye county, Nevada, with silver minerals.

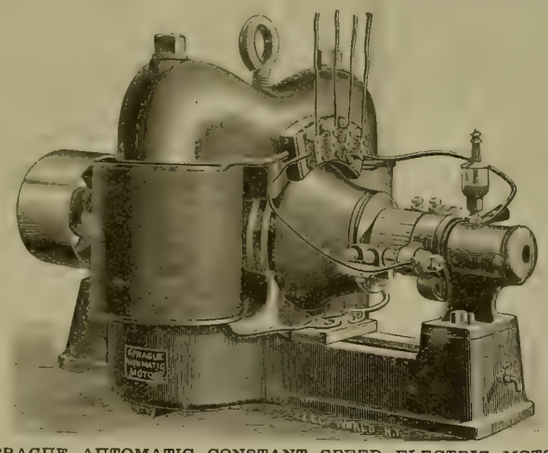
It is a curious fact that wherever quicksilver has been deposited or is being deposited, nearly all the volatile minerals are found, and many of the soluble ones.

PROFITS OF THE MECHANICS' FAIR.—At a meeting of the trustees of the Mechanics' Institute held October 15th, Treasurer Bauer made the following statement of receipts from the Twenty-fourth Industrial Exhibition: Tickets sold at office, $40,607; tickets sold outside, $3361; tickets sold to members, $4883.50; excursions, $812.63; catalogues, $146 40; gas, $293.50; privileges, $6604. Total, $56,708.03.

Electrical Apparatus in Africa.

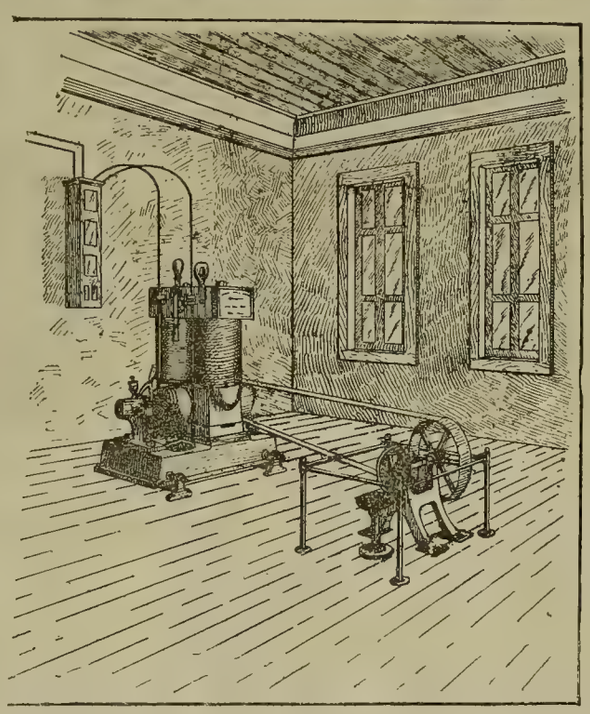
The Forbes Reef Gold Mining Co. of Transvaal, South Africa, have ordered from the Sprague Electric R. R. & Motor Co. of New York, a complete electrical equipment for transmitting 140-horse power three miles. At a waterfall three miles away are to be three Pelton wheels, provided by Fraser & Chalmers of Chicago. The *Engineering and Mining Journal* describes the plant as follows:

To each of the Pelton wheels will be belted one far-transmission constant potential Edison dynamo of 50,000 watts or 67 H. P. capacity each. To the other wheel will be belted a dynamo of the same type and voltage as the others, but of 40,000 watts or 55 H. P. capacity. These dynamos are similar in appearance to the standard Edison dynamo for incandescent lighting and are built at the Edison Machine Works, but their winding is especially adapted according to the Sprague method for the work of long-distance transmission of power. These machines have an efficiency of 95 per cent. The station will be lighted by incandescent lamps and will be complete in every detail.



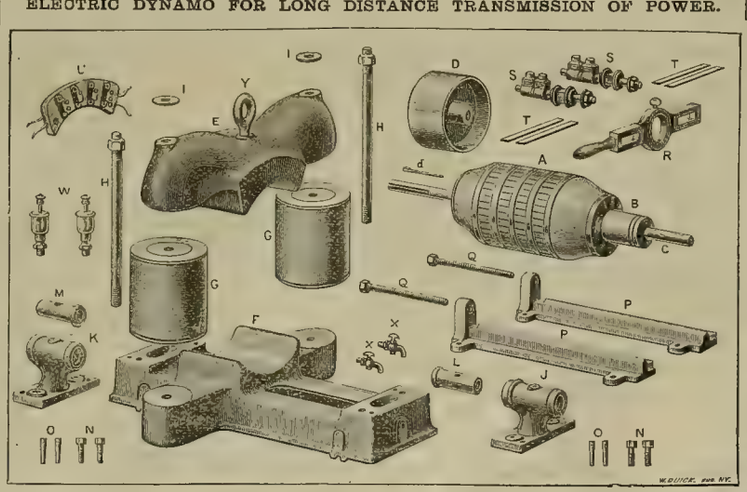
The wires, which are insulated, will be carried overland across country on wooden poles to the point of distribution, where are located the four long-distance transmission motors of the constant potential type, one of 80 and three of 20 H. P. capacity each. These motors are divided into two groups, one single 20 H. P. motor forming one group, and the other two 20 H. P. motors and the 80 H. P. motor forming the other group. Each group is supplied with current by a separate set of wires, thus practically insuring a constant flow of electricity under all circumstances.

The motors are wound to run on a constant potential circuit, and all the motors of each group are connected in parallel from negative to positive wires, thus equalizing the strain on the dynamos when the loads are thrown on and off. This method of connecting dynamos and motors in parallel is used in all the Sprague installations for the transmission of power, and it is claimed is much superior in reliability and economy to the series method of connection by putting each motor on a separate circuit. In principle it is the same as supplying a city with water, using city mains instead of running a separate pipe from the reservoir for each consumer.



The method of regulating the motors and keeping them at a constant speed, in spite of varying loads, is accomplished by winding the motors in a special way, so that there is no mechanical governor to get out of order.

The governor being in the winding, and consequently inert, the motors are more durable, and the use in what nearly all machines proves to be a delicate piece of mechanism is avoided.



The Standard motor is now made in parts divided for shipment, where transportation, as in mining districts, is difficult. These parts are made interchangeable in each type of machine. In the accompanying cut showing the parts, *A* is the armature; *B*, commutator; *C*, shaft; *D*, pulley; *a*, pulley key; *E*, keeper; *F*, foundation plate; *G*, field magnet; *H*, connecting bolt; *I*, washer; *J*, pillow block, composition; *K*, pillow block, iron; *L*, *M*, pillow-block cushings; *N*, pillow-block bolts; *O*, pillow-block pins; *P*, rails; *Q*, rail bolts; *R*, rocker arm; *S*, brush-holders; *T*, brushes; *U*, connecting board; *W*, oil cups; *X*, pet cocks.

SPRAGUE AUTOMATIC CONSTANT SPEED ELECTRIC MOTOR.

ELECTRIC DYNAMO FOR LONG DISTANCE TRANSMISSION OF POWER.

PARTS OF ELECTRIC MOTOR.

Con. California and Virginia.

At the annual meeting of Con. California and Virginia, Oct. 14th, 181,349 shares out of 216,000 were represented, and the following officers elected: Chas. H. Fish, president; Geo. R. Wells, vice-president, and H. B. Havens, Con. O'Connor and Wm. S. Lyle, directors. A. W. Havens was re-elected secretary, and D. B. Lyman, superintendent. The secretary's financial statement showed a credit of $70,000. The superintendent's annual report showed that there has been extracted from the various levels during the year 136,189 tons of ore, all of which has been milled by the Comstock Mill and Mining Co., and from this ore there has been produced bullion of the assay value of $3,327,281, which shows an average yield of $24 43 to the ton. This bullion carried $1,544,595 in gold and $1,782,686 in silver. The above showing is not so good as that made last year, when 148,302 tons of ore, which yielded bullion having a value of $4,060,978, or an average of $27.24 per ton, was extracted. The decrease has, therefore, amounted to 12,113 tons of ore, $733,699 in the bullion yield, and $2.81 per ton in the average yield per ton. The report virtually states that the old California ground has not been prospected to any extent, the ore and main work having been done in the old Con. Virginia ground. The report states that from the 1500-foot level upward there remains a portion of the old stopes to work over. Judging from the portion that has been already worked, and which has been productive, there is every reason to believe that the unworked part in proportion to its extent will be equally productive in bullion. North from the main shaft and westerly (about the center of the California ground) there still exist quantities of ore in places, the extent and limits of which are as yet undefined, in ground adjacent to old stopes which are visible at many points. Taking the report as a whole, it gives hope for much to be expected with more extensive work in the unexplored levels commenced.

OFFER REJECTED.—Oct. 13th a meeting between the ranchers and millmen was held at Genoa. The object of the meeting was to see if an amicable settlement could be made between the millmen and ranchers respecting the water question. M. Cohn of Carson was chairman of the meeting. Frank Newlands, on behalf of the Sharon estate, through the mill attorneys, made a proposition to take a decree for 6000 inches of water instead of 8000, and during the years 1890 and 1891 give the ranchers water until July 15th. After this the mills would take all the water the year round, and put up an equal sum with the ranchers to build storage reservoirs. After considerable talk pro and con, the ranchers decided not to accept the terms offered by the millmen, and so the meeting adjourned. The millmen will now begin suit against about 100 ranchers on the Carson river, and the legal battle will be fought to the bitter end.

COPPER.—James Lewis & Sons' Liverpool copper circular, under date of Oct. 1st, states that the visible supply of copper in England and France has steadily decreased from 124,853 tons on April 1st to 106,033 tons on Oct. 1st. In the circular they say that the abnormal demand to supply the wants of consumers all over the world, who had reduced their purchases to the smallest possible limit during the prevalence of the high prices due to the operations of the French syndicate over a period of 16 months, appears now to be satisfied, and although the consumption due to the revival of trade and the increased use of electricity is still very large, the supplies appear to be quite equal to it.

THE Government has advertised for bids for the construction of torpedo cases for the defense of San Francisco harbor.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NORTH GOVER.—Amador *Ledger*, Oct. 16: A meeting of the stockholders of the North Gover Improvement Co. was held in the Knights of Pythias hall, Amador City, on Wednesday evening. The president of the meeting was J. R. Tregloan; secretary, J. Myers. The meeting was addressed by R. M. Ford and J. R. Tregloan, who dwelt at length on the advantages of the mining district in which the North Gover is situated. The object of the meeting was accomplished by electing five trustees—Messrs. Tregloan, J. Myers, W. Ford, J. Lepley and C. Culbert—who are to confer with the trustees of the original company as to the terms of the bond of the property. Eighty-nine thousand shares in the new company have been sold. The Drytown Consolidated has levied assessment No. 4 of two cents per share, delinquent November 9th. The Amador gold mine paid off one month's wages on the 12th. The superintendent went to San Francisco this week on business pertaining to the mine. The new 40-stamp mill of New London, near Plymouth, is being rushed ahead as fast as possible. The South Spring Hill has completed the laying of their new water-pipe which extends from the Talisman to the adit of the South Spring shaft, it being the intention of the company to run by water their air-blower in place of steam and thus do away with all the noise and clatter of the steam, making more room in the hoisting works and furnishing a cheaper motive-power. J. R. Tregloan is working the Talisman; a night and day shift runs the crosscut. The moment water arrives, the machine drills will be placed in position.

Butte.

THE CHEROKEE MINE.—Oroville *Mercury*, Oct. 16: It is understood at Cherokee that the big hydraulic mine is to be changed into a drift mine as soon as possible, and people, generally, applaud the wisdom of the management in making the change. Supt. Gregory has urged this for some years, and is jubilant over the prospect. The tunnel will be run in from the west side of the gold-bearing gravel hill, and, having sufficient incline, will drain itself. Since the surveys have been made, it has been found that the cost of getting to the gravel will be much less than the managers anticipated, and the chances are that this famous old mine will again spring into prominence as one of the great institutions of the State.

Calaveras.

BONDED.—Angels *Echo*, Oct. 19: We understand that the Gold Valley mine, adjoining the Star of India mine, owned by Otto Dolling & Co., has been bonded to a San Francisco syndicate. Otto claims that it is one of the best mines in the country.

STRIKE.—John Cates, who is engaged in mining on Bald hill, near Altaville, made quite a little strike last Saturday, taking out nearly $40 during the day. He says he has still a good prospect to work on.

El Dorado.

GARDEN VALLEY DISTRICT. — Placerville *Observer*, Oct. 23: Mr. H. Lawrence, superintendent of the Lone Jack mine at Garden Valley, was in town Thursday of last week, and was a caller at the *Observer* office. He says that a correspondence in the MINING AND SCIENTIFIC PRESS, copied in the *Observer* of last week, relating to mines in the Garden Valley district, is in error where the correspondent says that "the Rosencranz and Taylor mines lie east of the Lone Jack, as that would lead to the conclusion that the mother lode runs east and west, when in fact the course is north 25 degrees west." The Rosencranz and Taylor mines lie east and north of the Lone Jack. Mr. Lawrence informs us that at the 400 level at the Lone Jack they have run drifts 60 feet each way north and south on the vein, and that the ledge is 16 feet wide of fair-grade ore.

Mariposa.

THE CHAMPION. — Mariposa *News*, Oct. 16: Work is progressing on the levels at the Champion or Barleyfield mine now owned by Jas. Ridgway and a Chicago Co. Good milling ore has been run through since they commenced running the levels. On Monday they struck one that is supposed to go over $1000 to the ton. We hope this will continue. This Co. is conducting its business on a business basis. We want a few more such companies in the county. They are now building an immense arastra to thoroughly prospect the rock. It will be run by steam. If a good mine is found here a large mill will be put up. Here's success to the Champion.

Nevada.

CHAMPION.—Nevada *Transcript*, Oct. 18: It is reported that the ledge in the lowest levels of the Champion mine has widened to six feet, and samples recently sent to the Selby Smelting Works gave high milling assays. The pumps at the Peabody mine in Grass Valley district were started again Thursday after being idle some two years. Messrs. Tregidgo & Co. propose to sink the shaft 800 feet deeper before drifting. It is now down 200 feet.

FEDERAL LOAN. — Nevada *Transcript*, Oct. 19: Supt. Vincent of the Federal Loan mine went to San Francisco Friday for a short stay. All of the hoisting and pumping machinery recently purchased from the New Constitution claim has been removed to the Federal Loan, and will be erected as fast as the weather will permit. The incline shaft is now down 160 feet, but is too small for practical working. It will be enlarged and sunk to a depth of 350 or 400 feet before any drifting is done. The ledge is large, the pay-chute long, and gold-bearing ore can be found at most any point where it has been opened. If this mine proves the success that is reasonably expected, it will lead to several other Willow Valley mines being extensively worked. Most former operations in that district have been of a desultory character.

CENTENNIAL.—Capt. Richards is down from the Centennial drift mine in Washington township. It has been definitely ascertained that the old shaft was half a mile north of the channel. A 50-foot cut has been run since the resumption of work this season, and the new tunnel into the south side of the ridge is now well started. This tunnel will, according to the estimates, bottom the center of the channel within a distance of 1200 feet, which can be run in about 12 months at an approximate cost of $5 a foot. The San Jose Co., on the same channel as the Centennial, have a fine prospect. They are now drifting toward the center of the channel, but will have to sink to get under it.

NORTH BANNER MINE. — Grass Valley *Union*, Oct. 18: The North Banner mine is developing finely. The ore vein is showing well in both the north and south drifts on the second level, and in the south drift the ore is now all of high grade. The ledge in the shaft, which is now being sunk below the No. 2 level, is also of first-class quality, and the vein solid and regular in formation. From the openings that have been made on the No. 2 level the ore shoot is found to be over 400 feet in length, which will afford a large quantity of backs when the No. 3 level is opened up. Above level No. 2 the ground was found somewhat broken, but now the vein is regular and the stringers are all making down to the foot-wall, with the promise of making a strong vein. The vein at present is 14 inches in size. The ore is highly mineralized with gold-bearing sulphurets, which will yield several hundred dollars to the ton, and besides will give paying results in free gold. Supt. Skewes says the mine has never looked as well as it does now, and there is no doubt that the ore body that is being opened up will prove extensive and valuable.

MACHINERY.—A large lot of machinery for the Idaho Co. is arriving by railroad, consisting of new fixtures for the concentrating department.

Placer.

GOLD RUN.—Placer *Republican*, Oct. 16: Moody's Bear Valley mine is being worked and will be continued until wet weather prevents. This property has paid immensely this year. J. R. Gayetty has leased his mine on Bear river to the San Francisco Development Co. at a figure that is very satisfactory to him. The Co. named are now at work on the mine and have great expectations.

Plumas.

THE HALLSTED.—Greenville *Bulletin*, Oct. 16: From Chas. Bressler, who is up from Rich Gulch, we learn that the Hallsted Bros. have just completed a crushing of ore from their mine there, and that it yielded them $6 per ton. The ore was taken from different levels. This mine has an immense ore vein, it being 12 feet wide. It runs into the side-hill of a deep canyon, thus making it possible to obtain backs 1600 feet. The property is so situated that water-power of practically unlimited extent can be introduced easily. With a large mill, this mine would become an important and valuable property.

San Diego.

PINACATE DISTRICT.—*San Diegan*, Oct. 18: Work in the newly located main shaft of the Good Hope mine at Perris has reached a depth of 135 feet, and a depth of 45 feet in a second shaft. It is the intention of the owners to sink the main shaft not less than 1000 feet and construct 200-foot levels. There are now 20 men at work in the mines and within five months it is anticipated that this number will be increased to 75. Some very fine ore has been taken out of the main shaft on the 100-foot level and the owners are very sanguine of success. Possessed of a good mining property, ample experience in mining property and backed by unlimited capital, there is no reason to doubt but that the Good Hope will loom up on the mining world as a "bonanza," and be the means of attracting capital and brains to the Pinacate district, and result in the opening of some splendid mining properties that are known to exist there. J. Everett Bird will superintend the Good Hope here, and James M. Sigafus, his partner, will in all probability return to New York City soon. In conversation with Mr. Bird, after the foregoing was written, he informed us in addition to the facts noted above, that he would in the course of a few months put up about a 30-stamp mill, but that they would do nothing until they had thoroughly developed the mine and knew their needs in the matter of machinery.

Sierra.

WIDE AWAKE.—*Mountain Messenger*, Oct. 19: The Wide Awake Co. struck through the lava last week, over 600 feet in their new tunnel. They have now slate rock in the face and gravel and boulders overhead, and they have about 160 feet to go to get the center of the channel.

LOGANVILLE.—The Marguerite mine is at present running full blast. The work of hoisting ore commenced last week, and now the mill is running its full capacity, 20 stamps. The pump is keeping the mine dry on four strokes a minute.

Siskiyou.

QUARTZ.—Yreka *Journal*, Oct. 23: Spencer & Co. of Humbug are now receiving a lot of machinery from below for pumping out water from their ledge and hoisting the quartz. The first installment arrived last week and was hauled to the mine from the Yreka depot last Friday. Boyle & Co. are having their steam engine and fixtures at Forks of Humbug hauled to their mine near the head of the north fork on the divide between the Humbug and Deadwood creeks, under supervision of John Burgess. Mr. Boyle is now at San Francisco securing a new quartz-mill of large capacity, with intention of having it delivered at the mine before the wagon-road from Yreka to Humbug gets too heavy from stormy weather to make hauling difficult. The miners at Hawkinsville feel hopeful of obtaining a supply of water this winter from Long and Canal gulches, not having been able to obtain any during the entire extraordinary dry season this time last year.

Yuba.

DRIFT MINERS PROSPERING.—Marysville *Democrat*, Oct. 17: John Dunn, from Smartsville Monday, gives a very encouraging account of the progress of drift mining in that good old town. The Blue Point Drift Gravel Mining Co. has at present 56 men employed, which, together with 40 employed by the Excelsior Mining Co., makes the number of men 96 who are earning good wages. We understand that Wheaton & Co. are about to open up a new claim at Mooney Flat and Smartsville which will give employment to about 400 persons.

QUARTZ.—Marysville *Appeal*, Oct. 18: For about a year there has been more or less activity in and around Brownsville on the prospecting quartz ledges of that vicinity, and the indications have been most favorable for some very rich finds. The miners who have been at work in the various locations are all old-timers in the business and they are very profuse in their talk concerning the richness of the specimens. Should any of the claims now being worked more as prospects than anything else, ever amount to anything, the people of that vicinity all expect to become wealthy and be surrounded by a large population. Among the claims now being worked is one known as the Howell, which has been in operation for nine months, during which time ten men have made 800 feet of drift tunnel and gone through 100 feet of ledge, taking out pay ore all the time. The rock in the nine months netted $4000. The men in this mine are now going through the second hundred feet of ledge, and the specimens are much more rich than in the first. The mill is a very small one, and used only by prospectors. There is some prospect of a large Eastern company taking hold of it. There are other claims in the vicinity known as the Colorado, Commonwealth, Emma and Ida mines, in which probably 25 or 30 men are employed in making tunnels and taking out rock, all of which is good pay. These mines are all under the superintendence of J. C. Campbell, who has great faith in their future. The Johnson claim, which is worked by the arastra process, has been taking out $15 of free gold to every ton.

Tulare.

AT WHITE RIVER.—Visalia *Times*, Oct. 17: The Bald Mountain mine at White River is not being worked very actively at present, on account of the lack of water with which to run the quartz-mill. Some ore is being taken from the mine and placed on the dump, and as soon as the winter rains furnish the necessary water, work will be pushed with vigor. The mill connected with the mine has sufficient capacity to crush 10 tons of rock per day, and the ore now on the dump, it is believed, will average from $25 to $30 a ton.

HARRIS & CO., who are working the Keyes mine near White River postoffice, have struck a very rich vein of ore at a depth of about 200 feet. The ore is the richest that has ever been found in that section, and one piece of it exhibited is actually wired together with gold. The proprietors are very reticent as to their find, but they have a very rich thing.

Tuolumne.

LEASED.—*Union-Democrat*, Oct. 19: Judge Stoner has leased his two pocket mines at Yankee Hill to Fred Greiner. These claims are situated near the pocket mine of Nate Arnold, from which large amounts of gold have been extracted in recent years.

BULLION.—The amount of gold taken from the Buchanan mine recently was brought to Sonora Sunday last, and sent to San Francisco the following morning. The bullion was estimated to be worth $25,000. The new machinery at the Black Oak has been put in place, and work was resumed this week with everything in fine order. The gold recently taken from the Bonanza mine, together with the sulphurets, will amount to about $85,000. We are informed from reliable sources that the Kanaka mine has been sold, and part of the purchase price paid down. The Mt. Jefferson mine near Groveland, owned by an English company, will be started up in November.

NEVADA.

Washoe District.

SIERRA NEVADA.—Virginia *Chronicle*, Oct. 19: On the 520 level from the main east drift, 1185 feet from the shaft station, a south drift is advanced 330 feet, continuing in a porphyry formation showing a slip of clay, which runs southeast and northwest from the course of the drift.

UNION CON.—On the 1465 level the north lateral drift is advanced 524 feet, from the south line, continuing in porphyry and clay.

MEXICAN.—On the 1465 level the north drift from west crosscut No. 1, 200 feet in from the lateral drift, is advanced 497 feet, continuing in porphyry and streaks of quartz.

OPHIR.—On the 1300 level the east crosscut from the shaft station, to connect with the top of the raise above the 1465 level east drift, is extended 233 feet, continuing in porphyry showing some quartz.

CON. CALIFORNIA & VIRGINIA.—The usual quantity and grade of ore is being extracted from the various openings on the 1435, 1500, 1600 levels. On the 1900 level where work was suspended in the south end of the mine Aug. 16th, have resumed operations and are extracting some milling ore from that point. On the 1650 level: The stopes on the seventh and eleventh floors above this level continue to yield the usual quantity of ore of fair quality. Also continue stoping ore from upraise No. 2, carried up above the north drift from the bottom of the winze 60 feet below the end of the south drift. During the week 1126 tons and 1980 pounds of ore were shipped to the Morgan mill, 1635 tons to the California. The average assay value of all the ore, worked at these mills during the week, according to battery samples, was $27.10. Bullion valued at $60,349.03 shipped to the Carson mint.

GOULD & CURRY.—On the 400 level west crosscut No. 1 is extended 410 feet. Formation hard porphyry. On the 1000 level the northwest drift is extended 336 feet. Formation hard porphyry.

SCORPION.—The 520 level south drift is out 263 feet and continues in porphyry.

SAVAGE.—Continue to extract ore of good quality from the 500 level north drift. A south drift has been started from the top of the raise above the 400 level.

HALE & NORCROSS.—West crosscut No. 1 on the 300 level continues in vein porphyry. No. 3 cut through 85 feet of low-grade quartz. West crosscut No. 2 on the 700 level continues in quartz. Fair grade ore is being stripped on the 1200 level. Retimbering the 1300 level station.

CHOLLAR.—Connection has been made with the Hale & Norcross workings on the 850 level. The 750 level north drift is out 570 feet and continues in porphyry.

POTOSI.—The 850 level south drift continues in hard porphyry.

NORTH GOULD & CURRY AND EAST BEST & BELCHER.—The northwest drift to connect with the North Gould & Curry workings has cut through a ten-inch streak of quartz.

IMPERIAL.—An east drift from the winze bottom below the 300 level to connect with the Imperial shaft is out 90 feet. The joint Confidence-Challenge 500 level north drift is out 1027 feet from the Yellow Jacket shaft.

WARD COMBINATION SHAFT.—Repairs in progress to the 1800 level shaft station.

ALPHA AND EXCHEQUER.—Underground explorations are temporarily suspended pending repairs to the joint hoist plant.

YELLOW JACKET.—Daily ore shipments average 50 tons. The Brunswick mill is crushing 100 tons daily from the reserves accumulated.

OVERMAN.—The south drift from the winze bottom continues in clay and quartz carrying fair grade ore.

CROWN POINT.—The 700 level south drift is out 490 feet. The 900 level west crosscut is showing four feet of fair grade ore. Are raising above the 600 level for ventilation.

BELCHER.—No. 2 east crosscut on the 1200 level is in porphyry. The 1000 level east crosscut is in porphyry and quartz.

SEG. BELCHER.—The 1100 level east crosscut is in 398 feet, and is in clay and porphyry.

SILVER HILL.—The 160 level northeast crosscut continues in quartz and porphyry. The 260 level level northwest drift continues in porphyry.

JUSTICE.—Crushed 232 tons of ore showing an assay value of $25.90 per ton.

ALTA.—Crushed 320 tons of ore, assay showing a value of $33.75 per ton. The 825 and 925 level stopes continue to improve in the quality of the ore.

NEW YORK CON.—Ore still showing in the raise above the 800 level west crosscut.

EAST SIERRA NEVADA.—The 520 level south drift is out 140 feet and continues in porphyry.

UTAH.—On the 600 level the southeast drift is advanced 90 feet from the shaft station. Formation hard porphyry.

OCCIDENTAL CON.—During the week extracted and milled 300 tons of ore, showing an average assay value of $21.10 per ton.

NORTH OCCIDENTAL. — Continue stoping ore from the 450 level and raising above the 350 level to connect with the 300.

Barbee District.

GOLDEN JACKET MINE.—*Silver State*, Oct. 18: Work is being resumed on the Golden Jacket mine in the Humboldt range. If the powers that be at Washington would embrace the present favorable opportunity to increase the coinage of silver dollars, thereby creating a demand for bullion, many mining camps now deserted would be revivified.

Eureka District.

A MINING SALE. — *Sentinel*, Oct. 19: Ten months ago Mr. Cassidy of this paper undertook the sale of the Diamond mine on Prospect Mountain, for its owners. He made a contract with Richard MacIntosh, of Salt Lake, for $60,000, certain work to be performed by Mr. MacIntosh. The whole business was finally consummated the past week, and Mr. MacIntosh paid out $75,000 in cash for the Diamond and Antelope properties. This is the best sale that has been made in Eureka for 20 years. It is new blood and means new life and business for the camp. The Diamond promises to be a great property. It is not fully developed as yet. We are to have a sampling-mill here by the Salt Lake parties, and this, together with the new cheap transportation rate, will make Eureka the best camp in the State next year. The Smelting Trust is "busted" and all things are once more bright for the Base Range. The parties receiving the money from the sale were Dan H. Foley, $30,000; Dennis O'Leary, $15,000; Morris Bros., $15,000; Pat Finnegan, $15,000. In addition to the purchase money Mr. MacIntosh has spent about $25,000 in developments, so, in round numbers, the deal represents about $100,000 of cash money to the camp.

NEW ORE RATES.—The new ore rates for transportation of ores to Salt Lake and San Francisco, went into effect last Wednesday, since when 11 carloads have been shipped as follows: From the Eureka tunnel, 20 tons; Williams mine, 12 tons; White Pine, 25 tons; and Morey, 21 tons. There are also 15 tons left at the depot from White Pine awaiting shipment. The rates will be of immense benefit to the outside districts where there are thousands of tons of low-grade ore on the dumps that can now be shipped with profit. There is new encouragement for prospectors, and we may reasonably expect a booming camp again.

Golconda District.

COPPER.—*Silver State*, Oct. 17: The Adelaide copper mine, near Golconda, is being thoroughly prospected. A drift has been run 100 feet on the 110-foot level. It is in ore all the way. Some of this ore yields 20 per cent copper and 34 ounces of silver to the ton. A drift will shortly be started south on the 110-foot level to prospect the lead in that direction. The Great Republic and New Star Con. Co. is prospecting one of their mines by shaft. They will ship two carloads of the ore to be reduced as soon as teams can haul it to the railroad.

Pioche District.

THE RAYMOND.—*Record*, Oct. 16: At the Raymond shaft the work of opening up the Black Ledge continues. The 1500-foot winze station on the 12th level is now nearly wholly recovered. The station is 30 feet long, 15 feet wide and 25 feet high. The engine which was stationed over the winze is being overhauled at the machine-shop, and will soon be ready to put in place again. When the station caved, heavy timbers fell across the mouth of the winze and no great amount of dirt seems to have gone down it. The water is clear as crystal and the winze as far as can be seen is in good shape. The old stope through which access to the Black Ledge was had some weeks ago has been repaired, and an upraise is being run on the Black Ledge. At this place the ledge is five feet in width, carrying two feet of 100-ounce ore; the balance of the vein is not worth saving. The upraise will eventually be connected with a winze from the 10th level. On this level work on the ledge also continues, the ore taken out averaging 202 ounces. The ground between these two levels is unexplored and present appearances indicate that it will produce thousands of tons of high-grade ore.

ZERO.—This is the name of the claim owned by the P. C. Co. on the iron or manganese ledge running southerly from the Raymond works over the divide, and which is being prospected by a tunnel run on a level with and at a point about 100 feet east of the works. The tunnel is now in some 200 feet, and the result is very encouraging. As reported several weeks ago, the ledge was cut about 100 feet from the face of the tunnel, from which point it was run south along the ledge for 100 feet or more. The ledge averages three feet in width, with a paying streak of 23-ounce ore running through it. Such ore as is in the way is taken out in drifting and stored in the Raymond ore bins. The tunnel will be continued until it reaches

an old prospect shaft which is on the ledge about 300 feet up the hill, at which point the ledge averages 40 ounces in silver. The extraction of ore will then properly begin and another feeder of the smelter turned loose.

Robinson District.

GOLD, White Pine *News*, Oct. 19: Since the last report published in the *News* of the Joanna bonanza, its fame has spread far and wide. For the information of all we can truthfully say that its merits have not been exaggerated. Mr. Watson is now quietly quarrying out the mountain-side and working it at the Ely mill, leaving the rich ore in the drifts to be disposed of hereafter, perhaps by a more saving process. A few days ago he scraped the plates at the mill and brought down-town and showed us a pan of amalgam weighing six pounds nine ounces. That there are many other mines in Robinson district equally as promising as the Joanna, all the indications of similar formations go to prove. The Joanna No. 2, which adjoins the Joanna on the west, and upon which the owners, Messrs. Watson, House, Larsen and Ostergard, have been doing prospecting work, bids fair to rival its sister to the east. They have run a drift north, out into the canyon, with good prospects. To tap this drift, they went out in the flat 100 feet and sunk a shaft. In doing so they found more or less gold in the gravel. At a depth of 30 feet the water came in on them so strong that they could not handle it and will have to wait till a pump is put in. They believe that when they reach bedrock they will find a rich deposit of gold there, and later cut down into the ledge, which they believe crosses the canyon.

Silver King District.

SUSPENDED. - White Pine *News*, Oct. 19: Work at Silver King district has been suspended for this season, and John S. Wheatley and family have gone to Pioche.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Oct. 16: West crosscut, 250-foot level, extended 13 feet; the face is in vein matter.

NAVAJO.—Men have been put in the old stopes, which look fair. About 40 tons of first-class ore have been hoisted and sent to the ore-house.

NORTH BELLE ISLE.—The shaft has been sunk and timbered 11 feet; total, below the 400-foot level, 159 feet. The rock continues very hard. The concentrator is running well and doing excellent work.

NORTH COMMONWEALTH.—During the week a carpenter-shop 16x30 feet has been erected. Joint crosscut, 225-foot level, extended 14 feet; the face is looking very well. South drift from the joint crosscut, 225-foot level, shows the ore much higher grade.

DEL MONTE.—Joint crosscut, 225-foot level, extended 14 feet; the face is looking very well. East crosscut No. 1 from north drift, same level, extended 10 feet; the face is looking favorable for ore. No. 2 east crosscut, 100-foot level, extended 12 feet; the face continues to intersect strata of high-grade ore.

GRAND PRIZE.—400-foot level: Winze in the east drift from the north crosscut has been sunk nine feet. Ore is improving in size as depth is attained. Concentrator is nearly completed, and will start up during the coming week.

COMMONWEALTH.—100-foot level: North drift has been advanced 17 feet; total distance from turntable, 206 feet; face of drift is in the vein. East crosscut from north drift extended 19 feet; continues to show good ore in face. 150-foot level: South drift from No. 1 east crosscut has been started and run 11 feet in low-grade ore, assaying $12 to $62 per ton. 300-foot level: North gangway has been advanced 17 feet; rock is breaking better. No work being done in any of the stopes.

Tybo District.

DIMICK.—White Pine *News*, Oct. 19: The Dimick mine, which is part of the estate of the late Eugene N. Robinson, is reported to be looking fine and yielding large quantities of ore of high grade.

Wild Rose District.

THE PARADISE VALLEY.—*Silver State*, Oct. 16: Nick Frayer, from Spring City, says the ore body in the Wild Goose is the largest ever found in the Paradise Valley Co.'s mines. It is fully 25 feet wide and averages $40 to the ton. There are thousands of tons of ore in sight.

ARIZONA.

TURKEY CREEK.—Prescott *Courier*, Oct. 16: Turkey Creek district maintains its old reputation for the richness of its ores. It was in this district that Morgan & Gavin found the Pine Spring chimney which yielded between $20,000 and $30,000 in less than a month from the time it was struck. This was in silver. The Old Bully Bueno furnished a great many tons of rich gold ore. The richest known ore now in the district is coming out of the Mulvenon & Roach mine, on the Goodwin lode. Two industrious miners, Messrs. Fitzgerald and O'Neill, are working it under lease from Mulvenon and Roach, and have a 12-inch stratum of ore that averages 800 ounces of silver to the ton. A piece of the ore contains silver of the value of 1000 ounces per ton. John Holmes continues to hoist very rich ore from his mine. The district is about 18 miles south of Prescott, is well timbered and watered, with a climate which for 9½ months of the year cannot be excelled for mildness and healthfulness. The gold ledge recently discovered in French Gulch by Messrs. Hagadorn and Dolph is attracting attention, on account of its size. Should it maintain size and richness, great things may be expected of it. The company that is operating in Big Bug district have several men engaged constructing houses for their men, and sheds over hoists, etc. The management was never excelled in Arizona. We still look to this company to erect and run such reduction works as are needed in several places in this county. It will encourage poor miners throughout this section to be told that not in 20 years have so many agents of capitalists been here looking for good properties. Their examinations will lead to a good many sales and more active working of mines.

COLORADO.

NOT A SUCCESS.—Elk Mountain *Pilot*, Oct. 17: The Augusta mine and concentrator have been shut down tight for the winter. The running of the mine seemed to depend on the success of the concentrator, and as that was not a success to start with, the entire work was shut off. In order to make the concentrator a success, new machinery will have to be put in at an outlay of several thousand dollars. Work has been stopped on the Excelsior mine in Poverty gulch for the winter, we suppose. As the developments on this mine were proving satisfactory, we supposed the work would be continued all winter. Old Poverty gulch will be about deserted again this winter as usual. The Sunset mine, situated up the Maroon gulch on the road between here and Aspen, has been sold to a company known as the Aspen United M. & M. Co., with George Lloyd as superintendent. An attempt will be made to list it on the Denver mining exchange. It is a galena ore, not running high in silver. The Jenny Lind mine is shipping a carload of ore this week. We believe this mine will shut down for the winter. It would be interesting for the owners as well as for the country if they could see their way clear to work a small force all winter. The Runnoe Bros. are working their mining property on Galena mountain. A report reaches us that good ore was struck last Saturday in the Excelsior mine, situated on Sheep mountain. It belongs to C. J. S. Hoover, and is being worked by Tom Boughton and Art Edgerton. It is very close to the Black Queen mine, which has recently jumped into prominence as a rich producer.

KITTY CLYDE.—Idaho Springs *News*, Oct. 19: The Kitty Clyde stamp-mill in Spring gulch is to be started up. The ore-bins are full of ore from the mine, which gives steady employment to a number of men.

THE PENNSYLVANIA M. CO., with L. Sternberger as manager, is doing some great work in the vicinity of York gulch and Fall river. The Jumbo mine near the head of York gulch is supplied with a good substantial ore-house, having a hoisting plant which renders excellent service, and other improvements. The shaft is now down 100 feet, and sinking on a vein of smelting ore, slightly scattered, is going on night and day. On Fall river, beyond the mouth of York gulch, work on the Pennsylvania crosscut tunnel is being pushed vigorously. It will be a great success. The outlook for this company is certainly bright and promising.

DAKOTA.

GALENA PYRITES.—Deadwood *Pioneer*, Oct. 16: It is anticipated that the Iron Hill smelter will be blown in again shortly. Preparations looking thereto, such as obtaining a quantity of pyrites, have been under way some time. Most of the pyrites used for the last run were taken from the Alexander and Emma mines, Galena, whence supply for the next run will also be furnished. Several shipments have been made during the week, the last lot, four wagon-loads, going to Carbonate on Friday.

NOT IDLE.—Though mining stocks have been dull for the past two months, and brokers have in consequence paid them considerably less attention than they have county and city securities, the mines have not been idle. Individual and corporation owners of good claims have been steadily developing their properties. This is true at Bald Mountain, Ruby Basin, Carbonate, Galena, Strawberry, Two Bit and other places contiguous to Deadwood. The result is that when activity again asserts itself and stocks boom once more, they will do so on a more substantial basis than formerly. Purchasers will realize when buying that they are getting an interest in a pretty good mine, or one that prospects well, and gives promise of becoming a large producer.

PREPARING FOR WORK.—Deadwood *Pioneer*, Oct. 16: Col. Carpenter, lessee of the Deadwood Reduction Works, yesterday visited the site of the old building for purpose of informing himself what material thereat may be used for the new structure. Roasters, engine and perhaps the boilers will come into play. Work will begin, under management of a competent superintendent, on Monday of next week.

GOLDEN REWARD.—The Golden Reward Co. has determined to hasten its shipments of ore to Omaha. All available transportation has been secured from the Northwestern, and what remains of the 3000 tons of ore at the reduction works site will be sent forward as quickly as possible. Returns have been received from the first six carloads shipped, and were entirely satisfactory to the company.

CHLORINATION WORKS.—The Harmony M. Co. continues operating Keith's Keystone Chlorination Works with satisfactory results. The percentage of loss is nominal, tailings of $40 ore not assaying to exceed $3 per ton.

IDAHO.

CUSTER.—Challis *Messenger*, Oct. 19: We arrived in Custer in the early evening and made two brief halts, one at the express office and the other at the postoffice, not long enough to learn anything; but we returned and have looked the town over, and Custer is beginning to move, is on the point of a boom that looks wedge-shaped and it is hard to tell at the present writing just how big the other end will be. The Dickens-Custer Co. complications have been settled, and the mill is dropping, as of yore and with old-time regularity, her 30 stamps upon the rich ores of the Lucky Boy mine. A new 20-stamp mill, as fine as modern ingenuity can construct, is being erected upon the Fourth of July mine, and the mines and prospects, old and new, adjacent to the camp, never showed such bodies of ore well defined at depth as they do at the present time. The old business houses are about all occupied again—their occupants doing a good business—and a number of new houses are being erected.

THE GOLD BELT.—Wood River *Times*, Oct. 16: The news from the Gold Belt is most encouraging. The Camas No. 2 people recently cut into an extensive body of rich ore on their lower level, and, the water supply being now ample, will start up their mill in a few days, and run it to its full capacity. The Huntington mill to be put in by the Tip top people will demonstrate that the ore will pay, even if, owing to its small capacity, it does not realize much profit for its owners. The improvement is very slow in coming; but it is evident that only a short time must now elapse ere the Gold Belt is taken hold of by parties who will have ample means to develop it.

ATLANTA.—Wood River *Times*, Oct. 16: G. A. Williams, who returned last Saturday from a visit to Atlanta, where he went to witness the practical working of the new riffled Frue vanning tables, says that they are an undoubted success and seem likely to bring out that long-neglected but exceedingly meritorious district. The vanner seems to be just what was needed to work the low-grade ores of the district—for Atlanta was exploited in just the same way that Wood River has been, to wit: The high-grade ore was extracted, while the low-grade rock was left in place; but as there are mountains of the latter, if a cheap process can be found the camp will prosper as it never has before, and give permanent employment to thousands of men. The concentrating test made at the Buffalo and Tehoma mills having demonstrated the excellence of the new vanner, the above companies have concluded to greatly increase the crushing capacity of their mills. The Buffalo Co.'s mill is of 10 stamps, but 15 additional stamps have been ordered; the Tehoma mill is also of 10 stamps, but 20 additional stamps have been ordered. These, together with a sufficient number of vanners to concentrate the pulp—one vanner putting through 8¼ tons per day—will be put in as soon as possible in the spring, and from that time thenceforth Atlanta will put on new life.

BLACKBURN DISTRICT.—Wood River *Times*, Oct. 16: James Cassady, a prospector who has lived in Blackburn district since 1881, reports the district very dull since the shutting down of the Viola Co.'s smelting works at Nicholia, as that was formerly the market for the claim-owners of the district, and they are now compelled to either haul their ore to Blackfoot and ship it on their own account, trusting to entire strangers and waiting a month or more for returns, or haul it to Hailey, which is 90 to 100 miles away. The ores of the district being generally of low grade, they cannot pay the heavy expense which this necessarily involves. This season the Bob Ingersoll was about the only claim that shipped in any quantity, the ore being of fair grade. The Hidden Treasure has also yielded small lots of shipping ore. On Badger creek, about 10 miles farther, there are large bodies of sand carbonates which are being developed. One of the groups there—the Triumph, owned by C. Bunting, Chas. Thum and others—is opening up very encouragingly. Six men are employed.

YREKA DISTRICT. — Wardner *News*, Oct. 19: The group of mines on Elk and Deer creeks, belonging to the Alma & Nellie Wood Co., have yielded rich returns, and at present are being worked to the entire satisfaction of the owners. The upper tunnel, or what is known as Tunnel No. 1, on the Nellie Wood, is in 825 feet; from there an upraise has been made containing man-way, ore chutes and waste chutes to a level 65 feet higher, which level has been extended 100 feet on the vein, showing an average width of 2½ feet of good milling ore. Above this level a large amount of stoping is in progress, yielding a supply of ore to keep 15 stamps running regularly. Tunnel No. 1, in its eastern course, gains a depth of 500 feet before reaching the in-line of the claim, consequently it has been found necessary to open levels, 70 feet apart, between this tunnel and the surface, in order to facilitate the development of the mine and to make the extraction of ore easy and convenient. Tunnel No. 2 has been extended 750 feet, and the vein stoped out up to Tunnel No. 1. This is the lowest working from the surface on the mines. On the west side of Elk creek, on the Alpharetta, Hawkeye and Alma claims, about 2000 feet of development work has been done, consisting of tunnels and upraises, from which large quantities of ore have been stoped and reduced in the mill. At present 30 men are employed, and work has progressed with regularity for the past seven months, under the superintendence of James Cronin. Thomas Sorden has charge of the mill.

MILO GULCH.—A carload of machinery arrived last week for the Bunker Hill & Sullivan mines. It consists of a complete hoisting plant. The hoist will be used for the connection between the Reed, or lowest tunnel, and the workings above. A large-sized blower, for supplying air in extending the Reed tunnel, and a Blake steam plunger-pump to handle the influx of water in some of the lower workings, were also received.

THE HUNTINGTON MILL.—The Huntington Centrifugal Roller Quartz-mill, which has been so successful in the treatment of ores in California, is attaining much popularity in the Territories. The plant in use at the Fay Templeton mine on Pony gulch is doing good service, and is working both economically and satisfactorily. A 20-ton mill, of the Huntington make, has been ordered to test the ores of the Tip-Top mine in the Wood river country.

LOWER CALIFORNIA.

ANOTHER BRICK OF GOLD.—San Diego *Sun*, Oct. 16: The steamer Dublan yesterday brought up L. B. Howard of the Occidental Mining Co., of Real del Castillo, who was making his regular visit to San Diego with the output of the mine and mill. The present brick is valued at $3000, and is the clean-up of a 15 days' run on 190 tons of ore from the mine. This makes $6000 which Mr. Howard has brought up in the last 18 days, and over $15,000 in the last three months. All of this is the output of the Occidental mine, owned by Messrs. Dare, Collins and Howard. At present the company are working about 40 men. Their shaft is down 200 feet from the top of the hill and in a large vein of good ore. It is Mr. Howard's intention to begin the construction of a 500-foot tunnel running into the side of the hill, which, it is supposed, will strike the ore vein about 300 feet below the bottom of the present shaft. This tunnel will largely decrease the cost of mining, as none of the ore will have to be lifted.

MONTANA.

AT CABLE.—Anaconda *Review*, Oct. 19: This prosperous camp is in a chronic state of push and progress. On every hand are indications of prosperity and enterprise. The Cable mill is running 30 stamps on first-class ore, and there is every indication that this run can be maintained. The Red Lion is running full capacity, and with the brightest of prospects. Salton Cameron's new mill is slowly assuming shape, and will of course add materially to the resources of the camp. As soon as completed the mill will be run on ore from the Southern Cross, which is showing up better and better as work advances. A large amount of ore is in sight, and the mill will be run to its fullest capacity. The Pyrenees mine has shut down, and will probably not resume operations till spring. The prospects of the camp are very bright, and the coming season bids fair to be a busy and successful one.

THE KEYSTONE.—A new mining company has been incorporated under the laws of Montana for operating in the Oro Fino district, one and one-half miles east of Champion. The company is named the Keystone Mining Co. The principal claim of the new company is the Washington mine, upon which development work is being done with favorable results. The vein is of silver ore in a granite formation, running from four ounces to 160. The vein is from four and one-half to five feet wide between well-defined granite walls. The company is now sinking a two-compartment shaft about 55 feet east of discovery, to top lead at 300 feet depth. The work is now down 65 feet. A fine hoist is in position for working to a depth of 350 feet. If when the main lead is tapped at 300 feet, the mine will justify, it is the intention of the management to erect a 40-stamp mill and push the work of development.

ANACONDA.—*Inter-Mountain*, Oct. 16: Some little difficulty is being experienced on the upper level of this mine for want of better ventilation. The heat is so intense that a miner is compelled to wear extra light clothes. The heat comes from the large number of timbers that are used to stay the ground. There is a larger body of ore on the 1000 than any level in the mine. The lead is between 15 and 16 posts wide, and yet no sign of either wall has appeared. Crosscutting and drifting are in progress, but as yet no stoping is or has been done on this level. All of the stations and some of the drifts are illuminated by electricity, it being much safer and giving a much better light under ground than the old style of numerous candles stuck around in many places, or of the coal-oil lamps hung in the center of the station. Work on the 300-foot level is confined to the first floor, and a raise is being put through to the 200 from this level. Much ore is yet to be taken out. The connection between this mine and the St. Lawrence has just been made on the 300 of the Anaconda with the 100 of the St. Lawrence. There are also connections between the two mines as follows: Four hundred with the 200 of the St. Lawrence, 500 with 300, 600 with that of the 400, 700 with the 500, 800 with the 600, and from thence down no connections are yet made, though drifts are being actively extended. Sinking continues in the St. Lawrence, and it is now down about to the 800. When the sinking has been completed to the 1000 of the St. Lawrence, connections will be made with all drifts of the Anaconda down to its depth. The St. Lawrence after reaching the 1000 will be 200 feet deeper than the Anaconda, there being that much of a difference on the surface.

NEW MEXICO.

THE MCGREGOR.—*Southwest Sentinel*, Oct. 18: John Spiller has commenced to operate the McGregor mine at Georgetown on the leasing system. Ten men are at work taking out ore, the higher grades of which will be shipped and the lower grades will not be worked until next spring, when the Mimbres company's mill will be started up.

KINGSTON.—Cor. Silver City *Enterprise*, Oct. 16: The Templar is now working on ore, with M. Lynch as foreman. It was reported worked out; one naturally suspects stock manipulation in a case of this kind. The Virginian, adjoining on the south, under lease to Judge Holt, is continually taking out ore, with a force of 15 to 20 men, and grows better and better; while the Keystone, next adjoining, has been taking out ore the past month. The celebrated Grey Eagle property is now advertised for sale under deed of trust. This, it is supposed, will finish the complications on the Grey Eagle, and that after the first of the year, ore will again be rattling down the rough south Percha road on its way to the smelters. Some leasers have been taking out ore for several months. On the north end of the belt, the Ingersoll, which has always produced ore, and is owned and controlled by Las Vegas parties, is advertised for lease and bond. This mine, like many others, needs capital. The Comstock leasers still go on taking out ore. M. G. Barton, the general manager, has gone East to look after several carloads of ore. The Lady Franklin just now is doing nothing but pumping the water out of the mine, except what the leasers are doing. Wages were reduced to $3 per day, by orders from London, and the men at work stopped. The leasers are taking out large amounts of ore, as usual. Buck & Daniels are still working successfully on their Iron King lease, and taking out ore. The Brush Heap group and Illinois are still the steady producers. The Iron Clad tunnel is in about 80 feet.

UTAH.

MINERAL IN UINTAH COUNTY.—Wasatch *Wave*, Oct. 16: Mr. S. B. Moore of Provo has recently returned from a prospecting trip into Uintah county. He went through Strawberry and over the spur of the Wasatch range which controls the connection with the Uintah range. He found a belt of iron, inexhaustible, carrying precious metals of gold and silver. This lies on the Uintah reservation, just over the belt of the Wasatch range. He has also discovered other claims on the reservation, and wants the Government to open this country, as he has found precious metals all the way through, but cannot develop them unless Congress will throw the land open to the public.

BINGHAM MINING NOTES.—Salt Lake *Advertiser*, Oct. 18: There is increased activity in Bingham camp this fall, and the outlook for an increased output from the rich mines there is assured. The lead mine is running night and day, and is worked to its fullest capacity. It sends out 55 tons of concentrates daily. The ore is brought from the Brooklyn and Lead mines, five and 6½ miles from the mill. This mill alone employs 15 men. The owners of the Brooklyn and Lead mines are expending a large sum in improving their tramway to the lead mill. The Lead mine is down about 900 feet, and the vein appears to be inexhaustible, while improved machinery is being put in the Brooklyn mine. The Highland is down 175 feet, and has a daily output of about 10 tons of steel galena, worth $20 to $25 per ton. This ore is raised by means of a windlass. The future output of this mine looks so encouraging that the company is thinking of putting in steam hoisting works. New pumps and other machinery are being put in the old Yosemite mine by the owners, Messrs. G. M. Scott, and Remmington, Johnson & Co. of Salt Lake City.

MECHANICAL PROGRESS.

An Important Contribution to Metallurgical Science.

At a late meeting of the British Association, Mr. Wm. Anderson, president of the mechanical section of the association, as reported by the English correspondent of the *American Manufacturer*, contributed a most suggestive and practical paper upon the molecular structure of matter in connection with engineering—which paper has attracted much interest among English metallurgists.

The Modern Engineer and His Materials.

The progress of engineering, Mr. Anderson very truly said, is rapidly coming to depend upon more exact methods of utilizing the properties of materials and upon a more thorough understanding of the laws by which those properties are defined. He does a service equally to engineers and to metallurgists who suggests some new means of meeting this growing requirement. His address was a remarkable demonstration of the truth that as science advances and discoveries multiply, the line between practice and theory, once so hard and fast, is rapidly melting away.

Molecular Action in Iron and Steel.

I will not follow Mr. Anderson through the brilliant periods in which he described the molecular constitution of matter and laid down the main laws of its action. He based his references of molecular action of iron and steel upon the hypotheses that molecular motion pervades matter in all its forms, and that the solid passes, often insensibly, into the fluid or even direct into the gaseous. It follows, almost of necessity, that there must be a borderland, the limits of which are determined by temperature and pressure, in which substances are constantly changing from one state to another. Mr. Anderson deals with metallurgical processes from the standpoint of one who sees in them the manifestations of this phase of molecular action.

The Hardening of Steel.

Thus, if steel be looked upon as a solution of carbon and iron, then the hardening of steel is explained by the theory that dissociation has taken place at the temperature at which it is suddenly cooled. That is, the sudden cooling fixes the molecular motion at such an amplitude or phase that it gives a characteristic structure, one of the properties of which is extreme hardness.

The Treatment of Alloys.

That steel, and probably other alloys, differ in the nature of their composition according to the way in which they are worked, both with respect to heat and mechanical pressure, has been abundantly proved. It would appear as a natural sequence that the properties of steel would be greatly affected by the manner in which its temperature was changed. Indeed, we find that steel is thus affected when these changes are produced by baths of melted metals, by oil, or by water at different temperatures. Practically metallurgists are applying these principles at random. The value of steel rests with the temperature at which it is suddenly cooled, yet no precise law has been discovered to apply to the process.

The Importance of Small Changes.

One thing Mr. Anderson insists on vigorously—the immense effects produced by what would be considered "little" changes. It is not so very long ago that any one would have been considered a dreamer for propounding a theory that the presence of the fraction of a per cent of carbon, phosphorus, or sulphur would totally alter the character of iron; that the addition of one or two thousandths part of aluminum to molten iron would make the pasty mass as fluid as water; that the presence of the smallest impurity in copper would have a disastrous effect upon the metal's powers of conducting electricity; and that the addition of one-thousandth part of antimony would convert the "best selected" copper into the worst conceivable.

A Valuable Metallurgical Deduction.

From the various instances of molecular action which have been collected one law has been deduced—the Periodic Law of Dr. Mendeleef. According to that law, the elements, arranged in the order of their atomic weights, exhibit an evident periodicity of properties; and, as Prof. Carnelly has observed, the properties of the compounds of the elements are a periodic function of the atomic weights of their constituent elements. Acting on these views, Prof. Roberts Austin has recently devoted much time and labor to testing their exactness with reference to the mechanical properties of metals. In view of the difficulty of obtaining other metals of sufficient purity, he selected gold as his base. In a communication to the Royal Society made last year he shows that the metals alloyed with gold which diminish its tenacity and extensibility have high atomic volumes, while those which increase those properties have either the same atomic volumes as gold or have lower ones.

A New Era in Metallurgy.

The inquiry has only just commenced, but it seems to Mr. Anderson to promise ultimate results which will prove as important to the engineer and as fruitful of progress as the great generalization of Mendeleef has already been to chemists. A law which cannot only indicate the existence of unknown elements, but which can also define their properties before they are discovered, if capable of application to metallurgy, must surely yield most valuable results. It will render the compounding of alloys a scientific process instead of the lawless and haphazard operation which it is now.

Effects of Mr. Anderson's Theories.

It will be seen that Mr. Anderson has most thoroughly practical ends in his view in his scientific investigations. His theory of molecular action explains, as the result of external stresses, many of the metallurgical eccentricities which are the abiding problems of engineers. The application of heat will cause a change of volume, and, at last, a change of condition; the application of external stresses, he tells us, will also produce a change of volume. The most tenacious metals have high melting points.

"The Fatigue of Substances."

This is the phrase in which is described the permanent changes of form produced by long-continued stresses or stresses frequently applied. Stretched beyond their elastic limits—which limits Mr. Anderson does not suppose to exist except when stresses are applied quickly—substances are permanently deformed. The same effects follow the long application of heat.

The Explanation of Mysterious Metal Failures.

The constant recurrence of stresses, even those within the elastic limit, causes changes in the arrangement of the particles of substances which slowly alter the properties of the latter, and in this way pieces of machinery, which theoretically are abundantly strong for the work they have to perform, fail after a more or less extended period of time. The effect is intensified if the stresses are applied suddenly, if they reach nearly to the elastic limit, and if they are imposed in two or more directions at once. In these cases the molecular disturbance becomes very intense, the internal equilibrium is upset, and a tendency to rupture follows.

A Whole Series of Such Cases.

Such cases occur in artillery, in armor plates, and in parts of machinery subject to impact. As might be expected, the destructive effects do not always appear at once, but often after long periods of time. When considerable masses of metal have to be manipulated by forging, or by pressure in a heated condition, the subsequent cooling of the mass imposes restrictions on the free movement of some, if not all, of the particles. Internal stresses are developed; they slowly assert themselves, and often cause unexpected failures. Considering the frequency of these accidents, it is satisfactory to know that not only Mr. Anderson, but Capt. Noble of the Elswick Works, and Lieut. Crozier of the United States Artillery are making such investigations into the subject of stresses in metals as will probably lead to much greater attention being paid in the future to the principles upon which the annealing and hardening of steel is carried on.

Another Singular Cause of Failure.

Mr. Anderson attributes a good deal of influence upon the quality of steel to the efflux of time. The highest qualities of tool steel are kept in stock for a considerable period. It seems certain that bayonets, swords and guns are liable to suffer in this way.

Wanted!—A Newton.

"I have now laid before you," said Mr. Anderson at the close of his address before the British Association, "the views respecting the constitution of matter which I think are gaining ground, which explain many phenomena with which we are familiar, and which will serve as guides in our treatment of metals, and especially of alloys. But I must admit that the subject is still by no means clear. A great deal more definition is wanted. We are still awaiting the advent of a man who shall do for molecular physics what Newton did for astronomy in explaining the structure of the universe." There are those who will see in the laborious investigation and clear-sighted intelligence of Mr. Anderson himself qualifications for even so high a destiny as this.

ENGRAVING BY ELECTRICITY.—The French Academy of Science has received communications on a process of engraving on glass and crystal by electricity. The plate to be engraved is covered with a concentrated solution of nitrate of potash and put in connection with one of the poles of the battery, and the design is traced out with a fine platinum point connected with the other pole. By this process it is claimed that marvelously delicate work can be done.

IMPORTANT EXPERIMENTS connected with the coal consumption of locomotive boilers are being conducted by Mr. D. Drummond, the engineer of the Caledonian Railway Company. For some time past he has had engines running between Carlisle and Aberdeen at high pressure, and careful data have been taken in order to ascertain the relative value of coal consumed in the same boilers working at different pressures.

DURABILITY OF STEEL RAILS.—A commission representing the various German railway companies has published a report detailing the results of observations made during six years on the durability of steel rails on German, Austrian, Hungarian, Dutch and Belgian lines. It appears that the duration of a steel rail may be reckoned on an average at 35 years.

SCIENTIFIC PROGRESS.

What Is Color?

A correspondent of the *Manufacturer and Builder* calls attention to the following facts which will be of interest to many who are just now asking themselves the question: "What is color?"

All visible matter acts on light in some manner, and all objects except black ones send off light of some hue, and all light produces sensation in the normal eye. The term "color" has been applied to the sensation and to the light by which the sensation is produced; but the word is used chiefly in describing a certain appearance of objects, and for this purpose black and white are as necessary, and hence as legitimate, as any other words.

But this communication is intended to deal only with the cause of the difference in appearance (color) of different objects. On what does their color (in daylight) depend? Is it on the kind of matter of which they are composed, or on some condition of such matter? It may depend partly on kind, yet the instances in which color changes with change in condition are so numerous that they suggest the idea that every kind of matter may possibly assume more than one hue.

Beginning with simple, or elementary, matter, we find that carbon, in the form of the diamond, is transparent, is a grayish-white as diamond-dust, but black in the form of coal or lamp-black. Phosphorus is yellow or brown, according to its condition; and sulphur is light yellow, dark yellow, orange or brown. Mercury, in the form in which it is usually seen, is light-colored and brilliant, but is a dingy blue when finely divided. Gold, in its native state, is yellow, but on precipitation becomes brown. When used in gilding it sometimes assumes a reddish tint; and Smee says that he has seen this metal of every color. Copper and titanium are usually red, and most metals are light-colored; yet all of them are invariably black when rapidly separated from weak solutions by means of a comparatively strong electric current. Silver electrically deposited on a cast of mother-of-pearl has the same colors as the pearl itself, and evidently because the silver has the same shape of surface, or topography, so to speak. Right here it may be remarked that the different colors of the pearl are not owing to different kinds of matter in different parts of the shell, because any given spot will show different colors when viewed at various angles.

Compound substances afford many examples of change in color merely by change in condition. Transparent and "colorless" substances, in general, like glass, quartz, ice, etc., become white when pulverized; and highly-colored crystals, like copper sulphate and potassium bichromate, are much lighter in color when reduced to powder. Indeed, the latter changes from red to orange. A more striking change may be noted in chloride of cobalt. This compound, in crystals, is a garnet-red, but it assumes a decided blue when a thinly-spread of weak solution is dried. In one condition sulphide of mercury is black; in another it is a brilliant red. Iodide of mercury, at the instant of formation, is a light yellow; but it rapidly changes to a brilliant scarlet. The action of iodine on silver is most interesting. If a small piece of solid iodine be held about a sixteenth of an inch above a piece of clean silver in a still atmosphere, the silver directly under the iodine will soon become violet, then it will slowly show all the colors of the spectrum in concentric circles, the colors spreading outward like waves made by a stone dropped into still water. If the iodine be kept steadily in position, the colors will be repeated—that is, the color which first appears under the iodine will reappear.

All are well aware of the fact that a half-blown soap-bubble is "colorless," and that it shows the prismatic colors when much thinner. These colors are also exhibited by corroded glass, and by some specimens of coal, and by oil spread thinly on the surface of water.

If color depended on kind of matter—that is, if each element had its own hue, and only one, it would seem that all compounds of any given elements ought to be similar in color. They are, however, often quite unlike. Thus, one compound of chromium and oxygen is a decided green, while another is beautiful red. One oxide of copper is red, another is black. Oxygen forms with lead compounds that are respectively yellow, brown and red. Solid black carbon, and solid opaque, yellow sulphur, when combined, form a colorless, limpid liquid.

If it be true that blind persons can distinguish color by the sense of touch, the fact very strongly supports the view that the color of opaque objects depends on the mechanical condition of surface. They feel minute *shape*, and not *light*, because no light proceeds from the spot touched while the finger is against it.

Many more examples might be given, but the foregoing are enough to furnish food for much reflection by those who may think that color is a fixed property of matter.

THE SCIENCE OF TRANSPORTING PETROLEUM. We read that at a late meeting of the Mechanical Section of the British Association, there was a most animated discussion about new types of petroleum ships—an important industry having arisen of late years in the construction of vessels specially adapted to the trade. Electric lighting, the position of the machinery, the arrangement of tanks, and the distribution of cargo in reference to the stability of the vessel, were exhaustively discussed, and "it was incidentally stated that as the oil gives off a most inflammable vapor, safety-lamps have to be used on board ship." This is incidental, of course, as it only relates to the chances the ship and living creatures on board have of being blown to atoms by an explosion.

BRICKS OF MESOPOTAMIA.—Unburned bricks, says the *Brickmaker*, were never regarded by the inhabitants of Mesopotamia as a safe building material, and experience demonstrated the necessity of supplementing with huge buttresses the buildings in which the material was employed, and it is probable, from the evidence of those who have explored these ruins, that the supplemental supports were more thoroughly and carefully constructed than the buildings the walls of which they were intended to sustain. The crude brick walls of Chaldean buildings were perforated with numerous ventilating tunnels, through which the warm air could penetrate, and thus dissipate any moisture that might be contained in the bricks. Perforations of this kind have been discovered in the ruins of Babylon and also in other Chaldean cities; but in Assyria no such openings of the kind which we have described, for the admission of air, have been found. It is the almost unanimous opinion of explorers that sun-dried bricks were never left unprotected in Mesopotamia, the material being commonly protected by a thin coat of stucco. It is stated by M. Place that at Nineveh this stucco was formed by a mixture of burned chalk and plaster, the compound producing a sort of white gum which adhered intimately to the clay wall. It is probable that many buildings had no outward ornament beyond that imparted by the brilliant whiteness of this stucco, the effect of which is still to be seen, even at the present time, in the whitewashed houses of the East.

PHOTOGRAPHING THE STARS.—The New York *Star* furnishes the following description of the manner in which this interesting operation is accomplished: The method of photographing stars is interesting. When the photographer places in the focus of the telescope a highly sensitive photographic plate, the vibrations of the rays of light throw themselves assiduously on the plate and steadily apply to the task of shaking asunder the molecules of silver salts in the gelatine film. Just as the waves of ocean by incessantly beating against a shore will gradually wear away the mightiest cliffs of the toughest rock, so the innumerable millions of waves of light persistently impinging upon a single point of the plate will at length effect the necessary recomposition and so engrave the image of the star. It will be obvious that this process will be the more complete the longer the exposure is permitted, and thus we see one of the reasons why photography forms such an admirable method of depicting the stars. We can give exposures of many minutes or of one, two, three or four hours, and all the time the effect is being gradually accumulated. Hence it is that a star which is altogether too feeble to produce an impression by a telescope of the utmost power may yet be competent, when a sufficient exposure has been allowed, to leave its record on the plate. Thus it is that photographs of the heavens disclose to us the existence of stars which could never have been detected except for this cumulative method of observation that photography is competent to give. No telescope is required, as the photographic apparatus takes the exact impression.

PHOTOGRAPHING SPEECH.—*Popular Science News* says: It is stated that M. Leon Esquine, a Mexican, has perfected a marvelous invention in electricity and photography. By speaking in a photophone transmitter, which consists of a highly polished diaphragm reflecting a ray of light, this ray of light is set into vibrations, and a photograph is made of it on a traveling band of sensitized paper. Now comes the wonderful part. If the image of this photographic tracing is projected by means of an electric arc or oxyhydrogen light upon a selenium receiver, the original speech is then heard. It is evident that there is no limit to the development of this peculiar combination of methods. This is very important, if true.

HIGHT OF GREAT WAVES.—Carefully repeated experiments made by an English navigator at Santander, on the north coast of Spain, showed the crest of the sea waves in a prolonged and heavy gale of wind to be 42 feet high; and allowing the same for the depth between the waves, would make the hight 84 feet from crest to base. The length from crest to crest was found to be 389 feet. Other estimates of the waves in the South Atlantic during great storms give a hight of 50 feet for the crests and 400 feet for length. In the North sea the hight of crest seldom exceeds 10 feet and the length 150 feet.

CHANGE IN EGGS.—It is a common fact that eggs, though so well inclosed, begin to decrease in specific gravity, as well as freshness, as soon as they meet the air. This is shown by the popular test of age in lye or brine. A fresh-laid egg will descend to the bottom of a solution that will float it higher every day thereafter, until it will soon appear above the surface. A coating impervious to the air prevents these changes.

USEFUL INFORMATION.

THE RUBBER USED FOR HORSESHOES is of a peculiar character. It is quite a new material, and one of great durability and lightness, which the ingenuity and fertility of resource has produced and adapted to horseshoes. These shoes may be described as frictional elastic shoes, providing a horse with a covering of the foot closely resembling the natural hoof. Owing to its semi-elastic and peculiar properties, it can be cut and pared to fit the hoof, and nailed on in the ordinary way. These shoes give a firm foothold on all sorts of pavements, even if covered with ice or snow. It is stated, after a series of trials in London streets, that the new shoe will last as long as an iron shoe, but the cost appears to be 40 per cent greater. It is probable, however, that this apparent loss would be a decided gain in saving of wear and tear of horseflesh, while it would certainly preserve the high-stepping action so much admired in park hacks. Animals with tender feet and legs gain confidence and strength when shod with "whaleite." A boot for horses is also made of the material, which is being used for boot soles. A company under an influential directorate is being formed to work the invention.—*Ex.*

PRESERVING FRUIT IN SAND.—It is said that the Italians have a method of preserving citrus fruits in sand. An excavation of from four to seven feet is made, and a board floor put in it. Upon this floor about three inches of clear dry sand is placed. The fruit (orange or lemon) is carefully cut from the tree and wrapped in tissue-paper. The fruit is then laid upon the sand in such a manner that the wraps do not touch each other. Three inches more of the sand is then spread on the oranges, and another layer then put down in the same manner as the first, and so on until there are three tiers of either. If more than three tiers are laid down, the underneath oranges are crushed. Sand to the depth of seven or eight inches is then spread over the whole. Oranges are frequently kept for months by this process and kindred methods. All authorities are agreed that oranges and lemons, which are intended to be preserved, should be cut, not torn, from the tree. A similar method has been adopted by a grower of oranges in South Africa, and the fruit comes out of the "silo," as he calls it, in famous condition, at a time when oranges are scarce and yield good prices. Sweet potatoes may be preserved in the same manner.

FIRING FOR STEAM BOILERS.—Manufacturing neighborhoods, and especially large cities, would be saved the annoyance of a vast amount of sooty carbon if firemen were property taught how to feed the furnaces. It is the practice of perhaps nine in every ten firemen to throw a large amount of coal into the furnace at one firing, thus making fire so deep that it cuts off air supply that should come through grates, and in consequence the coal on top is rapidly coked by heat underneath, and gas and smoke (the very cream of the coal) escape unconsumed. An equal amount of coal placed in the furnace in three or four firings, instead of one, would in many instances evaporate much more water and almost entirely avoid the emission of heavy masses of black smoke from the stack. In their efforts to abate this smoke nuisance, from which the people of this city suffer manifold discomforts, the authorities should receive every encouragement from manufacturers. Hasten the day when the smoke nuisance shall be done away with, and the atmosphere of our large cities on any day of the week shall be as translucent as it is on Sunday.

PECULIARITIES OF MOTHS.—More than 150 years ago Reaumur, observing that clothing moths never attacked the wool and hair on living animals, inferred that the natural odor of the wool, or of the oily matter in it, was distasteful to them. Consequently he rubbed various garments with the wool of fresh pelts, and also wet other garments with the water in which wool had been washed, and found that they were never attacked by moths. Experiments with tobacco smoke and the odors of spirits of turpentine showed that both were equally destructive, but it was necessary to close the room very tightly and keep the fumes very dense in them for 24 hours to obtain satisfactory results. Chests of cedar or sprigs of this tree are so disagreeable to them that they will not deposit their eggs where this odor is at all strong, but should the eggs be laid before the garments are placed away, the odor will not prevent the hatching nor the destructive work of the larvæ afterward.

A PROCESS OF LETTERING BONE OR IVORY by sinking the letters into the material in a permanent fashion has recently been introduced. These ivory plates are taking the place of engraved metal plates for signs, checks, badges, and so on. Electrical engineers have also adopted the new plates, which can likewise be applied to organs and pianofortes.

TRAVELING BY RAIL is said to be much safer than by coach or horseback, and probably it is much safer than any other method of getting over the earth's surface that man has yet contrived, unless it be by ocean steamer. There is some show of reason, says an exchange, that traveling by rail is safer even than walking. The figures show that the passenger may travel continuously day and night at the rate of 30 miles per hour for 36 years before being either killed or injured. While the calculation of chances of receiving injuries while walking is pure guesswork, it may be claimed that the average proportion of minor injuries resulting from sprains, bumps, bruises and falls would be greater than one in 36 years of continuous pedestrianizing. The statement that railway traveling is safer than walking is not quite so wild as it appears.

A NEW ARTIFICIAL LEATHER.—Several different preparations have been devised as a substitute for leather, but nothing as yet seems to be a success in that direction. The latest device is one invented by Dr. George Thenius of Vienna, who makes what he calls an artificial leather from red beechwood. The best wood for the purpose is taken from 58 to 60 years old trees, cut in the spring, which must be worked up immediately, bark peeled off, steamed, treated with chemicals in a kettle under pressure, and exposed to several more operations which the inventor does not mention, as he wants to have them patented. From the prepared wood strong and thin pieces are made by means of heavy pressure. The inventor states that a solid sole leather can be obtained, which he claims is superior to the animal leather in firmness and durability, can be worked up in the same way as animal leather, nailed and sewed.

THE LATEST TRUST.—The New York *Journal of Commerce* says that a meeting of the heavy carpet manufacturers of New York, New England and Philadelphia was held recently at the Fifth Avenue hotel. Although the meeting was held behind closed doors, enough is known to warrant the statement that initial steps were taken looking toward the formation of a carpet trust which will control upward of 75 per cent of the entire carpet production of the country. Outside manufacturers whose interests would be in a measure jeopardized by such an organization are skeptical as to the success of the movement, as, they say, the industry is too complex to be consolidated under one general management. But it is stated that a carpet trust is one of the near probabilities, and that German and other capitalists are prepared to put in $25,000,000.

JAPAN is rapidly growing in civilization, and we should not be greatly surprised if it turns into a republic some day in the not very distant future. Among other encouraging things, we learn that the Imperial University at Tokio has now no less than 138 instructors and 788 students. That would be a very respectable college in any country. "New buildings for technical education and a new chemical laboratory has been erected at a cost of nearly $300,000, and more money is promised by the Government for further extensions." The Mikado's palace is lighted by electricity, the dynamos for which are run by a Sweet straight-line engine.

GOOD HEALTH.

Health of the State.

Dangers to be Avoided.

The monthly bulletin of the State Board of Health for September, 1889, contains reports from 106 localities throughout the State, with an estimated population of 799,000, in which the deaths reported are 876, an annual mortality of only 13.08, which, while a very low percentage, is still much higher than the record for August. The reports of many of the local health officers throughout the State express much surprise at the immunity from sickness which prevails in their various localities at this season of the year. This immunity is considered largely due to the increased diligence which has lately been manifested in the cleanliness of towns by which breeding-places for disease are kept in subjection.

Typhoid Fever, and How to Avoid It.

It is noticed by the monthly reports that typhoid fever is increasing in the State. This may be expected at the present time from the extensive lowness of the water in our rivers and small streams. In regard to this the report before us throws out the following very timely suggestions: "This increasing prevalence of typhoid fever should put us upon our guard relative to the water we drink, and especially to the sources from which it is derived, as it is acknowledged by all those physicians who have carefully investigated the sources from which the disease is communicated, that in 90 cases out of 100 the chief distributor of the infection is water. It can, however, be communicated by air, the clothing of the sick, and by the hands of the attendants, if precautions are not taken to observe the utmost cleanliness. The possibility of infection by drinking-water should render it the care of a paternal government to supply the people with a pure water free from pollution of any kind. At present an attempt is being made to turn the sewage of some large towns into one of the chief rivers of the State. If this is permitted, the result cannot be otherwise than an increase of sickness wherever this river-water is used for domestic purposes.

"The excreta of *one* typhoid-fever patient poisoned the whole water-supply of a town in Pennsylvania, caused the sickness of over 1100 persons and the death of 414. If the diffusion of the excreta of one person carried into river-water used for domestic consumption was followed by such dire consequences and fatal results, what may we expect when the sewage of many towns is conveyed into our rivers to pollute their waters and poison the consumers? That the purity of our drinking-water has a marked influence in lessening the prevalence of typhoid fever may be instanced by the City of Vienna. In 1854 to 1874 that city was supplied by well-water, and water pumped from the River Danube. The deaths annually from typhoid fever in these years averaged 340 in each 100,000 people. In 1874 a supply of spring-water was introduced, and the deaths immediately fell to 50 in 100,000. As the well and river water continued to be abandoned and the supply of water entirely obtained from the springs, the deaths from typhoid fever have fallen to 11 in each 100,000. Can we ask anything more convincing than these statistics to impress us with the necessity that exists of preserving the purity of our water supplies, and keeping them free from sewage contamination? The question of how we are to dispose of our sewage is one that must engage the attention of our legislators before very long. Self-preservation will compel attention to it, as daily our soil is becoming more and more saturated with excremental matters, and it is only a question of a very short time when the ground air will be charged with virulent poisons, and the ground water surcharged with living messengers of death, so that we will be forced into the preservation of our water-supplies from contamination if we desire to preserve our health and our lives."

Consumption in California.

The report gives the following timely suggestions in regard to the prevalence of consumption in this State: "We have noticed with some apprehension the frequency with which consumption is mentioned in our reports, which might convey an erroneous impression that the disease was increasing in the State among the rising generation. That this, in a limited sense, is true, cannot be denied, but is capable of satisfactory explanation when we take into consideration the fact that for some time past California has been extensively advertised in the Northern and Eastern States as the sanitarium of the world; its luscious fruits and semi-tropical verdure have been exhibited, and its 'glorious climate' so dilated upon that a perfect exodus of diseased humanity has been precipitated upon us. Thus we find sufferers from tuberculosis in all its stages lounging in our hotel corridors, crowding our health resorts, filling our churches and assemblies, and scattering the seeds of death with every mouthful of saliva they expectorate so promiscuously wherever they are gathered together. To this influx of immigrants with diseased lungs may we attribute the apparent increase of consumption in this State. The expositions upon our 'glorious climate' throughout the East have sent us an undesirable element in the population of any country. There is no longer any doubt of the contagiousness of consumption, or of the fallacy that cure resides in climate. The climate of many parts of California will, no doubt, prolong the life of many consumptives, and, perhaps, arrest the disease in a few, but until we can afford to build sanitariums for the isolation of this class of patients, or erect hotels, and devise pleasure resorts for their exclusive use, our State is better off without these immigrants. They disseminate a disease which practically might be unknown under proper sanitary laws, increase our mortality returns, and lessen that high standard of health to which the State is capable of attaining, from its unsurpassed climate, its geological formation, and its possibilities of presenting a temperature suitable to the climatic wants of any constitution which the system may demand for the better preservation of its perfect health."

CONVULSIONS IN CHILDREN.—When a child has a convulsion, or what is commonly called "a fit," attention should be given to the urinary secretion at once. If there is suppression of urine, the child should be put into a warm bath and made to sweat as speedily as possible. In many cases in which children die from a succession of convulsions, the real cause of death is suppression of urine (a fact which is probably not so generally known as it should be), so that the child really dies of poisoning through the retention of the urinary secretion. When a child is subject to attacks of this character, care should be taken to dress it warmly in flannels, so as to keep up a degree of perspiration most of the time, and hot baths should be administered frequently.

HEALTHFULNESS OF FLOWERS AND PERFUMES. It is now established that flowers and the perfumes distilled from them have a salutary influence on the constitution and constitute a therapeutic agency of high value. Residence in a perfumed atmosphere forms a protection from pulmonary affections and arrests phthisis. In the town of La Grasse, France, where the making of perfumes is largely carried on, phthisis is unknown, owing to the odorous vapors from the numerous distilleries.

THE world's medical periodicals number about 266, of which no less than 174 are published in the United States.

LEECHES are more used than they were ten years ago, a barber says.

ELECTRICITY.

Triumphs of Electricity.

The report comes from France that the entire process of tanning hides of all kinds is being revolutionized by electricity. By the present process the conversion of hides into leather requires from 6 to 12 months' time. Much experience is required to conduct the operations properly. With the greatest care and the best facilities, many of the hides are imperfectly tanned. A large plant is required when several thousand hides are to be converted into leather in the course of a year. Large capital is also needed, as the raw material purchased cannot be put into a form that can be sold for a long time. It costs less to fit up a tannery than it does a cotton factory, but the products of the latter can be sold at the end of each day's operation. By the electrical process the light hides, like those of the sheep and goat, are tanned in 24 hours. Calfskins are converted into leather in three days and ox hides in less than a week. It is claimed that the operation of tanning is perfectly performed, while the cost is reduced one-half. Only one-fifth as many men are required to tan a given number of hides. A tannery that employs the electrical process may be a very small affair and still do a great amount of work. But little capital is required to operate it, as the hides bought one week can be sold the next. The process described in the French papers is a very simple one. The prepared hides are placed in large cylinders which revolve upon horizontal axes. A decoction of tannin is placed in the cylinders with the hides and a current of electricity is kept passing through it. Aluminum is being separated from the oxide by means of an electrical current. The oxide is dissolved by some metallic flouride and the pure metal is deposited in a fused form. The substance employed as a solvent can be used for an indefinite time, as none of it is wasted or decomposed by the electrical action. Another use for electricity has been found in a device for holding dishes on a table set in the dining-room on an ocean steamer. It consists of a small piece of iron sunk into the bottom of each dish, which touches a wire rendered magnetic by means of a current.—*Chicago Herald.*

THE FUTURE OF CITY TRANSPORTATION.—The future possibilities of electricity, as applied to locomotive purposes, makes one fairly dazed with the impossibility of grasping the subject. Much has been said and written in regard to the application of electric-power to street railways for the transportation of passengers, and this especial branch of electric-power has already developed into a great industry, the size of which is appreciated by few. The application of electric-power to the transportation of merchandise in our great cities is yet a *terra incognita*, though its possibilities are even greater than the street-railway service. An electric street car can, under skillful management, be operated cheaper than one drawn by horses. It requires three times the power to propel a vehicle over a stone pavement that it does on a rail or iron roadways. Horses cannot draw heavy loads on iron roadways because of the difficulty of obtaining a sure footing. On an iron roadway an electric locomotive can draw a load for less money than horses could draw the same load on the best stone pavement. The expenditure for cartage in the City of New York each year reaches the enormous sum of $100,000,000. At some future day, not far distant, we hope, when the public are sufficiently aroused to the importance of this question, a certain width of our great thoroughfares all over the city will be given up to an iron roadway, on which self-propelled electric vans may noiselessly carry on the great traffic which now offends our ears, wears out horse-flesh, and has been but little improved up to the present time since the days of the Cæsars. In fact, we aver that with our boasted improvements of the nineteenth century, it requires more expenditure of horse-power to draw a ton of merchandise a mile in the streets of New York than it did in Rome in the early days of the Empire. —*Electrical Review.*

THE IMMENSE ELECTRIC PLANT that is now being erected at London on the Thames river will consist of at least six buildings. The engine recently put in is of 5000 horse power and runs one dynamo capable of generating electricity for over 40,000 lights. The driving-wheel to this dynamo is over six feet in diameter. There are very few arc lights in London, as the majority of business men look with disfavor upon running any extra risk of fire.

LIGHTNING has been known to strike overhead electric-light wires and discharge itself through the dynamo to earth, to the imminent danger of the machine.

A BIG $200,000 central electric-power station is among the probabilities in Cleveland, Ohio, where the progress of electric roads has been markedly rapid.

IN AN ELECTRIC ROAD the power the engine develops is directly in proportion to the work being done, whether one or a dozen cars are in the circuit.

THE San Jose electric railroad is to be operated by an overhead system, the underground plan having proved a failure.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Clayton Duplex Air Compressors, 317. Sprague Automatic Constant Speed Electric Motor; Electric Dynamo for Long Distance Transmission of Power; Parts of Electric Motor, 319. Bedded Ore Deposits of Ouray County, Colorado, 325.

EDITORIALS.—The Clayton Air Compressor, 317. Passing Events; Mexican Lead Ores; The Eclipse Expedition; Land Grants and Minerals; Railroads and Ores, 324. Bedded Ore Deposits; Chrome, 326.

MISCELLANEOUS.—Mercurial Minerals and Their Associates, 318. Electrical Apparatus in Africa; Con. California and Virginia; Offer Rejected; Copper, 319.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 320-1.

MECHANICAL PROGRESS.—An Important Contribution to Metallurgical Science; Engraving by Electricity; Durability of Steel Rails, 322.

SCIENTIFIC PROGRESS.—What is Color; Bricks of Mesopotamia; Photographing the Stars; Photographing Speech; Hight of Great Waves, 322.

USEFUL INFORMATION.—Preserving Fruit in Sand; Firing for Steam Boilers; Peculiarities of Moths; A New Artificial Leather; The Latest Trust, 323.

GOOD HEALTH.—Health of the State; Convulsions in Children; Healthfulness of Flowers and Perfumes, 323.

ELECTRICITY.—Triumphs of Electricity; The Future of City Transportation, 323.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 330.

Passing Events.

The decision of the Treasury Department with regard to free lead ores from Mexico and Canada will be a great disappointment to the lead miners of the Pacific Coast, for it legalizes a continuance of a practice which has wrought great injury to the lead-mining interests of the United States.

The reduction of freight rates on ore will doubtless bring renewed prosperity to the famous old camps of Eureka, Nevada. It will admit of the miners of that district shipping lower grades of ore to other centers, so that local "smelting trusts" cannot longer control the product of the region adjacent to Eureka.

The early but heavy rains which have prevailed all over the coast for some days have brought a very desirable water supply which will start up many mills and mines. In many places stamps have been hung up for lack of water for a month or two, the suppiy having been short this summer. There will now be an abundance to fill all the ditches and streams.

The coinage of silver dollars is to be resumed at the Mint in this city. It is the opinion that henceforth the San Francisco and Carson Mints will be allowed to coin a part of the $2,000,000 which are turned out every month. Silver bullion to the amount of $200,000 has been shipped here from Omaha. Last year less than $300,000 in silver, all told, was coined at the Mint in this city.

ARIZONA MINERALS.—The Governor of Arizona says the mineral products of 1888 are given as follows: Copper, 31,797,000 pounds; gold, $850,000; silver, $560,000. With better railroad facilities the Governor thinks the mineral output would be greatly increased.

ST. LOUIS AND NEW YORK CAPITALISTS are putting $2,000,000 into a 100,000-acre grant in Mexico, where is located the Vegonia vein and a number of undeveloped ledges.

Mexican Lead Ores.

The decision of the Treasury Department with relation to Mexican silver-lead ores, just given out, will be a great disappointment to the mining community; though the great smelting companies now reaping a profit from the ruling will rejoice. Miners do not believe that the decision is legal, but it will be impossible to change it until Congress again meets. Whether, even then, the smelting companies cannot put off legislation still further, is a question. Some sections of the country, where there are great smelting plants, prefer to see the present system continued, though the miners who have lead ores to sell which are produced in this country are the sufferers.

Secretary Windom, in his decision, sustains the present classification that admits argentiferous lead ores imported from Mexico free of duty. The Secretary, in his letter promulgating the decision, after reciting the uniform decisions and practice of the Department with respect to the classification of these ores since 1880, says: "The dutiable or non-dutiable character of these ores was a subject of investigation by the Judiciary Committee of the Senate, who reported, on the 5th of July, 1888, in effect, that ores of the character mentioned, namely, ores containing more lead in weight than either gold or silver, but more gold or silver than lead in value, are not, in the opinion of the committee, subject to duty under the existing law. If the question presented were a new one, and had not been a subject of administrative construction, fortified by the opinion of the Judiciary Committee of the Senate, I would feel at liberty to give greater consideration to the weighty arguments which have been adduced, tending to establish the dutiable character of all ores of this description containing lead in appreciable or considerable quantity, more so if it had been satisfactorily demonstrated that these ores are not known, nor entitled to be known, commercially, as ores of silver."

He assumes that the rulings and practice in vogue were known to Congress when it passed the Tariff Act of 1883, and that the Department is without authority to change the congressional definition of ores, on the faith of which large business interests have been established. These large "business interests" are the smelting plants which are making more money out of these Mexican ores, produced by peon labor, than they could out of ores produced in the United States. The Secretary says: "That Congress did not intend to impose a duty upon lead which might be found in different ores, but only upon such ores as were then recognized under decisions of the Department as lead ores, is gathered from other parts of the Tariff Act, for in paragraph 186 'copper' is made dutiable whenever found in ore, and in paragraph 191 'nickel' is also made dutiable whenever found in ore or in other crude forms. In those cases it is clearly metal contained in ore which is made subject to duty, and had the same form of expression been used in reference to lead, that metal would have been dutiable at the rate prescribed whenever found in ore. According to well-settled rules of statutory construction, this difference in form of expression must be deemed to indicate different legislative intent and to limit the authority of the Department to impose a duty in such cases to the ore itself under existing rules of classification. I consider, therefore, that the present classification has attained the force of congressional enactment, and that change, if desired, must be sought in congressional intervention."

The smelting and reducing corporations on the frontier will continue to reap large profits, while the lead miners of the whole country will suffer. Canadian ores can come into Oregon, Idaho and Montana under this same ruling. Lead ore pays duty; silver ore does not. Under Secretary Windom's ruling large quantities of lead ore come in duty free under the bald pretense of being silver ore. It is understood that Judge Bachelder, the Assistant Secretary of the Treasury, gave this whole subject a careful examination, and came to the conclusion that the foreign ores should pay duty before being admitted into the United States, but an order from the President delayed the decision. The matter became one of international importance, and it has been finally decided in favor of the Mexican ore men and American smelting companies.

The Eclipse Expedition.

On the 16th inst. the U. S. steamship Pensacola, with 375 officers and men and 40 scientists, left New York for the west coast of Africa, where the total solar eclipse of December 22d will be observed. The expedition is well equipped with the most improved instruments, some of which are new inventions. Prof. Todd of Amherst College is the head of the astronomical party. Mr. J. E. Jens, our correspondent at New York, was among those who went down to see the party off. He writes us that Prof. E. J. Loomis of the Smithsonian Institute goes along to study African plants and birds. Prof. C. A. Orr, anthropologist of Clark University, will upon reaching the coast of Africa leave the expedition, and accompanied by five black and five white men, all fully armed, strike out for the interior, visiting many of the native tribes, whose manner of living he will closely observe, photographing and measuring them, noting their habits and studying all the characteristics peculiar to each tribe. H. Chatelain accompanies the expedition to talk Portuguese to the African settlers. Prof. Bigelow will help Prof. Todd manage the observations, as will also S. H. Jacoby, who represents Columbia College, and H. S. Davis of Princeton College. Harvey Brown of the National Museum, at Washington, goes as naturalist. The Pensacola is in command of Capt. A. B. Yates. All hands will eat their Christmas dinner in St. Paul de Loanda, Africa, and will return about next May, when we may learn something new in regard to solar heat and the whole solar system. H. Carbut of Philadelphia has gone to photograph the eclipse as well as all other interesting objects on the journey.

Owing to the public spirit of Mr. C. F. Crocker, the Lick Observatory of this State is enabled to send a party also to observe this clipse, that gentleman having undertaken to defray the expenses from his private purse. The Lick Observatory has sent two experts—Burnham and Schaeberle—to Cayenne. One of their duties will be to verify an important observation made at the eclipse in January last. On this occasion a remarkable extension of the outer corona was noticed and appears on a number of the negatives taken with the large instruments. Professor Holden considers it very desirable to secure photographs of the regions still further remote from the moon's limb. Some observers, who contend for a connection between the solar corona and the zodiacal light, hold that the direction of the principal streamers in eclipses occurring in December and January exactly bears out their view, and they look to the coming event for final confirmation.

Messrs. Burnham and Schaeberle will do the chief work at Cayenne. They will have at their disposal a six-inch Dallmeyer photographic lens from the Washington Observatory and a six-inch portrait lens which did good service at the California eclipse in January in the hands of Mr. Ireland. Mr. Burnham will also have a six-inch Clark telescope stopped down to three inches.

The objects of the expedition are threefold. First, to obtain negatives of the inner corona, showing all the detail possible from the limb outward; secondly, to secure photographs of the extension of the outer corona; thirdly, to secure photographs with a small camera immediately after the third contact, on standardized plates, for use in measurements of the brightness of the sky. Mr. Burnham will remain in Cayenne for some time after the eclipse to take advantage of the opportunity for stellar observation in the southern heavens.

YUKON MINERS.—Forty-six miners came down this week on the steamer St. Paul from the Yukon river, Alaska, and very few had realized from the placers more than enough to pay their passage home. There is said to be no danger of starvation among the miners wintering on the river, as one of the Alaska Commercial Co.'s supply steamers has gone up to within 200 miles of the miners' camps.

THE British ship Earl of Granville has cleared at Port Townsend for Shanghai with 982,000 feet of lumber. In the hold were four sticks of fir 24x24 inches square and 110 feet long.

THE Thomson-Houston electric railway system has been adopted by the San Jose and Santa Clara Street R. R. Co.

Land Grants and Minerals.

As before noted in the PRESS, the Montana mining public is exercised over the probable issuance of patents to the Northern Pacific railroad on lands well known to be mineral in character. In fact, in Oro Fino district, in one section claimed by the railroad company, is the Champion mine, which alone is valued at over a million dollars. If the patents are issued, the mines will belong to the railroad company. The Board of Trade of Butte, M. T., has sent to the Secretary of the Interior the following telegram:

In behalf of the miners and people of Montana, we earnestly request and urge that any order for the issuance of patents to the Northern Pacific Railroad Company for lands in Montana, be delayed until a full and proper presentation of the facts as to the mineral character of a large portion of them can be made. Millions are at stake, and our people are threatened with irreparable injury which will bring ruin to thousands. Vigorous measures are being taken to present the facts to your Department.

A delegation of mining men from the Oro Fino mining district sent a similar telegram. Last year the miners of Montana held what is called a mineral-land convention at Helena and presented the facts in this case to the Department in categoric form. The papers have been pigeon-holed at Washington, and lost through the change of administration. S. M. Stockslager, ex-Commissioner of the General Land Office, says a recent decision of like nature by the Department in favor of the Central Pacific railway would probably act as a precedent in the Northern Pacific case, and the patents be issued, notwithstanding the protests.

Railroads and Ore.

The first thing a mining camp wants is mines; then it wants capital to develop them; then comes the need of smelting works or mills, and then a railroad, and after that cheaper rates of transportation. It seems that all of these things are necessary, though it might be supposed that when the smelter or mill period arrived, the people could get along very well without the iron tracks. It appears to have been generally the case, however, that unless there were means of transportation for low-grade ores to other reduction centers, the local works have made such charges as to get about all the profit there was from most of the mines and claims.

Eureka, Nevada, has been in this fix for some time. The smelting companies have made such a scale of charges, and the nearest railroad such a rate of transportation, that the camp has been far from prosperous. Quite recently, however, as noted in the PRESS, the rates of transportation on ore to other smelting centers have been materially reduced, which will bring about a lively competition on low-grade materials. Unless the smelters are reasonable, all the ore will be shipped elsewhere.

All this is good for the miners. Many of them can now work claims which were practically valueless under former conditions. There will be more men at work, more money in circulation, and a more prosperous community. A recent sale of the Diamond and Antelope mines in the district will still further better matters. The developments in these mines by the new owner will renew life in the district and bring back numbers of men who have left for other camps.

MORE LOWER CALIFORNIA PLACERS.—The discovery of rich placers is reported at San Pedro Martier, Lower California. They are northeast of Vallecios valley about 55 miles, and the water is said to be good and plentiful. Several hundred prospectors have already gone to the placers, and the Mexican customs officers have increased their force, expecting a rush. Miners are said to come into Alamo from the new fields to trade nuggets for provisions and then hurry back. A Mexican has brought in one nugget worth $60. A dispatch states that freighters from San Diego and Ensenada are refusing freight and taking passengers only. This will cause doubtless another Lower California "excitement," if the reports are only half truth. Nothing is known of the extent of the new fields. Judging from the character of the country, the diggings are probably "dry."

THE Copper Queen mine at Tombstone, Arizona, has paid $70,000 in dividends this year.

Bedded Ore Deposits.

The ore deposits of all that portion of the San Juan country within the borders of Ouray county, Colorado, are either in the tertiary eruptives or confined to a relatively narrow zone in the sedimentary beds just beneath them. The ore deposits in the igneous formation would be classed as fissure veins. In addition to these, however, there is that form of fissure locally called "chimney." In the sedimentary formation the ore deposits are either fissures, usually along fault-planes, or intercalated beds between limestone, which forms the footwall, and a quartzite or shale that forms the hanging-wall.

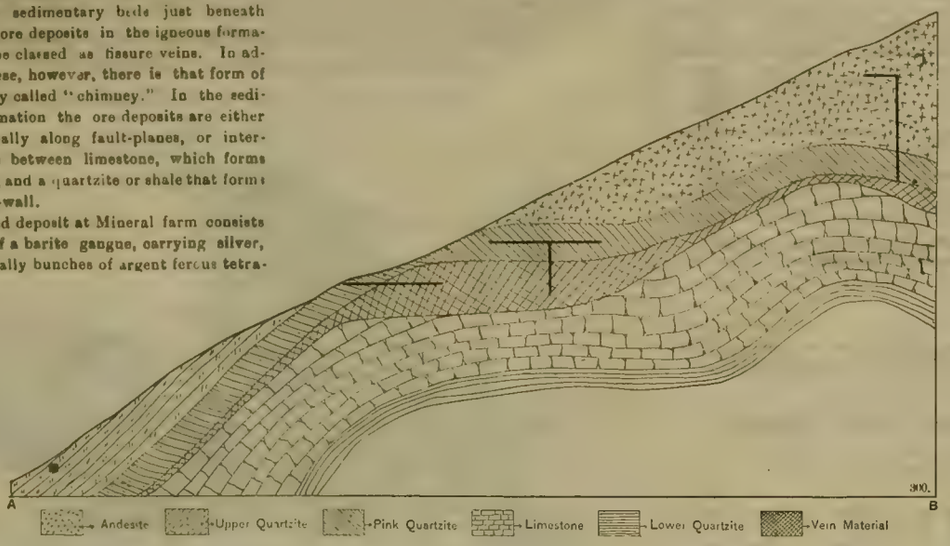
The bedded deposit at Mineral farm consists essentially of a barite gangue, carrying silver, and occasionally bunches of argent ferous tetrahedrite. The Red mountain bedded deposit is on the west slope of Mt. Abram, near its base. Mr. G. E. Kedzie of Ouray, Colorado, read a paper on this subject before the American Institute of Mining Engineers from which we make the following extracts with engravings.

"In descending series from the park level, the first formation encountered in passing up-hill is a white and compact vitreous quartzite in beds from one to three feet thick. The 'pink quartzite' is a light-red argillaceous quartzite in thin beds, about 35 feet thick. The top of this bed is a fine-grained conglomerate, consisting of worn fragments of white quartz with a red argillaceous ground mass. The line of the bed which forms the hanging-wall of the ore deposit is finer grained and lighter colored.

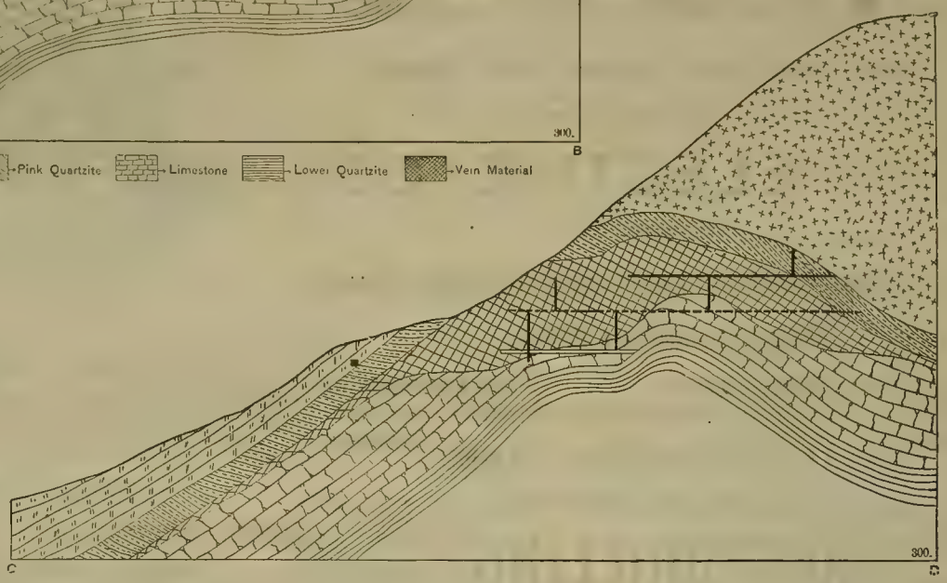
"The crystalline limestone is white and massive-bedded, having a mean thickness of about 35 feet. This limestone forms the footwall of the ore deposits, which are mainly located on the upper portions of the bed, at or near its contact with the overlying pink quartzite.

"The lower quartzite is light-gray and foliated, and from one to two inches thick.

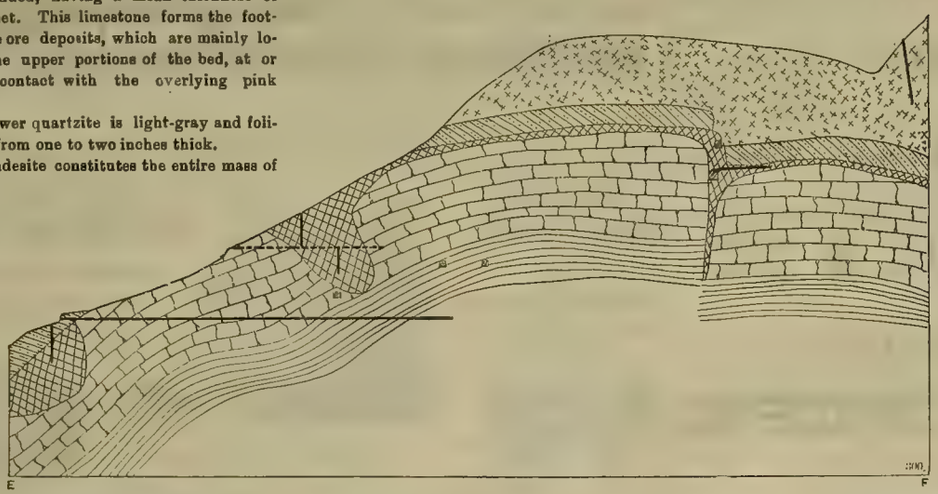
"The andesite constitutes the entire mass of the rugged mountains in the vicinity, and is nearly 3000 feet thick on either side of the valley. Microscopically, it consists of a light-gray or pink ground mass, with an abundance of white crystals of an altered feldspar together with few grayish-green crystals, either of hornblende or angite."



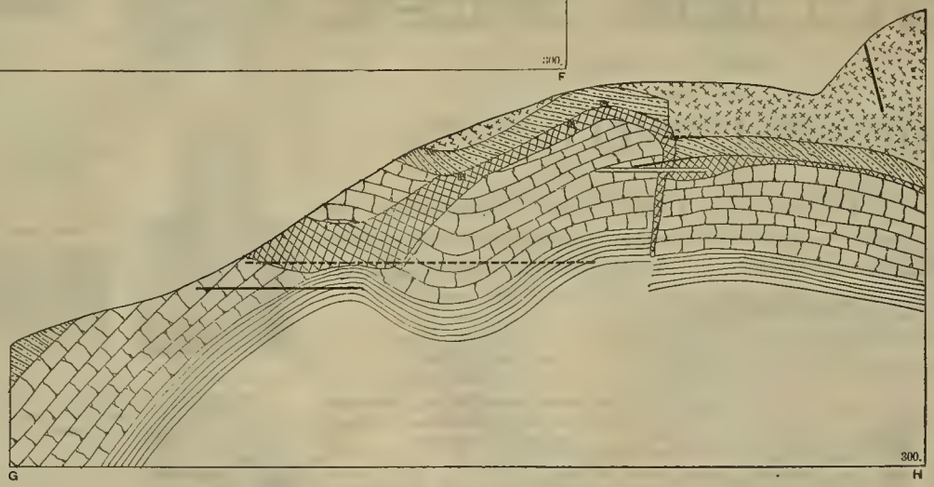
There are several vertical ore bodies, partaking of the nature of fissure veins, the principal one being the Mono. The ore body is from one to two feet wide, and is a continuous body of pyrite and chalco-pyrite. In general this ore is not very rich in silver.



A vertical vein of barren quartz, with a few disseminated crystals of pyrite, is found just east of the Brooklyn workings. The walls of the vein, where is the igneous formation, are strongly kaolinized and heavily impregnated with pyrite.



Lastly, at the Comstock workings, in the upper quartzite, there is a one-foot vertical ore body, the ore of which consists principally of galena, with some chalco-pyrite and blende, which, with large quartz crystals, forms a lining to a closely connected series of vugs.



The ore body of the greatest commercial value occurs on the crystalline limestone, at its contact with the overlying pink quartzite. The minimum thickness of the vein material is three feet, but it extends downward into the limestone for a very variable distance, being nearly 100 feet thick at the Saratoga workings, while in the Brooklyn workings the vein material reaches nearly to the base of the limestone. The greatest longitudinal extent of these bodies of vein material is in a direction parallel with the strike of the inclosing rocks.

The rich ore bodies in the vein material are very irregular, and the line of demarcation between rich ore and low-grade vein material is exceedingly indefinite. There is, however, an apparent tendency of the richer argentiferous iron ore to assume a horizontal position, while the light-colored kaolin bands with which the lead values are associated assume positions nearer vertical along the original fracture planes of the limestone. The pyrite and the great mass of vein material is of low-grade in silver, containing from a mere trace to 20 ounces per ton. The assorted ores, which are shipped to smelters in ten-ton lots, vary from 50 to 80 ounces of silver per ton, with an occasional shipment giving much higher returns. All of the ores vary from one to three-tenths of an ounce of gold per ton.

BEDDED ORE DEPOSITS OF OURAY COUNTY, COLORADO.

Chrome.

Although California is one of the few places in the United States where chrome is found, the mining of that substance has not been profitable of late. The freight expenses have eaten up most of the profit. The chrome men want a higher duty put on the imported article, and say that if this were done many mines now unworked would pay. The most extensive deposits in California are in Placer, Alameda and San Luis Obispo counties. The deposits are irregular, however, the substance not being found in regular ledges anywhere. There are deposits in other counties than those mentioned and some of them are being opened.

Quite recently work has been commenced on a chrome mine 25 miles west of Red Bluff, Tehama county. The ore will be hauled to Red Bluff, shipped by rail to this city, then by sailing vessels to New York, and from there by rail to the Philadelphia Chrome Works. This mine can turn out about 15 tons a day now, with a dozen miners at work, but they expect to employ 50 men shortly. A good road is being built to the mine.

ALASKAN COAST.—The Government Coast Survey steamer Carlisle P. Patterson returned the past week from a five-months' cruise off the coast of Alaska. The engineers and officers of the Patterson have been engaged chiefly during their trip in making soundings along the coast south of Juneau and around Admiralty island, a large island east of Sitka.

California Fruit Farms.

$1.00 A WEEK INVESTED IN A CALIFORNIA FRUIT FARM

Will make you a pleasant home and be a safeguard against poverty. Think carefully about this proposition. Thousands of men and women spend their money as they go along and have nothing to show for it.

We have taken one of the finest tracts of land in the famous Fruit Belt of California, viz: the Sacramento Valley, and are selling it in subdivisions of **5 acres each at $75 for each 5-acre tract, payable $1.00 per week, no interest or taxes until you have paid in full.**

You can pay more if you wish at the same rates and terms. Title U. S. Patent; land everything that it is represented to be, good fruit, farming and vine land.

Apply immediately for maps and information. Or if you wish, send your first payment, viz: $1.00 for each 5 acres required, and we will return you your contract, maps, etc.

Such an offer has never been given before and never will be again. Apply immediately, as this advertisement will only appear twice in this paper. "A word to the wise is sufficient."

Smelter For Sale or Exchange.

One 50-ton. wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING OCT. 15, 1889.

413,125.—FRUIT-DRIER—J. H. Bard, Oakland, Ogn.

412,645.—SIDE-HILL PLOW—J. D. Burkhart, Dayton, W. T.

413,040.—FENDER GUARD FOR CARS—R. M. Edwards, S. F.

413,044.—CAR COUPLING—F. S. Fox, S. F.

412,741.—ORE SEPARATOR—J. B. Freeman, Los Angeles, Cal.

412,742.—ROAD-SCRAPER—Geo. Fry, Phœnix, A. T.

413,149.—HEADER AND THRASHER—Geo. W. Haines, Stockton, Cal.

412,757.—FASTENING FOUNDATIONS TO PILES, ETC.—R. Hunt, S. F.

412,923.—NECKTIE FRAME—Jos. Kaiser, S. F.

412,926.—CONE CENTER FOR LATHES—John Knight, S. F.

413,071.—DEVICE FOR SECURING THE COVERS OF BEDS—Rosa H. Lowe, Sumner, W. T.

412,965.—SEWER-FLUSHING TANK—E. B. Mastick, Alameda, Cal.

413,062.—PENHOLDER SOCKET—M. L. Rodrigue, S. F.

412,983.—WEED-CUTTER—E. Schmidt, Marysville, Cal.

412,699.—OBSTETRICAL APPLIANCE—J. P. Turney, Arlington, Ogn.

413,120.—CABLE RAILWAY CROSSING SIGNAL—G. H. Wright, S. F.

The following brief list by telegraph, for Oct. 22d, will appear more complete on receipt of mail advices:

California Elliott H. Woolsey, Oakland, speculum attachment; George Mullins, Los Angeles, mixture for refining copper and its alloys; Thomas F. Haggerty, San Francisco, concrete pavement; Reuben W. Hunt, San Francisco, roller bearing; Wallace H. Holland, Pasadena, holder for sashes or blinds; Leslie A. Gregg, assignor of half to Plank, San Jose, orchard cultivator; Charles O. Farcott, assignor of two-thirds to N. W. Spaulding and C. Goodall, San Francisco, automatic recording compass; Frank F. Eggers, San Francisco, for manufacturing battery zincs; Charles W. Bassett, Alameda, buckle; Henry Anderson, San Francisco, sewer.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable prices, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DISTILLING APPARATUS.—Pedro Napoles of Napa, California. No. 412,407. Dated Oct. 8, 1889. This apparatus is mounted compactly upon a wheeled truck, whereby it may be transported readily. It consists essentially of a series of boilers operating in pairs, each pair independent of the other, whereby when one is being cleaned out, the other may be in use, thereby rendering the operation a continuous one; a steam boiler, a rectifier and condenser, pipes connecting the steam boiler with the boilers of the series, and controlling-cocks, whereby the steam may be directed into any or all of the boilers of the series, pipes connecting the boilers with the rectifier and condenser, and cocks controlling said pipes whereby the vapor may be directed from any or all of the boilers into the rectifier or into the condenser, and a pipe connecting the rectifier with the condenser.

ELECTRIC-IGNITING DEVICE FOR LAMPS.—Manuel Carranza of Guatemala, Central America, and Jose M. Tinoco of San Francisco, California. No. 412,464. Dated Oct. 8, 1889. This invention consists of a swinging frame adapted to be moved forward and backward to close and open an electric circuit, said frame having a spiral platinum wire in said circuit whereby it is heated to incandescence, and when brought into contact with the top of the wick lights the wick. In addition to these points are other mechanical constructions adapted to render the device simple and effective.

ADJUSTABLE CONE-CENTER FOR LATHES.—John Knight, S. F. No. 412,926. Dated Oct. 15, 1889. The main features of this improved cone-center are its peculiarly adjustable jaws. The object is to adapt the cone-center to pieces of work which have an open center or hole and which have to be trued from the outside irrespective of the inside. When a piece of work is put in the lathe which requires to be turned true from the outside without respect to the inside or center hole or cavity which it may have, then the jaws are properly set out independently of each other, to fit and bind upon the open center or hole of the piece of work and hold it so that its outside can be turned true.

AUTOMATIC SEWER-FLUSHING TANK.—Edwin B. Mastick, Alameda. No. 412,965. Dated Oct. 15, 1889. This invention relates to a device for automatically flushing sewers where it is necessary to have a periodical and intermittent discharge. The main portion of the body of the tank is rectangular, with the bottom horizontal; but from the point where it is pivoted, and about which the movement is made, the bottom slopes or inclines upwardly, gradually decreasing in depth, the two sides and the tank being continued out. By reason of this construction, the tank may be nearly filled with water and still maintain its normal position; but as the water rises and the weight is transferred more and more to the outer or wedge-shaped end, it will be finally overbalanced so that this shallow-pointed end will be tilted downward and the contents discharged. The tank again tilts back on being relieved of its load, ready to be again filled. This provides an automatic self-discharging tank which will continue to operate as long as the supply of water or other liquid flows into it, and it needs no attention, having no joints, hinges or other parts to get out of order.

HEADER AND THRASHER.—Geo. W. Haines, Stockton, assignor to the Stockton Combined Harvester and Agricultural Works. No. 413,139. Dated Oct. 15, 1889. This invention relates to certain improvements in that class of apparatus employed to cut, thrash and clean grain while the apparatus is traveling about the field, being propelled by steam, horse or other power. The patent covers certain details in the construction of the header portion of the apparatus, and its attachment to the thrashing mechanism.

NECKTIE FRAME.—Joseph Kaiser, S. F. No. 412,923. Dated Oct. 15, 1889. This invention consists of a skeleton frame, over which a necktie may be formed into a bow-knot, and the whole readily attached to the collar-button. The object is to provide a simple and effective device for enabling any one to form a necktie into a bow-knot and attach it in place, and also providing for the ready removal of the tie from its frame and the substitution of another tie.

Old Mining Districts.

There are numbers of mining districts on this coast which have been practically abandoned for years because the mines would not pay under the system in vogue when the camp had its boom, and many of them lie idle today because there was once a boom and no money was made. However, the time will come when most of those districts will again become the scenes of busy labor. Improved processes, less extravagant habits, better means of transportation, more knowledge, and better system should in a great many cases repopulate these camps and make them profitable. Mismanagement and the attractions of more prosperous regions had their influences in wrecking those districts, but the claims still remain and many pay under improved conditions.

The Placer *Herald* in speaking of the Ophir district gives some of the reasons why this and other quartz regions did not pay. It says:

The mines are just as rich to-day as ever, but the metal must be sought in lower levels than formerly in the mines that have been opened. Unfortunately for the reputation of the district, the miners that used to operate did not work systematically and in accordance with the laws that govern other industries. They were too impatient of delay, too anxious to strike a rich pocket to make the necessary preparation for the practical working of the mines. Though they might be poor in purse, they had no ideas of economy, and threw away the chance of making their fortunes through their carelessness of expenditure and their misdirected labors. In their haste to strike payrock they often found themselves unable when it was struck, to work it at a profit because they had neglected to do the preliminary work so necessary to the successful development of a mine. Although a fortune lay within reach, they could not handle it because their machinery was not sufficiently strong, or their pumps could not raise the water; or perhaps their funds through their extravagance failed just at the point when success was in sight. Sometimes when the pay chute was worked out they concluded it was no use to prosecute the work any further, as the lead had petered, and they abandoned the mine. Still with all their mismanagement and ignorance of the proper mode of mining, a vast amount of gold was taken out, and what is better, when the future of the district is considered, a large knowledge of the nature of gold-bearing veins was acquired by their misguided attempts to find out the mysterious hiding-places of the precious metal. This experience has taught miners that nature has not stored all the gold in the upper layers of the ledge. It has taught them that as they descend, successive deposits will be found, and that practically the possibility of exhausting the supply is limited only by man's power of descending into the earth. The greater number of the mines have only been prospected and only imperfectly at that. The shafts are mere pinholes and the cuts mere scratches. They tell nothing in many cases of what is below. The formation, the kind of rock in the hanging and foot walls, indicate that the mines are valuable and that they will well repay the labor of opening them. There is every indication that they are deep mines, and that years will be required to exhaust their treasures. There is no question of their richness and permanency, and all that is needed to make Ophir one of the great mining centers of the coast is capital and confidence.

THE Vallejo *Times* says: It is stated that the suit of George Schild vs. the United States, on account of infringement of patent in building the gates of the caisson, has been settled, Schild receiving $30,000.

The Clayton Air-Compressor.

(Continued from page 317.)

which is patented, and covers what is claimed to be the only practical and efficient method of circulating water around an air cylinder, for cooling the air.

The patent combined speed and pressure governor, for controlling both the air pressure and the speed of the compressor, operates by cutting off the steam when the desired pressure of air is attained and turning it on again when the pressure becomes reduced; in addition to this, the speed governor regulates the speed of the compressor. This governor is guaranteed to control both the speed of the compressor and the pressure of air without any attention from the engineer. Besides the foregoing, there are other features of excellence embraced in these air-compressors which add to the superiority of their general design.

In addition to their use in sinking caissons, working pneumatic riveters, furnishing air to divers in submarine operations, working rock-drills, coal-cutters and underground hoisting and pumping machinery and charging automatic sprinklers, they are largely used in the aerated system of burning crude petroleum for fuel purposes, and have been very successful in the transmission of natural gas. Four of a large size are being used for this purpose at Rixford, Pa., forcing the gas a distance of 13 miles, for heating and lighting the city of Bradford. They are also in use for a like purpose at Wellsville, N. Y.

Two duplex gas compressors have just been constructed for compressing 2,000,000 cubic feet of gas each, per day, to a pressure of 200 pounds per square inch, for the Kentucky Rock Gas Co. in supplying the City of Louisville, Ky. Natural-gas companies, civil and mining engineers, contractors, bridge-builders and others interested in compressed air, will do well to send for their complete Catalogue No. 6, to the Clayton Air Compressor Works, No. 43 Day street, New York.

Mining Personals.

Ralph Lowe of the New Almaden mines is in town from San Jose.

Archie Borland, the mine operator, has returned to Oakland from New Mexico.

Maurice Clark is superintendent of the Red Rover mine and mill, Actos, Los Angeles Co.

Superintendent A. C. Hamilton of the Chollar, Potosi, and other middle mines arrived in this city last week.

A. S. Bates, superintendent of the Adelaide copper mine, Nevada, has been informed of the death of his father, which occurred in New York, and he and Mrs. Bates have gone to that city.

W. E. Sharon, superintendent of several of the Gold Hill mines, Virginia City, arrived here on Oct. 18th, to attend a meeting of the managers of those mines to determine upon future work.

J. Everett Bird is superintendent of the Good Hope mine at Perris, Pinacate district, San Diego county. He has commenced a new $6000 residence. The shaft water will be used for irrigating, and handsome grounds will be laid out surrounding the house. Some 20 acres will be devoted to oranges and deciduous fruits. This is a good way to combine mining and fruit-raising, but there are not many sections of country outside of California where this can be done.

Luther Wagoner, mining engineer of this city, is at present engaged for the U. S. Geological Survey examining the reservoir sites to be formed in the higher Sierras of Tuolumne, Calaveras and Mariposa counties. Mr. Wagoner's party traveled by pack-trains and could only visit those sections where provisions and forage could be obtained. The party located about 50 sites suitable for small reservoirs, and also located and surveyed eight sites on which reservoirs of immense size and capacity could be constructed. These larger sites were surveyed in ten-foot counter-lines, but the actual capacity of each has not yet been calculated. Mr. Wagoner's party has located sites on which reservoirs could be constructed capable of furnishing the greater part of the San Joaquin valley with an unfailing supply of water. Many more suitable places for dams are known to exist in the counties visited.

Business-Like and With Dispatch.

AUBURN, PLACER CO., CAL., Oct. 20, 1889.

Dewey & Co.—DEAR SIRS: I received the patent for improvement in tool handle through your office all correct; also a copy of the PRESS with published notice of the same, for which accept thanks.

I can cheerfully say that everything in connection with the patent has been done in a business-like manner and with dispatch. Yours truly,

J. S. JAQUITH.

Assessment Notices.

Lapanta Consolidated Mining Company.

Location of principal place of business, San Francisco, California. Location of Works, Hawthorne Mg. Dist., Esmeralda Co., Nevada.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 2d day of October, 1889, an Assessment, No. 2, of Two Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, Room 56, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of November, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21 day of December, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room 56, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Gray Eagle Mining Company, Location

and principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 16th day of October, 1889, an Assessment, No. 15, of Six (6) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, Room 11, No. 303 California St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of November, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 10th day of December, 1889, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.

J. M. BUFFINGTON, Secretary.

Office, Room 11, No. 303 California St., San Francisco, California.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

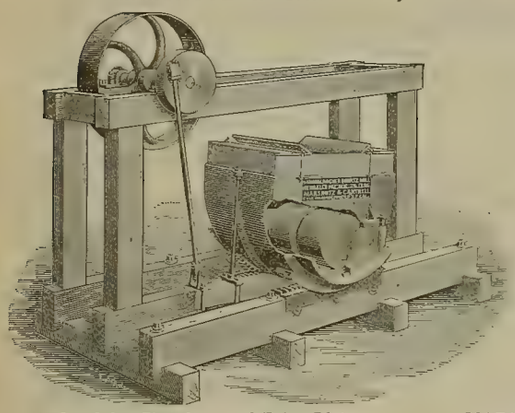
ALL WORK TESTED AND GUARANTEED.



IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

FREEMAN'S

Dry Process

GOLD SEPARATOR.

They are good machines. If the gold is in the dirt they will save it. They will save finer gold than water will.

T. J. SCOTT,
Osceola, Nevada.

Smith & Drew took out Tuesday, in their dry wash diggings, in addition to 5 ozs. of fine gold, a nugget weighing 22 ozs. The machine used was Freeman's Dry Process Separator.—*Utah Daily Union, May 10, 1889.*

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 24, 1889.

The local money market is reported easy, although at the close there is a stronger market for sterling and New York exchange. The demand for crop purposes is about satisfied and in consequence remittances from the interior are increasing. The rains in the valleys and foothills with large deposits of snow on the mountain ranges have given ample water supply to start up many quartz-mills and hydraulic claims. Iron-workers report the receipts of fair orders for work, with the outlook of the most flattering character for next year's business. This opinion is grounded on a more liberal supply of water for mining purposes than has been had for several years, and also every probability of an easy money market in 1890.

MEXICAN DOLLARS—The market has held strong throughout the week at 76¾ to 76½ cts, By steamer leaving for China on Oct. 17th there went forward $142,079 shipped by Chinamen to Hongkong.

SILVER—The steamer that left on Oct. 17th for China took out the following shipments of bullion: To Shanghai, $73,000; Hiogo, $47,000; Japan, $234,000. Total, $354,000. Immediately following the sailing of the steamer, the London and New York market shaded off, causing buyers in our market to bid lower, but with holders indifferent sellers. With an advance in the English and Eastern markets this market appreciated in sympathy under fair buying orders and a scarcity of bullion. As there is an ample supply of water in Carson river, the mills on that stream, it is claimed, will soon start up on ore from some of the Comstock mines, but with the Carson and San Francisco mints coining standard dollars the supply of silver bullion available for export will not be materially increased. The Government bought silver at Omaha for coinage here. The price paid is private, but reported at 94 1-10 cts at Omaha, which makes it a fraction over 95 cts here. Our market closes strong to-day with 95 cts bid.

QUICKSILVER—Receipts the past week aggregate 374 flasks. The market is reported unchanged, but mine-owners anticipate a better home demand from now on, owing to a large supply of water for the mines. The shipments by overland railway in last month aggregate 101,900 pounds.

BORAX—Shipments the past month overland aggregate 805,370 pounds. The market continues strong, with a good Eastern demand ruling.

ANTIMONY—The market continues to rule strong at 20 cents. The East reports a continued scarcity, a good demand and a strong market.

LIME—Receipts the past week aggregate 3987 barrels. The home demand continues to fall off.

TIN—European mail advices report a very strong market at an advance for plate, but no essential change for pig. With us the market is quoted higher for prompt shipment and firmer, with no business for spot.

COPPER—In another department of this week's paper there appears a review of the situation abroad. Later mail advices report a strong market and a fairly active demand.

LEAD—The market is essentially unchanged. The general tone at the East is reported to be steadying, although the demand is, as yet, restricted to near-by wants.

IRON—The market is reported strong for both spot and to load. As far as we can learn, iron-workers generally, while not distressed for supplies, are willing to take any desirable parcels offering at concessions. Both the English and European markets are quoted active at higher prices.

The following are the latest comparative quotations f. o. b. at Glasgow:

" Glengarnock	65s 0d	67s 6d
" Dalmellington	57s 6d	58s

COAL—Imports the past week aggregate as follows: From Nanaimo, 714 tons; Coos Bay, 1250; overland, 80; Departure Bay, 2320; total, 4364 tons. Imports the past week were exceptionally light, but the heavy arrivals of coal-laden vessels in the forepart of this month gave us liberal supplies. While the local demand is not so pronounced, yet it is fairly active, with consumers purchasing ahead. The southern ports have been in the market for coal, owing to the light coal tonnage on the way to those ports. The last week several vessels were taken to load with coast coal for San Diego. High outward freights still rule in Australia, which are against any low prices for Australian coal.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Oct. 24, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42⅞	93½	$10 75	$3 90	$20 90
Friday	42⅞	93½	10 75	3 90	20 90
Saturday	42⅞	93½	10 75	3 90	20 90
Monday	43	93⅝	10 70	3 80	20 90
Tuesday	43¼	93⅝	10 75	3 80	20 75
Wednesday	43⅜	93⅝	10 85	3 80	20 90

NEW YORK, Oct. 23.—Borax supply is light and old rates firm. Quicksilver is easier in tone, 68@69c. No quotable change in copper. Pig lead is weak under the announcement that there is no variation in the tariff. Spot, $3.80@3.85; for October, November and December, $3.75@3.80.

THE *Kern County Californian* says: The railroad company is laying steel rails over the Tehachipi mountains that weigh 70 pounds to the yard. These are the heaviest ever used in the West, and are American steel, made at Scranton, Penn,

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

CALIFORNIA CONTRACTING CO., Oct. 19. Object, to conduct a general building business of houses, bridges, canals, etc. Capital stock, $100,000. Directors—A. J. Hughes, Rhodes Borden, I. L. Borden, J. A. Fairchild and W. E. Brown.

SAN FRANCISCO STREET-INDICATOR CO., Oct. 19. Object, to utilize an invention of H. G. Krasky. Capital stock, $250,000. Directors—Henry G. Krasky, Frank van Deventer, James H. Anderson, G. F. Ochs and E. P. Farnsworth.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Eureka Cons., Oct. 22, $24,000; Mt. Diablo, 22, $6438; Cons. California and Virginia, 19, $60,349; Butte and Boston, 17, $25,344; Hanauer, 19, $2775; Lexington, 19, $27,848.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

EUREKA CONSOLIDATED. — At the annual meeting of the Eureka Con. mining company the following officers were elected to serve during the ensuing year: Wm. Fries, Pres.; P. N. Lilienthal, V. P.; H. P. Bush, Sec.; and D. Friedenrich and F. A. Benjamin, trustees. The Anglo-Californian bank was appointed treasurer. The financial statement showed the assets of the company to be $125,000, the liabilities, $38,000, the net assets being $87,000,

Mining Share Market.

Under strong bear points, the banks calling on brokers to strengthen their accounts and the brokers in turn calling on their customers for more money to keep their margins good, had a depressing influence on the market, and as prices shaded off under outside selling, further calls for money to keep up margins were in order, which naturally threw large quantities of stock on the market. With the close of business on Tuesday a steadier tone set in for the Comstocks that was followed by a slight advance yesterday (Wednesday) under confirmed reports of heavy rains in Storey county and sufficient water in the Carson river to admit of the mills starting up on or about November 1st. There is water enough to allow the Nevada mills to start up soon. The bears are not happy, owing to prices not having shaded off enough, but they affirm that the low prices should come within the next ten days. The bulls, while trying to look satisfied, are nevertheless far from confident in their position, yet they affirm that not only large lines of margins have been uncovered, but large quantities of stock carried by outside parties have been sold, owing to the assessments to be paid. In outside stocks the market has been dull and heavy, as if the manipulators are waiting for an upward move in the Comstocks, so as to sell their holdings out at an advance.

From the mines reliable private advices are hard to get. It looks as if the manipulators are doing all they can to depress the Comstocks and purposely keep back news. The crushing of Savage and Hale and Norcross ore is to be resumed about November 1st. It is also stated that two or more of the Gold Hill mines will also soon send ore to the mills. Yellow Jacket ore to the extent of 100 tons a day is now being milled. It runs in assay about $25 a ton. Now that there is plenty of water, Potosi ought to begin soon to take out ore for milling. It is generally claimed that after next week very important work will be inaugurated on the Comstock, much of which has heretofore been noted in these columns. From the outside mines there are confirmatory advices of an improvement in two of the Quijotoa mines. From the Tuscaroras and Bodies there is nothing new to report, last week's advices virtually covering this week's.

The market opened this (Thursday) morning at higher prices for the Comstocks and barely steady for outside stocks. As there were selling points out, outside holders were free sellers. After the boom prices shaded off under fairly active business. There is an agreement between the managers of the Gold Hill and Alta groups of mines to pump the mines to the lower levels and divide the expenses pro rata. With a confirmation of this agreement by the board of directors of each mine in interest, pumping will be inaugurated as soon as possible thereafter. Virginia city papers report rains and snow for several days past in the mountain ranges on the Nevada side; they also state that the Comstock Tunnel Co. will commence work at an early day to extend the tunnel farther west. This work will be inaugurated in the Savage ground. This confirms our statement regarding contemplated work made fully two months ago.

IN ALASKAN WILDS.—A. Ingram and F. C. Young starved to death on the Takeenor, a tributary of the Yukon river, Alaska. Their provisions had given out and they had lost the trail. Their companions on the prospecting trip, R. C. Rose and J. W. Sperry, kept on and were saved, having traveled 600 miles on foot. They found a cache of 53 dried salmon on which they lived until settlements were reached.

OBSERVATORY SITES. — Says the Pomona *Times:* Parties representing Harvard University in the matter of locating observatories are expected here to investigate the feasibility of locating an observatory on Mt. San Antonio, or on some of the adjacent peaks. The energies of these parties are now directed to the selection of the best site before the observatory is permanently located.

John Kelley, superintendent of the Bodie, Mono and Bulwer mines, is in this city.

For New Subscribers—Something New and Rare.

PACIFIC COAST RELIEF CHART.

PHOTO-FACSIMILE.

With subscription paid one year in advance for this paper, and 10 cents to pay postage and mailing tube, we will send a fine Photoplate Relief Chart of the Pacific Coast, embracing California, Nevada, Oregon, Washington Territory, and part of Montana, Idaho and Utah. Photographed from a topographical relief model in plaster (5 feet 3 inches by 5 feet 6 inches in size), made recently by Isaac Winston and Prof. Geo. Davidson (the latter Chief of the U. S. Coast Survey on this Coast for the past 20 years).

While it does not take the place of an ordinary map, it illustrates, comparatively, the elevations and depressions of the principal mountains, valleys, rivers, lakes, ocean and bay-shores of the Pacific States and Territories, and makes a permanently useful, handsome and desirable picture for either library, office or home.

The charts are 19x24 inches, well suited for framing, if desired. It is as handsome, and even more durable, than an ordinary photograph. Seldom is so choice an article offered as a newspaper premium. Sent to old subscribers on the same terms on paying one year in advance of current date. Subscribe and secure this permanently valuable chart.

Address Publishers of this paper No. 220 Market St., S. F

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

POCKET MINING.—The last pocket found in the Bonanza mine, Tuolumne county, yielded between $60,000 and $75,000, and came from the footwall, off the lead from which the present management have taken all their gold in the several pockets found. When the mine was owned and operated by Divoll, Clark & Bray, all the gold taken out was invariably found on the hanging-wall. The distance from the surface to where the present gold was found is 300 feet.

ASPHALTUM OILS.—The Santa Paula *Chronicle* says: The refinery is running on full time, manufacturing asphaltum oils and distillates. The company has recently completed a steam still that enables them to manufacture deodorized gasoline. Some of this gasoline was sent to a manufacturer of gas machines in Los Angeles, who, after giving it a trial, pronounced it the best quality he had ever used.

ANOTHER TOWER.—A company has been formed for the purpose of erecting a tower in London on the Effel plan. The tower will be 1250 feet high. Five hundred pounds has been offered as a prize for the best design, and £250 for the second best. The competition is open to the world.

A MALGAMATOR, ASSAYER AND GENERAL MILLman of long practical experience desires situation in quartz-mill. Thoroughly understands running batteries, concentrators, etc. Best of references.
Address, G. S., Box 2517, San Francisco.

STEARNS M'F'G CO.,

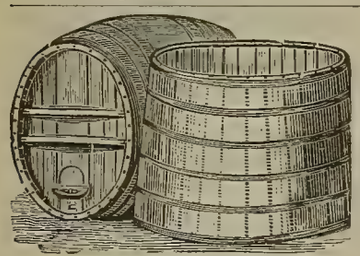
29 & 31 Spear St., San Francisco, Cal.

—MANUFACTURERS OF—

HIGH-GRADE SAW MILL MACHINERY, ENGINES, STEEL BOILERS, Etc.

—IMPORTERS OF—

Munson's Leather Belting, Goodell & Waters' Woodworking Tools, Hill's Clutch Pulleys and Couplings, Emerson's Saws, Emery Wheels, Tool and Knife Grinders, Ewart's Link Belting, L. & D. Wood Pulleys, Hoisting and Pile Driving Engines, Etc.



RIX & FIRTH,

225 and 227 First St., San Francisco, Cal.

Compressed Air and Water Power Machinery.

KNIGHT'S WATER WHEEL,
For Mills, Pumping and Hoisting.
OVER 300 IN USE.
All estimates guaranteed. Send for Circular.

WATER TANKS, WINE TANKS!
CALIFORNIA WINE COOPERAGE CO.
FULDA BROS., Proprietors,
30 to 40 Spear St., San Francisco.
ALL KINDS OF CASKS, TANKS, Etc.
☞ SHIP, MINING, and WATER TANKS a Specialty.

WINCHESTER HOUSE,

4 Third Street, - San Francisco, Cal.

This Fire proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families.

HOT AND COLD BATHS FREE.

Terms, Board and Room, $1.00 per Day
And Upward.
Rooms with or without Board.
Free Coach to the House.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

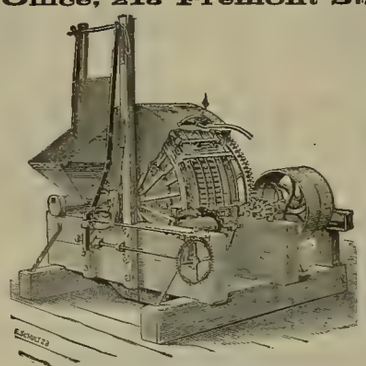
—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 8 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths **STEEL RAILS** from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address



PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 213 Fremont St., San Francisco.

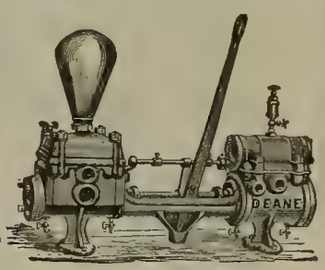
TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.



MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.

SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers. DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.
Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

Agent for HOSKINS'

HYDRO-CARBON ASSAY FURNACES

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

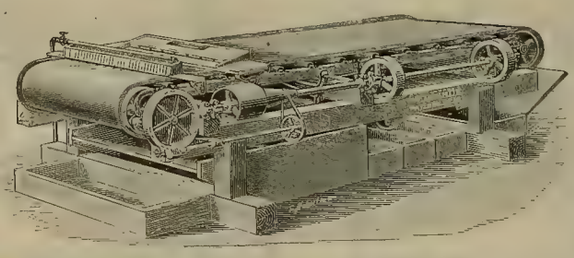
These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Sts.

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

IRRIGATING PUMPS FOR HIGH LIFTS.

25 TO 2,500 GALLONS PER MINUTE. Specially adapted for Irrigating, Water Works, Fire Plants, etc. Will force water to any height desired and require less power than any other pump in the world. Specially arranged for deep wells. Engines, Boilers, Water Wheels, Piping, Tanks, Etc.



NICHOLS MAN'F'G CO., 218 California St., San Francisco.

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

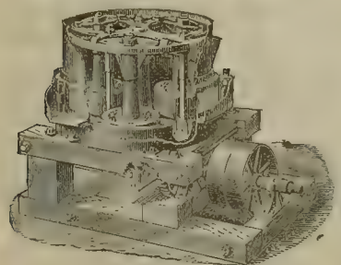
MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

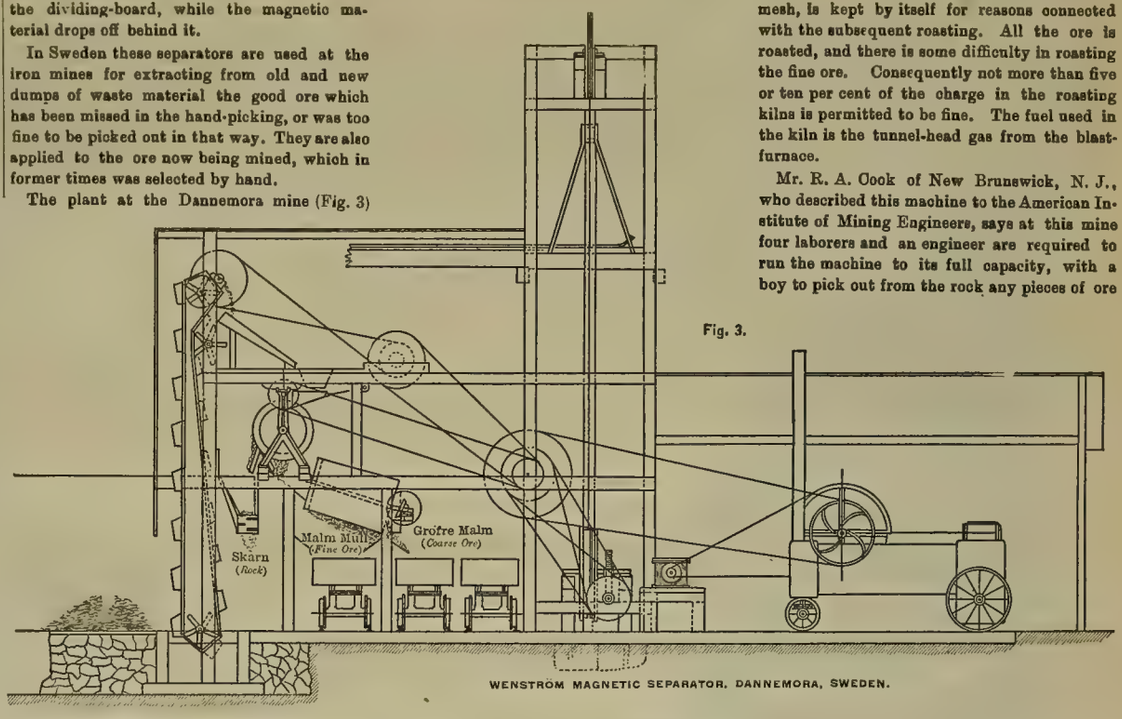
The Wenstrom Magnetic Ore-Separator.

Tho only magnetic separating machine which has actually taken the place of hand-picking in the iron mines of Sweden, was designed and patented by Jonas Wenstrom of Oretro, Sweden. It has also been successfully adopted by the Lackawanna Iron and Coal Co. of Scranton, Pa., where the fine waste before it goes to the dump is put over this separator. It is useful for treating cinder from the Bessemer converters. In this machine (in which soft iron becomes magnetized by induction) the barrel is made up of soft iron bars and wood which is rotated around a stationary shaft by a cog-wheel. Inside of this barrel on the shaft is placed eccentrically a cylindrical electro-magnet, provided with a number of flanges (*N. S.* Fig. 1), between which wire is wound so the flanges are of negative and positive polarity, being energized by a current passing through the wire coils from a small dynamo. As will be seen in Fig. 1, the flanges, *N*, *S*, are circular, and follow the internal contour of the barrel on the front side, while on the opposite side they are cut down to the line *B*, *B'* in Fig. 2. Hence the bars of the revolving barrel on the front side of the machine are magnetic only while passing from *B* to *B'*; and after they pass the point *B'* in the lower part of the machine, they cease to be so, and remain entirely without magnetism in passing through the space from *B'* to *B*, at the back of the machine. The bars have alternately two and three projections coming close to the polar flanges, so that each bar becomes virtually a prolongation of the magnetic poles.

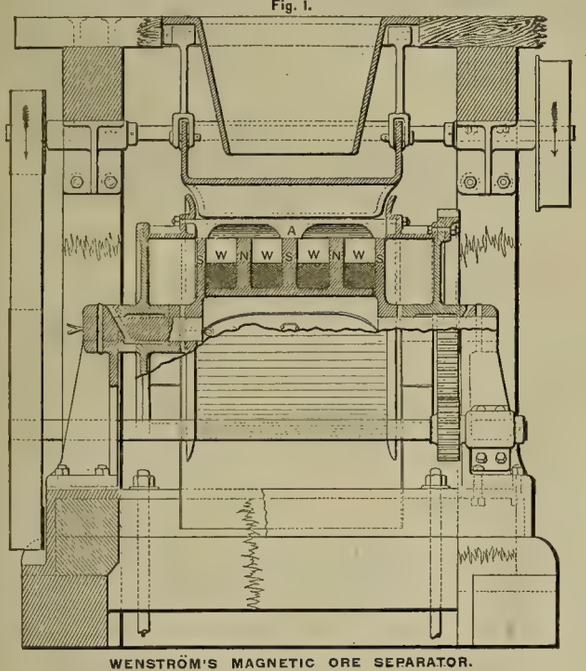
The ore and rock are fed on top of the revolving barrel, coarse and fine together, and the ore adheres to the barrel during half a revolution, being only released after it has passed out of the magnetic field *B'*; the non-magnetic material rolls off the barrel and falls in front of the dividing-board, while the magnetic material drops off behind it.



In Sweden these separators are used at the iron mines for extracting from old and new dumps of waste material the good ore which has been missed in the hand-picking, or was too fine to be picked out in that way. They are also applied to the ore now being mined, which in former times was selected by hand.

The plant at the Dannemora mine (Fig. 3) consists of a separator, 24 inches on the face and 27 inches in diameter, a small dynamo and a portable engine, which runs not only the separator but also a bucket elevator and a hoist capable of raising a car loaded with half a ton of ore. The material (anything below a four-inch mesh) is dumped from a trestle at the elevator, which conveys the material to the feed of the separator, and the separated rock falls into a chute, and is thence delivered into a car and run off to the waste dump. The ore runs down into a barrel screen of perforated steel, the holes being one inch in diameter. The pieces which pass through fall into one car, while the coarser portions fall into another. These cars are then hoisted on the elevator and run off to the point of shipment. The fine stuff, below one-inch mesh, is kept by itself for reasons connected with the subsequent roasting. All the ore is roasted, and there is some difficulty in roasting the fine ore. Consequently not more than five or ten per cent of the charge in the roasting kilns is permitted to be fine. The fuel used in the kiln is the tunnel-head gas from the blast-furnace.

Mr. R. A. Cook of New Brunswick, N. J., who described this machine to the American Institute of Mining Engineers, says at this mine four laborers and an engineer are required to run the machine to its full capacity, with a boy to pick out from the rock any pieces of ore which may have been mechanically knocked off by larger pieces of rock.



There are other uses to which this magnetic separator has been profitably applied in Sweden. One is that of separating the pieces of iron from the dirt, in yards where pig iron has been stored, or from any old heaps of waste material —for instance, where the dumpings from cupolas have been piled.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Tuolumne County.

Items of Interest from Sonora.

EDITORS PRESS:—The miners of old Tuolumne need no longer grumble that base-ore mines of any value have to remain idle, in consequence of there being no means at hand for the reduction and treatment of their sulphurets, for I am pleased to be able to state that this county has now a very complete and efficient chlorination outfit just erected outside of the town of Sonora, on the Summersville road, by the owner, Mr. A. Maltman. The mining community is to be congratulated on securing the valuable services of the above gentleman, for he is a thoroughly competent and experienced metallurgist, chemist and assayer. The want of such works has been long felt, and many valuable mines have been shut down, as there were no means nearer than Amador county to treat custom sulphurets; besides, all samples of rock or bases had to be sent to San Francisco for assaying, there being no office for the latter in the county. Now the presence of Mr. Maltman is a real boom for us all, and he being well equipped, must succeed and give general satisfaction. Aside from this, quantitative analysis of any substance, rock, metal, water, etc., can be determined and attended to in person by Mr. Maltman.

I will now briefly describe the chlorination works. The main building is 116x30 feet, graded in floors downward toward the creek at the back, with a frontage on the main road upward. The first floor is the receiving and weighing room for the crude sulphurets. The second floor contains the reverberatory furnace, 40x12 feet, most strongly braced transversely and laterally. A double-lined iron smokestack of considerable hight conveys the fumes, gases, etc., far away. I may here mention the furnace contains some special improvements over the ordinary old reverberatory—firstly, producing a more even combustion, promoted by the admission of oxygen in the right place, and an arrangement of the floor by which the sulphur from the last added charge helps to provide fuel and finish the roasting of the prior charge, and so on till completed. I am not at liberty to disclose further the modus operandi. Then again, no troublesome smoke is seen issuing from the ports or doors, making it an easy matter to rake forward or otherwise the molten mass, which is most perfectly roasted and desulphurized; being devoid of any cinder, it now passes to the cooling floor, therefrom to the vats, in the right condition to receive the chlorine. The process is the hyposulphite for leaching silver, and used in conjunction in the chlorination of gold. Mr. M. makes his own chemicals used in his works, from the crude material.

Assaying and scorification charges are moderate. Cost of reduction per ton $20 to melting into gold bar, and 90 per cent guaranteed of the assay value. Same for 30 or 100 tons. Water is laid into the works from an altitude of 150 feet. Office and assaying room is attached to or adjoins the main building. The owner contemplates making further additions and improvements later on. The works are kept steadily at work.

I trust all mine-owners will patronize Mr. Maltman that he may in the near future be able to enlarge his premises. Present capacity, 4500 pounds. I had the pleasure to inspect plans gotten up by Mr. Maltman for the Grant, Treadwell & Co. mines at Alaska. Capacity, 14 tons daily, for a reverberatory furnace of his own design, similar to the one built at the works described, which speaks well for his ability in his profession, and for the superiority of his furnace.

From the Bonanza mine of Sonora has been taken out to date considerably over $100,000 in the old works, and not yet cleaned up; but on a more westerly crossing the lucky lessees have constructed fine hoisting works 60x30 feet and are sinking an incline shaft about 70 degrees to connect old works, or rather to enable them more cheaply to work the chute below the old works, which will give them considerable backs of several hundred feet, and by means of a powerful pump will be able to drain the mine and the chute from the point tapped upward. A new horizontal engine is just placed in position of increased power.

The mines generally depending on water-power are shut down, owing to the short-sighted and penurious system of the old Tuolumne Water Co., by not providing against a dry season by constructing large storage reservoirs high up in the mountains; but I am pleased to state they have partially awakened and have commenced to build a storage reservoir, which, I trust, by next fall will be completed. It can be if they put sufficient men on the work. This reservoir embraces many hundred acres of land and will, when completed, be a vast and profitable revenue, which, had it been undertaken several years ago, this county would be to-day in a more flourishing condition as regards its mines and ranches. Water is the grand desideratum, and a scarcity means loss, idle men and unproductiveness to every one. ARGUS.

The Proposed Mining Law.

EDITORS PRESS:—Having thoroughly examined the proposed new mining law, I find there is far from any improvement over the present one. In the first place, there will be entirely too many dates to observe. The present law, as regards the beginning of the assessment year, is all that any reasonable person can wish. There is winter at both ends of the year, and all summer in which to perform the necessary work.

No man who is self-sustaining enough to strike out to find something for himself should be restricted to one claim. It is not one time in a hundred that the first claim located is the best one in a camp. In this case, the proposed law would greatly decrease the prospector's rights, as well as encourage the camp-followers and do-nothings to follow a little in the rear of the prospector and rest on their oars until he found something; then a grand charge would follow, and the prospector would have no advantage whatever over the do-nothings. It is the industrious prospector's rights that should be fostered, and not the whisky ring. No doubt there can be some improvement on the present law.

As about all relocations are made on or about the first of the year, there is ample time for doing the required work the same year—in other words, do not allow any remnant of the year on any relocated claim. This would stop relocating to save doing assessment work.

An individual having more than one claim should have the right to concentrate his work all on one claim, provided he did, say, three or four times as much as it would require to scatter his work over all of his claims. A company may have the same privilege by doing a much larger amount of work.

This would be a stand-off to the present tunnel law, which grants about the same thing. It is a well-known fact that most of adjoining claims located by the same person are for self-protection, and not for the worth of the ground. E. H. R.

Eureka, Nev.

Shasta County Notes.

EDITORS PRESS:—The Iron Mountain Silver mine is running to its full capacity with 20 men employed. The ore is an iron cap, and the supply seems inexhaustible. About 20,000 ounces of bullion is shipped from the mill every month. James Sallee is superintendent.

Manzanita, the mine owned by Greenbaum & Levy, has suspended operations; the cause assigned being that the ore has given out. They have a five-stamp mill at Grizzly Gulch—a new plant run long enough to use up the 200 tons of ore taken from the mine.

The Niagara mine on French Gulch is producing well. This is the mine purchased of Mr. Coleman, of San Francisco, by the English and German syndicate.

Mr. Conant has recently purchased the Wheeler mine on Kline's gulch, and is working it.

The J. I. C., next to it, is a very promising mine. As yet it is hardly more than a prospect; 31 tons of ore produced $3200 worth of bullion.

The Gladstone comes next, and is another good one.

The Utah & California Gold Mining Co. (Walker Bros.) have just completed their new mill, near the Sacramento river, at Old Diggings. The location is excellent. The superintendent, H. D. Rippetu, furnished the plans and had charge of its erection. It is a model for convenience and economy in handling the ore. The work was done by Wm. Stephens, of Redding, who has built other mills in the vicinity, and speaks well for his ability as a mill-builder.

The work of clearing the ground was commenced on July 20th, and the mill started on October 6th. It has 10 stamps and uses a Blake crusher.

The Central mine, just above, is not being operated. Hart & Flemming employ 12 miners, and are running to their full capacity.

A very rich find is reported in the Mammoth, and San Francisco parties are negotiating for its purchase.

The Calumet is adding to its plant. The machinery used in the mill is almost entirely the invention of the superintendent, Mr. A. B. Paul, and has proved very successful.

Gold mining in this county is yet in its infancy. The country is being thoroughly prospected, and quite a number of promising finds are reported. All that is needed is capital to develop the treasure which lies hidden in its mountains. H. B. P.

OUR TWO GREAT PETROLEUM STATES.—Five years ago the production of petroleum in Ohio was hardly worth mentioning. Last year her production was 10,000,000 barrels, against 16,000,000 barrels for Pennsylvania, and this year it is believed that the production in Ohio will lead all other States.

A VEGETABLE CARTRIDGE SHELL, which is entirely consumed in firing, is a French novelty. With this shell the cartridge has scarcely half the weight of a metal cartridge, the cost is considerably less, and the inconvenience of removing the shell after each shot is avoided.

The Discovery of Gold.

Oregon has developed a "new" discoverer of gold in California. On the tombstone of Capt. Charles Bennett, in the Rural cemetery near Salem, it is recorded "that he was the discoverer of gold in California." Hon. Stephen Staats writes in the *West Side* newspaper and says: "As to the gold business, it is related that Marshall picked up something in the race at Sutter's mill, not knowing what it was, and showed it to Bennett, who examined the same and pronounced it gold. 'Why, that is gold!' was his exclamation. And this is the simple story of the discovery that may be said to have transformed society and worked such wonders in the material development of America, if not of the world. But the circumstance was merely fortuitous, and anticipated the events only a few months at the most. Adventurous Americans were beginning to enter California and roam over its wastes, and their sharp eyes would have soon detected the shining metal. But Captain Bennett was the discoverer of gold in California, nevertheless."

The real story of the "discovery of gold in California" has been told in the PRESS, as related by Marshall himself. It seems strange that Bennett's name was never linked with the discovery in any prominent way, and it is rather late to get any acknowledgment of his claim. The only other names connected with the occurrence are those of Sutter, Peter Weimer and Mrs. Weimer. Marshall and Weimer were together when the gold was found, the former picking up the piece of gold in the tail-race. According to their version, they thought it was gold, and finding more, kept the matter secret several days. Bennett is not mentioned by them or others. Marshall's statement is confirmed by Mr. and Mrs. Weimer. Sutter and all the hands at the mill Henry W. Bigler's diary or journal, the only written record, gives the date as Jan. 24, 1848. But Marshall put it at Jan. 19, 1848. This confusion of date is explained by the fact that Marshall and Weimer kept the matter secret several days, and Bigler recorded it when he heard of it. None of the participants of the event mention Bennett in any way.

The credit of the discovery doubtless belongs to Marshall, and always will. The State of California has lately erected a statue to his memory on a site near the point where the old mill stood.

It was this discovery which led to the rapid settlement of this State and the greatest gold excitement ever known to the world. Nevertheless, gold had been found in California long before, and was known to the Mexican Government. In 1844, Manuel Castanares, representative in the Mexican Congress from the Department of Upper and Lower California, published in Mexico the fact that placers had been discovered, and officially called attention to their importance. He said that in 1843 there were in circulation in Los Angeles about 2000 ounces of gold which had been taken from the placers near there. This had been taken out in 1842–3 Who made the original discovery no one knows; but it was that of Marshall that started the "California gold-fever" that resulted in the memorable "days of '49."

The Giant Madrona.

The genus really belongs to the Old World. Asia has its species, and Mexico claims one or two representatives, but the pride of the family and the delight of arboriculturists is the strong, healthy and handsome child of the west coast. It is often 80 to 100 feet high, 3 feet in diameter, and a famous specimen in Marin county has a measured girth of 23 feet at the branching-point of the tremendous stem, with many of the branches three feet through. The foliage is light and airy, the leaves oblong, pale beneath, bright green above. The bloom is in dense racemes of cream-white flowers; the fruit a dry, orange-colored berry, rough and uninteresting. But the charm of the madrona, outside of its general appearance, is in its bark—no, it is not a bark, it is a skin, delicate in texture, smooth and as soft to the touch as the shoulders of an infant. In the strong sunlight of the summer these trees glisten with the rich color of polished cinnamon, and in the moist shadow of the spring-time they are velvety in combination colors of old gold and sage-green. There is a human pose to the trunk. Seen through the tangle of the thicket, it looks like the brown, lithe body of an Indian, and in the moonlight the graceful upsweep of its branches is like the careless lifting of a dusky maiden's arms. Every feature of the madrona is feminine. They grow in groves or neighborhoods and seldom stand in isolation, courtesy to the winds, mock at the dignified evergreens and oaks, and with every favorable breeze and opportunity, flirt desperately with the mountain lilacs that toss high their purple plumes on the headwaters of Los Gatos creek.—*F. N. Somers in Oct. Harper's.*

A GERMAN SCIENTIST wishes to determine, by means of photography, if the moon is inhabited; and it is said that the King of Wurtemburg has decided, in order to solve the interesting problem, to cause to be made, in the best possible condition, photographs of the moon; then to enlarge the negative 190,000 times.

Bankrupt Law.

The National Bankruptcy Convention that recently assembled at Minneapolis, Minn., consisting of representatives from the commercial bodies of the United States, formulated a National Bankrupt law. The following are the salient points: Jurisdiction in bankruptcy proceedings is conferred upon the United States District Courts; the appointment of a referee at a salary of $3000 per annum is provided for, and a trustee is to be nominated by the creditors. The United States District Attorney must examine every bankrupt at the first meeting of creditors and also at the last meeting before the debtor is discharged. It is made the duty of that official to lay all questions of fraud before the Grand Jury. Fraudulent preferences are strictly forbidden. Valid liens created in good faith are protected. The bankrupt is allowed exemptions according to the State in which he lives. If he can show a faultless record and clean hands, he will be immediately discharged, no matter how small a dividend he may pay.

A committee was appointed by the convention to present these and other points to Congress in the shape of a bill, but judging from former efforts in this direction they have a big task on hand. Our experience in this matter has not been satisfactory. The Constitution of the United States authorizes Congress to establish "uniform laws on the subject of bankruptcy throughout the United States." A Bankrupt law was passed in 1800, limited to five years; but was repealed before it had been in operation three years. In 1841, another Bankrupt law was passed, and repealed 18 months afterward. In March, 1867, another Bankrupt law was passed, that was thought by the legal minds that framed it, to be so well adjusted in the light of past failures, as to prevent all fraud and insure justice to everybody, but it worked so badly that it was soon repealed.

The ideal of a bankrupt law looks wise and beneficent. It works uniformly all over the country. It helps the unfortunate debtor who honestly surrenders his property to receive a final discharge and go where he pleases to repair his fortunes. It can work no hardship toward the creditor, for all his dealings and contracts are made in the light of such a contingency.

But the chief complaint against such laws has been that proceedings in the District Courts of the United States are too cumbrous, liable to vexatious delay, and unnecessarily expensive and inconvenient. For instance, under the old Bankrupt law, so far as this State was concerned, the proceedings had to be commenced and the estate of the insolvent debtor closed up and distribution made in the District Court of the United States sitting in San Francisco. This made it very inconvenient and expensive for parties and witnesses at a distance. It also tended to create a monopoly of the legal business in the hands of a few lawyers, who, residing in the city of San Francisco, managed to get the ear of the Register and Court, and becoming experts in the forms and practice, fattened upon the spoils. The delays wore out the patience of all parties concerned, because the lawyers put off the final settlement as long as they could invent a plausible reason. It is hard to see how any national bankrupt law can be shaped so as to avoid these disabilities. In the nature of the case the proceedings will always have to be taken in some branch of the Federal Courts, and this will cause the burdens to bear heavily upon the majority who live at a distance. It would seem that for all practical purposes an insolvent estate may be as well closed up and distributed in the Superior Courts of the respective counties of the State, and it certainly can be done more promptly, at less expense and a great saving in time and trouble.

CIVIL ENGINEERS AND IMPROVEMENTS.—Three members of the Oakland City Council, W. W. Camron, president, and John Hackett and H. M. Collins, have been empowered by that body to select three civil engineers, who are to make a report as to the cost, etc., of mooted public improvements. It is probable that Colonel Mendell of the U. S. Engineer Corps will be nominated as one of the trio of experts.

THE Placer *Argus* says that the Auburn electric-light works will have a plant capable of 1000 incandescent lights and also an arc-light plant. They hope to be fully equipped by the middle of October. Their water force is taken from the Bear river supply by a ditch about 2400 feet long. Both dynamos will receive their force from turbine wheels. About 19 miles of wire in all will be placed.

A LOAD FOR WIRE ROPE.—The proper safe working load for wire rope is as follows: One-half inch in diameter, 1000 pounds; five-eighths inch, 1500 pounds; three-fourths inch, 3500 pounds; one inch, 6000 pounds. This is for 19 wires to the strand, hemp centers.

MRS. PAGE carries the mail twice a week between Neskowin and Grande Ronde, in Tillamook county, Oregon. The distance is 30 miles and she never fails to be on time.

A LARGE SAWMILL is to be put up at Slab creek, El Dorado county, to cut timber for a V flume to carry lumber to Folsom.

On the Nicaragua Route.

Preparations for building the inter-oceanic canal by the Nicaragua route seem to be progressing favorably. It is reported that the hitch in the proceedings which came about through lack of harmony between Nicaragua and Costa Rica, which have riparian rights on opposite sides of the stream which is to form a part of the canal, is said to have been adjusted, and credit is given to a Californian, Hon. L. B. Mizner, now U. S. Minister to Nicaragua, for efficient service in adjusting matters. Hardly too much can be said of the importance of the successful termination of this project to California interests, and we hope it will be speedily attained.

To gratify curiosity as to the character of the country through which the canal will pass, we have secured a number of authenticated views from the Government, representing the points especially noted by the engineers. One of these is presented on this page. It is of the San Juan river, at the junction of the San Francisco. The point is on the division between the eastern end of Lake Nicaragua and the Atlantic terminus at Greytown, and about one-third of this distance, westward from Greytown. The San Francisco is a stream of considerable volume, and has formed a part of the canal line as laid down by some surveys, there being a canal proposed from the San Juan to the basin of the San Francisco, thence for a considerable distance in the basin of the San Francisco, and thence by canal again to the terminus on the Caribbean sea. In using the basin of the San Francisco it is proposed to make an embankment about a mile and a quarter long connecting two high hills confining the valley of that stream and turning it into a large artificial lake, affording unrestricted navigation for eight and one-half miles, where ships can wait or pass each other. The water thus stored will be of much value in operating contiguous portions of the canal.

The engraving gives a good idea of the San Juan and San Francisco rivers in their lower portions. Higher up, the streams run between projecting mountain spurs and have some rapids and rippling flow, but as shown in the engraving the water is deep and slow, and the banks, broken only by low, isolated hills, are well covered with tangle of forest tree and vine peculiar to the lowlands.

ON THE NICARAGUA ROUTE—THE RIVER SAN JUAN AT THE MOUTH OF THE SAN FRANCISCO.

FOR CUTTING GOVERNMENT TIMBER.—In 1884 a judgment was rendered in the U. S. Circuit Court against Robert Noble of Georgetown, El Dorado county, for $5230, for cutting timber on Government lands. A few days ago Deputy U. S. Marshal Hopkins went to Georgetown and attached Noble's mill, 184 acres of land, a large lot of logs and lumber, houses, etc., to satisfy the judgment.

First Idea of Employing Steam.

The following extract from the life of George Stephenson, Railway Engineer, by Samuel Smiles, Boston, 1859, page 69, is of interest:

Solomon de Caus, who was shut up for his supposed madness in the Bicetre at Paris, seems to have been the first to conceive the idea of employing steam for moving carriages on land, as well as ships at sea. Marion de Lorme, in a letter to the Marquis de Cinq-Mars dated Paris, Feb. 1, 1641, thus describes a visit paid to this celebrated madhouse in company with the English Marquis of Worcester: "We were crossing the court, and I, more dead than alive with fright, kept close to my companion's side, when a frightful face appeared behind some immense bars and a hoarse voice exclaimed, 'I am not mad! I am not mad! I have made a discovery which would enrich the country that adopted it.' 'What has he discovered?' asked our guide. 'Oh,' answered the keeper, shrugging his shoulders, 'something trifling enough! You would never guess it. It is the use of the steam of boiling water.' I began to laugh. 'This man,' continued the keeper, 'is named Solomon de Caus; he came from Normandy four years ago to present to the King a statement of the wonderful effects that might be produced from his invention. To listen to him you would imagine that with steam you could navigate ships, move carriages—in fact, there is no end to the miracles which, he insists upon it, could be performed. The Cardinal sent the madman away without listening to him. Solomon de Caus, far from being discouraged, followed the Cardinal wherever he went with the most determined perseverance, who, tired of finding him forever in his path, and annoyed at his folly, shut him up in the Bicetre.'"

An Amiable Nuisance.

It may seem just a little bit cruel to find fault with good-natured people, and yet a recent writer in one of our popular monthlies has been hard-headed enough to call attention to some of the evil results of too much amiability.

One of the many mischievous forms of what usually passes for good nature that he particularizes is that of indorsing and guaranteeing. It is very hard and unpleasant for a kind-hearted, amiable person to refuse a neighbor or old friend who asks him to indorse a note or guarantee his good faith in a transaction, and yet the amount of evil and suffering which often results from this form of cleverness and accommodation is too frequent to need comment. Many a thrifty man has been wrecked by not being able to refuse to put his name to a note as security, and many a family has suffered in consequence. It may be impossible for the best of men to get along under our present business methods without this sort of indulgence, at times, still one cannot be too careful in looking into the solvency of those who desire this kind of accommodation. Good faith and ability to pay is not afraid of rigid scrutiny. Then indorsements are often no real kindness to those who ask them, for, securing funds they have not earned so easily, they are led into extravagance and speculation which might have been avoided had they been compelled to operate in a more moderate way.

There is one form of mischief incidental to an unwise amiability that there is hardly an excuse for thatthis writer overlooked. It is that of recommending incompetent or unreliable persons for responsible positions. We once heard a State Senator boast that he had signed about 200 applications for positions in the mint. "I sign the paper of everybody that comes to me," he said. We were told the other day that the present superintendent of the U. S. mint in San Francisco had a book nearly as big as a ledger crowded with names of applicants, every one of whom came well indorsed. The same state of things exists at the custom-house, and indeed where Uncle Sam has any soup to ladle out. Now this deluge of applicants for office is largely owing to the fact that our leading citizens who are supposed to possess some influence with public officials are too indolent or good-natured to turn away any one who applies for their signature. It is easy to see that this state of things must be very annoying to our appointing powers, for when hundreds and thousands come to them, equally well labeled, how are they to discriminate? When eminent and leading citizens from indolence or too much good nature are careless in their recommendations of persons for places of trust and profit, the unworthy or incompetent are sure to get into office and the evil may be far-reaching and not easily remedied. And yet this is going on all around every day.

Many other instances of the mistakes and deceptions practiced upon the public by good-natured and really well-meaning people might be given. But this is sufficient for the present. The impulse or desire to oblige a friend, neighbor, or poor applicant, may seem very beautiful and praiseworthy, but no impulse, however generous, if tainted with injustice, deception, or even carelessness, where the welfare of the public or private persons is imperiled, should be allowed to masquerade as a virtue.

STATISTICS OF RAILWAYS IN THE U. S.—The first annual report on the Statistics of Railways in the United States, made by Statistician H. C. Adams to the Interstate Commerce Commission for the year ending June 30, 1888, submitted in March last, with the accompanying tables, makes an octavo of 390 pages. We are indebted for a copy to the courtesy of E. A. Moseley, secretary of the I. C. C.

OVERHEAD CHECK-REINS.—About 500 veterinary surgeons in Great Britain have signed a paper condemning the overhead check-rein as painful to horses and productive of disease. It distorts the windpipe, and is liable to cause paralysis of the muscles of the face, apoplexy, coma and inflammation of the brain.

The Silver Problem.

For the first time for years the San Francisco and Carson City Mints are coining standard dollars, which gives color to the impression that the administration intends having $4,000,000 coined monthly. That the wants of the country demand the full maximum monthly coinage allowed by Act of Congress is well illustrated in the fact of there only being $2,500,000 of net silver in the Treasury at the close of business on October 11th. The call was chiefly for small silver certificates for moving the crops, farmers and business men in general apparently giving them preference. In this connection it is in place to state that the usually well-informed correspondent of the New York *Journal of Commerce*, writing from Washington, D. C., under date of Oct. 11th, says that it is reported on good authority that one condition of the acceptance of the office of Director of the Mint by E. O. Leech was that no attempt should be made by him to depreciate the price of silver, and that the advance of silver in the London market on the day of his acceptance was due to a change in the policy of the United States Mint.

It now looks as if silver bullion will gradually appreciate in value, and before three months pass reach in this market, in sympathy with higher prices abroad, $1 an ounce fine. This opinion is based first on the rapidity with which the silver certificates in this country have gone into circulation; already over $280,000,000 have been issued against the silver coin held by Treasury. Besides this, of the standard dollars coined, the amount that is in general circulation aggregate $58,370,317 on the 11th day of this month. Second, the output of silver by the mines does not keep pace with the increasing demand for the bullion for coining and manufacture. Third, the appreciation of the Russian roubles also has a decidedly favorable effect on silver. Fourth, with a general revival in the various industries in England and other European nations, it is found that the circulating metallic currency is not sufficient to meet trade requirements, and therefore the more demand for small subsidiary silver coin, or else small certificates issued against silver held by the national banks. Fifth, the Asiatic countries are heavy buyers, taking apparently more than they did at this time last year, and that taken by them never returns again as a disturbing factor in the markets of this country.

THE raw borax, which is to be refined at the new East Oakland refinery, will come from a deposit at Lone Ranch, Oregon, 25 miles north of Crescent City.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Butte.

BIG SPECIMEN.—Chico *Enterprise*, Oct. 24: Jno. Adams was in town the other day and exhibited a specimen of the riches of the Butte creek mines, which put us in mind of old days. On the Sam Dean mine, on Little Butte, near the mineral slide, there was found in the regular course of mining a nugget which weighed 21¼ ounces, valued at nearly $400. It was a solid piece with no quartz in it.

El Dorado.

GEORGIA SLIDE.—Georgetown *Gazette*, Oct. 24: The Georgia Slide miners took advantage of the rain last Monday and co-operated in floating down the ditch their winter's wood, amounting to a hundred or more cords. This is their practice every fall. They have also started up their sluice claims.

Fresno.

KINGS CREEK.—Cor. Fresno *Expositor*, Oct. 25: The mineral developments in the Kings Creek mining district are very promising. Late assays being made from the shafts are valued from 500 to 800 ounces in silver and 16 in gold. This ore was taken out of what is known as the Second Sierra—Mace mine, Little Expositor mine and the Lone Pine mine. They are showing similar ore now from the Sierra. The ore taken out of the Sierra at present is nearly pure silver. In the bottom of the shaft there is four feet of white silver ore. There is a pack-train being made up near Fresno Flats to pack in barley and pack out ore in order to have it worked. The ore has been taken out by Milton Mann, an old forty-niner and experienced miner, and others. Their statement is that it cannot be beat on the Pacific Coast or any other coast.

Inyo.

IMPROVED PROSPECTS.—Inyo *Index*, Oct. 26: In the old mine, formerly known as the Drummer Boy, but now called the Erin, good prospects have been reported for some time. Heretofore the ore carried only lead and silver, but late developments show a high percentage of gold. The mine is only a short distance east of Independence Depot, and is being worked by Tom Treglown and Ike Wilmot. A piece of ore from the new strike shows free gold and if we mistake not, is rich in tellurium.

KEELER.—Mr. J. V. Skinner has his largest ten-animal team at work between Keeler and Cerro Gordo. Heavier and larger teams were found to be necessary in order to haul the large amount of freight constantly arriving for the Union Mining Co. The company are still shipping first-class ore. Ore is now coming in from the mines worked by Frank Fitzgerald, six or seven tons having arrived at the depot and now awaiting another load to complete a shipment. Regular shipments will be in order soon.

Mono.

BODIE.—*Alta*, Oct. 26: During the past week the upraise from south drift, 900 level, was advanced 12 feet; upraise from south drift, 1000 level, was driven 13 feet; east crosscut from shaft was extended 25 feet.

MONO.—During the week the south drift, 1000 level, was advanced 38 feet; west crosscut No. 2 from same was driven 22 feet.

BULWER.—During the week raise No. 5 was extended 2 feet. East crosscut from the top of same was driven 12 feet; north drift from top of raise No. 5 was started and driven 18 feet; finished putting in partition and ladders; also put in door to force air up raise.

Nevada.

GOLD POINT MINE.—Grass Valley *Union*, Oct. 25: Work on the Gold Point mine will start up again in a few days, operations having been suspended for some time, owing to the destruction by fire of the shaft-house. For the present, hoisting will be done by a horse-power whim, but the company contemplate to soon introduce water-power, which will be obtained from the Empire pipe-line, for hoisting, pumping and milling, as it is found that it will be necessary to have a mill on the ground, instead of incurring the present cost of $4 50 per ton for hauling and milling. The ledge in the shaft of the Gold Point is showing strong, between six and seven feet in width, and of good milling quality.

THE FORTUNA QUARTZ MINE.—The visit of ex-Congressman Page at the present time is with reference to the Fortuna quartz mine, near Nevada City, and while here it is his intention to make arrangements for pumping out the mine and resuming development work. The mine has a good reputation as a "prospect," having a ledge of good size and carrying well in sulphurets. It has not been worked to any great depth, and may be said not to have had a chance to show its good points. There is good hoisting and pumping machinery on the mine, and although it has not been in use for some years, with ordinary repairs it will not take long to put everything in good working order.

THE SPANISH MINE.—*Transcript*, Oct. 23: The buildings for the mill and hoisting works at Lord & Co.'s Spanish mine on Woods' ravine are inclosed, and now the putting in of the machinery can proceed without regard to the condition of the weather. The owners are operating on a limited capital, but they have a first-class property and by a continuation of the same energy and grit they have heretofore displayed will not be long in getting it under full headway.

THE CROWN POINT.—*Tidings*, Oct. 29: The water-wheel, 8-inch pump and accessories purchased from the Bidger Mining Co. have been put in place on the Crown Point mine and are now in operation. Pumping was commenced Sunday night, and as the underground workings below the 180-foot level are not extensive, it is expected that the mine will soon be dry. Joseph Bonivert is superintending operations.

Plumas.

THE GOLDEN KEY MINE.—Greenville *Bulletin*, Oct. 23: Some time since we mentioned that Moore & Owens, owners of the above-named property, were packing ore from the mine to the Hoffner mill on Rush creek, two miles distant, to make a crushing test. They crushed 57 tons, cleaned up and have shipped the bullion to the mint. The product was 53 ounces of bullion, worth over $900. The ore crushed was taken out the full width of the large vein. The showing, therefore, is very good, and stamps the Golden Key as being a valuable property. It is about 8 miles west of Greenville. A steam-mill can be erected on a good site less than half a mile from the mine. Plenty of timber for all needed purposes is at hand, on the ground. The owners are poor men, able to work the property only in a small way. It would be much better for the community if a large company could secure control of it and operate it on a larger scale.

NEW SHAFT.—We are informed that a contract has been let to sink a shaft on the ridge between Gibsonville and La Porte, 500 feet deep. The contract price is $27,500.

Placer.

TO START.—Placer *Republican*, Oct. 24: The mill on the Kendall mine at Badger ravine will start up Nov. 1st. They take 30 inches of water. B. F. Hartley has returned from Minneapolis, and he will at once build a Huntington mill for his quartz mines at Ophir. The owners of the Horman mine at Iowa Hill have bought the Grizzly ditch of "China" Tom and intend to run their machinery with water.

San Diego.

WORKING MINES.—Julian *Sentinel*, Oct. 26: Our mining interest has marched out from among the possibilities of the future and taken its place among the fixed facts of the present. The Ready Relief is being worked to-day with good success. For 20 years the boys have been sinking away, and they haven't found bottom yet, although they are down 475 feet. The Stonewall mine is the finest property in the State, employing about 200 men. A new 20-stamp mill is being added to the 10-stamp already in operation, and when completed will be the finest work of the kind on the coast. This, with other improvements the Governor is making at the camp, will cost about $200,000. The Owens, Helvetia, Big Blue, Washington, Gold King and Queen, Cincinnati Belle, Fraction, Warlock, Richmond, Hidden Treasure, Ruby, and a number of other mines are being worked at present, and prospects are good for others to start soon. Some of the last-mentioned mines are working three shifts a day, others two, and some only one.

THE WARLOCK.—Julian *Sentinel*, Oct. 18: The Warlock mine, situated about three miles from Julian, and owned by Robert Walker and Robert Bell, is now being worked by the owners. The boys have been silently at work for some time, and but little has been said or known about the results. About two weeks ago they commenced building an arastra. The boys, though inexperienced in methods of saving the gold, manage to clean up nearly $100 per ton. It has been said by persons who ought to know that they lose a large per cent of the gold. The boys are satisfied with present returns, and with plenty of good rock in sight they ought to be.

OWENS.—In the Owens mine the water this week has increased to such proportions that it is impossible to control it with the light pumps now in use, and work is temporarily suspended.

Shasta.

ANOTHER MINING SALE.—*Democrat*, Oct. 30: Another important sale of mining property was closed last Monday. Messrs. Lawrence Garrecht, Frank Young and Frank Panter sold their Mammoth mine in Old Diggins, to Mr. F. H. Meyers, of San Francisco, for $45,000. We are informed that a good portion of the purchase price was paid down, the balance to be paid in short time installments. Two Woodland bankers are interested with Mr. Meyers in the purchase. The new company will commence extensive development work right away with the view of erecting a large milling plant on the property in the near future.

UNCLE SAM.—Shasta *Democrat*, Oct. 23: The Uncle Sam M. Co. of Squaw creek, besides adding 10 more stamps to their milling plant, making 20 in all, and which will be dropping by the 1st of November, have also put in a Burleigh drill and air-compressor engine. The Burleigh will be in operation in a few days in the lower tunnel, which, when it encounters the vein, will be about 1400 feet long. This is a mining enterprise that will give Shasta county mining interests a big reputation away from home.

OLD DIGGINGS.—Redding *Free Press*, Oct 26: Ed Minot, one of the boys in blue, who has been working on the new mill of the Walker Bros., at Old Diggings, informs us that the mill is a fine one and that it is now in working order. The ore-bin will hold 500 tons of ore, and the concentrators are doing splendid work. The owners have spared no expense in getting the mill and mine in shape for the production of wealth.

Sierra.

QUARTZ MINING PURCHASE. — Grass Valley *Union*, Oct. 25: Yesterday Stephen Long and Andrew Husom paid into bank the purchase-money for a three-fifths interest in the Lone Star quartz mine in Sierra county, which is situated about 12 miles from Downieville and east of Sierra City. They have had a bond for this interest for several months, and being satisfied from careful investigation as to the value of the property, they have now paid for it upon the condition that the title is clear and indisputable. The location of the Lone Star on the vein is between the Empire and Garibaldi mines, the former now running a ten-stamp mill and the latter a five-stamp. The ledge is well defined, about two feet in width, and shows well in free gold. The Lone Star is not developed, except as to prospecting shafts, but the new owners expect to sink a working shaft on the vein as soon as they enter into possession, and steam machinery will be put up at no distant day, as both water and fuel are right at hand and can be had at but small cost. Messrs. Long & Husom have a very favorable opinion of the location and believe they have become interested in a property that will turn out well.

THE SADDLE-BACK.—*Tribune*, Oct. 19: The Saddle-Back Gold Mining Co. crushed five tons of rock from its mine this week and it went $60 a ton, or a total cleanup of $300 was the result. We have heretofore stated in these columns what the situation is and who the owners of this mine are. It is needless to say that they are all jubilant over the handsome result of their first test of the rock through a milling process. The ore was crushed in the Kentucky mill, which is situated a short distance above town. Owing to there being no wagon-road to the mine, it was necessary to bring the rock quite a distance on pack mules, which brought the cost of getting the rock to the mill up to $15 per ton. Of course the crushing of the five tons was just to ascertain the grade of the ore. A tramway will be erected very soon from the mine to the Kentucky mill, and it will not be long before the fortunate stockholders will be realizing big results from Saddle-Back mine.

A GOOD MINE.—*Tribune*, Oct. 25: The mill at the Salinas and Mercer mine was started up Tuesday. The company have completed their dam above the mine. It backs up water a distance of a quarter of a mile and is 22 feet deep. The building of the dam has been quite an expense for the company, but it will be an everlasting help to them. They will now be able to run the mill the entire year around. The Salinas and Mercer is an excellent property, and it will not be long now before the stockholders will be getting regular dividends. There are six men employed in the mine at present. G. Black is doing the amalgamating work at the mill. A large force of men will be put to work before long.

LOST THEIR DUMP.—*Mountain Messenger* Oct. 26: The Union Consolidated Mining Co. of Happy Hollow, near Port Wine, lost their dump during the storm by its sliding down upon the Highland Mary ground. The rain softened the ground to such an extent that the bulkhead gave way. There were about 8000 carloads of gravel in the dump, estimated to contain $30,000 worth of gold. Not having water to wash the gravel, it had been stored awaiting the water that caused the disaster.

SHAFT.—It is reported that the Scotch Mining Co. near Gibsonville are about to sink a 400-foot shaft on their mining claim, as they have a fine prospect.

EXTENSION.—Bald Mt. Ex. Co. made 32 feet with their main tunnel last week. The main tunnel is in 3500 feet, and very soft dark-colored slate at the face.

Siskiyou.

RAIN AND SNOW.—Yreka *Union*, Oct. 24: Miners and others can begin to laugh now and take comfort; the rain has been a pretty copious one in the valley, and the snow has been a goodly one in the mountains. It is said Sawyer's Bar mountain has several feet of the latter. With plenty of rain and snow this winter, Siskiyou is bound to make a big showing next year.

Trinity.

NEW RIVER. — Cor. Trinity *Journal*, Oct. 26: Work is being done on the Ridgeway. The tunnel is now in 715 feet and the ledge is expected to be tapped daily; the contractors are now in the footwalls, a hard black slate and full of ore matter and mineral stains, looking very favorable for a large ledge. Water is not very strong yet and is not expected in large quantities until the ledge is reached. The fine 10-stamp mill is about completed and can be got ready to run in short order. Beyond doubt it is one of the finest pieces of work in Trinity county. Taking the Ridgeway property as a whole, it is hard to conceive a more complete arrangement or to obtain a more economical way of treating ore. All the camp is deeply interested and look for further developments with great interest. The Mountain Boomer, Excelsior and Uncle Sam are at work with paying results; the Grover Cleveland is also working a small force with good results, crushing with arastra. Mr. Sherwood starts up this week, but work generally has been slack lately, owing to the lack of water. Some three weeks ago a party started for Virgin creek, consisting of some eight of our principal miners, and the reports brought back are really inconceivable. They took up or relocated some claims known to exist there for some time, and if reports speak the truth, it is one of the most valuable discoveries in the world. It consists of a mammoth ledge of free-milling ore followed on the surface for over 2000 feet and varying in width from 220 feet down to 40 feet. As a matter of fact, all the ore prospects in free gold, but of course it is low grade, but should the ore average as anticipated, $2 per ton, there is a bonanza in it for some one, as the conveniences for working cheaply were never excelled.

KNOW-NOTHING CREEK.—Trinity *Journal*, Oct. 26: From Rudolph Junkans, in the Know-Nothing creek mines, we learn that the camp is generally prosperous and the mines get better as they are opened. The Gold Run mine, owned by Raddlefinger, Dannenbrink & Co., is looking very well. The ledge they are now working is 4 feet wide. The tunnel by which this ledge is worked is being driven ahead to tap the Gold Run ledge proper. The latter ledge will be tapped at a depth of 200 feet. Much work has been done in fitting up the mine for convenient working, putting in chutes, tracks, etc. Last week the mill was started up on $100 ore. There are over 200 tons of this ore now ahead of the mill and things are now so arranged that the mill can be run during the entire year, except, perhaps, a short time during the heaviest freezing weather. The Know-Nothing is owned by Bennett, Black, Hansen & Reiley. They are now taking ore from a 2-foot ledge, having plenty of stoping ground on first-class rock. They are running a tunnel to tap the ledge at a depth of 60 ft. which will greatly facilitate labor in the extraction of ore. The Hansen is owned by D. Hansen and Geo. Morris. The tunnel they were at work on for some time proved a success, tapping the ledge as was expected. They are down on the ledge with a shaft 50 feet. The ledge shows well, being a 22-inch vein. This bids fair to be one of the best mines in the camp. The crushing of ore will begin in about a week. The Wolverine, owned by Hagelin, Dayton & Reiley, furnishes some good ore which is being crushed in an arastra. This ledge is about 1 foot wide. The Yocumville mine is owned by Bennet, Cannon and Mitchell. The ledge has been struck in the lower tunnel and they are now making a raise to connect with the upper tunnel. The lower tunnel taps the ledge at a depth of 125 feet and the ore is very good, but none has been crushed yet. They are developing the mine preparatory to putting up a mill if the body of ore is found sufficient to justify.

Tuolumne.

KANAKA MINE.—*Union-Democrat*, Oct. 26: This mine, lately purchased by parties in New York, will soon be started into full operation. The five-stamp water-mill will be increased to 10 stamps and a Blanding crusher added to the plant.

BUCKEYE MINE.—The developments on this mine show a strong vein—some 13 feet wide—of good milling free ore, and the sulphurets are found by assay to be of unusually high grade. It is stated on good authority that arrangements have been made by the owners with parties here to put hoisting works and pump on the mine at an early date and to develop it in length and depth. The work will be pushed. The mine from all present indications has a bright future. It is situated near Summersville in this county.

NEW ALBANY.—We understand that the development on the south end of this mine is showing finely, and the parties who lately purchased it from Dr. John Walker are well satisfied with the property. The 10-stamp water-mill on mine is being put in thorough repair and will soon be at work on ore of good-paying grade.

HYDE MINE.—The machinery placed on this mine by the new owners who purchased it one month ago is in successful operation, and the water is being rapidly lowered in the main shaft, 350 feet deep, preparatory to extensive work on the different levels.

TO WASH.—Tuolumne *Independent*, Oct. 23: Preparations are being made at the New '49 Diggings for washing when water comes. The ground has been well prospected and yields from two bits a pan up. Messrs. J. B. Doyle, Hugh Adair, Dan McMillan and Charles Reed are the members of the New '49 Co.

Yuba.

SMARTSVILLE.—Cor. Marysville *Democrat*, Oct. 24: The town is about one mile from the Yuba, the old mining town of Sucker Flat being between Smartsville and the Yuba. The Blue Point Mining Co., John Dunn Supt., and the Excelsior Mining Co., John Doubt foreman, are working on the Old Bar, above the famous Blue Gravel mines, which in its day took out over 7½ millions, and it is estimated did not save 25 per cent of the gold. The rest of the gold and quicksilver, enough to pay for the working, lies in the Yuba. On the Blue Gravel claim the owners had worked from the top of the hill down 250 feet to the bed of the old river. The action of the water on the old bedrock is as plain as if 250 feet of rock and gravel had never been on top of it. We noticed the place between two large rocks where $1,000,000 was taken out in 50 days. There is a natural rift in the rocks 80 feet deep below the ancient bed, which the old company utilized in that tunnel to carry the water out to the Yuba and which would have cost, Mr. Dunn says, $1,000,000 to have built. The volcanic character of the rocks is plainly perceptible. The Blue Point is working 56 men day and night and the Excelsior 40. They are both putting on new men. Each mine is paying out as wages about $3000 per month. The cement seems to be alive with gold. The pan washings show a very large percentage of gold.

NEVADA.

Washoe District.

CON. CALIFORNIA & VIRGINIA.—Virginia *Chronicle*, Oct. 26: The usual quantity and grade of ore is being extracted from the various openings on the 1435, 1500 and 1600 levels. On the 1300 level in the south end of the mine have resumed extracting of milling ore. On the 1650 level the stopes on the 7th and 11th floors continue to yield the usual quantity of ore of fair quality. On the 1950 level the incline winze below that level is down 125 feet on the slope, and are extracting ore from the bottom on the south side of the winze. During the week 1075 tons and 1440 pounds of ore were shipped to the Morgan mill; 1540 tons to the California. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $28.16. Bullion valued at $48,219.15 shipped to the Carson mint.

SIERRA NEVADA.—On the 520 level from the main east drift, 1185 feet from the shaft station, a south drift is advanced 380 feet, continuing in porphyry.

UNION CON.—On the 1465 level the north latera drift is advanced 548 feet from the south line, continuing in porphyry and clay.

MEXICAN.—On the 1465 level from the north drift from west crosscut No. 1, 50 feet in from the lateral drift face, a west crosscut is advanced 26 feet. Formation porphyry.

OPHIR.—On the 1300 level the east crosscut from the shaft station, to connect with the top of the raise above the 1465 level east drift, is extended 266 feet, continuing in porphyry showing some quartz.

GOULD & CURRY.—On the 200 level, the southwest drift is extended 58 feet. Formation soft porphyry. On the 400 level, west crosscut No. 1 is extended 424 feet. Formation hard porphyry.

BEST & BELCHER.—On the 550 level, west crosscut No. 1 is extended 41 feet. Formation clay and porphyry. On the 1000 level, the northwest drift is extended 357 feet. Formation hard porphyry with streaks of quartz.

SCORPION.—The 520 level south drift is out 283 feet and continues in porphyry.

SAVAGE.—Extracting ore of good quality from the 400 level north drift. Extracted 197 mine cars of ore since last report.

HALE & NORCROSS.—East crosscut No. 1 on the 300 level is advanced 25 feet. West crosscut No. 2 on the 700 level has connected with the Chollar workings. Preparing to extract ore from the 1200 level.

CHOLLAR.—The 750 level north drift is out 590 feet and continues in porphyry. The 850 level north drift is in low-grade quartz.

POTOSI.—The 850 level south drift continues in hard porphyry. Repairing 750 and 650 drifts for timbering.

NORTH GOULD & CURRY AND EAST BEST & BELCHER.—The northwest drift to connect with the North Gould & Curry is being rapidly advanced.

IMPERIAL.—An east drift from the winze bottom below the 300 level, to connect with the Imperial shaft, is out 110 feet. The joint Confidence-Challenge 500 level north drift is out 1090 feet from the Yellow Jacket shaft.

WARD COMBINATION SHAFT.—Repairs still in progress to the 1800 level shaft station.

ALPHA AND EXCHEQUER.—The joint shaft is down 85 feet below the 500 level. The 500 level west crosscut is out 310 feet.

OVERMAN.—The south drift from the winze bottom continues in clay and quartz.

CROWN POINT.—The 700 level south drift is out 490 feet. The 400 level west crosscut cut four feet of fair-grade ore. The raise above the 600 level is up 22 feet. The bottom of the winze below the 800 level is showing ore. The 900 level south drift is reopened 464 feet.

BELCHER.—No. 2 east crosscut on the 1200 level is in porphyry and quartz. The 1000 level east crosscut continues in porphyry. The 850 level

south drift is out 172 feet. The 200 level west crosscut is in low-grade quartz.

YELLOW JACKET.—Daily ore shipments average 50 tons, battery samples showing an average assay value of $25 per ton.

SEG. BELCHER.—The 1200 south drift from the Belcher is being advanced south.

SILVER HILL.—The 160 level northeast crosscut continues in quartz and porphyry. The 260 level northwest drift continues in porphyry.

BALTIMORE.—Stripping ore on the 338 and 225 levels.

JUSTICE.—Crushed 232 tons of ore showing an assay value of $25.99 per ton.

ALTA.—Crushed 300 tons of ore, assays showing a value of $29.75 per ton. Opening the 1040 level station to cut downward continuation of 925 level ore, showing in winze below the latter level.

NEW YORK CON.—Ore of fair grade still showing in the raise above the 800 level west cro-scut.

EAST SIERRA NEVADA.—The 520 level south drift is out 165 feet and continues in porphyry.

UTAH.—On the 600 level the southeast drift is advanced 135 feet from the shaft station. Formation, hard porphyry with some water.

OCCIDENTAL CON.—During the week extracted and milled 316 tons of ore, showing an average assay value of $20.50 per ton. Shipped to Salt Lake for sale concentrates showing a total estimated assay value of $18,500.

NORTH OCCIDENTAL.—Have connected the 350 and 300 levels by an upraise and are now stoping ore from the 300 and 400 levels.

Flowery District.

OPERATIONS SUSPENDED.—Virginia *Chronicle*, Oct. 24: The suit of injunction filed by Gov. Stevenson, owner of the Lady Bryan, restraining industrious miners from developing Flowery district locations within the boundaries of the 500 acres of mineral land claimed by the Governor as included in the patented lines of the Lady Bryan, has resulted in a complete suspension of operations in that district. The suit was not entered until Messrs. Sheppard & Lees developed a stratum of high-grade ore in the Adriatic, and probably would never have been entered had no important discovery been made.

Golconda District.

GREAT REPUBLIC.—*Silver State*, Oct. 22: E. L. Labadie, who has been looking at the Great Republic and New Star consolidated mine at Golconda, says the shaft is down over 60 feet and the ledge carries three feet of good ore at the bottom of the shaft. The company will ship a carload of ore to Salt Lake to-morrow to be reduced.

Jumbo District.

THE DUNLOP MILL STARTED.—Virginia *Chronicle*, Oct. 21: The Dunlop five-stamp mill, erected in Jumbo district near the Wild Goose location, was started crushing ore from that mine last week. The mill is operated by steam-power and pulverizes 15 tons of ore in 24 hours. The ore of that district is exclusively gold-bearing, and the mill has all the modern attachments for saving the yellow metal. There is a vast amount of ore in Jumbo, showing a value of from $15 to $20 per ton in gold that can now be profitably worked.

Pennsylvania District.

TO CONCENTRATE.—Pioche *Record*, Oct. 24: W. R. McFadden, Phil Smith and John Smith have leased from T. C. Poujade the Pennsylvania quartz-mill for eight months, and went down during the week to put the mill in repair. They will make an effort to concentrate the "black jack" ore, taken out during the last workings of the mine, and which contained so much base material as to render it unprofitable to work by the milling process.

Pioche District.

ORE-PRODUCER.—Pioche *Record*, Oct. 24: The old "iron" or "paint" mine, situated in the rear of the buildings on the north side of Meadow Valley street, and which has been located and abandoned a number of times during the past 15 years, just now bids fair to become a valuable ore-producer. It was relocated several months ago by John Sheridan and Henry Deno as the Gypsy Queen, and a shaft started at a point about opposite Cedar street. The shaft is now down some 60 feet and the indications during the past week are so good for ore that the owners are encouraged to continue their developments with vigor.

Robinson District.

LOCAL MINING SALE.—White Pine *News*, Oct. 26: A mining sale was consummated in Ely last Saturday. It was not for a large amount, but, nevertheless, it is a straw that indicates a favorable mining breeze has set in for Robinson district. A. L. Tyler (the "Red Wagon" man) purchased a one-half interest in the Los Angeles mine of Willie Watson for $1000 cash. The claim is as yet but little prospected, but is located in the center of the mineral belt and prospects well. Mr. Tyler intends to develop the claim.

Sacramento District.

OFF TO THE MINES.—*Silver State*, Oct. 23: M. S. Bonnifield and County Clerk Dunn left this morning for Sacramento district to look at the mines. According to report there are good mines in that section.

Wild Rose District.

THE WILD GOOSE.—*Silver State*, Oct. 29: The ore body in the Wild Goose mine, which belongs to the Paradise Valley Mining Co., is getting larger and richer. At latest accounts it was 27 feet wide and nearly all ore.

Wolverine District.

DECEPTIVE ORE.—Virginia *Chronicle*, Oct. 24: An assay of ore recently developed in a Wolverine district mining location, eight miles east of the mouth of Six Mile canyon, showed a value of $95 in gold and $218 in silver per ton. The vein is about nine inches in width and the character of the ore is black sulphuret, carrying a small percentage of lead. Experienced miners pronounced the material worthless until they were shown the assays. The vein has a total breadth of about three feet, with well-defined walls and an eastern dip of 60 degrees.

ARIZONA.

NEW DISCOVERY.—Mohave *Miner*, Oct. 24: Thos. Woods and J. H. Cofer are working a new discovery in the Wallapais. It is an adjoining claim to the Democrat and Antelope, and they think that they will develop the richest mine yet found in those mountains. Supt. G. M. Bowers of the Nighthawk had his recent shipment of 40 tons worked at the Arizona Sampling Works instead of shipping to California as intended, being fully satisfied that he could do as well with his ore here as anywhere else. E. F. Thompson is highly pleased with the ore body in the Empire mine at Chloride. As work is pushed, the ore vein grows wider and richer. The work of pumping the water from the lower levels of the Cupel mine will require about ten days or two weeks constant pumping, when Supt. Mackenzie will resume active operations on this valuable property. Mr. Murray and others are now working the Boggs and Hackberry mines in Big Bug district, Yavapai county, and are very well satisfied with the outlook in these mines. The Arizona Sampling Works have worked since our last report the following lots of ore: E. W. Stedman, Daggett, 2½ tons; John Hawkins, a small lot of lead ore from Cerbat; M. D. Howell, C. O. D. mine, one carload; George M. Bowers, three carloads high-grade ore from the Nighthawk; M. D. Howell, C. O. D. mine west, two cars lead ore; N. C. Amer, eight tons from the Silver King mine; John Hughes, four tons of ore.

BRITISH COLUMBIA.

GOLDEN.—Cor. New Westminster *Truth*, Oct. 20: The mining sections tributary to Golden are at present suffering a reaction from the slight boom which annually strikes the country about the season the geese return. There are quite a number of prospectors out on the new discoveries on Deception and Copper creeks, and others will return to those fields just as soon as the bondholders loosen their grasp or raise the bond on the properties. There is a small force of government employes putting the finishing strokes to the Copper creek trail, and the early spring will see the Lost Chief and other claims commence a steady shipment of ore. Lowe and Daniard returned from the South Fork of the Spilimichene country, where they are engaged in assessment work. They claim to have struck the Dark Horse vein in a spot where the vein matrix is 30 feet wide. They return in a few days to prosecute further investigations in the hunt for unearthed millions. Up the Columbia, Rosamond and Kirkpatrick have started up with a force of eight men to develop, according to contract, their Tobby creek property. These claims will also be in shape to commence a steady shipment of ore in the spring. For the present, Jubilee mountain is worked only by a few prospectors finishing their assessment work, but we are led to believe that C. F. Law resumes operations there in a few weeks. The Maggie McRae is turning out larger than ever, the owner having uncovered a large chamber of copper ore, running from 30 to 40 ounces in silver.

COLORADO.

SAN JUAN.—Silverton *Miner*, Oct. 24: The Ajax is turning out some fine gray copper, which is being sacked for shipment. Two cars of 200-ounce ore per month has been the steady product of the Lookout this season. Six men will be employed all winter. The Iowa is looking fine. The gold ore is treated at Ward & Shepard's mill, and the heavy lead ore comes to town. Two men sacked 91 sacks of ore on the Ariadne last week, and the first carload of ten tons will come down in a few days. Charley Carlstrom is taking out 400 sacks of ore per week running 65 ounces silver from the Seven Thirty. The North Star (Sultan) dump which has been tested this week in the Victoria mill is found to be profitable and there is every probability that a stamp-mill will be erected for its treatment at an early day. Tim Hart, A. H. Kellar and Henry Schwarz have taken a lease on the Pandora mill dump and are putting in lixiviation works there for treating the tailings and slimes that pass from the mill. The Victoria mill has been running all the week on the North Star second-class ore, with a view of ascertaining its concentrating qualities. The Sheridan, Union and Mendota mines are all short of miners, but a man must know his business if he remains there long. A rich strike of gray copper was made last Saturday in the North Star on Solomon in the seventh level, and shipments of a carload per day are being made in add tion to 30 tons of concentrating ore which goes through the mill. The prospects up Mineral creek are developing into good mines rapidly.

DAKOTA.

THE DEADWOOD SMELTERY.—Deadwood *Pioneer*, Oct. 24: It is stated on good authority that the syndicate represented by J. K. P. Miller, of this city, has determined to at once build an experimental plant of from 15 to 20 tons capacity, for the treatment of refractory ores by pyritic smelting. If the ores are successfully treated in a plant of this size the same syndicate stands ready to furnish whatever sum may be necessary to increase the capacity to 200 or 300 tons daily. Coincident with building the larger plant the D. C. railroad is to be extended to Bald Mountain and Ruby Basin, and spurs run from the main line to camps of all the principal mines. The fact that F. R. Carpenter, to whom credit must be given for introducing the process here, yesterday presented his resignation as Dean to the school of mines faculty at Rapid, with request that it take effect at once, is construed here, as well as there, to mean he is immediately coming to Deadwood to superintend building the plant and to conduct the operations thereof.

IDAHO.

SEAFOAM.—Ketchum *Keystone*, Oct. 25: A lot of 8 tons of ore from the Birdie R. mine at Seafoam was sampled at the Ketchum sampling works this week, yielding 335 14-100 ounces silver, 2-10 ounces gold and 29 per cent lead per ton, netting the owners of the mine $2312. This is the highest grade ore shipped in quantity from the above-named camp during the season. Other shipments of ore have been made from the Birdie R. mine prior to this, but none so rich, showing evidently that the ore in this mine is improving as the work of development progresses.

THE POORMAN MINE.—Butte *Inter-Mountain*, Oct. 23: Patrick Clark, superintendent of the Poorman mine in the Cœur d'Alenes, is in the city, and this morning informed a reporter that everything is lovely at the Poorman, and the mine and concentrator are in active operation. A shut-down was rendered necessary last month, owing to a smelter combination. The shut-down was of short duration, however, and everything is now running at full blast. All the other companies are also in full operation. Mr. Clark is much disappointed, of course, at Windom's lead decision, and says the effect of it can already be noticed in the falling of lead to $3.80. Previous to the decision and in the face of an expected favorable ruling, lead sold at $4@4.05. Mr. Clark says that the disappointment of Cœur d'Alene lead miners is very great, as they had expected a favorable decision.

LOWER CALIFORNIA.

SULPHURETS OF IRON.—Alamo *Nugget*, Oct. 26: The International Co.'s mill shut down Saturday on account of their having gotten into sulphurets of iron ore on the Princesa and Telemaco mines which cannot profitably be worked in a Huntington or stamp-mill. It is thought that enough of the free-milling ore from the Ulises and the other mines will soon keep the mill running again. Just what process will be adopted for the reduction of the Princesa and Telemaco ore it is impossible now to predict, as there are several processes, either of which may be used. It is likely that a good quantity of the ore will be thoroughly tested in order to ascertain which of the different methods will produce the best results. It may be necessary in order to make these tests to take the ore to some of the big reduction works in the States. One thing is certain—an ordinary quartz-mill cannot work the ore to advantage and save the gold even with concentrators. The ore is very rich and lies in large veins, in the Telemaco being five feet wide.

ANOTHER BIG GOLD BRICK.—Before the International Co.'s quartz mill shut down last Saturday Mr. Ayers cleaned up 40 pounds (troy) of amalgam, which was retorted Monday and left a gold brick worth $3500. Altogether the company's mill has run 24½ days and has turned out $12,500 in gold.

THERE have been many prospectors here and good ones, too, who have not struck it rich—in fact have not struck it at all, and many a tenderfoot has left the country a sadder if not a wiser man. This occurs in all mining countries, but the yield of bullion now commencing to set in will after a while begin to convince the outside world that somebody is making a living down here in these frosty mountains.

NEW MEXICO.

SAN PEDRO.—Silver City *Enterprise*, Oct. 25: San Pedro is resting on her laurels just now. Quiet reigns supreme, and all are looking longingly forward to renewed activity in the mines. The closing down of the Santa Fe copper mine and smelters has had the effect of throwing a damper upon the "boomers." Much necessary improvement is being made in and about the mine and smelters, and as a consequence, considerable time must elapse before work will be resumed. A large amount of additional machinery is arriving, all of which has to be set up before anything can be reasonably expected. The mines are doing well, and a large amount of development work is being done in a quiet way. Lincoln-Lucky, as a matter of course, is eagerly watched, as it is presumed to be in the lead. Black Hawk is plugging along slowly, and is more eagerly inquired after, if possible, than is the Lucky. The reason for the interest shown in this property is evident, as a big strike here would settle the camp for all time to come. Situated as it is, at the north end of the camp, nearly 2 miles distant from the Lucky, should a body of ore be encountered here, it would conclusively prove the continuity of ore, through all the intervening space. It is a theory borne out by experience in camps of similar formation to this one, that galena and carbonate ores are apt to be found at points largely removed by distance, and it has also been demonstrated satisfactorily that the ore bodies prove continuous, or nearly so. There are a few notable exceptions, but the rule applies generally.

AROUND CHLORIDE.—*Black Range*, Oct. 25: L. J. Otto is making a survey of the Goodenough mine and the claim adjoining on the west, the Extension, which is the property of the lucky owners of the Goodenough. Dr. E. P. Blinn is working his newly discovered prospect which he has named Mrle. The Mrle, though an infant prospect, produces some fine-looking ore. The Ana Bell, on the upper waters of Mineral creek, in this district, has a body of milling ore 17 feet in width and gives assay returns from 10 ounces in silver to 50 ounces in silver; the ore also carries gold. This property is developed by a shaft and a tunnel; the tunnel is being steadily pushed forward and has now attained the length of 250 feet, and it is expected that 30 feet more development work will tap a chute of high-grade ore. The Ana Bell is owned by Messrs. Payne, Cloudman & Chandler of Fairview. Owing to the reorganization of the Midnight Mining Co. the Midnight mine shut down temporarily last week. The Midnight mine can show more solid stoping ore for the amount of development than any other mine in Sierra county, and the beauty of the whole business is that the ore contains excellent milling properties. The mine has for a long time been carefully and judiciously developed under the management of Superintendent Cass, and is now in excellent condition to be worked on a large scale and at good advantage.

MONTANA.

TWIN MOUNTAIN.—*Inter-Mountain*, Oct. 22: With the completion of the road now being built into Twin Mountain district the mines of that locality will soon be better known, and as knowledge of them spreads, interest in them will increase, and unless present indications are entirely false, a new and profitable field for investors will be opened and the reports of large deals from there will be frequent. One reason why so comparatively little is known about the district has been its hitherto almost inaccessible location; being away from all roads, no one but the hardy prospector has cared to visit it. Although badly handicapped by reason of their isolated position and consequent difficulty of obtaining supplies, the prospectors have continued to develop their claims and now have some good results to show for their faith and labors. One of the principal mines is the Richmond, owned by the American Gulch company of Anaconda. A shaft 150 feet deep has been sunk and tapped the ore body at a depth of 25 feet from the surface. From this point a continuous vein of ore has been followed and the present bottom of the shaft is in a body of iron and lead carbonate ore 15 feet wide. The Grasshopper, owned by Abel Fitz, has a shaft 27 feet deep and a tunnel of 80 feet. An 8-foot body of iron carbonate ore has been uncovered in both the shaft and tunnel which assays 250 ounces in silver and 71 per cent lead. The Edwards Carbonate, one of the first locations made in the district, is owned by Edwards & Co. Development consists of a shaft 95 feet in depth and a tunnel of 300 feet which follows an ore body of about 2½ feet. Several heavy shipments have been made during the present year and more will follow, as the mine is in condition to allow of its being worked during the entire winter. Limebach, McIntyre & McDonald own the Cassey Howard. A well-timbered shaft 60 feet deep has been sunk upon this claim. Crosscutting for the main ledge is now being carried on from the bottom of the shaft. Considerable galena ore has been taken out. Another very promising prospect is the Levi P. Morton, of which Walter R. Fish & Co. are the proprietors. From the bottom of the shaft, 28 feet deep, a level has been run a distance of 50 feet showing ore the entire length. Between 10 and 15 tons of fine lead carbonate ore are piled on the dump. Assays from this ore run from 75 to 250 ounces in silver. A mine owned by Wolf, Bair and others of Butte also shows up well, and work upon it will be carried on all winter. The Lynn, owned by Guler and Driscol, has been opened by a 25-foot shaft and several tunnels. Quite an amount of good ore is piled on the dump. Of course there are numerous other prospects in the camp, and some of them make exceedingly good showings for the amount of development done upon them. Those mentioned above are among the best known and so far most valuable claims in the district.

THE CHAMPION.—*New Northwest*, Oct. 25: The Champion Co., last Monday night, temporarily cut down their mining force materially in the mine. The reason for this is obvious. They are erecting a 20-stamp mill which will be completed on or before Jan. 1st, to mill their ores instead of shipping them. They have now on the dump ore that it is estimated will net the company $100,000, and ore enough exposed in the mine to run the mill a year. The ores are not high enough grade to justify shipping, when by holding them a short time they can be reduced at a much greater net profit in their own mill. With the amount on the dump it is not considered necessary or desirable to continue raising large quantities now at heavy expense until the mill is in operation. Hence the force is reduced, and those retained are working on the upraise from the 350 foot level leading toward a heavy body of ore. Work is progressing satisfactorily on the mill building and it will be ready for the machinery, a part of which is already in transit.

UTAH.

LEAD MINES SHUT DOWN.—Salt Lake *Tribune*, Oct. 24: The blow struck at our lead-mining industry by the Secretary of the Treasury takes sudden and severe effect. It crushes immediately operations of the two distinctively largest lead companies in Utah, and they will be obliged to shut down. The Lead Mining Co. of Bingham and the Brooklyn employ directly and indirectly over 300 men. Their product should yield a revenue of some $10,000 monthly; but the immediate effect of Secretary Windom's ruling is to not only destroy that revenue, but to make an actual deficit in the operations of these companies. Six hundred tons of ore, produced at a cost of $16 per ton, have to be sold for $15.75. The company cannot stand that sort of a balance-sheet, and on the 1st of the coming month will be obliged to shut down and discharge all employes except three or four watchmen. It is a severe blow to the industry of the Territory, and will be especially hard on Bingham. It will also have consequences more far-reaching than the mere cessation of industry in two great producers, for the lack of the ore hitherto put on the market by these companies will seriously cripple and reduce the smelting activity of this valley. It is probable that this great and disastrous shut-down will be followed by others that in the aggregate will stagnate Utah's mining industry in general, leaving running only such exceptional concerns as the Ontario, Daly and others whose lead product is not their life. Hitherto the companies now shutting down have sold no ore except on a four-cent basis, the smelters at Denver, Omaha and Pueblo taking it at that rate for its excellent fluxing qualities and in the hope that the Treasury Department would do our home lead-producers justice; but now that rate is no longer available. The highest Treasury official says our miners must compete with 60 cents a day Mexican peon labor and the price of lead ores come down accordingly. The result is a compulsory shut-down, as recited above. In regard to the capital invested, of which so much bandle is made, the companies named have a plant which stands them at about $400,000, and this is but the investment of two allied companies. The companies which are now shutting down have spent large sums in improvements and for machinery the present season, expecting the favorable decision they had a right to. A cessation of work means practically an abandonment of their property.

WASHINGTON TERRITORY.

THE IRON AGE.—Ellensburg *Capital*, Oct. 24: The continued advance in iron in the East and South is causing manufacturers to turn their attention toward the iron mines of the West within the past month, and Kittitas county, which contains the most extensive and varied deposits of iron of any section in the Northwest, is now being carefully examined by iron experts and capitalists. Mines hitherto neglected are being relocated, developed and bonded at good prices. The iron fever is spreading in a degree that is certainly gratifying to the people of Ellensburg, who see in it great possibilities for their city. It would be impossible to find a city more favorably situated for the establishment of large iron furnaces and rolling-mills than Ellensburg, located as it is in the center of iron and coal deposits, the extent of which it would be impossible to tell. Ellensburg ranks first among the cities of Washington in a commercial point at present, and with its iron manufactories once established, it will rank first among the manufacturing cities of the Pacific Coast.

MECHANICAL PROGRESS.

Hardening and Tempering Steel.

The Value of Science in Metallurgy.

It must be very evident to every close observer of recent improvements in the metallurgical processes connected with the production and manufacture of steel and iron that those processes are receiving much more careful and scientific attention than was the case formerly. Still, with all the care and scientific research thus far expended, it is very evident to close observers that there is much yet to learn in regard to the metallurgy of iron and its compounds. There are good reasons for believing that iron itself can exist in more than one state—that it is allotropic in character. This is really an enforcement of the molecular motion theory in regard to iron, which is just now largely influencing the character of metallurgical experiments.

Iron and Steel Masters

On both sides of the Atlantic have been very much interested within the past few weeks in the proceedings of the late meeting of the British Association, especially in an address delivered before that association by Prof. Roberts Austen on the "Hardening and Tempering of Iron." The professor commenced with a brief history of the progress of knowledge in hardening and tempering steel. He remarked that notwithstanding the great progress in and importance of that art, the true theory of the process is still far from clear, and such knowledge as we possess has been very slowly gathered. His remarks under this head were very interesting and instructive, but we must reserve them for a future occasion, and call attention now to only the later experiments and progress in this direction. The professor proceeded to consider

The Mode of Existence of Carbon in Steel

He showed at great length that although carbon in any of its forms, graphite, soot, or diamond, could enter into intimate association with iron, the relations of carbon and iron were really very complex. The researches of Karsten, Berthier, and finally, of Sir F. Abel, had shown that in soft steel the carbon exists in the form of a true compound or "carbide" with iron, while in steel which has been hardened by rapid cooling, the carbon is "dissolved" and not truly combined. In "tempering" or softening steel another change in the relations of the carbon and iron is effected, the degree of hardness of the steel depending mainly on the relation subsisting between the carbon and the iron, although the state of the carbon did not explain all the facts of hardening and tempering.

The Allotropism of Iron.

The next portion of the subject was one of great difficulty. Prof. Austen gave full reasons for his belief in the allotropism of iron—that it can exist in more than one state. For instance, carbon may be equally pure carbon either in the diamond or sooty form; sulphur equally pure sulphur, either in a form which is soft and pliable at ordinary temperatures, or in the hard yellow form with which we are all familiar; the soft passing instantaneously into the hard variety with evolution of heat. In the same way there is strong reason to believe that at a red heat the molecules of iron are really hard.

The Effect of Heat on Iron.

If pure iron be cooled, either quickly or slowly, it passes into the soft modification; but if carbon be present and the metal be quickly cooled, it has no time to pass into the soft modification; the presence of the carbon hinders its passage, and hard steel is the result. Bearing in mind that evolution or absorption of heat is the surest indication of molecular change in the element, Prof. Austen gave experimental evidence of the existence of

Molecular Change in Iron.

One experiment was very curious. A red-hot bar was taken from the furnace, gripped only at one end, while a weight was attached to the other. The bar did not bend when in its hottest state; it might have been expected to be soft, but it fell six inches as soon as the point of molecular weakness came, the iron being comparatively cold.

The Condition of Iron Easily Affected.

The professor proceeded to show how important the action of small quantities of matter on masses of iron or steel really is, pointing out that this appeared to be a broad principle of nature, one recognized by the alchemists, and still employed by the metallurgists, who marvel daily at the extraordinary effect which would be produced on iron by quite small doses of sulphur, phosphorus, chromium, or aluminum. Prof. Austen said that he was not afraid of the taunt of Francis Bacon that "sottishly do the chymics appropriate the fancies of poets in the transformation of bodies to the experiments of their furnaces," for, although metals could not be transmuted, they could be transformed by very slight influences, so as to behave, from the point of view of special work demanded from them, either beneficially or prejudicially.

The Best Qualities of Steel.

Prof. Austen pointed out the importance of hardening and tempering in relation to all kinds of steel. In the early days, when steel was substituted for iron, it was viewed with suspicion, mainly because the fact that iron could exist in two distinct molecular states was ignored. He showed that the material of which the Forth bridge is made owes its substantiality to the fact that, while being very strong, it is very soft and ductile and will not harden energetically. The enormous importance of the

Substitution of Steel for Iron

Was shown by the figures supplied by Mr. Webb of Crewe, who stated that on the entire system of the London & Northwestern railway 18 tons of steel disappeared daily by oxidation and wear. The importance of oil-hardening in relation to gun steel was shown by the fact that at the St. Chamond Works, on the Loire, they had a tank containing 44,000 gallons of oil, into which the hot gun steel was plunged. With regard to highly carbonized steels, it was shown that a properly tempered die would strike 40,000 coins, while one that had been overhardened would probably fracture with the first coin it attempted to strike.

In Concluding His Address,

Prof. Austen said it was strange that so few researches had been devoted to the relations of carbon and iron, and so many to organic chemistry. This arose, he thought, from the belief of chemists and physicists that operations which involved the use of high temperatures were necessarily inaccurate. It could not be that chemists feared, to quote Macaulay, that "science would be degraded by being applied to any purpose of vulgar utility," for he trusted that he had shown that "the empire over matter," which is the object of all research, could be as surely gained in the field of metallurgy as in any other.

Rolling Fluid Metal Nothing New.

The wise King of the Jews was not far wrong when he said "there is nothing new under the sun." Reference is made to this remark by the fact that the London (Eng) *Ironmonger* of August 24th claims that the Norton-Hodgson (American) process of rolling melted metals into sheets, etc., noticed in these columns a few weeks ago, was covered by one of Sir Henry Bessemer's specifications of 1846 and 1857. The latter is as follows: "My invention consists in manufacturing sheets, plates, bars and other forms direct from fluid malleable iron or steel, in place of allowing the same first to cool, or set in molds."

It appears that the patent also included the rolling of rough plate-glass in a fluid condition between a pair of horizontal rolls, which were cooled by water passing through them; also an apparatus for making tin-foil in large sheets by allowing the fluid tin to flow in between a pair of rolls, kept cold by being made hollow and having cold water passing through them. And it is specially stated, "It will be obvious that by the same means as here described, thin sheets of other metals, or alloys of metals, as well as tin-foil, may be equally well manufactured."

Then followed the description of the rolling-mill, with its hollow rolls and water circulation, with external jets playing against the rolls, and the other accessories described in the American invention.

Subsequent History of Bessemer's Process.

It appears that this process was one of the inventions which Mr. Bessemer included in his licenses for working the Bessemer steel patent. Having thus ceded his personal interest in the process, he had no cause to undertake its working, and manufacturers generally seem never to have considered its possible profit worthy the difficulties of development. In the new American invention there may be, for all one can tell from the descriptions which have yet reached England, important differences from the process invented by Bessemer. But the fact remains that for years the principle has been available to our tin-plate makers and other metal-rollers for gratuitous utilization. Of course the patents controlling it have now expired. It does not, perhaps, say much for English metallurgical enterprise that it has been left to America to suggest the practical employment of the process.

Mr. Bessemer made various experiments at the time with his patent machine, and rolled some tin-plate which was pronounced by competent judges to be of splendid quality and finish.

The *Ironmonger* says: "A small piece of this very plate is shown in the large case of specimens of early Bessemer products which was presented some years ago by Sir Henry Bessemer to the Iron and Steel Institute, and is now in the possession of that body. The practicability of the invention was absolutely proven, but it was not pushed forward for the sole and simple reason that nobody had any direct interest in working it."

LOOKING INSIDE BOILERS WHILE UNDER STEAM. — A German scientist, Herr Blass, claims to have devised an incandescent lamp arrangement by which the interior of a boiler may be inspected while the same is under steam. A thick, black tube is inserted through a stuffing-box, through which a small incandescent lamp is introduced, which is connected with a battery. By means of a thick glass-plate, located in the shell of a boiler at a convenient place, the illuminated interior of the boiler may be inspected. While this appears at first sight but a scientific experiment, brought into practical shape it might prove a valuable aid in investigating the conditions prevailing in a boiler at work, and thereby be the means of providing remedies for many of the existing uncertainties in boiler manipulation.

SCIENTIFIC PROGRESS.

The Wonders of Science.

So many queer and unexpected things have been accomplished by science, in recent years, and especially by means of the telephone and its allied appliances, that the public mind is prepared for almost anything. True, we have not yet seen people getting their dinner out of the end of a wire, or men flying around in the air by aid of machines formed with aluminum and operated by electricity; neither have we seen sleep done away with as a waste of time, or the elixir of life fully successful in doubling or trebling the past extreme age of life. These dreams have not as yet been realized; but it is unsafe, in view of what has already been done, to pronounce them absolute impossibilities. But, in very truth, there seems to be scarcely any limit to the power and expansibility of electricity in connection with conducting wires.

For We Can See Sound

Looking down into the throat of a phonograph; we can see a laugh, a cry, a whistle, a strain of music, the ring of a bell, the bark of a dog, thunder, and the whistle of a locomotive. There it is all recorded on a sheet of wax in a series of little dents or holes made by the point of a needle, and without the use of a powerful magnifying-glass you cannot distinguish any difference between these sounds as recorded by the phonograph. Nobody, not even a scientist, would have thought such a machine possible 15 years ago, and that is why it was discovered by accident and not as the result of a long series of logical scientific deductions, and after it was discovered and perfected science has stepped in and furnished the explanation of its phenomena. Next we have a device for

Magnifying Sound.

It is called a "megaphone," or sound magnifier. This is one of Edison's latest efforts, and is regarded as one of his most wonderful exhibits at Paris, where it seemed to attract more attention from the Frenchmen than did any other of his numerous exhibits, not excepting the graphophone, which is so well known on this side. Going into the American exhibit with a friend, says the New York *World*, you would send him to a point a half mile away and ask him to whisper certain words into the megaphone. As soon, it seemed, as the syllables had left his lips, they came bounding over the wires to your ear so greatly magnified that what he spoke as a whisper reached you as a mighty roar, powerful, resonant, yet as distinct as if shouted at your side. The popular American topical songs, as rendered through the graphophone, attracted continuous and enthusiastic crowds. Then we have a

Far-Sight Device,

Which is quite certain to become a practical reality, and by which we will be able to see and recognize our friends even though many miles away. In addition to what Mr. Edison is doing with this device, several European savants have also taken up the development of this wonderful idea. Herr Korzel, a well-known German savant, recently showed its feasibility by exhibiting to a party of scientists in Berlin the image of a friend depicted on a glass plate, who was at that moment speaking to him through a telephone at Potsdam, many miles away. Just before Mr. Edison left London on his return home, he wrote to Mr. McLaughlin, who is Vice-President of the Pacific Phonograph Co., that he had some new phonographic ideas which he thought would be useful and which he would proceed to work out as soon as possible after his return to New York.

Electro-Magnetic Disturbances.

It is well known that electro-magnetic disturbances on this coast have occurred simultaneously with certain sun disturbances observed through the telescope. Evidently the electro-magnetic force must have traveled from the sun to the earth with the velocity of light. Twenty years ago Clerk Maxwell asserted that light was an electro-magnetic wave movement. Following out his suggestion, an interesting series of experiments has recently been made by Prof. Hertz of Brown University, at Providence, Rhode Island, which show that electro-dynamic force is, like light, a wave motion, propagated through ether, and, like light, subject to reflection, refraction, and concentration by means of lenses. Prof. Hertz's experiments were based on the variations of an induction current at various distances from a metal wall, reflecting the primary current; based, in fact, on the well-known phenomena of wave interference, and they show the length of an electro-dynamic ether wave to be 1.72 m., its velocity through space to be 300,000 m. per second, or identical with that of light. By means of a metal reflector, electro-dynamic waves were focused, some substances, such as wood, being transparent; others, such as metal, being opaque, and casting electro-dynamic shadows. A huge prism of tar, weighing 1200 pounds, showed that the laws of refraction are analogous to those of light. Almost infinitesimally short vibrations of ether manifest themselves to us as chemical action, longer ones as light, still longer waves as heat, and these very long waves as electro-dynamic force. Electro-dynamic force is the low and fundamental base of which light and heat and chemical action are the high treble.

Gravitation and Other Mysterious Forces

May yet be shown to be wave lengths in the middle register, and practical applications will undoubtedly be made of this new control over electro-dynamic forces possibly as important as those of the telescope, microscope and spectroscope over light.

Only in the Vestibule of Knowledge

It may be truly said that we are as yet only in the very vestibule of knowledge, and great as have been the unfolding of nature's treasures, what has thus far been done must only be regarded as but the beginning of what may be revealed to future generations. In the search for knowledge it may truly be said: "Veil after veil will lift; but there must be veil upon veil behind."

WHY MORTAR HARDENS.—Mr. G. R. Burnell says that until very recently it was held by most engineers and architects, by himself among others, that the solidification of mortars took place in consequence of the absorption of carbonic acid gas by the lime during the process of crystallization; but it has been fairly objected to this theory that the quantity of carbonic acid gas contained in the atmosphere, which could be brought into contact with a large body of cement, would not suffice to saturate the latter. The generally received opinion on the subject now is, that limes harden simply in consequence of the combination with water which takes place during the slackening; and that the rapidity of the setting, and the permanence of the newly-formed hydrate of lime, depends upon its being combined with some other salt; the pure hydrate of lime, in fact, is soluble, the hydrated silicate of lime is tolerably insoluble, but it forms slowly; while the hydrated double silicate of lime and alumina, or of lime and magnesia, are practically insoluble. The facts actually observed seem to confirm these views, and they certainly enable us to account for not only the different modes of setting, observable in different limes, but also for some of the more gradual actions which take place in that material, and the effects reciprocally produced by the mixtures of various ingredients. In the case of the now generally used Portland cements, and in that of under-burnt lime, some very curious phenomena may, however, be observed, which appear to indicate that the simple laws mentioned above do not comprehend all the conditions which may arise; so that the above theory itself must only be considered as a step toward the attainment of a complete one of a more general character. The phenomena, to which he thus alludes, are connected with the obscure subject of the chemical actions which take place under the influence of high degrees of temperature.

WHAT BRANCHES EMPLOY ELECTRIC WELDING.—At present electric-welding machines in different parts of the country are being used in the following capacities: Axle welding, carriage gears, fifth wheels, twisted-wire cables, welding safe ends of boilers, wagon tires, hoops for barrels. It is also used for joining wires of copper, iron, steel and German silver together in like metals and different combinations. Bars of metals may be joined at angles, as T or Y joints; welding eye rings to the end of bars making rings of precious metals, uniting steel with iron in the manufacture of agricultural implements, tools, etc.; lengthening or shortening rods, bars, screws or bolts; welding of cast-iron pieces in the general construction of machinery, such as frames, fittings, etc. Electric machines are also used in welding boiler plates and other sheet metal and thereby replaces the ordinary method of riveting. The machines are suitable for clamping devices, for electric soldering, brazing, forging or bending of metals. The electricians in the establishment of the Thompson Electric Welding Co. at Boston are now experimenting on radiator and general brazing, on riveting machines which it is claimed will cause a complete revolution in the old methods of riveting, as by electricity the riveting can be done so as to avoid all leaking. One of the latest and most satisfactory developments has been that of welding chain. The company claim that a great merit to the electrically welded chain links is that when subjected to a fracturing load the limb will break away from the weld, whereas when welded by ordinary processes it almost invariably breaks at the weld.

A NEW FLAMELESS EXPLOSIVE.—Miners have long been on the lookout for an explosive which, while doing the work of gunpowder, will be free from the danger which attends that explosive in mines when explosive gases are liable to be met with. It is now claimed that such an agent has been discovered. The *British Mail*, of September last, says that a flameless explosive, called carbonite, which has for some years been largely used in German coal-mines, will shortly be introduced into England. A powerful syndicate, comprising some of the engineers of the best coal properties in the United Kingdom, has been formed for this purpose. It is stated that this explosive has been proved to be absolutely safe in "fiery mines," and in cases where it has been exploded in the midst of an explosive mixture of fire-damp and air it has failed to ignite the mixture. The regulations against the importation of these explosives are so rigid that it is difficult to get any new explosive brought into the country. We are informed that, through the kind offices of Mr. Stuart Wortley, M.P., a special permit will be given for a parcel of the explosive for experimental purposes, and that the first experiments will be carried on at important collieries in the neighborhood of Sheffield.

GOOD HEALTH.

The Secret of Long Life.

We give below, from *Macmillan's Magazine*, some sound counsel for men in the middle of life, and for those as well who are far advanced on the down grade:

Bacon says: "Discern of the coming on of years, and think not to do the same thing still, for age will not be defied." Half the secret of life, we are persuaded, is to know when we are grown old, and it is the half most hardly learned. It is more hardly learned, moreover, in the matter of exercise than in the matter of diet. There is no advice so commonly given to the ailing man of middle age as the advice to take more exercise, and there is perhaps none which leads him into so many pitfalls. This is particularly the case with the brain-workers. The man who labors his brain must spare his body. He cannot burn the candle at both ends, and the attempt to do so will almost inevitably result in his lighting it in the middle to boot; the waste of tissue will be so great that he will be tempted to repair it by the use of a too generous diet.

Most men who use their brains much soon learn for themselves that the sense of physical exaltation, the glow of exuberant health which comes from a body strung to its full powers by continuous and severe exercise, is not favorable to study. The exercise such men need is the exercise that rests, not that which tires. They need to wash their brains with the fresh air of heaven, to bring into gentle play the muscles that have been lying idle while the head worked. Nor is it only to this class of laboring humanity that the advice to take exercise needs reservations.

The time of violent delights soon passes, and the effort to protract it beyond its natural span is as dangerous as it is ridiculous. Some men, through nature or the accident of fortune, will of course be able to keep touch of it longer than others, but when once the touch has been lost the struggle to regain it can add but sorrow to the labor. Of this our doctor makes a cardinal point, but pertinent as his warning may be to the old, for whom indeed he has primarily compounded his elixir vitæ, it is yet more pertinent to men of middle age, and probably it is more necessary. It is in the latter period that most of the mischief is done. The old are commonly resigned to their lot, but few men will consent without a struggle to own that they are no longer young.

Light in the Sick-Room.

Dr. B. W. Richardson, in the course of a lecture on "Disease, and How to Combat It," makes the following remarks:

A custom prevails, despite all our sanitary teachings, that the occupant of the sick-room in the private house should be kept at all hours in a darkened room. Not one time in ten do we enter a sick-room in the day-time to find it blessed with the light of the sun. Almost invariably, before we can get a look at the face of the patient, we are obliged to request that the blinds may be drawn up, in order that the rays of a much greater healer than the most able physician can ever hope to be may be admitted. Too often the compliance with this request reveals a condition of room which, in a state of darkness, is almost inevitably one of disorder everywhere; foods, medicines, furniture, bedding misplaced; dust and stray leavings in all directions.

In brief, there is nothing so bad as a dark sick-room; it is as if the attendants were anticipating the death of the patient; and, if the reason for it be asked, the answer is as inconsistent as the act. The reason usually offered is that the patient cannot bear the light; as though the light could not be cut off from the patient by a curtain or screen, and as though to darken one part of the room it were necessary to darken the whole of it. The real reason is an old superstitious practice, which once prevailed so intensely that the sick, suffering from the most terrible diseases, smallpox, for instance, were shut up in darkness, their beds surrounded with red curtains, during the whole of their illness. The red curtains are now pretty nearly given up, but the darkness is still accredited with some mysterious curative virtue.

A more injurious practice really could not be maintained than that of darkness in the sick-room. It is not only that dirt and disorder are results of darkness; a great remedy is lost. Sunlight is the remedy lost, and the loss is momentous. Sunlight diffused through a room warms and clarifies the air. It has a direct influence on the minute organic poisons, a distinctive influence which is most precious, and it has a cheerful effect upon the mind. The sick should never be gloomy, and in the presence of the light the shadows of gloom fly away. Happily, the hospital ward, notwithstanding its many defects—and it has many—is so far favored that it is blessed with the light of the sun whenever the sun shines. In private practice the same remedy ought to be extended to the patients of the household, and the first words of the physician or surgeon on entering the dark sick-room should be the dying words of Goethe: "More light, more light!"

PENSION DISEASES.—There is a delightful contrast between the rugged and healthy state of the veteran after his pension has been allowed and his decrepit condition before the allowance. I know a man who was simply a harbor of refuge for diseases until he obtained his pension, and then they disappeared. Having drawn his "arrears," he prudently took out a life-insurance policy. The affidavit upon which he obtained his insurance policy curiously contradicted the affidavit on which he got his pension, proving that the pension had restored him to health and made him a "good risk" for the insurance company. The Department was greatly shocked on learning the facts and revoked the pension, but on discovering that the delinquent was a good caucus warrior and hustler at the polls, the Department became shocked at its own imprudence and restored him to the "nation's roll of honor." It is not irony or sarcasm to say that the insurance companies can afford to give lower rates to old pensioners than to other people, because the pensioners' chances of long life are greater than the chances of other men.—*Gen. M. M. Trumbull in the Popular Science Monthly.*

FOR COLD IN THE HEAD.—There are a number of ways of aborting a cold in the head, but most of them are by the means of quite powerful drugs, which a person unfamiliar with their use is never justified in taking on his own responsibility. The Swiss method of treatment is one of the simplest and most efficacious. It is applied in this way: Half fill a jug with boiling water, and into that put a teaspoonful of well-powdered camphor. Fashion out of writing-paper a funnel with which cap the top of the jug. The camphorated steam should be inhaled through the nose for 10 or 15 minutes, the inhalation being repeated, if required, every four or five hours. If, in spite of its unpleasantness, the inhalation is persisted in, it is said that three repetitions will always effect a cure, however severe the "cold in the head" may be.

INTERESTING SURGICAL OPERATION. — The Manchester *Guardian* mentions a wonderful new departure by a provincial surgeon. A small tumor was removed from an important nerve in a patient's arm, and in the course of the operation some of the nerve itself was taken away. This was naturally followed by loss of sensation in the part of the skin to which the nerve was distributed. After 48 hours, the surgeon, having obtained a piece of healthy nerve from a leg which had just been amputated, proceeded to restore the continuity of his patient's nerve with the borrowed piece of tissue. The result was that sensation returned in 36 hours, and there was every prospect of a complete recovery.

USEFUL INFORMATION.

What Invention Has Done.

In making bread-boxes, three workers can do the work of 13 box-makers by old methods.

In cutting out clothing and cloth caps with dies, one worker does the work of three by old methods.

In leather manufacture, modern methods have reduced the necessary number of workers from 5 to 50 per cent.

A carpet-measuring and brushing machine with one operator will do the work of 15 men by the old methods.

In the manufacture of flour, modern improvements save 75 per cent of the manual labor that once was necessary.

In making tin cans, one man and a boy, with modern appliances, can do the work of 10 workers by the old process.

By the use of coal-mining machines, 160 miners in a month can mine as much coal in the same time as 500 miners by the old methods.

One boy, by machinery, in turning woodwork and materials for musical instruments, performs the work of 25 men by the old methods.

In the manufacture of boots and shoes, the work of 500 operatives is now done by 100, a displacement of wage-earners of 80 per cent by aid of machinery.

In stave-dressing, 12 co-laborers, with a machine, can dress 12,000 staves in the same time that the same number of workers by hand could dress 2500 staves.

In the cotton-mills in the United States, the manual labor has been reduced about 50 per cent. Now one weaver manages from 2 to 10 looms, where one loom was formerly tended by one worker.

In the manufacture of brick, improved devices save one-tenth of the labor, and in the manufacturing of fire-brick, 40 per cent of the manual labor is displaced.

In the manufacture of carriages, it used to take one man 35 days to make a carriage. It is now made by the aid of machinery with the work of one man in 12 days.

In the manufacture of agricultural implements, 600 operatives, with machinery, including 18 classes of wage-earners, do the work of 2145 wage-earners without machinery, displacing 1545 workers.

In the manufacture of wall paper, one worker, by the aid of machinery, does the work of 100 workers by manual labor, and in cutting and drying paper by machinery, four men and six girls do the work of 100 operators by old methods.

In manufacturing gun stocks, one man by manual labor was able to turn and fit one gun stock in one day of ten hours, while three men now by a division of labor, and the use of machinery, can turn and fit 125 to 150 gun stocks in ten hours. This displaces the work of 44 to 49 wage-workers.—*Ex.*

REMOVING OLD PAINT.—The ordinary process of scraping old paint, or burning it off, is hardly expeditious enough for general purposes, and is also laborious. Soda and quicklime are far more thorough, and the paint is more quickly removed. The solution of half soda and half quicklime is thus made: The soda is dissolved in water, the lime is then added, and the solution can be applied with a brush to the old paint. A few minutes is sufficient to remove the coats of paint, which may be washed off with hot water. Many preparations are sold for the removal of paint, all of them having some basis of alkali. A paste of potash and strong lime is far more effectual in operation, and the oldest paint can be removed by it. Afterward a coating of vinegar or acid should be used to cleanse the surface before repainting. One authority on the subject recommends the gasoline lamp, a quart of oil being sufficient to last 3½ hours. The method is considered superior to gas, as the flame is stronger and the cost less, besides which the lamp can be carried to any part, which cannot be done conveniently with a gas-jet. But the use of flame of either is dangerous, and to be avoided when possible. For removing varnish, spirits of ammonia is used, but it is a slow process, and several applications are necessary. Scraping and sand-papering can be employed; but it must be done carefully by experienced hands, or the surface of wood will be injured. The *Scientific American* notes that the chemical process of removal has the advantage of leaving the surface in a better condition than burning off or scraping, and for large surfaces of paintwork is to be preferred.

PRESERVING A LAWN.—After a lawn has been neatly leveled, sown, and become well set in grass, the main point is its preservation. This is in no way difficult, if frequent applications of fertilizers are made and severe wear is not allowed in particular spots for games or otherwise. Though fine bone is best to seed down with, when it is harrowed into the soil, it is of little or no use when sown upon the grass. Instead of that, a good complete fertilizer, using about five pounds to the square rod, once in a season, after the first spring mowing, will keep it up. An odorless brand is to be preferred. Wood ashes alone will keep up the grass for some time, but when this is used, it is well to apply some nitrous fertilizer occasionally, say a pound of nitrate of soda to the rod, when and where the grass lacks greenness.—*Vick's Magazine for September.*

A "READING LAMP," which is being put in use on the Southeastern railway, in England, is thus described: "It is on the principle of the 'put a penny in the slot' automatic machines. The apparatus is situated immediately over the passenger's head, and under the rack, and is contained in a small box five inches by three inches. The light is of five-candle power, and is obtained by the introduction of a penny at the top of the box, and by the subsequent pressure of a knob, and will last for half an hour, extinguishing itself at the end of that time automatically. If the light be required for an indefinite period, a penny every half hour will suffice. The light can be extinguished at any moment by means of a second button provided for the purpose. This invention will add greatly to the comfort of passengers during night journeys."

THE WORLD'S CONSUMPTION OF COAL.—The total coal consumption of the world is said to amount to more than 1,000 000 cwt. per hour. Of this quantity about 240,000 cwt. are required per hour in order to heat the boilers for stationary and marine engines, locomotives, etc. The production of pig iron requires 100,000 cwt., and that of other metals 80,000 cwt. per hour. The average hourly consumption of household coal is recorded at 200,000 cwt.

A HINT TO INVENTORS.—It is said that the common cowcatcher attachment to locomotives is about the only article of universal use that was never patented. Its inventor was D. B. Davies of Columbus, Ohio, who found his model in the plow. Red lights on the rear car of trains, it is further said, were adopted at the suggestion of the late Mrs. Swisshelm, after a railway accident in which she had a narrow escape.

COAL WITHOUT SMOKE.—A new process for burning coal without smoke, it is said, has lately been discovered. It consists in sprinkling water containing a special preparation of resin over the coal, and the result is that there is no smoke, and the glow is as intense as coke. An English company is to be formed to work the new atent.

CARPETS FROM COWS' HAIR.—By a new process, and by means of perfected machinery, manufacturers in the East are making carpets out of cows' hair, claimed to be superior to woolen carpet This industry will prove of great benefit to the cattle interests of the West in making a market for the hair as well as the hide.

A MOSCOW FOUNDRY fuses metals by electricity. The glare is greater than the sun, and employes work two hours per day.

ENGINEERING NOTES.

Bridge or Tunnel—Which?

The scheme for making a direct connection between England and France has assumed a new feature in the proposition to make a bridge the connecting link instead of the long-talked-of tunnel. The completion of the new Forth bridge and other great advances which have recently been made in bridge construction has so stirred the engineering world that a serious proposition has been made by Schneider & Co., the great French ironmasters, to construct a bridge from Calais to Dover, the length of which will be 24 miles, to be sustained on 120 piers planted in the sea, at a cost of $170,000,000.

The Project Before the French Savans.

A paper upon the subject was read before the late meeting at Paris of the French Iron and Steel Institute, in which it was shown that the construction would occupy about 12 years and require 1,000,000 tons of steel for the superstructure alone. The width of the openings between the piers would be about 320 feet; greatest hight of bridge above water, 180 feet; greatest depth of water, 170 feet. Thus the highest piers would be 350 feet above foundations. Bunker Hill monument would form but a small portion of one of the largest piers if they are to be built of masonry. The piers would undoubtedly be constructed of iron on foundations of solid masonry. The most serious engineering work would consist in constructing the foundations. If they can be properly laid and constructed, the superstructure would present no serious difficulty if the money can be had.

In Laying the Foundations,

All the sand and other sediment which rests on the chalk strata would have to be removed, as the chalk would form the only reliable basis for such an immense superetructure. Valuable information has been afforded by the borings lately made in connection with the proposed channel tunnel.

This Great International Subject

Drew forth many divergent views in the course of discussion. Mr. Daniel Adamson, speaking of its utility, well pointed out whether in the course of the next 10 or 20 years steamship communication would not become so much cheaper that a bridge would not be necessary. He pointed out with regard to Atlantic-going vessels that these were now using only about half the fuel that they consumed ten years back for carrying any given weight, and it was possible that in this department of fuel economy a similar rate of progress might be kept up in the future. The cantilever principle was not to be adopted. The truss-girder system would be employed in the construction.

The Channel Tunnel

Had, Mr. Tylden Wright thought, a better prospect of success than the bridge scheme. He thought the channel-bed was more suitable for a tunnel, and, besides, he believed the cost of a tunnel would not be one-sixth the cost of a bridge.

The Names that Guaranteed this Design

Had, the president thought, been overlooked during the discussion. Sir John Fowler and Mr. Baker believed it practicable, and there was therefore only one formality necessary, namely, the providing of the necessary funds. He had heard that a very eminent financial establishment was prepared to finance the scheme. The project had been seriously considered; it had been beautifully worked out and the calculations on the various departments had been checked by the highest authorities.

The Political Question

And the question of interference to navigation will probably stand in the way of the erection of the structure, but that is outside the province of the institute.

An English Opinion.

London *Iron*, in commenting upon the scheme, says: "It seems scarcely possible to treat seriously this proposal to construct a bridge across the English channel, and yet, we suppose, it must be regarded with a certain amount of gravity, seeing that the project has been broached to and discussed by such an august body as the Iron and Steel Institute. In spite of such sponsorship, however, the scheme can scarcely be said to come within the range of practical engineering. We should have been disposed to treat the matter as entirely outside the pale of reasonable discussion, but for the fact that two such eminent English engineers as Sir John Fowler and Mr. Benjamin Baker have appeared in the character of godfathers to the project by allowing their names to be connected with it as consulting engineers. It is very well for engineers to be daring in their conceptions, but when they approach the chimerical and the impracticable, as in our opinion they do in this case, it is time to utter a protest. We do not mean to say that it is not possible to build a bridge across the channel, with the expenditure of sufficient money and time, but what we strongly maintain is that it would never be a practical success, however much of an engineering one it might be considered; and that, moreover, the objections to it are so insuperable that the scheme stands at once condemned. Let any one think for a moment of the impediment it would offer to navigation.

Passing Events.

The late heavy rains have started the miners into activity all over this State. The past season was a dry one, and many mills were closed. When water is in short supply the mining industry languishes, but with full ditches, flumes and streams, the gold yield is increased.

Now that the cruiser San Francisco has been successfully launched, the Union Iron Works will go rapidly ahead with the other Government ship for which they have the contract. Having proven that good vessels of first-class type can be built here, these shipyards will have plenty to do in the future.

The gradual rise in the price of silver is pleasing to the mining public. Even when it reaches $1 the discount will be heavy enough—over one-fifth of the real value—but when it continues below that figure great loss is entailed on the silver miners.

A plan to effect the draining of the Gold Hill mines on the Comstock lode is being discussed by representatives of the following companies: Alta, Alpha Con., Belcher, Crown Point, Confidence, Challenge Con., Con Imperial, Caledonia, Exchequer, Justice, Overman, and Seg. Belcher and Mides Con. By the placing of pumps at the 1400 station of the Crown Point incline, the water can be pumped into the Sutro-tunnel connection, and in that manner the mines can be drained down to the 2760-foot level of the Belcher, where valuable ore is known to exist. The expense of the operations will be borne by the companies named.

Time for Action.

It begins to look very much like a necessity for the miners of the Pacific States and Territories to form an association of some kind, or hold a convention, in order that they may bring forcibly to the attention of Congress certain matters which seriously affect their interests. The Interior Department and Treasury Department seem to have altogether too much control over certain details, and their rulings, decisions and constructions are almost uniformly unfavorable to the laboring miners and prospectors.

Congress specially reserved mineral lands from the railroad land grants; yet in California and Montana the railroad companies are obtaining lands known to be mineral in character and to contain mines in operation. Between the deputy mineral surveyors' reports, the Surveyor-General's official maps, the Land Office rulings, and Secretary of the Interior decisions, technicalities and omissions have overcome the real intent of the law. The Montana miners are trying to make a fight in this matter, but their efforts thus far have amounted to little. Their protests and petitions have been pigeonholed and no attention paid to them.

Then the Secretary of the Treasury, by a technical ruling, permits lead ores to come into this country free of duty from Mexico and Canada, though the law puts a duty on lead ores. To this the mining community has vigorously protested, and continues to protest, but without avail. The ruling or decision, which has been in vogue some time, must hold until Congress again convenes. Meanwhile the lead miners of Nevada, Utah, Idaho, Colorado and other sections must practically stop work, while the big smelting corporations of the Southwest grow rich out of this interpretation of the law.

The authorities at Washington appear to care very little indeed for the mining interests of the country outside of coal and iron, in which the Eastern Coast is mainly interested and of which the Pacific Coast has little. Copper is pretty well looked after, too, because there are copper mines at Lake Superior. But silver and lead have a hard time of it, because, perhaps, they are mainly produced on this coast, where we have no special political influence.

It has been exceedingly difficult to accomplish any legislation which would be favorable to the silver interests. Recent events show it has been even more difficult to bring the Departments to a realizing sense of the injustice of the rulings concerning lead. As to contests concerning mineral lands and railroad grants, it appears as if the railroads were obtaining what they want. Between agricultural and mineral claimants the former are getting the best end of the bargain by systems which we have fully explained in the PRESS on former occasions. Of late, too, timberland claimants in the Northern part of this State are trying to cover mineral sections. Another thing; The Government is seriously interfering with the mining industry by the prevention of timber-cutting in mining districts.

All these things are seriously detrimental to the mining industry, but how they are to be remedied is a question. The efforts to combat the evil have so far been mainly by individuals. Some few local organizations have been formed, but thus far no general movement of the mining community has been attempted. Is it not time this should be done? In order to accomplish any permanent good and remedy the evils that are growing, vigorous action is necessary. Concerted action of a large number of people with the same aims and objects can accomplish far more than individual effort, however well directed. If half a dozen or more men prominently identified with the mining industry should get together and start the measure, it would soon lead to a large and powerful organization which would remedy the present state of affairs.

THE sale of the Silver Bell lead mines was closed Saturday to New York and London parties. The price paid was $200,000. The property is located 30 miles west of Tucson.

A SYNDICATE of Chicago capitalists are arranging for the establishment of two large blast furnaces in Seattle, W. T.

STRIKES among the Belgian coal miners are assuming large proportions.

Water and Gold.

As we get more knowledge of working gold ores and more fully realize the importance and difficulty of saving the very fine gold which all of them contain to a greater or less degree, the more must we recognize the fact that the water on which we depend so much, is, in truth, a great thief. Practically all of the processes in vogue for working gold, either in placer or quartz, involve the liberal use of water. Yet where there is any fine gold the water will carry it off in greater or less quantities.

It will be surprising to any one who has never made the experiment to see how long very fine gold will remain in suspension in water placed in a glass or bottle. Not only for hours but for days can fine particles be discerned with a lens, still suspended in the water, when most of the gold has precipitated. If this is the case in still water, how much can the constantly flowing water in batteries or sluices not carry off? Aside from that "rusty" or coated gold which refuses to amalgamate, large losses are constantly going on by reason of the tendency of very fine gold to "float" or remain in suspension in agitated water. There are places in this and other countries where floats covered with sheepskins are placed in rivers to collect these floating particles of gold. How far from the source the gold will be carried no one knows, but that it will go a long distance is certain.

It is not too much to predict that as we become more economical and careful in our methods of working gold ores and other auriferous material, the greater will be the tendency to work such ores and material with as little water as may be. Perhaps the miners of the future will depend on a dry process as much as we do in these days on the wet ones. The objection to such dry methods as have been advocated are mainly because they are comparatively slow; but possibly we can make more money by doing things slower. There is no better amalgamator than the old-fashioned arastra, but it is not a machine that can be hurried to advantage. It is possible that the element of time in amalgamation has not been sufficiently recognized. Mexicans, who are good metallurgists, do not work ores as rapidly as we do, but they get more out of them as a general thing.

Much improvement has been manifest of late years in the working of gold ores, but it has been mainly in the direction of attention to details, care and less extravagance and waste. There has been no radical change in processes. We can work ores cheaper and to a higher percentage than formerly, so that mines that would not pay 10 or 15 years ago are profitable now. Yet there is still a percentage of loss, which we ought to stop. How much of this is due to the quantities of water we use it is difficult to determine. It is very well understood, however, that such ores as have much fine free gold are hard to work anywhere near the fire-assay value. All gold ores and earth have more or less fine gold, much of which we now lose by our methods. At any rate, if we get rid of using water, one well-known element of loss will be avoided.

TUOLUMNE MINES.—Our correspondent "Argus" writes us to add to his communication (printed on page 336 of this number of the PRESS) that the "corrected amount of the yield of the last pocket in the Divol Bonanza is $80,000, not $100,000." Also in speaking of Maltman's chlorination works, he says: "Mr. Maltman intends at once to make considerable additions to his works, among them a dry pulverizer and a stamp-mill, so that miners can have their rock reduced, concentrated and chlorinated at his mill. To those miners having no crushing appliances this is a desirable advantage."

S. C. HOUGHTON, Master in Chancery of the Circuit Court, in company with Messrs. Barstow, Herrin, C. W. Cross and L. L. Robinson, has been examining into the workings of the North Bloomfield and Omega mines in connection with the alleged contempt of the owners in violating the decrees of the court.

AN English syndicate with several millions back of it is trying to acquire the proprietary rights of certain American patent medicines.

TWO HUNDRED tons of pig iron were shipped from Port Townsend to San Francisco last week.

The New Sutro Tunnel Scheme.

Superintendent Thomas of the Sutro Tunnel suggests the following novel and economical plan for draining the flooded levels of the Comstock mines, which is receiving the serious consideration and general approval of experienced engineers.

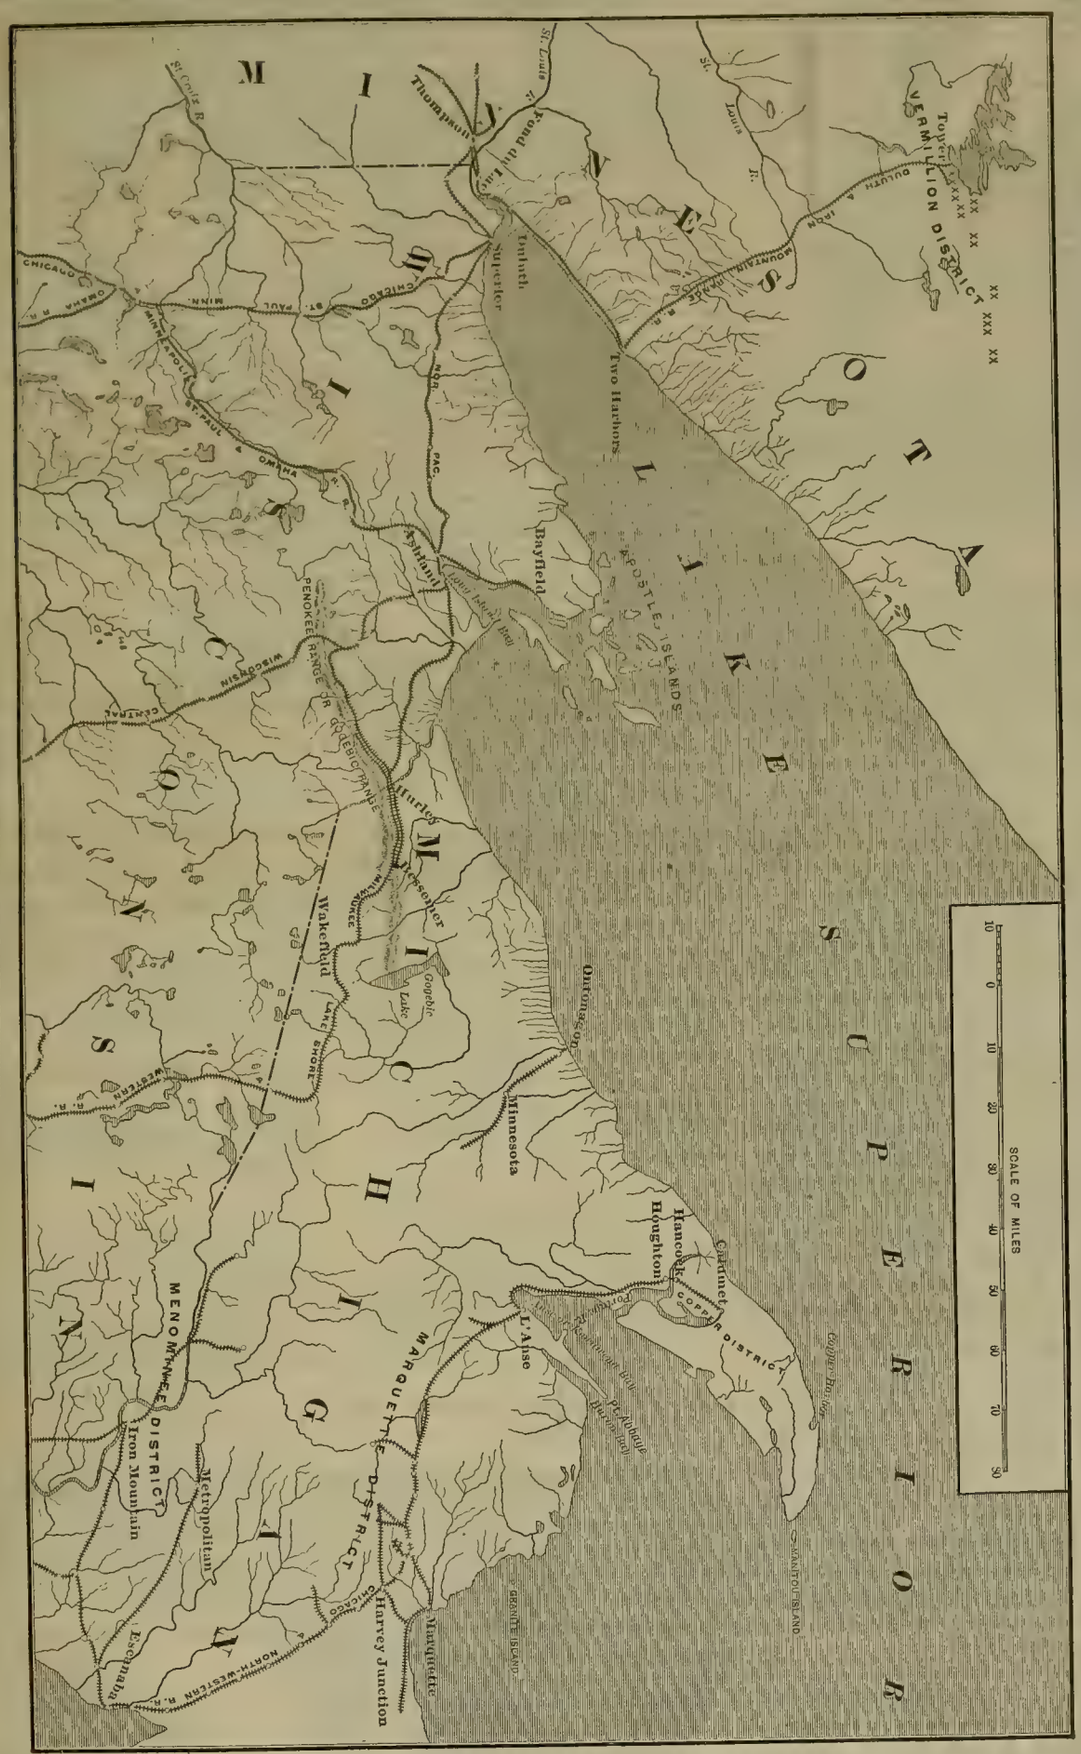
It is proposed to place powerful air-compressors at the mouth of the tunnel, to be operated by Pelton wheels driven by the water flowing through the tunnel, which will include also that raised to the tunnel level by a series of pumps of a combined water-lifting capacity of eight million gallons per day. These pumps are to be operated by compressed air furnished as above described.

The plan outlined is regarded as perfectly practicable and will give renewed life and activity to operations on the whole line of the lode. The vast amount of power developed by the waste water of the tunnel will admit of prospecting to much greater depths than ever before reached, as well as working profitably a large amount of low-grade ore that cannot be handled by any other means.

The vast amount of power saved by the use of the Pelton wheels in the Chollar shaft by electric transmission, and in the C. & C. shaft by cable transmission, has already made available immense quantities of this class of ore, furnishing employment to a large number of men. Compressed air has in many cases advantage over any other system of transmission, especially for deep workings, as the air, liberated, cools and freshens the underground chambers in a way to greatly facilitate work. A somewhat similar plant is, we understand, under construction for the Commonwealth mine in Colorado. Pelton wheels are to be operated on a stream about half a mile from the mine, which are to run powerful compressors, the air so furnished to be conveyed to the mine for the purpose of running the mill, hoisting-works, pumps, etc.

The mining interests of the country are now being greatly promoted by the increased attention given to the utilization of water-power, both by direct application and the various methods of transmission so successfully employed, the Pelton wheel being very largely used for generating such power, from the fact that it will work with the highest efficiency under any head and every variety of condition.

River-Bed Mining.



The big river mining schemes have been in hard luck of late. The Big Bend enterprise did not pan out as expected, and now a similar claim on the same river has met with disaster. The heavy and continued rains raised the Feather river so high that it went over the dam of the Golden Gate mine, near Oroville, and into the river-bed, where the men had just commenced to work. The loss is said to be $100,000, but that can hardly be the case unless both flume and dam are destroyed.

It often happens in river-bed mining that the first rise in the river washes out the dam and whole outfit. In this case, however, the managers of the Golden Gate were supposed to be prepared. The immense flume was carrying all the waters of the river, and it was expected it would continue until late in the season. The dam was 50 feet high and built to withstand a flood. The projectors realized the usual danger in such schemes and were supposed to be prepared for it. They had only been at work in the river-bed a short time and are said to have found very good prospects.

The general scheme is to divert the river from several thousand feet of its bed, by means of a dam and flume. If these were destroyed the amount of damage stated might have occurred, but the mere overflow into the bed again could cause no such amount of loss. Should the flume be all gone, the work of blasting out the rock for its bed is all done and it could be replaced for much less than the original work. The flume to carry the river is 50 feet wide and 3300 feet long. Mr. N. A. Harris and Frank McLaughlin will doubtless go to work again in the spring to put the claim in shape for work. It would not take more than a month's work in the river-bed to pay for all the labor if the claim is half as rich as thought for. In fact they expected to work the whole piece out in a couple of months. Had the heavy rains held off a few weeks longer, all would have been well.

Mines of Lake Superior Region.

To illustrate the geographical position of the prominent mining developments of the Lake Superior district, the annexed map has been prepared. In it no effort has been made to locate undeveloped properties; and the discoveries of ores in the Dominion of Canada, some

of which are mentioned later, are not shown. The only reference to ore properties which are not opened as mines and shipping ore are the *xx* marks east of the Vermilion lake in Minnesota, which are introduced to show the general strike of the ore in that region.

The shipping ports for the iron ores and their present railroad connections are indicated. Other lines are building or projected, but as they could not all be shown correctly, the completed roads only are represented. Marquette acts as a shipping-port for part of the iron ores from the Marquette range, and St. Ignace to the east (not shown on the map) also receives some ore. Escanaba ships the ore from the Menominee range, also part of that from the Marquette range, and some of the ores from the Gogebic range. Ashland is the natural shipping-port for Gogebic ores, and those from Vermilion district are shipped at Two Harbors.

In the Menominee iron district the principal mines are the Chapin, Norway and Vulcan. Others which have achieved prominence as large producers are the Ludington, Commonwealth, Perkins, Florence, Iron River, Quinesee and Cyclops.

In the Marquette region there are several large producers of iron ore. Those which have produced over 1,000,000 tons are the Lake Superior, Cleveland, Jackson, Republic, Champion and New York. Among other producers are the Lake Angeline, Barnum, Humboldt, Michigamme, Winthrop, Saginaw, Salisbury, Pittsburg and L. S., Cambria and McComer.

The Vermilion iron ore mines, in Minnesota, have been developed since 1883. Now a railroad has been constructed extending through the forest for 70 miles to Two Harbors, and 26 miles farther along the lake shore to Duluth, and over 5000 people living around the mines are dependent on the 1300 men engaged in extracting the ore from the mines. To reach the Vermilion iron-ore regions, the Duluth and Iron Iron Range railroad skirts the northern shore of Lake Superior, from Duluth to Two Harbors, where the shipping docks, with a capacity of 14,000 tons, and railroad settlement are placed. From Two Harbors the road follows a general northwest direction, rising in the first three miles 400 feet, and in the first 12 miles 1100 feet, to the summit of what might be called the Coast Range, then crossing the drainage area of the St. Louis river to the Messaba range, a ridge of granite, where explorations are now in progress for magnetic ores. Continuing 15 miles beyond the Messaba range, the Vermilion iron-ore mines are found at an elevation of 900 feet above Lake Superior.

In some of the mines the workings have been open quarries, but preparations are being made, and shafts sunk, for underground operations. The statement has been made that although the thermometer frequently indicated from 30 to 40 degrees below zero, it was not found necessary to suspend work day or night during the past winter in these open pits. Many of the houses at the mines are owned by the operators; the iron company leasing the ground for a term of years at a nominal rental, and permitting the owner of the house to dispose of it to persons in the employ of the company. The ore being hard and dense, lying practically free from any foreign material, except the generally well-defined seams of jasper and "soap-rock," demands the use of rock-drills and high explosives; but as comparatively little must be taken out besides the ore, the cost for explosives per ton of ore is less than is generally estimated.

If the development of the Vermilion iron-ore district is startling, that of the Gogebic iron range in Wisconsin and Michigan is even more so; for although the existence of visible outcrops of ore was well known, and considerable amounts of money were expended by some of our large iron companies, no actual exploitation can be considered as having been made until the year 1885, when railroad connections were completed to Ashland and dock facilities provided.

The district is now dotted along the strike of the ore-bearing rock with progressive towns, having an aggregate population of between 15,000 and 20,000 people. The development along the apparent strike of the ore covers nearly 20 miles in length, and active exploration is in progress for as great a distance both east and west of this territory and also upon a parallel ridge 12 miles south, the latter being for magnetic ore. The center of the present developed iron-ore properties is near to the Montreal river, which forms the boundary between Wisconsin and Michigan; the largest producers up to the present time are, however, chiefly in the State of Michigan. The ores in the Gogebic range differ from those of the Vermilion range in being softer, and, therefore, more easily mined, yielding less iron and also less phosphorus, but carrying a greater percentage of manganese, and more moisture. The dip of the Vermilion ore is nearly vertical; that of the Gogebic ores approximates 70 degrees.

The recent development of the copper mines on the Keweenaw Peninsula has been less marked than that of the iron ores of Lake Superior region; but, notwithstanding the active competition caused by the opening of large Montana and Arizona mines, the progress has been very satisfactory and the Lake Superior mines are operated successfully, where the material extracted yields less than one per cent of copper. The equipments which are connected with these mines, and which in 1880 raised the ore from depths of 2500 feet, but now elevate it 3800 feet, are marvels of American ingenuity, and the appliances for separating the native copper from the gangue are wonderfully complete. The depths of the shafts of the Calumet and Hecla copper mine are reported as follows: Calumet Branch No. 1, 3900 feet; No. 2, 3800 feet; No. 3, 3400 feet; No. 4, 3800 feet; No. 5, 3400 feet; Hecla No. 1, 3800 feet; No. 2, 3800 feet; No. 3, 3300 feet; No. 4, 900 feet; No. 10, 800 feet; No. 11, 1200 feet; No. 12, 1100 feet.

The principal copper mines are the Calumet and Hecla, Quincy, Franklin, Osceola, Atlantic, Central, Huron, Allouez and Copper Falls.

In a review of the Lake Superior mining in-

THE MINING REGIONS OF LAKE SUPERIOR.

dustries, Mr. C. D. Lawton, Commissioner of Mineral Statistics for the State of Michigan, says: "Copper mining in Michigan has become a very uniform industry; prices may vary, but the work at the mines goes on steadily with little apparent change. There is all the while a gradual increase in the magnitude of the operations, resulting in an increased production and a corresponding lessening of cost. Few, even of mining men, who are not acquainted with the details of the work at our Michigan copper mines are ready to give credence to the statements that rock which has a gross value of but $1.65 per ton, or less than 15 pounds of refined copper, on an average to the ton, can be mined at a depth of more than 1000 feet below the surface, hoisted, broken, stamped, washed and separated, smelted, taken to market and sold, and still leave a net profit of 22 cents on every ton. Each year as the price of copper has diminished the daily production has been increased in order to reduce the average cost. In 1876 the cost of stamping and washing was 88 cents per ton, while now it is but 30 cents. The mine is no richer than formerly; in fact there has been practically no change in the quality of the rock. The advantage gained is due to improved facilities for mining and manipulation, to a better comprehension of the work, etc. No business in the land of equal magnitude is more systematically and carefully conducted than is the copper industry of Michigan. There is none more legitimate, or that is conducted with more freedom from speculation and from those manipulations of stock which unfortunately too frequently characterize mining." These facts are condensed from a paper read before the American Institute of Mining Engineers by John Birkinbine of Philadelphia, Pa.

COTTON MANUFACTURES.

Cotton Culture in California.

Experiments have fully proven that cotton can be grown in this State and at a handsome profit when all the conditions are favorable. It would be a great gain to the State if the large extent of river-bottom land suitable to its growth could thus be realized. The following experience of J. W. Moore of Bear valley, San Diego county, was recently given to the editor of the San Diego *Sun:* In 1887 he raised 35 acres of cotton on his Bear valley farm. The field yielded about 6000 pounds, for which he received three cents per pound. Cotton culture did not pay because he had no gin-mill with which to separate the cotton from the seed. He stated, however, that he had had a great deal of experience raising cotton in the South, and that cotton would grow in San Diego county just as well as in Texas, provided it was planted in good corn ground. He also believed that it would do well upon mesa ground if properly irrigated.

Cotton has also been raised to some extent in the San Joaquin valley. Experience has shown that it could be raised there at a fair profit if we had gin-mills to separate the seed from the lint and a home market for its sale. In regard to the latter, the *Journal of Commerce* of this city has the following: The cotton industry here is in a flourishing state, the California Cotton Mills having been a success from the start, albeit they have to obtain most of their material from Texas. What it would be if they could obtain it in the State and at a reasonable figure may be dimly conjectured by the success already achieved. Every year the local industry has had to boast of a record surpassing its predecessor. Duck, twine, battens, crashes, bagging, toweling and cotton rope are made, and meet with ready sale.

The raw material can be raised in this State at a profit of [4@6 cents per pound. It can be grown to greater advantage in Tulare and Kern than in Texas, where we now get our supply. Cotton raised on one or two thousand-acre lots would be a very profitable industry in the State. The planter is not troubled by inclement weather or rains at time of picking, etc. We have many advantages over other States in this regard. We should utilize them. The manufacturing consumption now can give employment to 10,000 bales of 500 pounds each. The future would increase this in a very great degree. The consumption of the United States is about 2,000,000 bales annually. This would give, on the basis of population, about 60,000 bales to the Pacific Coast, to say nothing of export, so that there is room for a great cotton industry among us.

Since the above was in type, our attention has been called to the following paragraph from the San Diego *Sun* of Oct. 10th, which presents still further evidence that

Cotton-Growing in California Will Pay.

The ease with which cotton may be grown in Southern California has been proved more than once in San Diego county, where cotton of the finest sort, and of the perennial habit, has been produced with little or no irrigation. Some samples recently brought from Perris and entered in the Chamber of Commerce display compare with the best Sea-Island grade. They came from plants that had only been watered twice since the seed was put in the ground. From this and other demonstrations made within the past 12 or 15 months, it is fair to infer that cotton is as natural to the soil and climate of Southern California as grapes, figs or apples.

Would the cultivation of it pay? That is a question that ought to be considered. Without specific information on that point, the *Sun* will venture to say that it promises better returns than barley, to which so many of the farmers of this county have given their time without good pecuniary results. It is likely, too, that there is more money in cotton than there is in wine grapes or melons. One item that must not be lost sight of in the financial part of the discussion is the perennial qualities of the plant in this latitude, and the smaller cost of production which depends upon that fact. The ordinary Gulf State and Sea Island cotton has to be replanted annually, therefore the California farmer, who can get along for seven or eight years without renewing his plants, ought to compete with Southern producers to a very great advantage, certainly in a way to control the trade in the far West. Given a market, such as near-by cotton manufacturers could provide, and there is little doubt but that cotton production on a large scale would pay the farming community. There is cheap land enough, outside that adapted to citrus fruits and English walnuts, to provide the right ground plan for competition with the South. For the final labor involved, negroes could readily be imported when cheap Chinese or female pickers were lacking.

The Cotton Crop.

The present season's cotton crop promises well for a large yield. A month ago the crop was set by good judges at not less than 7,500,000 bales. During the past month some untoward circumstances have reduced this estimate to about 7,000,000 bales. The cotton returns to the Department of Agriculture on October 1st showed a large plant growth, an active opening of the bolls, fiber in good condition and generally fine weather for picking. But the crop is reported late at least two weeks. A general percentage of 81.4 of a full crop was the estimate October 1st against 79.8 at the same date a year ago.

A large crop, says the *Boston Journal of Commerce*, is greatly needed, and should the price of it rule on the basis of ten cents a pound for middling grade, it will be readily absorbed in spinners' demands. The present high price of cotton is due to the shortage of supply, which is specially evidenced in the present condition of cotton manufacturing in England and so admitted by those engaged in it. A crop of 8,000,000 bales would not give a surplus. We rather anticipate a slow arrival of cotton at the ports, at first, owing to the stand of the planters' alliances concerning bagging material, unless a change of feeling should take place that prices will rule higher in the early part of the season than later, which may induce the planters to bale their cotton in the hated jute bagging till a sufficient quantity of the cotton material can be had.

Before the war the high-water mark in cotton was 5,300,000 bales. The crop of last year is not yet entirely out of the hands of the planters, but those whose business attention is absorbed by the staple place the amount remaining on hand at not over 60,000 bales. If this season's yield reaches 7,000,000 bales, it will be worth more than four times as much as all the gold and silver produced in the United States for the year.

The World's Consumption of Cotton

Is annually increasing, being estimated, for 1888-89, at 11,421,000 bales, of which 2,685,000 bales were consumed in the United States. For the past 11 years there has been an increase in the consumption of cotton throughout the world of 52 per cent against an increase of about 40 per cent in the amount of production. In the last five years the European consumption of cotton has increased 18 per cent, while the population has increased only 5 per cent. For the same period the United States consumption has increased 42 per cent with an increase in the population of only 14 per cent, yet the wants of the people are not more than satisfied. A United States crop of 7,800,000 bales would not overstock the markets of the world, even with the usual supply coming from India and elsewhere. There has been a conspicuous increase in the number of spindles in the Southern States of late years.

COTTON MANUFACTURING IN ENGLAND.—Our English advices represent cotton manufacturing in the Lancashire districts as unsatisfactory. At the current prices for cloth it is impossible to convert the raw material into a manufactured product without a loss, which renders the situation peculiarly serious, the continuation of which must result in the stoppage of the mills. Already a large number of the looms are stopped because of a lack of orders at a profit, and their starting up again will depend upon the distribution of goods which are now held in considerable quantity by dealers and foreign agents. This condition of manufacturing has existed for some time, growing worse with time. Ellison noticed it in his July report, speaking of sales as falling short of the outturn of the mills, causing many looms to stop. Spinners felt the effects of dullness in the early part of the summer, causing a marked falling off in their demands for cotton. There is little prospect of an improvement till cotton declines in price very considerably. At present prices there is plenty of cotton, with goods as they are, receiving little attention from consumers. The price, alone, of cotton keeps the demand for it within the limits of its supply.—*Boston Journal of Commerce.*

Cotton Manufacture at the South.

The past year has been a phenomenal one in the progress that has been made in building cotton-mills at the South. The record greatly exceeds that of any previous year. In addition to the new mills built, many have been greatly enlarged. The number of mills throughout the South in 1880 was 161. The present number is 355. The increase in the number of looms shows a much larger proportion of increase—from 14,323 in 1880 to 45,001 in 1889. Georgia still leads, but South Carolina follows close behind.

Hitherto the goods manufactured have been almost exclusively of the very coarsest kind, the most conspicuous, or what are known as Southern plaids, or "negro plaids," on account of their extensive use by both males and females of that race. It is said that an overproduction of that class of goods is becoming apparent.

It is now proposed by a correspondent of the Baltimore *Manufacturing Record* that Southern mills be equipped for the manufacture of fine goods. He denies the statement that their climate is unsuitable for such work and declares that the skilled help required can readily be secured in the South—that the manufacture of print cloth could be profitably carried on in the South. It would be well for the Southern mills to move in this matter moderately, but there is no reason why the help in Southern cotton-mills cannot be easily taught to manufacture the finer counts, and we predict that within ten years such mills as the Piedmont, Clifton and Pelzer of South Carolina, and others throughout the South that are equipped for changing to the finer goods should they so decide, will find it greatly to their advantage, pecuniarily. There is also a profitable field for the Southern mill in the manufacture of the finer grade of ginghams, but they have not improved their opportunity in this direction, and chiefly because of the accepted notion that it is not profitable for them to manufacture them.

OUR COTTON IMPORTS.—Our domestic crop of sea island is not sufficient to supply the increasing demands for cottons suitable for the combing machine. Hence the employment of the long-stapled cotton of Egypt and Peru is becoming more general among the fine cotton-mills of New England and elsewhere. For the year ending June 30, 1889, there were imported into the United States 7,973,139 pounds of foreign cotton, being an increase over the amount imported during the year before of nearly 2,500,000 pounds. Most of this cotton was Egyptian, shipped from the Liverpool market. The cotton spinners of Great Britain, especially those about Bolton, are increasing their demands for long-stapled cotton for fine spinning. The Egyptian stock is low at present, and appearances seem to indicate a limited supply and high prices till the new crop makes its appearance in the latter part of October.

THE ADVANTAGES OF COTTON MANUFACTURE. It is of high importance to California to obtain some product to work up and export. If cotton would answer, then the sooner it is produced and made up, the quicker will the time arrive when trans-Pacific steamships can solve the problem of return cargoes from this port. We cannot send barley nor fresh fruits across the ocean. In manufactured articles must be our principal reliance for the Oriental trade. How important, therefore, it is to arrive at definite conclusions about what can be had for manufacturing purposes, and to obtain the product is a matter to which everybody's common sense can lend the needed emphasis.

SUPPLIES REQUIRED BY A COTTON-MILL.—Few persons realize the enormous amount of supplies required for a large cotton-mill. From the annual statistics of the manufactures of Lowell, we find that the Lawrence Manufacturing Company of that city uses 278,293 pounds of cotton per week, 9936 tons of coal per year, 17,879 gallons of oil per year, and 280,146 pounds of starch per year. This company turns out per week 696,526 yards of cloth, 17,046 dozen hosiery, and 900 dozen shirts and drawers. It employs 2089 females and 1051 males, and the power is furnished by seven turbine water-wheels and five steam engines.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

TAKE ELEVATOR No. 12 FRONT ST.

SAN FRANCISCO, CAL.

ANY ONE can take a picture with a Kodak. The operation consists merely in pointing the Camera, and pressing a button. The picture is recorded instantaneously on a strip of sensitive film, which may be removed and sent by mail to the San Francisco or Portland agency to be finished by experts. A new spool of film, for 100 pictures, costing only $2.00, may be inserted by any one. Thus no knowledge of Photography on part of user is necessary. Amateurs may finish their own pictures, if so desired. The Kodak loaded ready for taking 100 pictures, weighs only 1 lb. 10 ounces, inclosed in sole-leather carrying case, with shoulder-strap, and is no larger than a field-glass. Will photograph anything, still or in motion, indoors or out. Invaluable for securing photos of every-day home incidents—children in natural positions and at play, pet or fine animals. For those traveling it offers many inducements possessed by no other instrument, as it is much smaller than any other Camera producing pictures of equal size, and the only Camera which can be carried by any one, anywhere, and at all times, without hindrance. Send 2 cent stamp for Kodak "Primer" with sample Photograph.

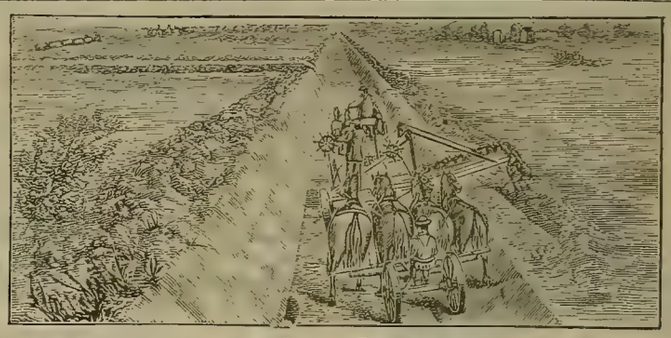
Pacific Chemical Works.

HENRY G. HANKS,
Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞ Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.



THE VICTOR CONCENTRATOR

Having passed the experimental stage, is now offered to the consideration of the mining public, in full confidence that it will meet satisfactorily all reasonable requirements. In operation it is unlike any other machine of its class. The concave disc having a rotary reciprocal motion, causing the waste sands to flow over its periphery continuously, while the sulphurets are also drawn continuously through its center, the whole process being automatic and complete. The Batea in the hands of an expert is known to be the nearest to perfection for concentration. This is the principle upon which this machine works. The advantages gained are:

1. Greater capacity with more perfect work.
2. Simplicity of construction and management.
3. When used as an amalgamator it has no equal.
4. The first cost is less than other machines of much less capacity.
5. The shipping weight is less than 1000 pounds.

Mine owners and millmen are invited to carefully examine the Victor before deciding upon their concentrating works. Address

S. W. SHAW, or N. W. SPAULDING,
17 and 19 Fremont Street, SAN FRANCISCO.

IRRIGATION

NEW ERA GRADER AND DITCHER

Will elevate and place in embankment **1000** Cubic Yards of earth in **10** hours, at a cost not exceeding **TWO CENTS** per cubic yard. Hundreds now in use. Write for circulars.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

B. E. HENRIKSEN'S
PATENT

Automatic Safety Clutch

For ELEVATORS.

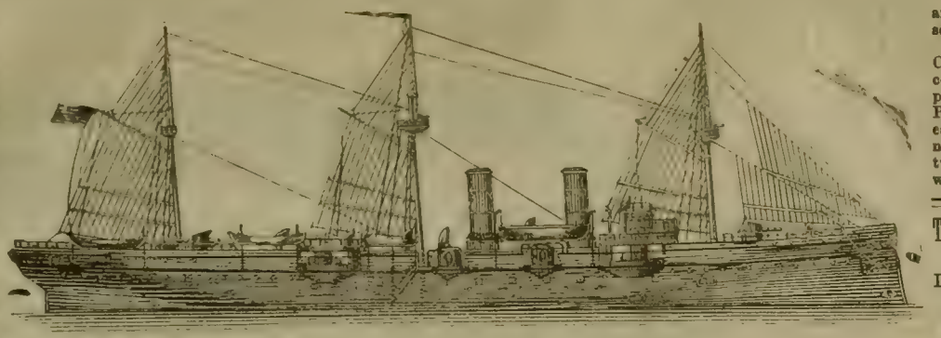
Simplest, Strongest & Most Reliable.

Constructed upon Scientific Principles.

Operates and Sets Automatically and Ever Ready for Service.

Entirely free from all springs, pawls, triggers, governors and other unreliable parts likely to stiffen, corrode or gum up.

ALWAYS IN FULL SIGHT, BUT NEVER REQUIRING ANY ATTENTION.



Has been practically tested in six actual elevator accidents and saved 51 persons from injuries and death.

SILVER MEDALS awarded by the Mechanics' Institute in 1880, 1882 and 1883. SEMI-CENTENNIAL GOLD MEDAL awarded by the American Institute of New York, Dec. 3, 1887. Apply to

B. E. HENRIKSEN, Architect,
218 Post St., San Francisco.

The San Francisco.

The cruiser San Francisco was launched from the shipyards of the Union Iron Works on Friday last, the launch being successful in every way, and largely attended notwithstanding the rain. An unusual feature was the promptness, the vessel leaving the ways at exactly the appointed time. The San Francisco, a view of which is given on this page, is the second of the cruisers built for the U. S. Government by the Union Iron Works of this city. Her dimensions are as follows: Length over all, 326 feet; length on water-line, 300 feet 9 inches; breadth of beam, 49 feet 1½ inches; depth of hold, 21 feet; displacement, 4083 tons. She is expected to develop 10,500 horse-power. According to contract she must steam nineteen knots per hour. The Government will pay a premium of $50,000 for every quarter of a knot in excess of that speed, and will exact a penalty of the same amount for every quarter of a knot she falls below it. The contract price was $1,428,000.

THE CRUISER SAN FRANCISCO, CONSTRUCTED BY THE UNION IRON WORKS.

There are four boilers, which are now set up in the yard preparatory to being lowered into place. Each one is 18 feet 3 inches long by 14:10 in diameter, is tested to 225 pounds to the square inch, built for a working pressure of 165 pounds, and weighs complete 132,000 pounds. They are the largest boilers ever attempted on the coast, and were built here throughout. All the machinery is aboard that can be put in place before the engines and boilers go in. The hull of the cruiser is completely finished, the decks calked, the circulating and feed pumps in, etc. The vessel presents a more pleasing appearance on the water than the Charleston, and when rigged will be a finer looking one. She will carry three masts with a sail area of 5400 feet. The citizens of San Francisco will present a silver service to the vessel when she is in commission.

The Union Iron Works have a great deal of work already done on another government vessel, the keel of which will be immediately laid in the place vacated by the San Francisco.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING OCT. 22, 1889.

413,427.—SEWER—Henry Anderson, S. F.

413,382.—BUCKLE—C. W. Bassett, S. F.

413,438.—BATTERY ZINC—F. F. Eggers, S. F.

413,250.—RECORDING COMPASS—C. O. Farciot, S. F.

413,443.—ORCHARD CULTIVATOR—L. A. Gregg, San Jose, Cal.

413 278.—CONCRETE PAVEMENT—T. F. Haggerty, S. F.

413,446.—ROLLER BEARING—R. W. Hent, S. F.

413,536.—REFINING COPPER, ETC.—G. G. Mullins, Los Angeles, Cal.

413,470.—SPECULUM IRRIGATOR—E. H. Woolsey, Oakland, Cal.

The following brief list by telegraph, for Oct. 29, will appear more complete on receipt of mail advices:

California—Isaac Sylvester, assignor of a half to R. A Gray, Colusa, cultivator; William H. Snow, Oakland, packing-box; Jacob Reeder, Fresno City, insecticide; Almarin B. Paul, San Francisco, ore-concentrator; Emery T. Nichols, assignor to the Nichols Manufacturing Co., San Francisco, rotary steam-pump; the same, a fruit-pitting machine; the same, a lifting-jack; Pontalba L. Nash, Hollister, over-draw bridle attachment; Elisha Haines, Sacramento, solder-melting furnace; Evarista Chatain and S. Gilett, San Francisco, concrete-mixing machine; Enos Churchill, Tulare, and assignor of half to W. L. Morrow, San Luis Obispo, washing-machine; Jules de Rose, San Francisco, corn-planter; Adeline T. Evans, St. John, combined flour-sieve and scales; George W. Bassett, Lower Lake, combined pulverizer and cultivator.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable prices, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC RECORDING COMPASS.—Chas. O. Farciot, S. F., assignor of two-thirds to N. W. Spaulding and Chas. Goodall. No. 413,250. Dated Oct. 22, 1889. Considerable difficulty is often experienced from the erratic steering of vessels when in charge of inexperienced or careless men, so that the vessel may often be found to be a considerable distance from her true course, and when approaching dangerous shores it is often the cause of great disaster. In order to provide a means for indicating at all times the course upon which a vessel has been steered and provide a permanent memorandum for future use, Mr. Farciot employs a traveling band or tape, which may be moved by clock-work at a fixed rate, and in connection therewith indicating points or markers so connected with the compass-needle that the course will be instantly shown by inspecting the strip or surface upon which the marks have been made. The course of the vessel is in this way automatically registered, so that upon inspection at any time the course which has been steered at any given hour or time may be known. This device is very ingenious, and the invention one of great importance.

SEWER.—Henry Anderson, S. F. No. 413,427. Dated Oct. 22, 1889. In order to make a strong and imperishable bottom, and also to retain it at its proper grade independent of such settling as may take place from time to time in the surrounding soil, the bottom of this sewer is formed of iron of proper curvature and shape to produce the best results in speed and current scouring effect. This bottom is made in sections of any suitable length and the sections are made to overlap each other by means of a joint in each, so secured together as to present a perfectly smooth interior surface. The upper portion of the sewer may be made of brick, concrete, or of wooden staves united with the upper edges of the iron bottom by suitable clamps or straps.

PROCESS OF MANUFACTURING BATTERY-ZINCS. Frank F. Eggers, S. F. No. 413,438. Dated Oct. 22, 1889. Various methods have been hitherto employed for the manufacture of zincs for battery use, in some of which zinc is heated or melted and amalgamated with mercury and either cast into the proper form or left in a pulverized condition. Mr. Eggers combines the metal zinc with mercury and afterward compresses the compound into a bar of the proper form for use. This method of forming the bar makes it somewhat porous or spongy, with insterstices throughout its substance which increase the surface upon which the battery liquid can act; and it is found by this construction that the effective power of the zinc-pole of the battery is greatly increased, while at the same time it will always remain bright and untarnished until it is entirely used up.

ORCHARD CULTIVATOR.—Leslie A. Gregg, San Jose, assignor of one-half to F. Plank. No. 413,443. Dated Oct. 22, 1889. The invention relates to that class of cultivators especially adapted for orchards, in which a wheeled frame carries a number of freely suspended teeth or lags and provided with devices for raising and lowering them; and the invention consists in freely suspended and laterally swinging side teeth or lags and means for raising and lowering them and moving them in and out from the sides of the frame. The object of the invention is to provide a cultivator, the working width of which can be readily and instantly varied by throwing or swinging said side teeth or lags further out or drawing them in as occasion requires, thereby cultivating the ground between the trees of an orchard and avoiding said trees successively.

SPECULUM IRRIGATOR —Dr. E. H. Woolsey, Oakland. No. 413,470. Dated Oct. 22, 1889. This invention relates to that class of instruments used for the treatment of the vagina and rectum in which a perforated nozzle or tip is attached to a syringe and is provided with a spring frame whereby the passages are expanded to permit inspection and proper direction and discharge of the washing fluid. The object of the invention is to provide an instrument of this class in which, by reason of the construction and shape of the expansion frame, the instrument may be readily and conveniently inserted, limited in its insertion, held well in its place, readily withdrawn, and the walls of the passages expanded in proper manner and places, so as to permit perfect inspection, as well as to aid in and allow free egress of water and discharges to effect the cleansing of the passages.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Mining Personals.

Capt. John Kelley, superintendent of the Bodie and Mono mines, left the past week for the Bodie district.

Hon. J. H. Neff, ex Governor Perkins, Wm. Garratt, and others have bonded a large quartz property in Trinity county.

A. Ekman, chemist and assayer, is making a collection of Butte county minerals to be displayed at the coming citrus fair at Oroville.

A. C. Hamilton, superintendent of the Alpha, Exchequer, Chollar and Potosi mines, in Virginia City, is in this city on official business.

R. P. Keating, superintendent of the Savage and Hale & Norcross mines, Virginia City, is in this city on business connected with those mines.

The Grass Valley *Union* says that Gilbert Gale and A. B. Doresbach intend shortly to commence mining operations on a ledge near Cherokee.

O. C. Steel, superintendent of West Con. Virginia mine, Virginia City, is in this city for instructions regarding more important work in the mines to be commenced at an early day.

The death of John Crockett, for 16 years secretary of the Belcher Mining Co., which occurred on Saturday last, is deeply regretted by all who were brought in business contact with him.

Joseph Snyder of Grass Valley, who first obtained the bond on the recently purchased Lone Star quartz mine in Sierra county, 12 miles from Downieville, will have charge of the mine for the new owners.

Mr. Archie Farrington, the well-known mining man and superintendent of the Reno Reduction Works, has been examining the Humboldt Queen mine, near Rye Patch, with a view of purchasing the same.

Oro Bella mill, Arizona, which has been idle for want of water, resumes operations about Nov. 1st, under the management of J. D. Helm. Wm. Tyack will have charge in the mine. He will soon increase his force.

Jim Butts, an old-time and inveterate prospector, who used to operate at and below Grass Valley, has for 15 years been living in Placer county. Last year he sold a mine at Ophir for a good round sum, and he has two others which promise well.

Messrs. R. N. Baskin and Jas. McGregor of the Executive Committee of the Crescent Co., Park City, Utah, have spent several days inspecting the mine. They have placed James Hickey, formerly superintendent of the Old Empire, in charge of the works.

Fred L. Buhn, a miner, recently made a discovery while prospecting on the mountain-side near Tehachapi. He found some croppings indicating the presence of coal, and following them up, soon unlaid a vein seven feet deep. Buhn had been at work for a prospecting company, which for some time past had searched all through the country near Tehachapi for coal indications, but with little or no success. His claim is between Mohave and Tehachapi and is within easy reach of the railroad.

George Everhart is the sole resident of Secret Town now, says the Placer *Republican*. He lives alone in a cabin there and was 72 years old not long ago, but he is mining with as much vim as he did in the same canyons and gulches almost 40 years ago. But it does not pay now as it did then.

Mr. N. T. Galloway writes from Red Rock to the *Arizona Enterprise* that in due time the camp of the Red Rock Copper Co. will be a good town. Mr. White, a practical mining man from Leadville, is the superintendent, and H. K. Cole, the general manager, is from the Calumet & Hecla.

The Paradise Valley Company, Wild Rose district, Nev., shipped to Denver, October 19th, 11 tons of ore concentrates. A recent visitor to that district says that J. V. McCurdy, the principal owner in the Paradise Valley mine, is in a fair way to again become opulent from recent ore developments.

A. Loughran, superintendent of the Benton Con., has returned to the Comstock from a business trip to S. F. He says the Benton management is arranging for the resumption of operations in the mine at an early date through the old shaft, over which a substantial steam-hoist plant will be set up.

Prof. P. D. Barnhart, formerly superintendent of the Red Chief mine, on Kanaka creek, has gone to Helena, Montana, to work up a new mining enterprise. C. H. Webster, Jr., a clothing merchant of Binghamton, N. Y., has arrived here to take charge of the Red Chief, so says the *Nevada Transcript*.

Mr. A. B. Paul returned this week to the Calumet mine, Old Diggings district, Shasta county, having been in the city for a month past procuring a 20-ton mill to work by the Paul dry process. The mine has now the largest milling capacity of any in Northern California. There are 24 stamps working wet, and two Paul mills for working ore dry, all run by water-power. Work is carried on all winter.

THE HOME BENEFIT LIFE ASSOCIATION

Life Insurance at Cost—Death Claims Paid in Full and Promptly.

Letters From Insurance Commissioner Wadsworth and Labor Commissioner Tobin.

For eight years the Home Benefit Life Association has been doing business on this coast. As the oldest and most conservative co-operative life association it has been constantly assailed by the old-line companies. Its downfall has been constantly predicted, but it has pursued its course quietly and steadily.

So long as the only attacks upon it were those incident to the plan upon which it worked no notice was paid to them; but false and malicious representations have of late been made so often that the truth should be made known through the columns of the public press.

The Labor Commissioner of the State some time since commenced a commendable investigation into the workings of "co-operative" insurance companies and fraternal organizations. In his list of companies doing business upon the assessment plan was the Home Benefit Life Association. No statement regarding its character was ever made by Colonel Tobin, nor did he term it "wildcat." The list disappeared from his desk, and the next known of it was its publication in an evening paper, with the statement that Colonel Tobin designated as "wildcat" those schemes embraced in the list. The statement was false. It was inspired by malice. The following letter from Colonel Tobin sufficiently proves this:

STATE OF CALIFORNIA,
BUREAU OF LABOR STATISTICS,
220 Sutter Street, San Francisco, Cal.,
October 24, 1889.

President Home Benefit Life Association, San Francisco, Cal.—DEAR SIR: It is not true that I have classed your association as a "wildcat concern." On the contrary, from the returns made in answer to inquiries from this office, and from other reliable information, I have reason to believe that the Home Benefit Life Association is honorably and efficiently conducted. Every facility has been placed at my disposal to investigate its affairs.
Yours truly, J. J. TOBIN, Commissioner.

This letter also shows that the association complied with the request of the commissioner and gave him every facility for examining into the affairs of the association.

From the report made to him it appears that the association paid on account of death claims during the past year the sum of $99,000, and that every death claim presented was paid in full.

This is sufficient answer to the statement that has been repeatedly made in a monthly insurance publication sustained by the old-line companies to the effect that the Home Benefit Life Association did not pay its losses in full. That statement is false, and no attention would be paid to it but for the fact that unprincipled solicitors of other companies, knowing the assertion to be false, yet make use of it in attempts to secure business.

The Home Benefit Life Association has always been ready to come under the jurisdiction of the Insurance Commissioner. This cannot be better shown than by the following letter from Mr. Wadsworth:

OFFICE INSURANCE COMMISSIONER,
STATE OF CALIFORNIA.
SAN FRANCISCO, October 26 1889.

W. H. Chickering, Esq., 101 Sansome Street, San Francisco, Cal.—DEAR SIR: Yours of the 10th inst. requesting me to reply to the following questions concerning the Home Benefit Life Association received:

1. Is it not the fact that that association has at all times, through Mr. Chickering, its president and attorney, aided you in your endeavors to obtain legislation placing assessment insurance companies under your jurisdiction?

In answer to which I reply in the affirmative.

2. Is it not the fact that the company has always expressed a willingness to have you make an examination of the affairs of the association and to come under your jurisdiction?

To which I also reply in the affirmative.

3 Do you know of any instance where the said association has failed to make payment of the entire sum due under any claim presented to it, or has complaint of such failure ever come to your knowledge?

In answer to which I reply in the negative.
Yours respectfully, J. C. L. WADSWORTH,
Insurance Commissioner.

The company issues certificates of membership in amounts from $1000 to $10 000. One of the last claims paid was that upon the life of Wilson White, who carried a certificate in the association to the amount of $10,000; and that the association pays its losses in full cannot be better shown than by the following acknowledging receipt of the amount:

SAN FRANCISCO, Cal., September 22, 1889.

J. O. Cadman, Esq., Manager Home Benefit Life Association—DEAR SIR: On the part of those interested in the collection of the life policy held by the late Wilson White in the Home Benefit Life Association, we take great pleasure in acknowledging the courteous and prompt conduct of the company in settling the claim. The matter was adjusted at once by payment in full ($10,000) without complication or delay. For such conduct the company deserves and receives the sincere thanks of the beneficiaries. BLAKE, WILLIAMS & HARRISON,
Attorneys for the Estate.

Many similar letters could be produced, but it is unnecessary.

The officers of the association are prudent, conservative business men, well known in business circles in this city. The entire salaried list is not one-tenth the amount paid many presidents of the old-line companies. The design of the association always has been, and, so long as its present management continues, always will be, to furnish reliable insurance to its members at actual cost,

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 31, 1889.

The general tendency shows quite an improvement, with the feeling among merchants being of more reassuring character. The money market is easy, with remittances from the interior increasing.

The last steamer from Australia brought a little over $175,000 in coin.

The steamer City of Peking, hence Oct. 29th for Hongkong, etc., carried the following shipments of treasure:

TO HONGKONG.

Chinese, Mexican dollars	$ 87 965
Chinese, gold coin	15,177
Chinese, gold dust	130
Hongkong and Shanghai Bank, Mexican dollars..	307,000
Hongkong and Shanghai Bank (bullion)	63,000
Anglo-Californian Bank, Mexican dollars	30,000
Total	$503,272

TO SHANGHAI.

Nevada Bank (bullion)	$ 72,600

TO CALCUTTA.

Anglo-Californian Bank (bullion)	72,000
Total	$647,872

MEXICAN DOLLARS—The market continues fairly active at 76½@77 cts., with a strong tone reported at the close.

SILVER—The local market, since our last week's issue, has been quiet with buyers and sellers apart. The active and advancing market abroad is naturally having its effect on ours, and to-day it is hardly likely that purchases can be made below 96 cents. Two banks quote 95¾@96 cts., while another quotes 95¼ cts. bid. As they are all buyers, sellers can be their own judges of prices. The supply with us is very light, not sufficient to meet trade requirements, but it is claimed that this, to a certain extent, will be obviated by Mexican shipments to this city instead of, as heretofore, to New York. Yet as the latter market is advancing, being to-day 94¾ cts., the change may be only temporary. This paper has been a consistent bull on the situation, and is well pleased at present results. With Brazil resuming specie payment, the Argentine Republic arranging for resuming specie payment, and Russian securities advancing, combined with a freer call for metallic currency the world over, the situation is of the most favorable character.

QUICKSILVER—Receipts the past week aggregate 187 flasks, and the exports 352 flasks to Guaymas. The market is quiet but steady.

ANTIMONY—The market is very strong, with some asking an advance on our quotations.

BORAX—Receipts the past week aggregate 397 ctls. and exports 251 lbs. to Guaymas. The market is kept steady by the pool or trust company regulating the output by the consumptive demand.

LIME—Receipts continue to shade off, aggregating only 3170 bbls. the past week. The home consumption is falling off. Quotations are unchanged.

COKE—The past week 120 sacks were shipped to Guaymas. The agents for the Tacoma coke claim that they can do better by selling up north than sending to this market. For English coke, both spot and shipment, the market is reported firm.

TIN—The exports the past week aggregate 245,610 lbs. to Santa Rosalia. The market for both pig and plate is very strong at an advance. All the plate to arrive has been placed, while free sales have been made of spot parcels. English advices continue to report an active market, with China having taken large quantities. The feeling there is decidedly bullish.

The past week 692 ingots came to hand from Australia.

COPPER—The market, which showed a stronger tone at a slight advance, is more quiet at the close. The large consumption in Europe and at the East is a leading feature in favor of a firm market, which has been materially increased by an advance in outward freights from Chili, which precluded shipments from that country at the low prices that ruled in September.

IRON—The market for shipment has been advanced. The spot market is quiet at unchanged prices. With the usual home consumption, about all the supplies here would be absorbed and prices advanced. It now looks as if the higher markets at the East will draw to us more orders that have gone East for foundry and machine work, owing to this market now being relatively the cheapest, which, if correct, ought to favorably affect us. The English and Eastern markets are still higher.

The following are the latest comparative quotations f. o. b. at Glasgow:

	Oct. 23, '89.	Oct. 16, '89.
F. o. b. Glasgow.		
No. 1 Coltness	75s	72s 6d

At Ardrossa.		
No. 1 Eglinton	58s 6d	58s
" Glengarnock	70s	67s 6d
" Dalmellington	60s 6d	58s

COAL—Imports the past week aggregate as follows: Overland, 84 tons; Ounalaska, 47; Puget Sound, 700; Nanaimo, 3867; Seattle, 4073; Australia, 19,850; Departure Bay, 3180; Coos Bay, 1850; total, 33,621 tons. The demand while good is not quite so active as heretofore reported, but owing to the high rates of freights, importers do not see their way clear to shade prices. It is claimed that $7.75 is the asking price for just shipped or immediate shipment from Australia, while for shipment the fore part of next year more is demanded. We are informed that a vessel which left here, and will arrive in Australia next January, has a return coal cargo at 20s, which will make the coal cost here $8.25 a ton. Receipts from the coast collieries are increasing.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Lexington, Oct. 25, $24,512; Justice, 26, $5550; Hanauer, 22, $2650; Alice, 23, $29,344; Hanauer, 23 $2600; 24, $2750; Con. California and Virginia, $18,219; Hanauer, 25, $2800; 26, $4600; 27, $2400; Mt. Diablo, 24, $6438; Eureka Con., 24, $24,000; Mt. Diablo, 28, $6601.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Oct. 31, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	43¼	93⅜	$11 00	$3 80	$20 85
Friday	43½	93⅝	11 00	3 80	20 75
Saturday	43 3-16	93⅜	11 00	3 80	20 80
Monday	43½	94	11 00	3 82½	21 40
Tuesday	43 5-16	94½	11 00	3 82½	21 0
Wednesday	43½	94½	11 00	3 82½	20 90

NEW YORK, Oct. 31.—Borax continues firm at unchanged prices. Antimony is in light supply, causing previous high prices to be maintained. Copper after showing a marked degree of activity, closes dull. Lead is barely steady. Tin continues to fluctuate under European advices.

San Francisco Metal Market.

Mining Share Market.

The market has been active throughout the past week, with lively and attractive fluctuations in the Comstock shares. The advance in prices has caused many if not all the smaller shorts to fill, but the larger shorts do not appear disconcerted at the slightly higher prices. The move appears to have been manipulated on water in the Carson river, and the strong probability of all the mills starting up within the next ten days. In the upward move the manipulators were assisted by the bulls who unduly exaggerate everything in their favor. They express more confidence by reason of the mills starting up; several more mines preparing to take out ore for crushing; a reduction of one dollar a ton in the cost of milling and a belief that outside dealers will come in the market as prices advance. The large bears, those well informed on the market, are confident that whatever the move is, it will be of short duration and be followed by lower prices than since last August. They also claim that while the idle mills will start up on ore, outside holders of stock will, as usual, derive no benefit—only get assessments while insiders get the bullion—and therefore it is only a question of a short time until outsiders let go of their stock at depreciating prices. They further claim that much of the work as now outlined will take time and money to make any new development in any of the mines, for no decided upward move, they claim, can be made without a new discovery of ore. Outside stocks have been stagnant at easier prices, owing to more assessments to come on soon, and the fear that as they did not move up with the Comstocks, that when the latter set back they will do likewise. From the mines our information reports that the Nevada Mill will soon start up with forty stamps on Chollar ore; some of the idle stamps of the Brunswick Mill are to run on Confidence ore; the Eureka Mill is running to full capacity on Con Virginia ore, which together with the ore crushed by the California Pan Mill, will admit of regular dividends in the future. The Vivian Mill is running on Overman ore. The Mexican Mill is to start up on Hale and Norcross ore. Crushing of ore from the Savage and Potosi mines is to be commenced at an early day, as also ore from Crown Point and probably Belcher. The usual spread eagle reports are to hand from the Alta mine. The Occidental and Yellow Jacket Mining Companies are accumulating money in their treasury. About two months ago we reported that in the Alpha west crosscut on the 500-foot level a ledge about eight feet wide was run into; this was generally denied, but it is now confirmed by the superintendent's annual report which gives the ledge ten feet wide, with the ore assaying from $20 to $30 a ton. This is the more important from the fact that it is the same west ledge cut in the Belcher mine and from which Confidence Challenge and Con Imperial are now running, and which they should cut soon. The work now going on in Best and Belcher on the 1000-foot level deserves careful watching from the fact they are running for an important ore ledge on that level. From the Quijotoas, Tuscaroras and Bodies, more prospecting work is under way. This week's official letter from Bodie reports the upraise from the 1000-foot level and the upraise from the 900-foot level being "driven" ahead by that well-known "driver," Captain John Kelley. The usual favorable news comes to hand from the Eureka and also from the Mt. Diablo.

The market for the Comstock shares opened this (Thursday) morning top-heavy under outside selling. After the regular call the north-end shares shaded off under bear points, and confirmed reports that Col. John W. Mackay had left New York for Europe. With strong buying orders, the market soon rallied, sending prices higher than they were on Call. It now looks as if the pool has some stocks they wish to dispose of, and if the public will not take them at the present prices, the market will be advanced until outsiders relieve them of their surplus holdings. Official letters received to-day from the Gold Hill mines are of a more encouraging character, particularly from Crown Point, where good milling ore is found. The Alta pumps are started to pump out that and the Gold Hill group of mines.

W. B. FROST—Monterey and San Luis Obispo Cos.

THE El Paso smelter, which gets so much lead ore from Mexico, employs several hundred Mexican laborers in the works, who are paid 80 cents per day of eight-hour shifts.—*Rio Grande Republican.*

Assessment Notices.

Lapanta Consolidated Mining Company.

Location of principal place of business, San Francisco, California. Location of Works, Hawthorne Mg. Dist., Esmeralda Co., Nevada.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 2d day of October, 1889, an Assessment, No. 2, of Two Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, Room 56, Nevada Block, No 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of November, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 24 day of December, 1889, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room 56, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Gray Eagle Mining Company, Location

and principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 16th day of October, 1889, an Assessment, No. 15, of Six (6) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, Room 11, No. 303 California St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of November, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 10th day of December, 1889, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.

J. M. BUFFINGTON, Secretary.

Office, Room 11, No. 303 California St., San Francisco, California.

FOR SALE.

One 10x13 inch Clayton Belt Air Compressor.
One 3-inch Sergeant Drill.
One 6-ft. Double Screw Drifting Column with Arms.
One 4-ft Single Screw Stoping Bar.
One 3½x13 ft. Air Receiver.

The above are in first-class condition and will be sold cheap. For price apply to the PAYMASTER MINING CO., Yuma, Arizona Territory.

PRACTICAL

Books on Mining

AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warnford Lock. 788 pages, with 8 plates and 271 engravings in the text. 4to, cloth, $15.00, express prepaid.

IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Ross. This work embodies the information, collected during four and a half years, of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrages, flood protection, methods of regulation, locks, etc., have been treated in detail. 367 pages, large 8vo, with 26 plates and numerous engravings in the text. Price $15.00, express prepaid.

MEXICAN MINES.—Dahlgren's Historic Mines of Mexico, *only a few copies left*; price $25 00. Handbook to the Historic Mines of Mexico, price $1.00.

Descriptive Catalogue and Circulars of Books relating to Assaying, Mining, Electricity and Mechanical Engineering, sent free on application.

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

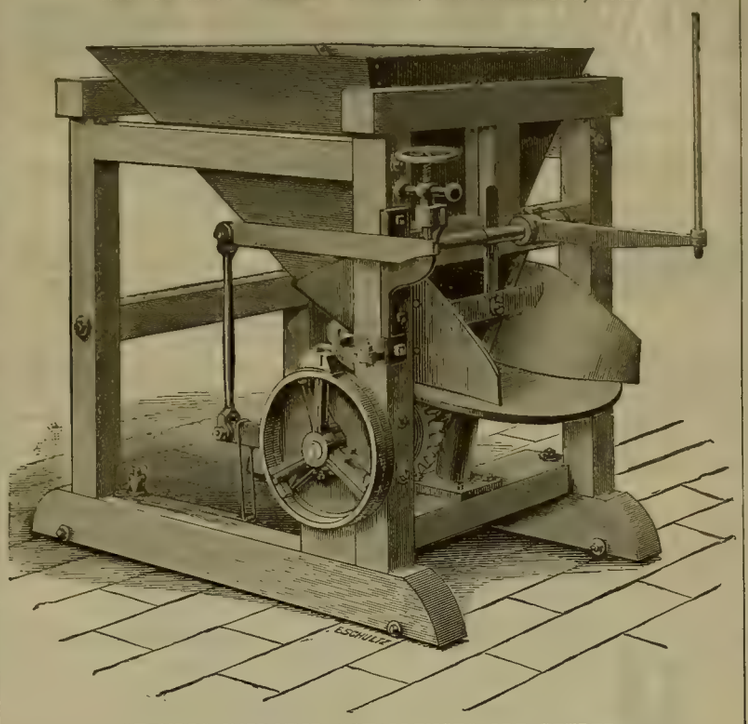
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth: 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:



Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S.F.

—THE—

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The **best form of Feeder ever devised,** and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

THIS is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,
Sole Manufacturers,

IMPROVED BELT FRUE ORE CONCENTRATOR,

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

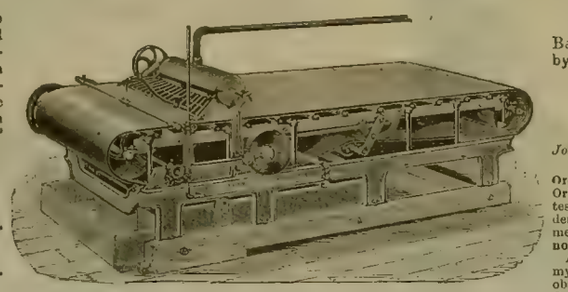
For Pamphlets, Testimonials and further information apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS.—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.



ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.
Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices. DAVID McKAY, Jr.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

PACIFIC IRON WORKS

1850. 1888.

—BUILDERS OF—
MINING MACHINERY.
GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

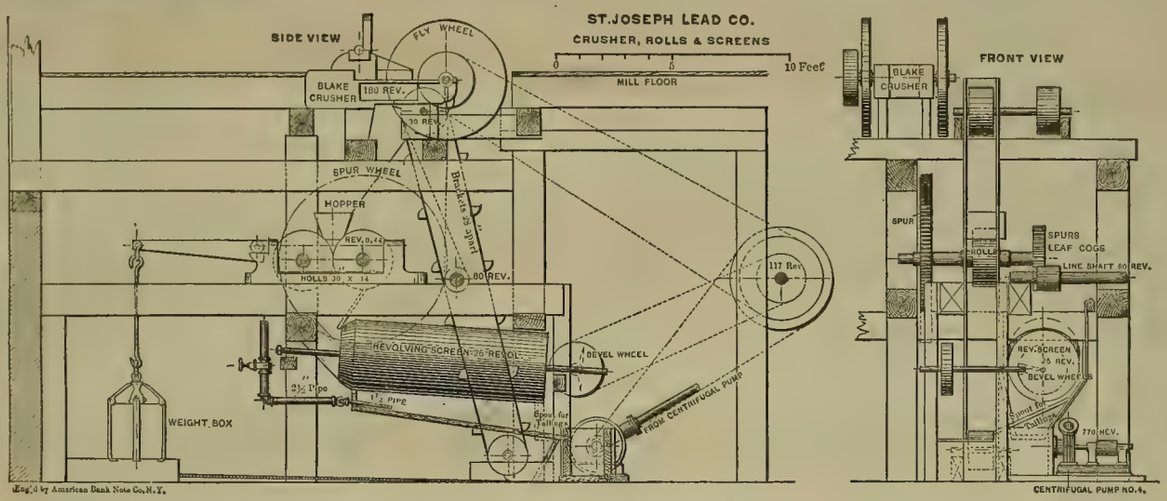
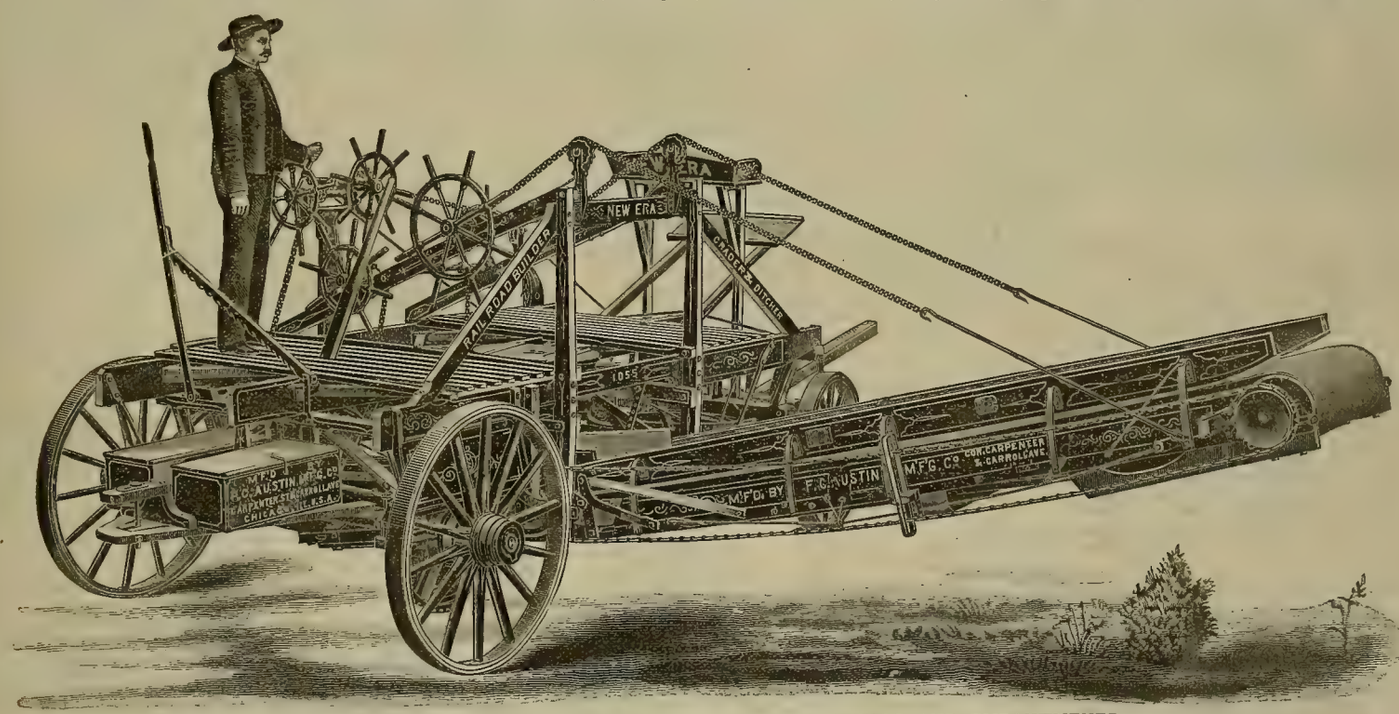
Grading Machine for Handling Earth.



Among the great industries of the country the irrigation of the arid region is now commanding a full share of public attention. Nearly all of the United States west of the 100th meridian may be classified as desert lands, and this includes more than two-fifths the entire area, if we exclude Alaska. These lands are of high fertility, but lacking water are comparatively worthless.

Major J. W. Powell, Director of the United States Geological Survey, estimates that there are from 90,000,000 to 100,000,000 acres of these lands for which a water supply can be obtained. More than $100,000,000 have already been invested. The smaller canals are being constructed by farmers themselves, and the larger ones in some cases by companies employing labor directly and others are under contract.



It is being demonstrated by the successful use in a number of places of the grading-machines herewith illustrated, that the cost of construction can be reduced nearly, if not quite, one-half. These machines have been employed for the past twenty years for building country roads, upon railway embankments, for loading wagons, and, in fact, wherever large amounts of earth are to be handled.

There are hundreds of them in use, from one end of the country to the other. There are 30 of them in the city of Omaha alone, where, owing to a strike several years ago, a number of them were put to work by contractors in grading down streets and lots, and loading wagons. They have superseded the old methods entirely, and are gradually being adopted by all successful earth-handling contractors.

As before stated, they are peculiarly adapted to the construction of irrigating canals, which usually follow the line of grade with an average cut of from one foot to four feet deep. The illustration herewith gives a clear idea of the work as done by these machines. A plow upon one side of the grader throws a furrow 12 inches wide and 6 or 8 inches deep upon an elevating belt, driven by the rear wheels, which deposits it at the pleasure of the operator from 10 to 22 feet away, in a solid continuous embankment. Each machine is capable of excavating and placing in an embankment from 1000 to 1500 cubic yards of earth in ten hours, or of loading 600 to 800 wagons in the same time. The F. C. Austin M'f'g Co., Chicago, Ill., makers of the "New Era," also manufacture the "Austin Reversible Road Grader," and a full line of prospecting and well-boring machinery.

ARRANGEMENT OF CRUSHER ROLLS AND SCREENS AT ST. JOSEPH LEAD COMPANY'S WORKS.—See page 382.

GRADING MACHINE FOR BUILDING ROADS, DITCHES, CANALS AND EMBANKMENTS.

THE mining assessments falling due in November amount to $299,400, of which sum the Nevada mines take $249,400; California, $10,000; Arizona, $15,000, and Alaska, $25,000.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Tuolumne River Group of Mines.

EDITORS PRESS:—This property is situated on the south bank of the Tuolumne river, about seven miles from Groveland and 14 miles from Sonora. It consists of 12 mining claims. The Mary Ellen mine, on which most of the developments and expenditures have been made, was discovered in 1856. A 20-stamp mill was built and operated, but financial difficulties arose, in a measure caused by the non-amalgamation of the gold; although the rock yielded high assays and showed freely the precious metal, the then crude methods of milling and reduction failed to obtain payable results. The coated, fractious metal proved a serious obstacle in those days of primitive knowledge of gold-saving. The mine was abandoned, but not before the flumes and mill were destroyed and carried away by the rapid rising of the Tuolumne river. The present owner, Mr. A. B. Cruikshank, took hold of this particular portion of the property, opened it up in a systematic and practical manner by drifting the upper tunnel, there discovering a fine lode from five to six feet in size, which now pays in the present mill $33 73 per ton. Mr. Cruikshank has built a first-class ten-stamp mill, with Challenge ore feeders, concentrators, etc., and will add thereto in the near future Frue concentrators and an improved Blake rock-breaker. This proves indisputably that so far the owner is sufficiently well pleased with the outlook of his mines to warrant the outlay and expenditures made and contemplated.

Developments lower down the mountain-side are being performed by tunnels being entered to tap the chutes at greater depths. A compressor will be placed and run by water-power to drive the drills in the mine, so as to expedite the advancement of the work of exploration. I may state that all the improvements, both in and around mill and mine, have been carried out and constructed in a most thorough, substantial and permanent manner. From the general aspect and well-known auriferous character of this belt, the perfect formation, large size of the lodes, the rich gold-bearing quartz, the high grade of the sulphurets, and the now nearly perfect method and appliances for gold-saving, this group of mines must soon take a prominent place among the leading gold-producers of the State. ARGUS.

THE ELECTRIC MILL PLANT.—H. S. Conner, one of the expert electricians in the employ of the Brush Electric Light Company, sent here from Cleveland, Ohio, to overhaul the electric plant at the Nevada mill, has been testing the dynamos on the Sutro tunnel level of the Chollar incline the past month, operating them with a pony-brake of 65-horse power, and reports the entire plant in perfect order to transmit auxiliary power for operating the mill when it resumes crushing ore next Saturday. Mr. Conner is confident that he has remedied the defects in the system and predicts that the plant will operate as smoothly as clockwork when the mill is started. He has introduced cards of instruction to employes in the underground dynamo chamber and surface motor room, and hereafter every flash will be noted in both places. A flash indicates carelessness on the part of operators, and Mr. Conner attributes the failure of the system to give satisfaction heretofore principally to that cause.—*Virginia Chronicle.*

SUGAR QUARTZ.—A San Francisco mining expert was inquiring the other day what was meant by "sugar quartz." An Alamo miner explained to him as follows: "You fellows don't understand the lay of the country here. It is to a great extent new to us all, and we have to invent names to suit what we find. We call it 'sugar' because it looks like sugar and is sweet to the heart of the miner. When we get through prospecting, some of these ledges will have to be described by saying we 'found some maple sugar float on the surface.' The ledge started down with a coffee footwall, a bacon hanging-wall and a sugar gouge which averaged about a barrel of sugar to the ton. At a depth of a quarter of a mile it was cut in twain by a hard-tack dike, which, after breaking several drills, disclosed half a ton of yellow gumdrops set in crystallized ice."—*Alamo Nugget.*

FRANCIS BYRNE has gone to New York to push ahead the organization of the Grass Valley Syndicate Tunnel Company, which has been formed to carry out the plans projected by the Gold Tunnel Company for running an eight-mile tunnel from the South Yuba river through the quartz-mining belt of Nevada City and Grass Valley, the new company starting 3650 feet farther down the river than the site near the Hoyt Crossing which was formerly selected. Estimates have been obtained for the cost of the plant necessary for completing five miles of the tunnel, and the figure is $93,000. This plant includes steel rails, water and air-pipes, two air-compressors, air drills, cars, compressed air locomotives with a capacity of hauling ten cars each, etc. Mr. Byrne says now the tunnel is certain to be constructed and that active operations on it will begin before next spring.

The Eucalyptus in Southern California.

[The following has just been issued as bulletin 6 of the California State Board of Trade of Forestry.]

The plantations at the Santa Monica Station, from which the concurrent notes were made, are growing upon a steep hillside, having a direct eastern exposure.

The "pitch" is sharp enough to form an angle of 45 degrees to 50 degrees, with the plane of the valley beneath, through which runs a small rivulet; the whole plantation, by its location, is protected from strong winds, and is distant from the seacoast about one-half mile.

The soil, which is typical of many hillsides in Southern California (and of which analyses are herewith appended), is of two characters; one a grayish, clay-like material, thinly overlaid with three to 15 inches of broken shale, some loam and a little humus, washed down from a higher plateau or mesa; the other, a reddish mass, bearing a large amount (nearly one-fifth) of decomposed iron, and is entirely bare and denuded of any superincumbent covering whatsoever.

For convenience of future reference, we will designate the former of these as tract A—the latter, tract B.

The area of both is about the same; tract A was planted January 5th, tract B on January 11th, of the present year. Neither received any plowing or cultivation of the soil whatsoever.*

Neither has received any water from any source since planting, except rainfall, of which the latest, and then a fair precipitation, occurred March 16th.

Growth made between the dates of planting and this rainfall was too inconsiderable for measurement; and at the time of planting, the trees measured 10 to 15 inches in hight. *Practically*, all the growth noted has occurred between March 16th and July 31st—a period of four and one-half months. The lowest temperature recorded during this time was on February 18th, when the themometer registered one degree below zero (30 degrees F.). None of these species seem to have suffered from this exposure, although it should be stated that no long-continued, low temperatures occurred, 1.10 (about 34 degrees F.) being the coldest weather enduring longer, or more continuously, than one night. In many instances, such exceptionally good results have followed; and some of the measurements obtained were so phenomenal that I feel constrained to record the details above set forth in order that due consideration may be given to the possible benefits arising from the greater or less atmospheric humidity incident to the contiguity of the streamlet and the ocean—the favoring temperature, and kindly shelter of the hills from strong winds.

Not only do the analyses show it, but Prof. Hilgard, who has kindly interested himself in the matter, assures me that these soils are not any way deficient in the elemental requisites to successful tree growth. Still the complete failure of some species, and pronounced success of others under identical external conditions and adverse ones at that, seems to indicate that where it is not practical to furnish cultivation or irrigation, that by conforming our plantations of forest trees to meet the controlling chemical characters of the soil for which certain species may show assimilative traits; that as happy results may ensue as where we can furnish those artificial stimulants to tree growth considered of such vital import to plant life in a dry climate.

The statement of the principle involved, i. e., that plants thrive best where furnished with congenial food, is a bald truism known to every cultivator of the soil, who, if successful, endeavors to fulfill those very conditions in the growing of general or special crops; yet I am unaware that in forest-growing its value has ever been suggested, or if so, the suggestion utilized to take practical advantage of conditions as we find them, and without reference to supplying those deficient elements of fertility, either organic or mechanical, essential to general agriculture, and which, applied to forest plantations upon rough and precipitous hillsides, would be expensive, inexpedient, almost impracticable, and probably unremunerative.

Analyses of the soils in question are as follows:

	Tract A.	Tract B.
Insoluble matter	49 948	48 570
Soluble silica	20.730	8 245
Potash (K_2O)	1 093	1 537
Soda (Na_2O)	658	.853
Lime (CaO)	3 227	8 143
Magnesia (MgO)	2 855	2 450
Br. ox. manganese (Mn_2O_4)	048	.020
Peroxide of iron (Fe_2O_3)	8 109	18.193
Alumina (Al_2O_3)	6 774	1.509
Phosphoric acid (P_2O_5)	228	.280
Sulphuric acid (SO_3)	2 648	733
Carbonic acid (CO_2)	....	3 180
Water and organic matter	3 597	6 376
Totals	99.913	100.89

Broadly classified, the soil of *A* is rich in lime in the form of sulphate (gypsum), with a larger amount of readily soluble salts than that of *B;* and as compared with the latter, about evenly supplied with potash and phosphates. *B*, strongly ferruginous, with less of plastic clay than *A* and its abundant lime in the form of chalk (carbonate).

Digging upon both tracts, July 31st, at depths of 15 to 30 inches, failed to reveal any moisture readily appreciable to touch or sight. Measurements of and notes of growth of different species upon that date, are herewith given. Hights are expressed in feet and inches, and "average" obtained by measurements "as they ran"—not the mean of the extremes of best and poorest specimens.

NAMES.	Tract A. Best.	Tract A. Average.	Tract B. Best.	Tract B. Average.	Remarks.
1. Eucalyptus polyanthema (Many-flowered Gum)	9.6	7	4.2	3.6	Growth in B., small but thrifty.
2. Eucalyptus globulus (Tasmania Blue Gum)	4.6	4	....	....	None planted in B.
3. Eucalyptus cornuta	7	6	4.6	4	Sent out last year as the "Tooart Gum" remarkably thrifty in both plantations.
4. Eucalyptus obliqua (Stringy Bark or Messmate)	6	5.6	2	0	Moribund in B. Lacks good color in A.
5. Eucalyptus leucoxylon (Victorian Iron Bark)	5	4.6	5.6	4.6	Richer, better color in the iron soil.
6. Eucalyptus rostrata (Red Gum)	....	....	5.6	5	Not planted in A.
7. Eucalyptus coryanocalyx (Sugar Gum)	6	5.6	....	....	Not planted in B.
8. Eucalyptus viminalis (Manna Gum)	6.6	5.8	4.6	4.6	"Off" color in B.
9. Eucalyptus stuartiana (Apple-scented Gum)	6.6	4.6	....	....	Not planted in B.
10 Acacia mollissima (Soft Leaf Wattle)	6	5	....	....	Not planted in B.
11. Acacia pycnantha (Golden Wattle)	3.6	3	3	2.6	Strongly vigorous in both.
12. Acacia melanoxylon (Blackwood)	2	0	0	0	Sickly in A. Dead in B.

From this tabulation will be noticed:

1. That the common Tasmanian Blue Gum, widely recognized as the typical exponent of all that is rapid among forest trees, has (under like conditions) been exceeded by all other species.

2. The general inferiority of all species upon *B* (as compared with *A*), with the single exception of the Victorian Iron Bark.

3. The remarkable growth of the many-flowered gum in *A*, and its *apparent* preference for the gypsum form of lime rather than the chalk and excessive iron-charged soil of *B*.

4. The complete adaptability of the iron bark to the latter.

5. The utter failure of the stringy bark upon *B*. In this instance, the stringy bark, it is not wise to formulate any hasty conclusions, implying want of water or proper nutrition. It is one of the few species making a distinctive tap-root and elaborating few superficial rootlets.

Both of these soils are, in their uncultivated states, strongly impermeable to even water, and the fair success of the same upon *A* may be due to the slender "top dressing" thereon, and that so soon as its tap-root reaches the densely impacted underlying soil, it may succumb as completely as it has upon *B*. Despite good growth upon *A*, it seems to show, in deficient leaf coloring, already an early expenditure of stamina and vitality. Whatever be the cause, its failure is the more regrettable, as in view of recent tests of the wood of this species made by Mr. Allen Ransome at Chelsea, England. His report* accredits it with the highest value for great strength, toughness and durability—characters not ascribed to it by previous authors, and, according to Von Mueller, it "quickly yields an immense bulk of wood on the very poorest soils."

Its adaptability to the poorest soils of California, I think, must obviously be sought upon lands of more porous nature, and hope to continue further experimentation to this end.

All the acacias develop an extensive tap-root, and we are measurably compensated for the failure of the Blackwood by the good showing made by the Golden Wattle. It seems to have found congenial organic conditions that counterbalance the bad physical situation that the Blackwood could not overcome. While the latter makes one of the most serviceable shade trees we know of, the former must come into more general use for forest planting, on account of its pronounced economic value.

To promote an interest in forest growing upon waste lands, where the risks and drawbacks are so considerable, where the initial cost is great, where neither water nor cultivation is available, vermin destructive and inroads from stock, mountain fires, and other perils imminent, and where final benefits are long delayed; demands that, though we may not assure the planter of any royal road to success, we can, at least, contribute our quota to minimizing these risks.

None recognize more forcibly than the writer the danger of formulating conclusions from results obtained within circumscribed areas and extending over so brief a time, yet making due allowance for the value of all climatic appurtenants, I am of opinion that a more careful study of soils and species adapted to them will measurably neutralize these evils.

Not alone do the results here tabulated justify this view, but it is emphasized by noting the unparalleled vigor with which the native evergreen shrubbery grows upon the most arid, forbidding and inaccessible of our California mountains. Beneath the fiercest of August suns, among naked bowlders, and upon almost vertical acclivities, and where the little soil obtainable at any depth accessible to tree roots is practically anhydrous dust, *Prunus illicifolia*, *Heteromeles arbutifolia*, and various *Rhus* will be found to expand in generous profusion their wealth of luxuriant flowers and foliage—an ever-present lesson that fundamental elements of success with other trees are not lacking if we well and wisely utilize the material at command.

WM. S. LYON, Forester.

Los Angeles, Cal.

* A scattered growth of weeds was once cut down; neglected cultivation was intentional.

*Kew Bulletin for May, 1889.

The Highway of the Nations.

In a communication to the *Railway Age*, October 18, John Arthur Lynch again comes to the front in advocacy of his favorite subject, through railway connection from end to end of the two Americas. Owing to the prominence given the communication by the *Age*, and also its partial acknowledgment of its practicability, the following from the article in question will, no doubt, prove of general interest: Mexico has made the most liberal concessions and ample subsidies for the construction of railways from the borders of the United States through her territory leading to Central America. Guatemala and others of the Central American States followed that example to a limited extent, considering their means and resources, and so have the Argentine, Chilian and Peruvian republics to a considerable extent, and the empire of Brazil, Ecuador, Bolivia, Venezuela and Colombia to a less extent, so that at the termini of the projected through line a great deal of work has been accomplished, and it requires but a few energetic efforts to be made to close up the gaps and have one grand through line of railway from Olympia on the Pacific and Portland on the Atlantic to Patagonia, where the Argentines are already building railways.

On the great Northern line to Alaska, progress has been made within the United States to the border of British Columbia, where the line has been taken up to continue it to the frontier of Alaska, and the Russian Government has been pushing her railway connections into the heart of Central Asia and the borders of China, and into what was heretofore considered the impossible, the almost inaccessible parts of Siberia, and is now drawing men to Behring Sea. China has also taken up the idea, and work is in progress on a railway from Chin Kiang to Peking that will require an expenditure of about $70,000,000.

The British East India Government proposes to extend its great lines of railway through Burmah and Thibet to connect with the Chinese system; the Coreans are planning out a system for their country; the King of Siam has authorized their construction in his dominions, and the Shah of Persia will soon have the railway engineers busy in laying out main lines through his kingdom, so that it remains with the people of the United States to bring all the nations of the earth into closer relationship by doing her part in the grand undertaking of the age, in the interests of progress, industry, the maintenance and perpetuation of peace—and therefore of prosperity and a higher state of civilization.

JOHN MCLEAN, one of the trio of Comstock miners who left for Corea last June under contract to work in the mines there, has returned. He left Frank St. John and Jeremiah Ryan at Shemulpoo. He says the native Coreans who work in the gold placers of that country look with distrust on the introduction of modern improvements in mining, as they think it will rob them of that means of livelihood. From these placers the natives produce above $2,500,000 in gold annually. The pay of native laborers is $3 per month. Those Comstock miners were paid for their lost time, but it was found the quartz they went out to work would not pay.

J. N. GRIFFIN and Jas. Wilson of Belmont, Nev., are at the Lower California mines, where they are both foremen. They say that as the Mexican law requires an expenditure of $300 and the employment of six men on the mines for six months every year, it takes a good mine to pay. There is no such thing there as one man locating a whole district and keeping out others who may wish to try their fortune under ground. Mr. Griffin reports all manufactured goods very dear, owing to the excessive duties charged, and thinks if the mines were on American soil the population would be trebled in a year.

MODOC COUNTY MINES.—Our correspondent, H. Kelley, writes us from Adin, Modoc county, as follows: "In regard to the mines and mineral sources of this locality, there is a large scope of country here unprospected. I was over the mineral belt or lode with J. H. Crossman in July, 1888, for a distance of 40 miles in a northerly direction. Mr. Crossman had a very favorable opinion of the country and was surprised to see that there had not been more prospecting done outside of Hayden Hill."

JAMES N. HYDE, who has been gold mining for the past 26 years in different parts of British Columbia, is now sojourning in Fresno. He says that in that country "there are only a few claims now running, and they are hardly making salt. There are only about 200 men, Chinese and all, on the Cariboo. The gold is of a coarse grade and requires no quicksilver to save it. Hydraulic is the principal mining, and is about all that was ever followed there. Yes, I think British Columbia has seen her best days."

THE *Calistogian* reports that while men were quarrying stone on the hillside back of Charles Foote's house, in Knights valley, a blast opened a fissure through which hot steam escapes in considerable volume and with pressure.

Artesian Wells in California.

[By C. E. Grunsky, C. E.]

The water which percolates through porous soils or which flows into crevices in the geological formation at the surface of the earth and enters by infiltration into the pervious strata of which the earth's crust is in part composed, not infrequently finds lodgment in localities where it becomes an important source of water supply.

It is such waters permeating to subterranean layers or gravel or sand, which are confined between impervious geological formations, that rise to the surface in the many artesian wells that have been bored in this State.

The term artesian has been derived from the Province Artois (Artesium) in France, where the practice of boring for water found favor in the beginning of this century.

Boring was practiced in a very early day in China, in many parts of Europe, in Asia Minor and in Egypt, and spontaneously flowing wells were by no means unknown in the countries named, though but little attention has, until within this century, been devoted to a systematic development of artesian waters.

The term "artesian" should never be applied to any water which does not spontaneously flow above the natural surface of the ground.

Although authorized by some compilers of dictionaries, it is always misleading to apply the term to wells from which no water can be obtained unless raised by pumping. Only a few miles from Sacramento there are four wells, all shallow, which have been sunk in the channel of a slough. They have tapped a water-bearing stratum of gravel from which water rises above the hight of the bed of the slough. The wells are flowing wells, yet it can hardly be claimed that they are artesian wells, because the natural surface of the ground adjacent to the slough in which the wells are located is some ten feet higher than the elevation to which the water of the wells will rise.

The water, in such geological formations as are water-bearing, has all had to travel a greater or less distance, through the air in the form of rain or snow, thence perhaps, across portions of the earth's surface, and finally through subterranean channels and interstices between particles of minerals, earth and rock to the particular point at which it has found lodgment. In this course it has been charged with gaseous matter, ammonia, carbonic acid, and with a certain amount of organic as well as inorganic matter. According to the route traveled, the subterranean water, originally pure, is always within wide limits, charged with foreign matter. Its quality for domestic use, irrigation or medicinal purposes, depends upon the character and quantity of the ingredients thus entering into its composition.

The water from a well on the northeastern shore of Lake Tulare, from the depth of 23 feet, is saltier than ocean water. The artesian waters from the Tulare county wells nearly all hold, in solution, together with other substances, small amounts of sulphuretted hydrogen. Those of Merced county nearest to the San Joaquin river are so strongly mineral in character that important medicinal properties are claimed for some of them. The deep wells near Stockton bring water to the surface from which large quantities of inflammable gas are liberated.

Experience alone, then, can be relied upon to determine the quality of water that can be drawn from sub-surface water-bearing strata.

Artesian water is rarely struck in fissures of rock—so rarely, indeed, that it is absurd to bore for artesian water in localities where it is known that the geological formation does not present stratification of large extent.

Where stratification does not exist, particularly if the layers be nearly horizontal, it will be found that not infrequently a stratum of pervious material, of which sand and gravel are typical, is inclosed between two strata—the one above, the other below, of impervious material such as close-grained rock or clay. If such a layer of gravel extend at any point to the surface of the earth, it will there receive a supply of water which, according to the amount of supply and relative elevations of the different points of the stratum, will permeate a portion of or perhaps the entire gravel bed.

If the gravel bed dip away from the point of inflow of water and has no outlet, it is evident that, as the water accumulates in the stratum to saturation, the pressure under which it is confined will rise until the head of water for all points of the gravel bed is equivalent to the hight of the point of inflow.

Should it now happen that some part of the surface of the earth directly over the gravel bed have an elevation less than the hight of the point of inflow, then a boring from above to the gravel must secure artesian water, unless the same be lost by leakage through a defective casing.

The layer of sand or gravel confined between an impervious water-bed below, and an impervious water-cap above, is typical of all artesian belts in this State of which I have any knowledge.

It is important to bear this fact in mind at all times in discussing the question of source of supply of any well or group of wells.

Deep as borings have hitherto been made, the same experience has everywhere been had, down to bedrock of our large valleys, of our mesas, and of our deserts, layers of pervious material alternate with impervious material, and the well-borer knows that if his boring were continued through the gravel bed in which, perchance, he has stopped, he would find beneath this pervious material an impervious stratum.

It is very easy then to trace our artesian waters to their source. The water must come from a distance; it must sink somewhere beyond the edges of the water-cap. It cannot come from underneath, access from below being cut off by the impervious water-bed. It must, therefore, enter the gravel or sand stratum, as the case may be, at the point where the same crops out of the surface, or at least connects with pervious material at the surface.

It is folly to look for a source of the artesian water of San Joaquin valley in the Sierra Nevada. None of our beautiful mountain lakes will ever be run dry by tapping the water-bearing strata of our great central valley.

Our great valley was at one time a great inland sea. Mighty glaciers were at work grinding down our mountain chains and depositing vast terminal morains along the base of our mountain slopes.

From the waters of the inland sea, layers of clay, of which some are in places more than 100 feet thick, were deposited. Sand was swept over them, gravel was run over them at some points, and the surface of the valley rose as the mountains were worn down by the ice and water.

The clay layers are thickest where the water of the sea was deepest. Near the central line of the valley they taper toward the east and west.

It is needless to discuss what convulsions of nature caused periodical interruptions of the deposit of clay and the formation of the sand strata. It is enough to know that the many borings that have been made prove the continuity of the clay layers and demonstrate that, to unknown depth, clay alternates with sand and gravel.

The pervious strata, open as they are to a source of supply, at once become Nature's subterranean water conduits, flat and wide.

For long distances they are closed conduits. The water they receive permeates all portions of them lying lower than the source of supply, whenever it enters in sufficient supply.

San Joaquin valley is 250 miles long and about 50 miles wide. The mountain ranges between which it lies are nearly parallel. The western slope of the Sierra Nevada mountains toward the valley is 50 to 80 miles long. The eastern slope of the Coast Range is generally but 5 to 10 miles in length. More detritus has been swept into the valley from the long slope of the Sierra Nevada than from the short slope of the Coast Range, consequently the present trough of the valley lies much nearer to the base of the Coast Range than to that of the Sierra Nevada.

The valley, where it opens out toward the outlet through the Coast Range, has not yet been built up to the hight of high tide in the ocean. Nearly 500 square miles of its surface at this point are almost absolutely level; thence land rises very gradually in the direction up the valley, but more rapidly toward the base of the mountains from points at the edges of the valley's trough. The lands rise faster toward the Coast Range than toward the Sierra Nevada.

In round numbers the general elevation of valley lands at the head of the valley is 400 feet above the sea; it is 200 feet near Tulare lake; it is 400 feet at the base of the Sierra Nevada directly opposite this lake. It is the same at the base of the Coast Range northwest of the lake; it is about 300 feet at Fresno; 150 feet in the trough of the valley directly west of Fresno; 170 feet at Merced; 20 feet at Stockton; 110 feet at the base of the hills east of Stockton.

The great eastern plain in the San Joaquin valley has a surface slope of from five to ten feet per mile from the mountains toward the valley trough.

As already intimated, the fact is clearly established, by the records of borings, that the layers of clay and sand found beneath the surface formation in San Joaquin valley dip toward the valley's trough with greater pitch than does the surface of the ground. The thickness of the clay deposits increases toward the valley's trough, decreases toward the hills, and even the deep clay merges into the surface-formation near the eastern edge of the valley. It is at that point that at or near the surface the upper edge of the water-bearing sands and gravel can be found.

Here, then, must be the source of supply for the artesian strata of our great valley.

Moreover, the pervious layers of the valley thus cropping out at their upper edges, or at least approaching close to the surface at the base of the foothills of the Sierra Nevada, are connected with or merge into the cobble or gravel beds more recently formed by the many rivers and creeks which drain the great western slope of the mountains.

Into these recent deposits many mountain streams sink; and even perennial rivers lose a very large portion of their flow by infiltrations into porous beds.

Whither does this water go, if not into the water-bearing strata already described? It finds its way, not alone into one bed of gravel or sand, but such layers by the dozen may receive it, and yet, when traced to points beneath the trough of the valley, may be widely separated by thick masses of clay. They may be hundreds, ay, thousands of feet beneath the surface. They may, when tapped from above, yield indifferent or excellent supplies of water according to the extent of each water-bearing stratum, the character of the material of which it is composed, the existence or non-existence of a natural point of outflow, and many other causes. The greater the depth from which water rises, the better is the prospect of obtaining an ample supply of water, because, other conditions being the same, it is reasonable to presume that there is less likelihood that a natural outlet from a deep water-bearing formation should exist, than in the case of others at a less depth.

Borings in the San Joaquin valley, to the number of about 300, bear out these conclusions, and a careful study of the well-borer's records reveals the further fact that there are points where some cause has interfered with the continuity of the great clay deposits. These points lie near the present river channels, and it is very likely that a large flow of water down the present river canyons into the sea was accompanied with a sand flow deposited in long ridges out from the present base of the hills toward the west.

The Tule river outflow into Tulare lake marks one of the points where the deposit of clay has been interfered with. Kings river delta is another.

Between these two points, increasing in thickness from 20 feet under Tulare at a depth of 200 feet, to 100 feet or more at a depth of 600 feet near the eastern high water shore of Lake Tulare, lies the great blue clay water-cap of the Tulare county group of artesian wells.

These remarks concerning the source of artesian water which refer to a particular section in this State, apply with equal force to all other localities in this State where a similar stratificaton prevails; and they indicate that the point at which artesian water sinks into the ground can frequently be located with precision.

Whenever this can be done, it may even be possible to determine the maximum permanent yield of a cluster or group of wells. For example, all the artesian strata of San Joaquin valley combined will never supply in the aggregate more water than sinks at or near the base of the foothills from the streams which descend from the mountains; an amount which can approximately at least be determined, and which fortunately is large enough to satisfy even the most exacting theorist.

When wells draw their supply from pervious layers of large extent, it may be months or even years before the natural storage is so decreased that equilibrium between supply and delivery is attained, before, in fact, the discharge of a well has decreased to that quantity which will be permanent till such time as further demands are made upon the same water-bearing stratum.

So soon as even a single well begins to discharge artesian water, just so soon is the hydrostatic pressure in the stratum of sand or gravel at the particular point from which the water rises reduced by that amount which the original head exceeds the head required to maintain in the well an upward flow of water. This reduction is sometimes great, being often equivalent to 20 and even 50 feet of water pressure.

If the well be of sufficient diameter to discharge at a moderate velocity, not engendering great loss of head by friction in the well-casing, all the water which the reduction of head just noted causes to accumulate (during continuous flow) at the bottom of the well-casing, then it would be impossible to materially increase the flow of the well by increasing its diameter.

Suppose the casing of a well already bored be free from leakage and fit snugly against the sides of the bore-hole through the water-cap, and it be found that water when its flow is checked by "capping the well" or by erecting a stand-pipe have a hydrostatic head of 40 feet. Let the well be one of moderately good flow, yielding from a seven-inch casing a daily discharge of 517,000 gallons, water rising from below with a velocity of three feet per second. The pressure-head required to cause this flow, if we suppose the well to be 500 feet deep, is three feet. Consequently the pressure required to force the water through the water-bearing stratum to the bottom of the well is 37 feet.

Now the question arises, will a well of twice the above-noted diameter discharge, as most books very arbitrarily tell us it ought to do, from two to four times as much water? Let us see. If it should discharge only the same amount as the smaller well, the upward velocity would be three-fourths of a foot per second. The pressure-head required to maintain this velocity would be about one foot, consequently there would be two feet more of pressure-head available to impel water through the water-bearing stratum toward the well than when only a seven-inch casing was in use. The greatest increase of flow possible would not therefore exceed the difference in the effect of 39 and of 37 feet of pressure, impelling water toward the well through its subterranean conduits. This effect may reasonably be supposed to be proportional to the square root of the pressure-heads. That is, it could not be hoped under the conditions supposed to prevail, and which can be ascertained for any properly cased well, that an enlarged well of 14 inches would discharge more than three per cent more water than the seven-inch well.

It is equally true, as in the case of the artesian wells in and near Stockton, that when the pressure-head required to maintain the upward flow of water is nearly as great as the hydrostatic pressure of water in the water-bearing strata, that a very material increase of flow must be expected if the diameter of the wells be increased.

The well-casing in ordinary use for artesian wells in this State is not water-tight. This should be regarded a very serious defect.

Any water which rises through a pipe penetrating layers of material from which water did not rise to the surface, subjects the pipe to an excess of pressure from within. Leakage must and will occur through any casing which is not water-tight. It will be greatest into dry pervious strata; least into those in which the natural water pressure is most nearly equal to the pressure within the casing. Not infrequently the water-table is 30 feet below the ground's surface, while artesian water is raised and delivered at 10 feet above the ground's surface. Under these circumstances, the hydrostatic pressure is from 10 to 40 feet greater inside the well-casing down to the water-table, and 40 feet greater below this point to the bed on which rests the stratum which carries the soil water, than it is outside of the pipe. The result must be a loss of water, unless the well-casing be water-tight.

That but a slight pressure is required to force large volumes of water into pervious strata of the earth's crust, is a fact well known to engineers, and one which has frequently been demonstrated by practical application.

Well-borers all tell us that we need not hope for a large supply of water from any well which can readily be filled by pouring water in from the top.

Near Paris, in France, there is a bored well 200 feet deep, into which about 21,000 gallons of waste water, from a starch factory, flow every 24 hours. Another well near by has a capacity of receiving 60,000 gallons each day, while still another, which for a portion of its depth has a diameter of only four inches and which is 265 feet deep, has swallowed water at the rate of 26,000 gallons per hour.

At St. Denis, in France, early this century, an artesian well was sunk to a depth of 181 feet. It supplied water of an inferior quality, but in such quantity that it flooded paths and streets, and created a nuisance. The local authorities had about decided to close the well, when, in the year 1828, Civil-Engineer Mulot undertook to mitigate the evil. By boring 35 feet deeper, he struck a second stratum, bearing artesian water of excellent quality but limited quantity. This was brought to the surface in a three-inch tube. From the upper water a seven-inch tube, encircling the three-inch tube, was also brought to the surface.

(*To be Continued.*)

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Butte.

THE GOLDEN GATE CLAIM. — Oroville *Mercury*, Nov. 1: The main dam was built and at its finish was a monument to the constant labor of 100 men, representing in a compact form the 20,000 tons of rock blasted out to build it, and the forest of trees cut to form its cribs. Its solidity was equal to that of the gigantic walls of rock which line the sides of the river. The head dam was equipped with waste-gates of capacity to handle any ordinary rise in the river, but not such a flood as first knocked upon their doors. The river was finally turned into the flume, and it carried the mammoth stream with ease, in fact leaving plenty of room for more, as was demonstrated on the 9th inst., when the flume carried three times the amount it was ever expected to take. The sub-flumes were constructed and the pumps set in operation preparatory to mining. Everything worked like a charm, and all was well until Oct. 9th, when the forerunner of the recent downpour of the elements made itself apparent. The rain fell heavily in the valley and mountains. The head dam was not injured in the least by this flood; the main flume carried three times the amount of water for which it was originally constructed, and the surplus water was let into the claim through the partly opened waste-gates. When this happened the company was on the eve of beginning mining operations. The effects of this storm faired off, however, and the work at the mine was renewed with zeal, and continued until Tuesday, the 22d inst., when the unceasing rain and consequent floods ended all hopes of the company again reaching the channel this season. On last Tuesday the river rose rapidly. The big flume was not able to carry half the water which was backed up behind the head dam. The great river poured over the crest of the dam in a stream four feet in depth; at last the massive right wing of the head dam gave way, and with a rush and roar the pent-up waters dashed through the break and in a few minutes carried from the claim all of the machinery for pumping purposes and the sub-flumes, derricks, etc., besides. Under the terrific strain the big dam held up many hours, but at last submitted to the gigantic force behind it, and gave way to the overwhelming stream. Huge boulders, weighing hundreds of pounds, were tossed into the air by the fury of the waters, and crushed and ground to sand in the crash of falling waters. Great timbers snapped into pieces and iron bolts were bent and twisted into inconceivable shapes. The waters were overwhelming, and in a few short hours the season's work in the claim was undone. The company has the grade of the main flume preserved, and the flume itself, roads, bridges, boarding camps and other buildings, besides a vast amount of lumber, poles, tools, etc., saved almost entire, which is half of the work.

Calaveras.

NEW MACHINERY. — *Prospect*, Nov. 2: A 15-horse-power engine and boiler have been put up at the Donnallan & Hagerman mine at the Bay State ranch, and hereafter the little five-stamp mill will be set in motion by steam-power, and the claim worked summer and winter. The owners have a good mine.

FINE ROCK.—L. A. Irvine brought a fine-looking piece of rock to town last week from the Spinola mine near the Jimmy Hill ranch, on the Mokelumne Hill and San Andreas road. Free gold in abundance could be seen all over the rock. The quartz was taken out of an old shaft that they recently cleaned out.

El Dorado.

ACTIVE.—Georgetown *Gazette*, Oct. 31: Business is quite active at the Taylor mine this week, and promises to be more so right along hereafter. The new superintendent, E. W. Chapman, has torn away all the old buildings and will immediately erect new buildings and equip the mine with a new plant throughout—new timbered shaft, new hoisting and pumping works, new mill of the roller kind with a 20-stamp capacity, new cars, new track, new everything. Work has been resumed on the Josephine mine, at Volcanoville. Thos. Evans, Lew Howe and two others have taken a contract to drift 600 feet on the ledge in the No. 5 or lower level. They laid in their supplies this week. It is probable that the 20 stamps will be running before long. The Mammoth Bar mine has been quite fortunate this season in having its regular 400 inches of water from the Cal. Water Co., right along, and with good prospects for its continuance until high water in the river interferes with further action of the hydraulic elevator.

Humboldt.

GOLD PROSPECTS.— Cor. *Northern Advocate*, Nov. 3: I have spent a good deal of time in prospecting Humboldt county. I do not claim that it is as rich as the placer mines in Sierra county, where I worked in years gone by. But I claim that, with proper facilities for working and saving the gold, Humboldt would soon rank among the foremost gold-producing counties of the State. The great difficulty at present is to get practical miners to investigate. A great drawback to investing in these mines seems to be fear of trouble on account of the debris question. But a look at the country would satisfy the most timid that there is very little farming-land to damage. And in regard to navigation, one trip up the river, a distance of only 20 miles, in an Indian canoe, would satisfy most any one that he was far above the head of navigation. And if he had had experience in mining he would see that he was in the heart of a great mining country, and that mining must ultimately predominate over any and all interests that may spring up—not even excepting the manufacture of redwood lumber. The great forests we have passed through in reaching here remind us that this will be one of the leading industries of northern Humboldt.

Lassen.

PAYING ROCK.—Susanville *Advocate*, Oct. 31: The company composed of Long, Peck & Thomas are working on their mine, which is situated about seven miles south-east of Susanville and near I. Scottini's ranch. Mr. Thomas showed us a piece of rock taken from the ledge, which is very good quality, with considerable free gold. The shaft is down 30 feet, and at that depth the ledge is three feet wide and widening as they go down. The company are well pleased with the recent developments, and are satisfied they have a good paying mine. In fact, they have enough good paying rock in sight to assure them that it is no pocket, but a well-defined ledge.

Napa.

THE PALISADE MINE. — *Calistogian*, Oct. 31: Forty-five men are engaged in work in and about the mine and reduction works. The reduction works are still run only 12 hours per day, and little or nothing is done under ground during the night. During the summer a great deal of wood was hauled for use at the works, and available space on the grounds about is nearly all occupied with wood, of which there are several hundred cords. The "dry process" is used in reducing ores, and for this reason the stamps and pulverizer can do far less work than if water were used. With 10 stamps and the pulverizer about a ton of ore is reduced every hour. The engine and boiler used in the reduction works are the same as were used in the mill of the old Calistoga Gold and Silver mine, though changes and additions have been made making the machinery far better than when in use on the side of Mt. St. Helena. Aside from some ore that is being taken out at a couple of places where excavations are being made for the purpose of ventilating the mine better, no work is being done except on the first level. Here stoping is being continued up toward the surface the same as during months past, and the reduction works are kept running on ore taken from there. The lower level was cleared of water several weeks ago, and it was found to be in a very bad condition. Much work and expense were necessary to put it in order. From there—the Palisade vein—high-grade ore will soon be taken and mixed with that of lower grade now being taken from the Easley vein on the first level.

Nevada.

NORTH BANNER.—Grass Valley *Union*, Nov. 3: Superintendent Skewes brought down from the North Banner mine yesterday a gold brick weighing 167 ounces, the product of five and a half days run of the mill for the past week, being the value of something over $2000. This run will more than pay the expenses of the mine for the past month. Besides the gold product the silver sulphurets saved in this run are estimated at $600. The new drifts of the mine are not yet opened sufficiently to keep the mill going constantly, but as far as opened the ore is of high grade, but with the further extension of the drifts, and the opening of the No. 3 level, which is now being sunk for, a large body of fine ore will be accessible that will keep the 10 stamps of the mill going regularly. The North Banner is making a good showing.

PEABODY.—Supt. Tilley is doing some reconstruction work at the Peabody mine. The foundations of the hoisting works are being repaired, and the water-wheel for pumping is receiving similar attention, and the structure generally undergoing improvement. When these changes are made the underground work will be pushed ahead vigorously, commencing during the coming week.

TAKING OUT GOLD.—*Transcript*, Nov. 3: The San Jose drift mine of this county is an assured success. President Spencer came down from there Saturday, bringing several nuggets of gold, worth from $1.50 to $2 apiece, that were, with many others of similar character, found there during the past week. The 300-foot tunnel is now in the channel a distance of 22½ feet, and is being pushed for the center. The deposit is of the genuine "blue-lead" kind, and is rich in gold. The San Jose people have spent much money and several years in prospecting.

HIGH GRADE ORE.—*Tidings*, Oct. 31: Ten tons of ore worth in the neighborhood of $1000 per ton were yesterday shipped to the Selby Smelting Works by the Champion M. Co.

WILL SELL AND DISINCORPORATE.—Grass Valley *Union*, Nov. 5: The Badger Hill G. M. Co. contemplates selling its real estate in the eastern part of the town and dissolving as an incorporation. The company owns over five acres of ground that is well situated for building lots. In the last operations of the company $18,000 were expended in the effort to develop a mine, but unsuccessfully. The building, machinery and pipe-line connections have already been sold.

IDAHO DIVIDEND.—The Idaho M. Co. declared monthly dividend, No. 240, yesterday, of five dollars per share, amounting to $15,500. The Idaho is the "old reliable," and has paid more dividends than any other mine on the continent.

Placer.

IOWA HILL.—Cor. Placer *Herald*, Nov 2: The repairs and additions to the mill on the Waterhouse and Dorn mine have not yet been completed. The Morning Star mine is, I hear, to have a compressor and air drills to forward their bedrock tunnel with the most possible speed. This is popularly the best mine in this district. Freight seems to be coming in rather lively for this vicinity, which indicates a prosperous condition of affairs. There are few idle men here at present. Of the upper divide we hear very little here. Report says the Hogsback Co. is running the new tunnel at Sailor canyon. The Sterrett Gravel Co. have been employing six or seven men nearly all summer. I hear that a five-stamp mill complete is on its way to Canada Hill to operate on the Buena Vista ledge, formerly operated by Van Vactor. Black canyon has not yet closed down its tunnel for the season. At Red Point the tunnel is being pushed rapidly and soon we shall get news of good pay being taken out. Damascus is quiet. Of the Pioneer, not much is heard here.

MAYFLOWER.—Placer *Argus*, Nov. 1: The shipments from the Mayflower for October aggregated $13,722.28. W. E. Beach was chosen assistant superintendent and is now in charge of the mine. Mr. Chappellet has been quite seriously ill. The south gangway is now in 1057 feet. Gravel in the north breast very good. They are breasting out 72 feet; channel getting wider. They expect good returns when the bedrock begins to raise. Very little work has been done lately on the Orono. In the end of the south gangway the channel has pitched below the track, and they have started two drifts from the end of the gangway—one west and one south.

ROYVILLE.—Cor. Placer *Argus*, Nov. 2: Capt. George Ross of No. 10 Folsom street, San Francisco, has the contract for running the Gray Eagle tunnel. The town-site is situated at the mouth of the Gray Eagle tunnel, on Owl creek, about five miles from Forest Hill. But it has resources, from the fact that it is situated in such a position that all the mining that can be done in this part of the Deep channel of the Forest Hill divide must necessarily be done through tunnels that have their outlets here. The Gray Eagle tunnel, which has its place of commencement here, is now in 250 feet, and with the new machinery which Capt. Ross is putting in place, it will not take over 10 months to complete his contract of 2500 feet. But long before that is done we expect to see a big strike made in the main channel. But this is not all for Royville, for about 400 feet above the mouth of the Gray Eagle tunnel, on Owl creek, Anthony Clark, the veteran prospector, has located a site on his Hawkeye ground for a tunnel to tap his series of claims adjoining the Gray Eagle. He has already commenced operations in the shape of putting up and repairing buildings, clearing ground, etc.

Plumas.

CRESCENT MINE.—Greenville *Bulletin*, Oct. 30: The Crescent mine now presents a busy appearance. Up to the present time, only 16 stamps of the mill have run. Mr. Whitney, the superintendent, is now putting the north half of the mill in condition, and soon 32 stamps will be operating, thus doubling the crushing capacity of the mill. An air-compressor will be placed in position to run two Burleigh drills. Another boiler and engine will be provided. These will be so placed, and of such capacity, as to furnish power to run the entire mill. The air-compressor will be run by water. The surplus water, if necessary, will be used to assist in running the mill.

Sierra.

SIERRA CITY.—Cor. *Mt. Messenger*, Nov. 2: Carpenters are at work building on the Chipps mine. The ore crushed at the Kentucky mill from the Buttes Saddle-Back mine turned out better than was expected. The Columbo leasers have put on four men this week. Only about 30 men are employed at the Sierra Buttes mine. Mr. Leffler has been appointed foreman at the Young America mine. The Marguerite is running along steadily, and is looking good. The Salinas and Mercer has started up again with plenty of water. Geo. Black has charge of the mill.

THE GOLD BLUFF has shut down for repairs to the mill. The mill is a very old one.

SOLD.—The Buffalo quartz mine at Hog Canyon was sold at Sheriff's sale last Monday for $2708.92 to S. A. Smith and Herman Shoelin. The Lone Star, owned by Andy Gibson and others, was sold this week. Gibson received $5000 for his interest.

A PURCHASE.—Grass Valley *Tidings*, Nov. 4: The Grass Valley syndicate, embracing Joseph Snyder, Andrew Husom, Stephen Long and others, has perfected the purchase of a controlling interest in the Lone Star Consolidated Mining Co.'s property in Gold Valley district, Sierra county, and 13 miles from Downieville. The Lone Star embraces 4100x1500 feet. A tunnel has been run a distance of 90 feet on the ledge and two shafts sunk in it. The ledge is of solid quartz and over three feet thick. The Gold Lake Co.'s mill is but a thousand feet from the Lone Star, and there is a good wagon-road leading to it. Mr. Snyder returned from the Gold Valley district Saturday night. He tells us that the Young America mine is on the same ridge and but two miles south, the Garibaldi intervening. The operators of this last-named property have a fine ledge and a five-stamp mill. The Gold Lake mine, also, has flattering prospects, fully justifying the outlay for the new mill. There is still another mine in Gold Valley which is being developed with encouraging results. Mr. Snyder predicts a lively camp there in the spring.

Shasta.

OCCIDENTAL.—Redding *Free Press*, Nov. 1: Jennings, Armstrong & Jones, owners of the Occidental mine on Sulphur creek, near Reid's ferry, have had their claims surveyed preparatory to commencing active operations.

THE MAMMOTH SALE.—More capital has been added to the mining industry of Old Diggings district by the purchase of the Mammoth mine, by F. H. Myers of San Francisco and Mr. Gable of Woodland. This is the mine owned by Garrecht, Young & Panter, in which was developed three weeks ago such rich ore. The price paid is stated to be $45,000, most of the money being paid down. New and extensive machinery will be introduced, and the mine put in the best shape for successful work.

Siskiyou.

SALMON RIVER.—Yreka *Journal*, Nov. 2: In the Salmon river section there is considerable excitement in reference to rich quartz prospects. At Clapboard Bar a rich find has been discovered, the quartz paying $2 to the pound, and in a place where the miners have run over during the past 30 years. Other fine prospects have also been discovered, and we may anticipate lively times on Salmon river and all its tributaries next season. Martin Andrews & Co. have been taking out considerable gold lately from their claim in bed of Klamath river at Humbug Bar, about $5000 having been taken in two days before the late heavy rainstorm, which raised the river at least two feet, causing considerable damage without damaging the claim to prevent resumption of work again.

BORING.—Several residents of Ashland, Or., who have located mining ground in Cottonwood district, near Klamath river in this county, are now boring with an artesian well apparatus to tap the blue lead, or an ancient surface ground, and expect to strike it within 300 or 400 feet, which is supposed to contain gold in rich paying quantity. The tertiary strata of the eocene, miocene and pliocene periods, in all the country along the Klamath river and its ributaries, have shown very rich prospects of gold, and in most places where fossil remains exist gold has been found, especially in the districts known to possess gold. The Hegler Bros. and Bruce Aldrich are running their steam quartz-mill on Humbug creek, about 18 hours each day, not having water enough yet to supply the batteries for keeping the mill constantly in operation. Spencer & Co., on Humbug, are busily engaged in erecting their pumping and hoisting machinery received from below, and will soon be prepared to open their ledge on a more extensive and successful scale. Mr. J. F. Boyle is now at S. F., superintending the construction of a first-class and extensive quartz-mill, for his mine at head of north fork at Humbug, and will soon have it shipped. The 25-horse power engine to run it has already been hauled to the claim.

RIVER CLAIMS.—Several river claims along the Klamath were damaged to some extent by the late storms raising the stream between two and three feet and filling up a few of them, but the companies have repaired damages and pumped out again to continue work a number of weeks yet. Messrs. Kincaid & Co. and other parties have located quartz ledges on Yreka Flat in Humbug Gulch, about a mile above the Big Ditch. The parties feel confident of having found good paying ledges, which, if so, will be very valuable, as the ledges are very wide and extensive.

Trinity.

EAST FORK.—Cor. Trinity *Journal*, Nov. 2: The North Star mines and improvements are located conspicuously at the left on the west side of the creek. The owners of the mines are now having a large stamp-mill constructed and will have it in operation by Dec. 1st. A few steps farther up the creek is located the Enterprise mine and works. For years, in fact almost from the discovery of the mine, the ore has been worked by an arastra; but about four weeks ago the present company completed its 10-stamp mill, which is now run by water-power. One battery of five stamps is all that is in readiness for operation; the other five apparently will remain suspended for a time, as there are no plates and other fixtures attached to them. About one mile farther on the road from the Enterprise are located the Coleman mines and the hamlet of Colridge. Here, too, the company are busily engaged putting up a large stamp-mill, and improvements of various kinds are steadily being made. In fact, Colridge is assuming an aspect that will eventually make it a very pleasant place for a small portion of the human family to dwell. The company at the present time may be presumed to have in its employ nearly 100 men, including about 40 Chinese who work on the ditch. From the store a trail leads onward to Yellow Jacket, Rattlesnake and New river. There are ledges being developed along the route, but it is sparsely settled. Cabins are far apart and very few accommodations. As to the pay of ores previously extracted from the mines, each and every one must judge for himself, as each company has apparently sealed the mouth of every workman. But every man can prophesy something when he takes into consideration the many improvements being made at the mines.

Tuolumne.

RIVER MINING DISASTER. — Tuolumne *Independent*, Nov. 2: The late storm effectually stopped the extensive mining operations of Mr. Moffitt, in the Tuolumne river. On Tuesday of last week the river flood carried away the dam, 400 feet of flume, and the pumps. Mr. Moffitt lost everything but his grip. They had been only able to get one week's wash of pay dirt, yielding $1100—the last day's work being $250 of this amount. This was enough to demonstrate the richness of the mine, which comprises about three-quarters of a mile of the river channel. The dam was 34 feet high from foundation to top. The rise was unexpected, and was within an inch or two as high as any time last winter. They managed to save some lumber, one or two wheels, and some of the machinery. About 50 men were employed. The $1100 only represented 10 per cent of the season's expenses. Mr. Moffitt will proceed to put in a foot-dam as soon as the flood subsides, and next season will build a permanent dam on top of this, so that he will not be troubled with such an accident in the future. The foot-dam will have its foundation of brush, and the cliff near will be blasted down on top of this to hold it. The debris above will fill in above and make a solid foundation. This will hold all the loose wash from above, and the current then will scour and strip the claim below. This stripping generally consumes most of the time of the short mining season, and prevents but a small portion of gold-bearing gravel from being mined. It is hoped that this plan will enable the enterprising gentleman to secure his reward next summer.

POCKET. — Tuolumne *Independent*, Nov. 2: Hank Gale and Jim Wickham struck a rich pocket in their claim at Jackass Hill. On Wednesday they took out 62 ounces; Thursday, about $600; and more in sight.

DID NOT PAY.—The miners who undertook to sink the new shaft on the Bonanza mine have thrown up the contract, as they failed to make it pay. Some of the miners went back to work yesterday, for wages.

GOLDEN GATE.—The Golden Gate mine has been closed down for the past few days on account of some defect in the roasting furnace, but will start up again as soon as poss ble. This mine now has about 40 names on the pay-roll.

NEVADA.

Washoe District.

ALTA.—Virginia *Enterprise*, Nov. 2: The mill is running steadily, crushing about 45 tons daily. The 600 level northwest drift, to tap the ore body, is being pushed forward. The stopes are looking well.

BALTIMORE.—Still saving ore from the exploration work on the 225 and 338 levels.

CROWN POINT.—The 600 raise connected on the fourth floor of the old stopes and gives a good circulation of air. The 800 winze is down 25 feet. The bottom shows spots of ore, but low grade on the average. Have cleaned out the 900 drift south 504 feet.

BELCHER.—The 1200 east crosscut No. 2 is out 104 feet; advanced 20 feet during the week, the face in soft porphyry. East crosscut No. 3 on the 1200 level is out 52 feet; face in low-grade quartz. No. 1 east crosscut on the 1000 level advanced during the week 22 feet; total length, 63 feet.

SEG. BELCHER.—The 1200 south drift advanced 55 feet during the week; total length, 90 feet. The face is composed of clay, porphyry and streaks of quartz.

YELLOW JACKET.—Shipping 65 tons of ore daily to the Brunswick mill. The west drift on the 500 level is out 730 feet. The 800 and 900 level north drifts are out 780 feet.

CON. IMPERIAL.—The joint Confidence, Challenge and Imperial north drift on the 500 level is now in 1094 feet from the Yellow Jacket shaft, 34 feet having been made during the week. The face shows quartz and porphyry. The east crosscut from this drift is out 158 feet, 25 feet having been added during the week. The face shows granite. The west crosscut from the 300 level north drift is being repaired, and the east drift from the bottom of the winze on the same level is now connected with

the Imperial new shaft, thus supplying a good circulation of air, which will thoroughly enable us to prospect this portion of the mine. The work in the Challenge and Confidence is jointly with the Imperial.

OVERMAN.—Upraise on the 25 level, 100 feet east of southwest stope, advanced 25 feet. Material, quartz and porphyry. Quartz giving fair assays. South drift on the 52 level is in 35 feet past west crosscut on the seam of ore. Southwest drift, 63 feet above the track floor of No. 3 stope, has been extended 14 feet. Material, porphyry. Timbered 35 feet of Lambert upraise.

CALEDONIA.—West crosscut No. 2 has been extended 16 feet. Material, vein porphyry. Total length, 114 feet.

JUSTICE.—The 622 level north drift advanced 67 feet; total length, 242 feet. The southwest drift, 490 level, extended 23 feet; total, 426; face chiefly porphyry. Shipped to the mill 214 tons; average battery assay, $19.51 per ton.

CHOLLAR-POTOSI.—Owing to repairs to surface machinery, no work was done in these mines the past week.

EXCHEQUER.—The 382 level east crosscut, 150 feet south of the north line, is out 34 feet; face in porphyry. West crosscut on north line, 500 level, is out 45 feet; face in quartz giving low assays.

ALPHA.—The shaft is sunk and timbered 100 feet below the 500 level. West crosscut, 150 feet north of shaft, 500 level, is out 325 feet; face in hard porphyry.

SILVER HILL.—The 260 level northwest drift advanced 20 feet through porphyry; distance from shaft, 700 feet. The 160 level northeast crosscut in southeast drift, 630 feet from shaft, advanced 20 feet through porphyry; distance from shaft, 830 feet.

NEW YORK.—The 800 level raise is up on the slope 100 feet; the roof in quartz giving fair assays. Have resumed work in the north lateral drift, 800 level.

WARD COMBINATION SHAFT.—The station at the 1800 level is completed, and a joint drift started west.

SAVAGE.—On the 400 level the southwest drift from the top of the north upraise is out 55 feet, 28 feet having been added during the week. Are stoping ore from the north drift on this level. On the 500 level are extracting fair-grade ore from the north and south upraises; also from the east drift from upraise No. 2. Have men engaged at necessary repairs on the different levels and in the main shaft. Have hoisted 71 cars of ore during the week.

SCORPION.—On the 520 level the south drift was advanced 50 feet, making its total length 380 feet. There is no change in the character of the ground since last report.

HALE & NORCROSS.—On the 300 level No. 1 west crosscut was advanced 20 feet; total, 125. No. 1 east crosscut is now advanced 50 feet, 25 added during the week. On the 500 level they have cleaned out and retimbered the east upraise a distance of 50 feet. This upraise shows considerable pay ore. Have finished retimbering the main north drift on this level. On the 1200 level an east crosscut is advanced 45 feet; face in porphyry showing some quartz.

Comet District.

LOW-GRADE ORE. — Pioche *Record*, Nov. 1: John Trewick and E. A. Shear went out to Comet district last Monday to examine the mining property there which Mr. Shear has bonded. Mr. Trewick came from Salt Lake to examine the property. Comet district is bound to come to the front as soon as the transportation facilities or local reduction works render it profitable to mine low-grade ore. Ore which in other sections of the country is extracted and made to pay dividends, is in Comet district thrown over the dump as waste, or allowed to remain in place. A mineral belt exists there, however, which will some day contribute largely to the wealth of the country.

A POOR MAN'S CAMP.—Park City *Record*, Nov. 2: E. A. Shear has become interested in the mines of the Comet district, near Pioche, and he declares that with the advent of the Union Pacific railway there will be no better place for a poor man to locate and develop mining property.

Jefferson District.

PROSPECTING.—Belmont *Courier*, Nov. 2: Considerable prospecting is being done in Jefferson mining district.

Morey District.

SILVER.—Belmont *Courier*, Nov. 2: The mine at Morey is still yielding rich silver ore in large quantities.

Pioche District.

RAYMOND SHAFT.—Pioche *Record*, Nov. 1: At the Raymond shaft the work of pumping out the winze on the 12th level will begin in a few days. The engine stationed there is nearly in place. It has been thoroughly overhauled at the shops during the past two weeks. Yesterday morning the small pump in the winze was run for an hour, and the water lowered 7 feet. It was an experiment. Steady pumping will not begin for some days yet. The Yuba Co. is hoisting ore from the 12th level of its mine and shipping it to the furnace. The ore as it is hoisted from the mine is comparatively free from waste and will average 100 ounces in silver per ton. The Yuba on the 1200-foot level has looked exceptionally well for some time, and it will be the main stay of the company in supplying ore for the furnace which will now soon be in operation.

Robinson District.

GOLD.—Eureka *Sentinel*, Nov. 2: Parties just in from Robinson District, White Pine county, report great excitement prevailing over the new gold discoveries there. Nothing like it has been known in Eastern Nevada since the discovery of the marvelously rich mines of Treasure Hill in 1868. The people of Ely and Ward and Taylor and the surrounding country are simply wild with the gold fever. It appears from latest accounts that gold is found over a very considerable area of territory—perhaps two miles long by a mile in width. A great bluff standing up hundreds of feet is found to be a mass of gold-bearing quartz worth $30 to $50 to the ton. The richest claim so far as known is owned by Mr. Watson, one of the pioneers of the district. Mr. House, the butcher of Ely, also has another good claim. The discovery of gold in the immediate locality under notice is of recent occurrence. McGill & Lyons had worked a low-grade gold ledge with varying success about three miles away. Robinson is an old district, but no one had looked specially for gold. There can be no room for doubt that gold is now found there to an extent that promises to be important—but how important we are not prepared to say. The prospects as far as tested would seem to justify the belief that the new field is both rich and extensive. If these discoveries had been made thousands of miles away, the roads would now be lined with pilgrims from every part of the country.

Tybo District.

DIMICK.—Belmont *Courier*, Nov. 2: A party of Salt Lake capitalists inspected the Dimick mine this week. This is one of the most promising mining properties in Nye county.

ALASKA.

THE BEAR'S NEST MINE.—*Oregonian*, Nov. 1: Since the unwelcome news was received here that the Bear's Nest mine, on Douglas island, Alaska, had proved of no value, but little has been heard from the mine. It was known, however, that some of the persons interested still had hopes that the mine might prove to be of value, and now it is learned that some of the largest holders of the stock in England have sent out two experts to make a thorough examination of the mine and decide whether it possesses any value or not. A citizen of Portland, who was in London when the news arrived there that the mine had proved worthless, says it caused great excitement there, a large number of people having invested a larger portion of their fortunes in the stock. It is pretty evident that the expert who tested the ore from the boring made by the diamond drill was cheated and fooled by the substitution of other rock for that taken out by the drill.

BRITISH COLUMBIA.

FRAZER RIVER GOLD.—Inland *Sentinel*, Oct. 30: William Teague of Yale and B. Douglass of Westminster own 402 acres of placer ground across the Frazer from Yale. They have interested a syndicate of London capitalists in the ground, and operations will soon be commenced to open it up. The machinery is now on the way from England, and is expected to arrive early in November. Water for hydraulic will be taken out of Yale creek and conveyed to the ground in pipes suspended from a cable stretched across the river. John W. Oliver will be the resident manager of the syndicate, and an office is already being fitted up at Yale. The syndicate's expert, J. H. Collins, is on his way up from Old Mexico, and on his arrival work will be begun. Yale may have a revival of former greatness if this hydraulic mining business proves a success.

COLORADO.

BOULDER COUNTY.—Cor. Denver *Republican*, Oct. 31: Mining in Boulder county keeps up in the even tenor of its way. There is no boom and no collapse. The Potosi mine at Caribou has been cleared of water which has stood in it for years, and is likely to soon be numbered among the paying properties of that camp. The Richmond mine at Salina, which has in times past yielded remarkably rich ore, but which was for some unknown reason shut down, is also being cleared of water and is to be worked again. It is near the famous Ingram mine, and when developed, as is the Ingram, may prove as good property. Machinery for the Modoc mine, at Ward, is still arriving at the Boulder depot and will be taken to Ward by freight wagons. The Ingram mine, at Salina, owned by St. Louis parties, is doing very well under Sam Galusha's superintendence. The Emancipation, Grand View, American, Nil Desperandum, White Crow, Sheridan, and other mines at Sunshine, are being worked satisfactorily. The Buckhorn mine at Jamestown is shut down because of a lawsuit. Some good ore is being taken out of the Potosi mine at Magnolia by Martin Comerford. It is an extension of the Kekiouga mine. Add Oregon.

GREENHORN DISTRICT.—*East Oregonian*, Nov. 1: Information comes from the Greenhorn district that the lucky prospector, Mitchell, who made the recent rich strike near Robinsonville, worked 10 hours with a mortar not long ago, and pounded out $7000 worth of gold. The ore was taken from an exceptionally rich pocket of decomposed quartz found in the mine.

DAKOTA.

REDUCTION WORKS.—Deadwood *Pioneer*, Nov. 1: Col. Carpenter's force, in spite of bad weather, was actively engaged at site of reduction works. Clearing up debris and straightening out affairs is practically complete. Carpenters will go to work in a few days.

DEADWOOD SMELTERY.—Authoritative information is at hand that if machinery for the Deadwood smelteries has not already left Chicago, it will be started to-day or to-morrow. The shipment includes all necessary for a 20-ton plant. Its arrival depends only on the time required for transit between Chicago and Deadwood. As the plant is complete and an extensive building to put it in is not requisite, probabilities are it will be in operation for thorough test of the dry process before close of this month.

SHIPPING ORE.—Several Galena mines are working forces taking out ore and shipping to eastern smelteries for reduction. Most of the product now goes to the works at Aurora, Ill. These have only recently been established, and mine-owners claim give better and quicker returns than do either the Omaha or Kansas City works. The distance is greater and freight charges consequently heavier. Claim-owners assert, however, that this is more than offset by the larger figure allowed for lead the ores contain and by the dispatch with which returns are received. Shipping is, nevertheless, costly; and owners of the properties referred to hail with delight prospect for speedy blowing in of the Galena and Iron Hill smelteries, and for establishment of large reduction works in this city.

IDAHO.

PARK NOTES.—*Record*, Nov. 2: The Southern Tier group of mines, the bonanza of Snake creek district, have been undergoing developments all summer, the work being done by contractors. As soon as connections can be made with the old workings for ventilation, the mine will be capable of producing more ore than ever. Of course developments will have to be continued to bring this about. If the condition of the roads permits, a large shipment of high-grade ore will be made from the Southern Tier before winter sets in.

THE UNCLE HARRY.—The leasers of the Uncle Harry mine, which is close to the Woodside, have obtained an extension of 12 months on their lease from the owners, and the calculation was to resume work this morning.

THE ALLIANCE.—The mine is in a quite satisfactory condition and a considerable force of men is engaged in opening up the ore reserves above water level.

CAMP CROSSCUTS.—Bad roads have interfered with ore hauling the past week. The various jiggers have made a profitable run this season, notwithstanding the scarcity of water. Another body of ore was encountered in the old workings of the Woodside Thursday, and a drift from below is being run to tap it. The Ontario three-mile drain tunnel is in a distance of over 2600 feet, and better working ground than her-tofore is being driven through.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped about 130,000 pounds of concentrates. The Ontario bullion shipment for the week was 28 bars, containing 16,358.18 fine ounces of silver. The output of Daly bullion from the Marsac mill for the week was eight bars, containing 7142 fine ounces of silver. For the week just ended the Mackintosh sampler received and forwarded 421,050 pounds of Ontario ore; 151,180 of Daly; 100,880 of Alliance concentrates from the Union concentrator; 84,770 of Mayflower No. 7, leasers' ore; and 22,150 of Woodside ore; total, 780,030 pounds.

BUNKER HILL & SULLIVAN.—Wardner *News*, Nov. 2: The Bunker Hill & Sullivan M. and Concentrating Co. will, on next Monday, commence the construction of a dam across the South Fork at the mouth of Elk creek. It will measure 400 feet and extend the whole width of the river, being four feet high in the stream and eight feet on the banks. It will be composed of logs, braced and bolted together, with clayed and planked bottom. The building of a flume 10 feet wide and four feet deep, for which the grading was done last summer, will also be commenced on Monday. It will be two and a half miles long with a capacity of 12,000 inches, and will furnish water-power to run the 400-ton concentrator to be erected at Kellogg. One million feet of lumber has been ordered from the Cameron Brothers, over one-half of which will be used in this structure. This denotes the carrying out of the mighty plans the Co. has resolved on. The erection of the 400-ton concentrator will follow, and that will cap the climax of the grand mining enterprises in and around Wardner.

MONTANA.

IN CABLE DISTRICT.—The Cable mill is running 30 stamps on first-class ore, and there is every indication that this run can be maintained. The Red Lion is running full capacity and with the brightest of prospects. The proprietors are in fine spirits and look forward to a prosperous season. Salton Cameron's new mill is slowly assuming shape, and will of course add materially to the resources of the camp. As soon as completed the mill will be run on ore from the Southern Cross, which is showing up better and better as work advances. A large amount of ore is in sight and the mill will be run to its fullest capacity. The Pyrenees mine has shut down and will probably not resume operations until spring. The prospects of the camp are very bright, and the coming season bids fair to be a busy and successful one.—*New Northwest*.

PHILLIPSBURG.—*Mail*, Oct. 26: If the organizations of new mining companies can be considered a criterion for prosperity, Phillipsburg certainly has a fine outlook for the future. Scarcely a week passes now that some new company does not come into existence, and to-day we have orders in our job department for stock certificates for three new organizations. And what is most encouraging about these new companies is the fact they are composed of home capital, and are not the so-called "wild-cat" adventures; but to the reverse, they have confidence in the properties they are undertaking to develop and spend their own money in doing so.

HARVEY CREEK DISTRICT.—Phillipsburg *Mail*, Oct. 31: Harry Sparks, formerly superintendent of the Red Lion, was in Phillipsburg Monday, on his way home from a trip into the Harvey Creek district, about 30 miles northwest of Phillipsburg. He gives the *Mail* very favorable reports on that district, and thinks it will eventually become a big camp. The Alps company continue developing their property, and it is their intention to commence the building of a 10-stamp mill as soon as enough snow falls to have the material hauled in on sleds, as the wagon-road is not yet in a condition to permit heavy loads being taken over on wheels. There are now only about 20 men in camp, which includes eight that are employed by the Alps Co.; the others are engaged in representation work, and as there are many encouraging-looking prospects in the vicinity, it is the general opinion that next season will be a lively one in that camp. When the new road is fully completed between Phillipsburg and that place it will have cost the miners not less than $3000, which shows quite conclusively the confidence they have in the Harvey Creek district.

ORE SHIPMENTS.—During the past ten days there have been numerous shipments of ore made from Phillipsburg, which is most likely due to the fact that the miners are beginning to realize that winter is close at hand and that they must prepare for it—sell their ore and lay in the usual supply of provisions.

ACTIVITY.—Butte *Miner*, Oct. 31: Considerable activity is now being manifested in mining circles in all parts of Montana. New prospects are being developed with wonderful rapidity and good results in and about Butte. On every side of the city new hoisting works for the purpose of developing the many promising properties are either in course of erection or have been lately finished, and are busy hoisting to the surface ores of various degrees of value. In no less than 1000 places in and about Butte holes from 5 to 200 feet in depth have been sunk by lessees and prospectors from many of which good ore has been taken, but later on abandoned by the workers because of a lack of capital to further continue the work.

ORO FINO.—Experts are of opinion that it will not be long before the mines in that district will place it in the front rank among the mining districts of Montana. The fame of the Champion is already established beyond a peradventure, with the chances of its rivaling the Granite Mountain itself in productiveness. The village that has already sprung up near that mine, from which it takes the name, Champion, will soon be a place of bustling activity, having already 30 or 40 houses and stores in it and others in course of erection. It is about 16 miles in a southeasterly direction from Deer Lodge, with excellent roads leading to it.

THE PARROT SMELTER.—The Parrot smelter is now running full blast, an ample supply of water having been obtained to start the concentrator. It is the intention of the company to keep all departments running to their utmost capacity during the entire winter. The bullion output of the Parrot is phenomenal, and it may be truthfully stated that no other plant of its capacity in Montana is earning a larger profit from the same class of business. In addition to an output of 1,000,000 pounds of refined copper per month, it ships almost twice as much silver bullion as any other works about Butte. The product of the mine and smelter is sent to Bridgeport, Conn., where the company has an agent whose business it is to handle it.

THE BLUE WING.—The Blue Wing, situated in the heart of Walkerville, is shortly to be developed on a grand scale. It is the property of the Alice Company, and although a shaft of several hundred feet in depth has already been sunk on the property, it is the intention of the owners to "send her" further down. New hoisting works are being erected, new machinery placed in position, and in a short time the Blue Wing will be flying high with Wm. E. Hall as its booster.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City *Enterprise*, Nov. 1: The Bremen mill has started up. The Standard mill at Gold Hill has again started, with plenty of ore to keep it busy. W. Mitchell, recently of Los Angeles, Cal., has purchased a mine on the Mangas from Henry Miller and Chas. Metcalf. He will soon put a force of men to work to develop the same. Before leaving for the North, Prof. Hand visited the Pacific mine, and said that he considered it the largest mine that he had yet seen in this Territory. Still another immense strike is reported in the Bremen. The ore was first struck Friday last while sinking a shaft in new ground, and has gradually developed to ten feet in width. The ore assays about $300, and from present indications may prove to be one of the big strikes for which the Bremen has always been famous. C. S. Kellum of Gold Hill last week sold the Minneapolis mine to George H. Utter of this city; consideration, $10,000. Mr. Utter will soon have a force of men at work developing the property. The ore will be treated at the Standard mill. John A. Miller has secured a working bond on the Nugget mine, Carlisle district, which is one of the richest mines of that section. He has also leased the Rain-in-the-Face and the Telegraph mills, through which he will work the Nugget ore. Nate Scarritt, who will be in charge of the mine, left Monday morning for Carlisle, and will commence work on the mine at once. It is said that there is $50,000 worth of ore in sight.

ZINC which does not average from 55 to 65 per cent will not pay in Southern New Mexico, unless very greatly reduced freight rates can be secured, or works of some kind erected at the mines. It has been tried in this section several times, and the above can be relied on as very nearly correct.

OREGON.

CORNUCOPIA.—Cor. Bedrock *Democrat*, Oct. 31: The larger portion of the assessment work has been done for this year and in most instances with good results, and while our people have not been able to induce capital to invest in the mines this summer, yet advances have been made, as more experts and capitalists have visited our district this year than in all former seasons, and in each instance we believe they have been impressed with the permanency of the veins and richness of the ores. The greatest need of our camp is that mining men on the outside may obtain a correct knowledge of the mineral resources of the district. Mr. W. F. Davis, of Union, has completed the erection of a Huntington quartz-mill of 10 tons capacity. It is just reported that the Oregon G. M. Co. have struck the ledge in the lower tunnel of the Red Jacket mine and that the quartz is rich. This is a happy strike for our camp, as it was beginning to settle deeply in the minds, not only of the non-mining portion of the people of our camp, but extending further outward, that the vein did not extend downward, and as the works are the deepest in the camp, this belief was beginning to cast its shadow over the development of other mines. The Red Jacket contains two ore chutes. The south chute is about 500 feet in length and north of which there is a barren section of about 300 feet, and north of this barren section the north chute exists which extends about 300 feet to the northern boundary of the mine. Thus from the south end of the ore chute to the north boundary of the mine, a distance of about 1100 feet, is, with the exception of about 300 feet, a continuous ore body.

PROSPECTS.—Jacksonville *Times*, Oct. 31: The prospects for a good mining winter are very fair. Mathis & Birdsey of Foot's creek precinct have everything in shipshape for a big run. Davis Bros., on Missouri flat, are working five men and report excellent prospects. They show some very fine specimens of dust. Should there be a wet winter a large amount of gold-dust will be extracted, for the miners are better prepared than ever for a good run; besides, most of them are now in their best paying ground.

UTAH.

REVIEW.—Salt Lake *Tribune*, Nov. 1: The special event of the week has been the sale of the Northern Spy at Tintic to the Bullion-Beck people, at a price supposed to be about $70,000. It is both a good sale and a good buy. The product of ore and bullion for the week has been good. The receipts in this city for the week ending October 30th inclusive, were to the value of $116,072.19, of which $70,043 42 was in ore and $46,028,77 in bullion. For the previous week the receipts were of bullion $54,472.92, and in ore $84,773.48, an aggregate of $139,246.40. The product of the Ontario for the week was from ore sales, $14,125.35; no bullion. The Daly output for the week was in ore sold, $4715.49. The Hanauer smelter produced during the week bullion valued at $22,525. The Germania has been running full blast for three months, both smelting and refining, but the product has not been reported.

MECHANICAL PROGRESS.

Hardening and Tempering Steel.

We last week devoted a large space in these columns under the above head to some interesting and instructive remarks made by Professor Austen at the late meeting of the British Association. The remarks then quoted were of a decidedly instructive and practical nature. We give below a brief history of the progress in the knowledge of the art of hardening and tempering, as related by the distinguished professor, and reported in the Chicago *Journal of Commerce:*

Notwithstanding the great importance of the art of hardening and tempering, the theory of the process is still far from clear, and such knowledge as we possess has been but slowly gathered. It was shown that in early times great pains were taken to secure what was believed to be a suitable solution for quenching the hot steel so as to abstract its heat. Othello's sword, Shakespeare said, had the "ice brook's temper;" but cold water was far too simple a material for many a sixteenth-century artificer to employ, as is shown by the quaint recipes for hardening steel which have been handed down to us; the operator being directed in a manual, published in 1531, to take "snayles and boil them with rainwater, taken in the two first months of harvest," in which solution if hot steel were plunged it would be very hard. The craftsman was prettily told, so late as 1809, that he might take the root of blue lilies, infuse it in wine, and quench the steel in it, and the steel will be very hard. The belief in such quaint "nostrums" survived into the present century, and it was pointed out that the early workers were right in attaching great importance to the nature of the fluid in which the steel was quenched, though their theories were wrong, the degree of rapidity with which heat is abstracted from the cooling steel being as important at the present day as it ever was.

Prof. Austen then traced the history of the theories relative to the internal constitution of steel, pointing out that the work of Bergmann of Upsala showed, in 1781, that steel only differs from iron by containing two-tenths to 1½ per cent of carbon. The curious relation between the belief in the existence of phlogiston, and the fight made by the phlogistic school with that of Lavoisier over the constitution of steel, was dealt with at some length, and it was pointed out that the work of Bergmann, though himself a believer in phlogiston, had entirely changed the situation by showing that carbon was the steel-giving element. Clouet did much to prove (1798) that carbon in its diamond form could combine with iron and convert it into steel, a fact which had been confirmed by a working cutler, Mr. H. Pepys, in 1818, and finally by Prof. Austen himself, who, for the purpose of the lecture, had heated diamond and carbon together in vacuo, because in all previous experiments a doubt as to the action of gases contained in the iron had existed.

Hardening, said the professor, is the result of rapidly cooling a highly heated mass of steel. "Tempering," or softening, consists in reheating this hardened steel to a temperature far short of that to which it was raised before hardening. He demonstrated these facts by hardening and tempering three sword-blades of the same steel and of excellent quality, showing how greatly the efficiency of the weapons depended on the treatment they received. A sword-blade which was over-hard snapped under gentle pressure into many fragments, while one which was overtempered could be bent by hand and remain crooked. Prof. Austen stated that such facts are of vital importance to the nation. He said that ironworking is the only art "of any consequence which we have at present in England," and that on armor-plates "our courage and endurance are written forever with an iron pen on iron parchment."

INTERESTING EXPERIMENTS IN "COLD SHORTNESS."—During litigation in a boiler explosion case in Toronto, Ont., recently, a number of experts were examined on "cold-shortness" of iron. A broken rivet from the exploded boiler was shown in the court, and from the appearance of the fracture the experts said, under oath, that the iron in the rivet was "cold short." Mr. W. Raub, an eminent mechanical engineer, who was employed by the defense, stated before the court that no person could tell the quality of iron by the fracture unless he saw the fracture. Mr. Raub secured a bar of best brand Lowmoor iron, took it to a blacksmith shop, cut a nick of about one-eighth of an inch thick all around it, tapped it gently with a small hammer for about an hour and then hit it hard with a sledge. It broke off "as short as a carrot." He then turned the other end over, after nicking it, and of course the fracture showed a beautiful fiber. The "short" end of the bar was first showed the experts, who one and all said it was "cold short," but when shown the other end of the same bar they were dumbfounded. Mr. Raub had by his light tapping completely crystallized the one end of the bar and had left the other intact.

AMERICAN PUMPS, ETC., AT THE PARIS EXPOSITION.—Whatever may be the meagerness of the general exhibit of the United States at the exhibition, observers from this country find much consolation in the fact that for the actual maintenance and operation of the water supply and hydraulic machinery, the exhibition is dependent upon American pumping machinery. Should the visitor go to the pumping station upon the banks of the Seine, he would find a Worthington high duty pumping engine at work supplying the Exposition with water; the elevators in the famous Eiffel tower are operated by pressure pumps of the same make, and numerous other American pumps are engaged in serviceable capacities all about the exposition. He will also find American elevators doing the important duty in that direction at the Eiffel Tower. The absolutely unique display of the wizard of Menlo Park covers a multitude of omissions in other directions.

HEAT EFFECTS ON BOILER PLATES.—A French engineer has prepared a paper giving the results of experiments on the transmission of heat through boiler-plates, and the damage which may be caused to the plates through forced fires. The first series of experiments was undertaken to find out the efficiency of different parts of the heating surface in a boiler. These were carried out on an ordinary cylindrical boiler with external surface. A section of the heating surface was isolated from the rest by internal partitions, and the steam produced on that section measured separately. It was found that immediately over the fire the average evaporation in ordinary work is about 30 pounds of water per square foot of heating surface per hour, and that with forced fires this may rise to 50 pounds, but at the risk of burning the plate, especially if it be covered with scale. In a second series of experiments the actual temperature of the plate was measured by means of fusible plugs of different melting points, and it was found that with clean plates seven-sixteenths of an inch thick the temperature never became dangerously high, even if the fire was forced. In another series the effect of incrustation and deposition of fatty substances on the inner surface of the plates was ascertained, and it was found very easy to produce the spheroidal state when the plates were covered with grease. Nearly all the fats were found to produce this effect, but linseed oil to a lesser degree than the other oils.

AMERICAN MACHINERY IN AMSTERDAM.—The United States Consul at Amsterdam considers that the trade in American machinery in his district is capable of great development. He says: "Worthington steam pumps have been introduced into this country, and are in considerable numbers now in use in water works, sugar factories, by the Royal marine, and for boiler feeding in several manufacturing establishments, and they are everywhere giving perfect satisfaction. Hydraulic elevators, made by Otis Brothers of New York, have been imported and are in use in several hospitals at Rotterdam and Arnheim, and in a hotel at Amsterdam. The superiority of American laundry machinery goes undisputed. A number of steam laundries have been supplied with washers, steam mangles, and with ironing machines for ironing collars and cuffs. About two years ago the Gardner governor, made by the Gardner Governor Company, Illinois, was first brought here, and notwithstanding competition from German manufactures, found a ready sale. Agricultural machinery and implements in considerable variety have found quite a market in Holland. Hay and manure forks were largely imported a few years ago, but have declined, owing to their light construction and the difficulty of repairing them."

A FEAT OF IRON-MOLDING.—A curious and noteworthy instance of expert foundry work is noted by the *Commercial Bulletin* of Boston. It consisted of three plates of cast iron about one-fourth of an inch thick and seven by five inches in surface covered with writing indented in the iron. This specimen of skilled workmanship was done by John Farrar, foreman at G. W. & F. Smith's foundry, a lifelong workman in an iron foundry. The impression on the iron is made by writing backward on thin paper, pinning the paper in a mold, and then pouring on the iron. The writing thus transferred to the plates when the iron is cooled, is wonderfully clear and distinct and is so deeply imprinted as to defy any attempt at erasure. The reporter showed these plates to several gentlemen familiar with iron work, and themselves skilled workmen, who declared that they never saw anything like it before.

A NEW ALLOY.—A new alloy has been discovered by Herr Reith, of Bockenheim, Germany, which is to practically resist the attack of most acid and alkaline solutions. Its compositions are as follows: Copper, 15 parts; tin, 2 34 parts; lead, 1.82 parts; antimony, 1 part. This alloy is, therefore, a bronze with the addition of lead and antimony. The inventor claims that it can be very advantageously used in the laboratory to replace vessels or fittings of ebonite, vulcanite or porcelain.

A NEW PROCESS OF BURNISHING STEEL THAT IS EFFECTIVE.—In M. Meriten's new process for burnishing steel, the metal is placed in a bath of water at about 180 degrees F., and is connected with a source of electricity just strong enough to decompose the water. Under these conditions, the plate becomes coated with a layer of magnetic oxide, which is firmly adherent and will take a high polish.

A BOSTON genius has discovered a sure means of preventing boilers exploding. His plan is to keep the water in them cool.

SCIENTIFIC PROGRESS.

Animal Sociability and Other Peculiarities.

Some curious facts bearing on the morale of the lower animals are given, says *Nature*, by a correspondent of the *Review Scientifique*. One source of animal sociability is a permanent sexual friendliness, making individuals mutually agreeable. Thus in stables without stalls, it is desirable to put animals of opposite sex next each other to avoid injuries. A mare may be safely put into a field containing a horse unknown to it, but if two unacquainted horses be thus put together, they will fight. A stallion, indeed, will sometimes get injury from an unknown mare put into a field with it. Again, the authority of the oldest and strongest in a group of males often favors sociability. In the Spanish ganaderias, a horseman will lead about a numerous troop of bulls by means of five or six bulls who obey him and maintain order. In the Madrid circus, the writer saw three of these animals bring to its stall a vicious bull which had ripped up five or six horses and mortally wounded its espada. They made a slight movement of their horns, but the creature, after a little hesitation, turned and followed them.

Why Geese and Ducks Fly in a Triangle.

When flocks of wild ducks and geese have to go long distances, they form a triangle to cleave the air more easily, and the most courageous bird takes position at forward angle. As this is a very fatiguing post, another bird, ere long, takes the place of the exhausted leader. Thus they place their available strength at the service of society.

The Homing Faculty in Animals.

The existence of the homing faculty in many animals is well known, but is none the less mysterious. It is known, for instance, that many honey-hunters find their prey by catching bees and letting them free at different points. Each bee strikes home immediately, and so, to find the beehive, one only needs to follow the bee-line of two or three bees, as they point to one and the same spot, and come across each other at the very spot where the hive is to be found and is actually discovered. Eels and fishes often go from one pond to another, very distantly located, or from a pond to the sea, in a quite straight line, without any mistake. It would seem that this homing faculty pre-exists to all individual experience, since Humphrey Davy informs us that he has seen a young alligator, which had just got out of its egg, which had been broken by this observer, make immediately for the direction in which water was close by. Again, a falcon, sent from Teneriffe to the Duke of Lerme, in Southern Spain, managed to escape, and 16 hours later had returned, quite exhausted, to Teneriffe. A dog, carried from Mentone, in the south of France, to Vienna, came back to Mentone, and a donkey of Gibraltar, which was shipwrecked 300 kilometers away, on the Spanish coast, also managed to get to his home in Gibraltar.

Atmospheric Electricity.

The earth may be likened to a huge armature, and the surrounding atmosphere the core; the clouds are the field coils containing the active element. The armature has its two terminals, positive and negative, or north and south, and the surrounding atmosphere its two opposite characters of magnetic attraction. The higher potential of the earth current flowing out at the south pole passes through space and the media of the clouds to the north polar axis of the earth, and manifests itself as it concentrates at the poles as the Aurora, which is similar in character to the striated bands seen in a Geisler tube when a static current is sent through it.

The lines of force radiating from all over the earth's surface pass into space through every spire of vegetation, and this is the accelerating influence when combined with the sun's rays in summer that causes the sap to flow and blade and bud to stretch upward. Just as the metal-head when charged with a static current will cause each individual silken hair to stand on end, and thus dissipate the overcharge into space and restore the equilibrium. Clouds are formed of finely laminated particles of frozen water, as thin as gold-beater's skin, and thinner, frozen in space from the latent moisture of the lower strata of atmosphere infinitesimally small atoms of water forming this flocculent scale, which absorbs the electricity between its scales and by its action forms positive and negative characters to these scales and keeps them apart like the electrified pith-balls. This is the aeriel house of the static charge, and as long as it floats in the cold upper regions of cloud space remains as visible frozen vapor or clouds, and a condenser of electricity, but when the cloud sinks to the level of the melting strata, then these electrified laminæ become dissolved in rain, and the static charge, turned out of doors as it were, collects in force and like an angry god darts to earth, the nearest place offering a home, to be returned by silent dissipation, by vegetation, mountain peaks, and other prominent points on the earth's surface, in the line of the lines of force pervading the earth's surface and ramifying into space through every elevated conductor large and small.—*Electric Light and Power.*

LIGHTING A COAL FIRE.—The phosphorus on the match inflames at the low temperature of 150 degrees Fahrenheit, and mere friction ignites it. In burning it combines with the oxygen of the air and gives out heat enough to raise the sulphur on the match to the ignition point of 500 degrees. This combines with more oxygen and gives out sufficient heat to raise the temperature of the wood in the match to 800 degrees, at which point it combines with enough oxygen to give out a temperature of 1000 degrees, which raises the coal to the temperature required for ignition and the latter takes on more oxygen, rising to the temperature of 3000 degrees or more, according to circumstances. The ignition of the coal is the last in a series of progressive steps, each increasing in temperature, but the oxygen supplied at each stage of the process is of the same initial temperature, and no boiler furnace has ever been built in which hot air was proved to increase the intensity of the combustion. The idea of hot air in this case has always been traced to the seemingly similar application in the hot-air blast furnace. There, however, the case is totally different. The iron lies among the coal, and the entering cold air before it has combined with the carbon chills the iron, thus rendering more coal necessary than if the iron had been heated. If the air could combine with the coal before it reaches the iron, the temperature of the air would be a matter of indifference.—*The Safety Valve.*

SCIENTIFIC OBSERVATIONS IN ALASKA.—Messrs. Turner and McGrath, who went up to Alaska on the steamer St. Paul for surveying and scientific observations, have been heard from. Mr. McGrath left the steamer at Fort Yukon, while Mr. Turner went up to the Porcupine river. Both, in their letters, speak very enthusiastically of a satisfactory series of magnetic observations, and also of experiments with the tide-gauge which was daily read. At Fort Yukon, while awaiting the return of the steamer from Porcupine river, McGrath made a series of magnetic observations, obtaining, through opportune breaks in the clouds, several sets for time and latitude. In his private letters he speaks enthusiastically of the rapidly-changing and highly-diversified scenery of the country and of the strikingly-brilliant displays of the aurora borealis, accompanied by a sound as of the approach of a flock of geese. He remained at Fort Yukon, of which hardly a vestige remains, until Aug. 12th, when he moved up the Yukon river. He was last heard from on Aug. 16th, and had not yet reached his place of camp for the winter.

CAUSE OF OUR WARM SPELLS.—The editor of the *Call* query column says in regard to this phenomenon: The explanation is offered that to the area of high or low barometer to the north and northeast of San Francisco are due the warm or cool spells observed here. With a high temperature in this area, the air will naturally flow from the land rather than from the cooler sea, accounting for the corresponding warm periods here. There is as much foundation for the saying that there are never more than three days of warm weather in San Francisco as there is in the belief current in the East in places that if it rains on one Sunday in one month a succession of storms will be noted for every Sunday in that month. It is true, however, that these periods of high temperature in the areas about San Francisco last from two to five days (the hot spell last week four days), but the general average period of such changes will be found to be about three days, giving foundation for the saying.

THE SMOKE AND WORK OF AN EXPLOSION.—A fact of some interest in connection with the recent explosion at Antwerp is that an instantaneous photograph of the gigantic column of solid-looking smoke which arose from the burned gunpowder was secured, the photographer being a little more than a mile away. The column had an approximate hight of 3937 feet, and the greatest width of its head 1739 feet. Officers of the Belgium engineers estimate that 79 tons of powder, in addition to what was in the cartridges, must have exploded at once, and the force exerted was sufficient to excavate a hole in the ground about 50 yards long, 40 wide and 6 deep, removing some 36,000 cubic feet, or 1900 tons, of solid earth. No less than 95 persons, it will be recollected, were killed and 62 injured.

AMERICA'S VASTNESS.—Somebody with a mathematical propensity figures out that the aggregate territorial extent of the nations represented by visitors of the Pan-American Congress falls but little short of twelve millions of square miles—more than three times the area of all Europe, and but little less than one-fourth part of the globe—while in respect to the power of producing the articles which are essential to human life and those which minister to life's luxury, they constitute even a larger proportion of the entire world. These great possessions to-day have an aggregate population approaching 120,000,000, but if peopled as densely as the average of Europe, the total number would exceed 1,000,000,000.

IMPROVEMENT IN EYE-GLASSES.—A patent has been granted to Prof. John A. Brashear of Pittsburg, Penn., for what he calls astigmatic eye-pieces for optical instruments. Persons often have a peculiar condition of the eye by reason of which objects are seen in a distorted form, and these new eye-pieces are designed to correct such defect.

GOOD HEALTH.

The Ocean Cure.

The philosophy of the ocean cure and the advantages of a sea voyage for invalids is well set forth in the following paragraphs which we copy from an exchange:

One of the most thorough and complete "changes of air" is for a dweller inland to take a voyage on the open sea, and I now pass on to notice briefly the ocean cure. In the first place, it may be well to mention the advantages of a sea voyage, as they are generally stated. They are:

1. Perfect rest and quiet, and complete removal from and change of ordinary occupation and way of life; a very thorough change of scene, and perfect and enforced rest from both mental and physical labor.

2. The life in the open air and the great amount of sunshine to be enjoyed; it is quite possible, under favorable circumstances, to pass 15 hours daily in the open air; and whenever it is possible the traveler by sea is certain to endeavor to escape from the close and sometimes unpleasant atmosphere of a small cabin, into the pure air to be found on deck.

3. The great purity of the air at sea, and its entire freedom from organic dust and other impurities. In this respect it has an advantage over the air of an open country, for the latter is apt to contain the pollen of grasses and other plants, which in some persons excites hay fever and asthma. The air of the cabins may, of course, be contaminated, but the air of the open sea is probably the purest to be found anywhere.

4. The presence in the sea air of a large amount of ozone, as well as particles of saline matter, more particularly in stormy weather, from the sea spray, and these may exercise a beneficial effect in certain throat and pulmonary affections on the respiratory mucous membrane.

5. The great equability of the temperature at sea. This refers chiefly to the daily variations, which rarely exceed four or five degrees F. It must be noted that in a long sea voyage very considerable variations of temperature are encountered, and in a swift steamer the transitions are somewhat sudden.

6. The great humidity of the atmosphere and the high barometric pressure, which are considered to exercise a useful sedative influence on certain constitutions. It is said that the temperature of the body averages one degree F. less on account of this sedative effect. The exhilarating and tonic effect of rapid motion through the air; for by the continuous progress of the ship the sea breezes are constantly blowing over it, and the passengers are borne through the rapidly moving air without any exertion of their own. The influence of these currents of air on the surface of the body is, no doubt, important, acting as a stimulant and a tonic, increasing evaporation from the skin and imparting tone to the superficial bloodvessels.

TAKE THE UPPER BERTH.—Everybody, said an old Pullman sleeping-car conductor to a Chicago *Tribune* reporter, who wants a berth in a sleeper wants the lower berth. I have been in the employ of the company for 14 years, and I have never yet had an application for an upper berth. Of course, the upper berth is not so easy of access as the lower, but if you don't mind climbing to the upper berth, you will at once admit, after the night is over, that it is the more comfortable of the two. The ventilation is better, and you are not so close to the rumbling noise. You are more private than you are in a lower berth, and in case of accident you have a chance of coming out on top. In hot weather the upper berth is cooler than the lower. The lower berth, as you know, is made up from the cushioned seats, which are of warm material. I have never known a man to fall out of an upper berth. I think if the company would make a difference of a half dollar in favor of the upper berth, it would soon be in demand. But I believe the Pullman company never makes any difference in the charges.

EFFECTS OF ALCOHOL ON THE HUMAN SYSTEM. An English investigation, just completed, puts in tangible form the effect of the use of alcohol, from observations covering 4234 cases in all walks of life. This report shows that, with men over 25, the intemperate use of alcohol cuts off ten years from life; those who never drink to excess, or use no liquor, living on the average ten years longer than those who do. Indulgence, if carried to excess, doubles diseases of the liver, quadruples those of the kidneys, and greatly increases the number of deaths from pneumonia, pleurisy and epilepsy.

THE DIFFERENCE BETWEEN MEASLES AND SMALLPOX.—At the outset of a popular eruption it is often difficult to decide whether the case is one of measles or of smallpox. M. Grisol's method of diagnosis is as follows (*Medical Times*): If, upon stretching a portion of the skin, the papule becomes impalpable to the touch, the eruption is caused by measles; if, on the contrary, the papule is still felt when the skin is drawn out, the eruption is the result of smallpox.

SORE THROAT.—Few ailments are more common than sore throats, yet they are largely preventable, that is, they seldom come to one in vigorous health, except as the result of some violation of physical law. The more simple form of sore throat is commonly due to exposure in inclement weather, and often, indirectly, to a disordered stomach; in fact, it is not infrequently due to this cause alone. The person says he has taken cold, and wonders how he could have done so, while the truth is he has not taken cold at all. The stomach, œsophagus, nose, etc., are lined with mucuous membrane, continuous through this whole region, and the irritation begun in the stomach is propagated over the whole mucous surface. In all such cases the seat of the trouble is in the stomach, and accordingly the efforts to cure, whether by medicine, by diet or by treatment, should be directed to that organ.

AN EFFECTIVE REMEDY FOR EPILEPSY.—Dr. Grubert recently read a paper before the Paris Academy on a new and effectual remedy for epilepsy. Ten years' experience had convinced him that a considerable number of severe epilepsies may be certainly cured by bromide of gold, in the dose of eight to ten milligrammes per diem for adults, and three to six milligrammes for children in solution; the maximum daily dose being 12 milligrammes. This dose almost always produced severe headache. By lessening the dose a point of complete tolerance may be reached, which includes all toxic effects.

USEFUL INFORMATION.

WHO OWNS THE COUNTRY?—This is the title of an article in the September issue of the *Forum*, by Mr. T. J. Shearman, which goes minutely and thoroughly into the question of the division of wealth in the United States. The results of Mr. Shearman's investigations, involving much statistical research, are most startling. Briefly stated, Mr. Shearman shows that there are 31,100 persons in the States, each owning over $500,000, whose fortunes aggregate $36,250,000,000, leaving to the other 64,969 000 persons who live in that country only $23,750,000,000 to divide among them. In other words, two-thirds of the country's wealth is in the hands of one two-thousandth part of its population. Forty-two years ago there was but one man in the United States worth as much as $5,000,000, but now there are 1600 persons whose possessions severally are equal to or greater than that. This concentration of wealth, to which the Civil war gave rise, and which railway building and speculation have accelerated, is, moreover, going on rapidly at the present time. Worse still, there seems to be no means at hand for checking it, as the success of the trusts and financial monopolies attest. But we may be sure that something will be attempted before long by the Americans to counteract the growing evil.

GAS AT FIVE CENTS PER THOUSAND.—It is said that a company is already in operation at Litchfield, Ill., which proposes to furnish gas for five cents per thousand. The gas will be manufactured from Lima, Ohio, oil—a very cheap oil, which is sold at one and a quarter cent per gallon at the well. The company has already eight miles of pipe laid. They claim they can afford to furnish gas for fuel or for light at five cents per thousand. One of the principal proprietors, Mr. O'Hara, says: "A plant with 12 retorts will cost about $5000, and will supply a town of 6000 inhabitants; it would produce 60,000 feet of illuminating gas daily and 13 times as much fuel gas; here are the figures—120 gallons of crude petroleum, $1.50; gas for operatives, 30 cents; one work man one day, $2; total $3 80—product 200,000 feet. The crude oil is introduced to the furnace direct from the tanks. Steam forces it into spray, and mingling, both absorb the elements from the air and a chemical degeneration commences that winds up in non-condensible, non-explosive gas. For intensity of heat the fuel gas excels. I have seen Swedish iron, which requires 4500°, made with it; and also crucible steel, not only made, but melted and burned up in a few minutes."

SIMPLE ENOUGH.—A manufacturer of some patent compound or other came into the laboratory of a chemist with a bottle containing an unwholesome-looking mixture. "I would give $50," he said, "to know what would make the water and oil in this emulsion separate." The chemist looked at it. "Very well," he said; "write your check, and for that price I am willing to tell you what will make the water and oil separate." The visitor hesitated a moment and then wrote his check for the sum named. The chemist carefully deposited it in his pocketbook, and then quietly dropped into the liquid a pinch of common salt. Instantly the water and oil separated, and whether the client was satisfied or not, he had got what he wanted and he had paid his own price for it.

"DELIRIUM FURIOSUM."—There was a time when people, even in this country, the birthplace of railways, were protesting against their introduction, predicting all kinds of evils that would follow in their wake. The most curious protest against railways, however, was that drawn up by the Royal College of Bavarian Doctors, recently discovered in the archives of the Nurnberg railway at Furth, the first German line constructed. It contains the following passage, pointing out the danger of the new system of travel: "Travel in carriages drawn by a locomotive ought to be forbidden in the interest of public health. The rapid movement cannot fail to produce among the passengers the mental affection known as *delirium furiosum*. Even if travelers are willing to incur this risk, the Government should at least protect the public. A single glance at a locomotive passing rapidly is sufficient to cause the same cerebral derangement; consequently it is absolutely necessary to build a fence ten feet in hight on each side of the railway." Times have slightly changed since that protest was issued. We wonder what those learned Bavarian wiseacres would say now to our underground or the American overhead railways?

PROFESSOR WINCHELL'S PASTE.—Prof. Alex. Winchell has a cement that will stick on anything. The recipe is as follows: Take two ounces of clear gum arabic, one ounce and a half of fine starch, and one-half ounce of white sugar. Pulverize the gum arabic, and dissolve it in as much water as the laundress would use for the quantity of starch indicated. Dissolve the starch and sugar in the gum solution. Then cook the mixture in a vessel suspended in boiling water, until the starch becomes clear. The cement should be as thick as tar, and kept so. It can be kept from spoiling by dropping in a lump of gum-camphor, or a little oil of cloves or sassafras. This cement is very strong indeed, and will stick perfectly to glazed surfaces, and is good to repair broken rocks, minerals or fossils.

PAPER FROM SAWDUST.—An important experiment has been made successfully at Ottawa, Ont. A mill has been established which makes paper pulp out of sawdust. It is now using all the product of one mill. The paper made wholly from sawdust is said to form an admirable sheathing that is fit for building after being tarred and dried. A better quality of paper is made by using one-fourth waste paper. The plant cost $15,000 and consists of American machinery. The mill has a capacity for converting about 12,000 tons of sawdust into pulp annually.

EXPERIENCED MEN WANTED.—The *Steamship*, a magazine published at Leith, Scotland, thinks that American mechanics and sailors need an infusion of a little English or Scotch blood to enable them to regain their footing upon the ocean. It says: "We may look forward to that country becoming our most powerful rival in the near future," and then adds: "All that will be required is the importation of some experienced men from this country to carry on the work." That will do for Johnny Bull.

STEAM FOR CLEANING MACHINERY.—For cleaning greasy machinery, steam has recently been emphatically commended. It is claimed that a steam hose attached to the boiler can be made to do better work in a few minutes than any one is able to do in hours of close application. The principal advantages of steam are that it will penetrate where an instrument will not enter, and where anything else would be ineffectual to accomplish the desired result.

THE FIRST STEAM ENGINE in this country was of the Newcomen type, and was built by Joseph Brown of Providence, R. I. It was in operation, pumping water from a Rhode Island mine in 1787. The cylinder was made of plate iron and was 2½ feet in diameter, and the valve between the cylinder and boiler was two feet in diameter. The engine raised seven hogsheads of water per minute, and the furnace consumed two cords of wood in 24 hours.

AN AMERICAN COAL OFFICE IN LONDON.—What is believed to be the first European office of an American coal firm has just been established in London by Percy Heiner & Son, Philadelphia. An office has been taken, and a man engaged to solicit orders for American coal. It is not expected that coal will be shipped to England, but contracts will be made to supply English steamers with coal at Atlantic seaboard points in this country.

IMITATION EBONY.—Wash any compact wood with a boiling decoction of logwood three or four times, allowing it to dry between each application. Then wash it with a solution of acetate of iron, which is made by dissolving iron filings in vinegar. This stain is very black, and penetrates to a considerable depth into the wood so that ordinary scratching or chipping does not show the original color.

STAMPING SHEET METAL has become quite a large industry, and rapid advance has been made in the heavy and intricate work accomplished. A company in Cleveland, Ohio, claims to be the only one which can put sheet metal into especially intricate shapes, such, for instance, as a cylinder and keep a uniform thickness in every part of the work.

ENGRAVING TOOLS.—Almost the hardness of the diamond is said to be given by German workmen to steel engraving tools. The tools are made white hot, plunged repeatedly into sealing wax until cold, and then just touched with oil of turpentine.

WE MAY ALL EARNESTLY PRAY that the prophecy of Victor Hugo shall be fulfilled, and speedily, "In the twentieth century war will be dead, the scaffold will be dead, but man will live."

ELECTRICITY.

The Electrical Interest.

The rapid increase and growing importance of the electrical business, in all its varied forms, has already placed it among the foremost industries of the age.

The claim is made that upward of $600,000,000 of capital is at the present time invested in the electrical industry in the United States. Of this vast sum, $200,000,000 is credited to the telegraph and telephone companies, $300,000,000 to the 60 electric railways in the country, the electric-light companies and the numerous factories, and $100,000,000 to the manufactories of electrical supplies, wire, cable and electrical appliances generally. In the words of the New York *Engineering and Mining Journal*, "before long the waves of the sea and the winds of heaven will be harnessed for the use of man in every part of this country. The field is limitless, and the reward of those who enter it will be great and constantly increasing."

There is always an element of danger in the manipulation of electricity that requires care and skill, and whatever measures tend to secure perfect safety and competent service should receive the approval of every citizen. The demand for intelligent employes is every day becoming greater, and skill and energy will soon command large compensation. To this end the study of electrical engineering is being fostered at so many of our American seats of learning that there can no longer be any doubt as to the adequacy of the supply of electrical engineers for the coming developments of the industry, or their proficiency in the various branches of knowledge pertaining to so vast and comprehensive a science. There is no other industry that calls more loudly for specially educated managers and operators. It is largely for this reason that European governments are stepping in to make special regulations for its conduct. In France the government has already assumed an arbitrary control of all telephones in the Republic, and it will not be long before definite regulations of all electrical interests will be placed under proper surveillance here as well as elsewhere.

ELECTRICITY'S WONDERFUL GRIP.—The impossibility to let go which has been noticed so frequently in accidents from accidentally grasping live electric-light wires has recently been utilized in an experiment on the Philadelphia & Reading railroad in increasing the tractive-power of locomotive engines. The apparatus consists of a small dynamo and engine mounted upon the locomotive and furnishing an electric current, which is passed forward to the rear driving-wheels through that portion of the track rails lying between them. The passage of the current into the wheels and back causes an increased friction between the wheels and the rails, which is claimed to be far superior to that obtained by sanding the tracks, and enables the locomotive to draw a much heavier train, without regard to the condition of the track, than is at present possible. The current used is what is termed a low-tension current, and the increased traction obtained is under complete control by the engineer.

PROFIT IN MOTOR WORK.—The question, "What profit is derived from selling current for operating electric motors?" was recently put by the *Electrical World* to the superintendent of a well-known electric light and power-station furnishing current to about 125 horse-power in small motors. His answer was 38 per cent net profit on the original investment. Part of his daily expense account for operating the motors only is made as follows: Coal, $9; water, $1.20; waste and oil, 10 cents; sundries, $3; labor, two men, $4. It is evident that the profit lies largely in the fact that the motors are numerous and small. The same quantity of current supplied to, say, large motors of 30 horse-power each, would not yield any such return. But even then there would be a much better margin than is suspected by those who have not yet looked into motor problems or noted how remarkably the varying call for current practically doubles the capacity of the plant for motive-power purposes.

AN ELECTRIC LOCOMOTIVE.—A New York electrician is now engaged in the construction of an electric locomotive to run on regular tracks from storage batteries. The ordinary rotary type of electric motor will not be employed. Suction magnets are to be located on either side of the piston, and the current will be supplied from storage batteries in the fire-box. The locomotive is smaller than the usual type, and has driving-wheels of less diameter. The question of the economical utilization of fuel by means of storage batteries is one that has not yet been determined, but it may be possible to generate electricity by means of large compound engines, with a final loss at the motor not much greater than that which is found in that great wasteful gormandizer of coal, the steam locomotive.

THE ELECTRIC LAMP promises to aid in exploring the external parts of living animals, as well as in studying the organic forms of the deep seas.

KEROSENE OIL will freeze at a temperature of from 10° to 12° below zero, Fahr.

TABLE OF CONTENTS.

EDITORIALS.—Grading Machine for Handling Earth, 355. Passing Events; Bullion Production and Silver; Windlassing; Oregon Mining Districts; Delinquent Co-Owners; Crushing and Screening Ore, 362.

ILLUSTRATIONS.—Arrangement of Crusher Rolls and Screens at St. Joseph Lead Co.'s Works; Grading Machine for Building Roads, Ditches, Canals and Embankments, 355. Exhibit of Minerals and Ores by Amador Co. at the State Fair at Sacramento, 363.

CORRESPONDENCE. — Tuolumne River Group of Mines, 356. Amador County, 363.

MISCELLANEOUS.—The Eucalyptus in Southern California; The Highway of the Nations, 356. Artesian Wells in California, 357. Academy of Sciences, 363.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 323-9.

MECHANICAL PROGRESS.—Hardening and Tempering Steel; Interesting Experiments in "Cold Shortness;" American Pumps, Etc., at the Paris Exposition; Heat Effects on Boiler Plates; American Machinery in Amsterdam; A Feat of Iron Molding; A New Alloy; A New Process of Burnishing Steel That is Effective, 360.

SCIENTIFIC PROGRESS.—Animal Sociability and Other Peculiarities; Atmospheric Electricity; Lighting a Coal Fire; Scientific Observations in Alaska; Cause of Our Warm Spells; The Smoke and Work of an Explosion: America's Vastness; Improvement in Eye-Glasses, 360

GOOD HEALTH.—The Ocean Cure; Take the Upper Berth; Effects of Alcohol on the Human System; The Difference Between Measles and Smallpox; Sore Throat; An Effective Remedy for Epilepsy, 361.

USEFUL INFORMATION. — Who Owns the Country; Gas at Five Cents per Thousand; Simple Enough; "Delirium Furiosum;" Prof. Winchell's Paste; Paper from Sawdust; Experienced Men Wanted; Steam for Cleaning Machinery; An American Coal Office in London; Imitation Ebony; Engraving Tools, 361.

ELECTRICITY. — The Electrical Interest; Electricity's Wonderful Grip; Profit in Motor Work; An Electric Locomotive, 361.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 368.

Passing Events.

The National Silver Convention which meets at St. Louis on the 26th inst., will doubtless influence Congress to favorable legislation on silver. By increasing the value of silver, hundreds of mines, now barely making expenses, would become profitable. The San Francisco Stock Exchange has appointed Homer King as a delegate.

A convention of American ore-producers, smelters, refiners, dealers and transporters of lead will meet at Salt Lake, Utah, on Nov. 20th, to decide on ways and means to gain by united action the protection of the great lead-mining industry, withheld from it by the recent ruling of the Treasury Department.

The United States Engineers who are investigating the debris question in this State are obtaining correct descriptions of the placer claims of the State, so as to compile such details as may be useful in their investigations. Among other things they are trying to find out the amount of auriferous material remaining unworked.

The Master in Chancery has decided against the North Bloomfield Gravel Mining Company, which was enjoined from dumping slickens, and then leased its property to the Omega Company. The decision is that the North Bloomfield Company is responsible for the action of the Omega Company, as lessee, and is in contempt. This was a test case and may materially affect mining operations. The penalty will be announced shortly.

Bullion Production and Silver.

The United States Director of the Mints annual report gives the bullion product of the world as follows: Gold, $105,994,150; silver, commercial value, $103,556,000—coining value, $142,439,150. Of the above this country produced gold, $33,175,000, and silver, commercial value, $43,000,000—coining value, $59,195,000. This shows that the United States, which is virtually this coast, produced about two-fifths of the total of the world's output. The Director of the Mint reports for the past fiscal year the coinage in this country as follows: Gold coins, in value, $25,543,910; silver dollars, $33,793,860; subsidiary silver, $721,686, and minor coins, $906,473. Total, $60,965,929. In addition to this, gold valued at $22,241,121, and silver bars, valued at $6,709,246, were manufactured. The profit of the coinage of silver dollars and subsidiary coin was $9,403,049. The total coinage of silver under the Bland Act up to the first of the present month was $343,638. Gold imports during the year amounted to $10,372,145 and exports $60,034,246. Silver imports amounted to $24,682,380 and exports $36,716,783. These figures show a loss to the United States of gold, $49,661,101; silver, $12,034,403. The director estimates the consumption of gold and silver in the United States in industrial arts for the fiscal year to have been: Gold, $16,000,000; silver, $8,000,000.

A close analysis of the above shows that bimetallists are pursuing the proper course when they demand the remonetizing of silver, and our country, more than any one nation, is directly interested in the promotion of this desirable result, for out of a total world's production the United States is credited with two-fifths. That this country is beginning to assert its rightful position on the metal is witnessed in the market value of silver bullion, for instead of having England dictating the price, we have, through able financiers, become the autocrats. Probably to San Francisco rightly belongs the credit for this successful move, as our city has for several months past ruled the market, and by consistently advancing prices forced the foreign markets to follow.

Touching on the silver question, we give the following from the New York *Financial News*, October 30th: "The feeling is growing rapidly that if the Secretary of the Treasury does not conclude to increase the coinage before Congress meets, that that body will probably instruct the Secretary to increase the coinage to the maximum amount, $4,000,000 per month. The silver element in Congress, by the recent admission of the four new States, has been strengthened by 12 votes in the House and Senate, and the West, with the assistance of the South, will have a sufficiently large vote to adopt the necessary resolution of instruction. The dollar of our daddies is with us to stay."

Windlassing.

Working a hand-windlass over a 50-foot shaft is no soft job; working one when the shaft is 100 feet deep is a very tough job; and when the shaft gets deeper than that it is time to quit the windlass altogether and hunt up somebody with money, who will risk it on a hoist.

All over the mining regions of the Pacific Coast hundreds of men are slowly testing their claims and hoisting their rock with windlasses, grinding and sweating at the crank and wishing for the day to come when they can get a horse-whim or steam hoist. It is mighty slow, tedious and steady labor. It is the men who are doing this kind of work who want to see capital come into the camps. Before they can make mines out of their claims and develop them with any degree of satisfaction, they must stop hoisting by hand. But horse and steam hoists take coin, and prospectors with undeveloped claims are not apt to have too much of this to spare; so they continue to develop their muscles and their claims, and hope for the good time to come. Once a good hoist is in place it seems as if 10 times as much work is being done. It takes backbone to work a windlass, but the backbone of capital is better on a hoisting proposition every time.

THE first practical result of the visit of the Governor of Canada to British Columbia has materialized in the formation of a large mining company by the members of the party.

Oregon Mining Districts.

Mr. C. B. Small, editor of the *Democrat* of Baker City, Oregon, made us a call this week, and from him it is learned that mining affairs in the districts around that point are quite active.

At Cornucopia, the Oregon Gold M. Co. has been operating the Red Jacket for the past year, and transporting the ores by wagon, but they have now built a $30,000 wire-rope tramway. Some 60 men are employed and the mill reduces 45 tons of ore per day. The concentrates have been shipped, but arrangements are being made to reduce them at the mill. The Last Chance has been worked for about five years, and has a four-foot ledge averaging about $30 per ton.

The Simmons group consists of the following claims: Pine Creek, Buckeye, Empire, Chessmate and Keystone; they are about two miles north of Cornucopia, and are owned by Messrs. Simmons, Williams, Lichtenthaler and Williams. This is the best developed property in Pine Creek, except the Red Jacket of the Oregon Co. On the Pine Creek claim the ore averages $20 free gold with rich sulphurets. The best developed property is the Buckeye. This has two veins, one 4½ and the other 2 feet wide, and the ore will assay $60 per ton free gold. Other good properties in the camp are the Union, Companion, Forest Queen, Red Boy, Maverick, Norway, Moonshine, Estella, May Queen, Wild Irishman, Queen of the West, Mayflower, White Swan, Crystallite, Wongee, and Glee Club. There is no custom mill in the camp and the ores are shipped East. It costs $50 to ship and work the ore in Denver.

Cracker Creek district is about 35 miles southwest of Baker City. The Eureka and Excelsior is the most prominent claim, and was sold to Eastern people not long since for a reported price of $1,000,000. They are now putting up a large milling plant, intending to start with 20 stamps and add 20 more. A large number of other properties are being developed and give promise of becoming good mines.

Granite Creek is near Cracker Creek and is an old placer district which is now showing up well in quartz.

Pocahontas district is nine miles west of Baker City; placer mining has been carried on there since the early "60s." The Big Aleck, under the management of Capt. James Baxter, is the principal claim. Their 3½ foot Huntington mill is found to be too small, and other reducing machinery is being added. The mine is really a big deposit of soft material, which is quarried out. It is from 100 to 200 feet wide and lies in layers about two inches thick, one above the other. In some places these layers form a deposit 10 to 15 feet thick. The material runs all the way from $3 to $100 per ton and there is an abundance of it, enough to keep large reduction works running for years to come. The mine is owned by the White Star Mining Co., composed mainly of Boston people.

The Baiseley mine is about twelve miles west of Baker City on Pine Creek. This is one of the best developed and richest mines in that part of the country. They are now putting up a mill.

Rock Creek district is a promising camp. All the properties are being worked and some mills will be put up next summer. They have many good prospects in the camp, but there is no machinery there yet.

The Robinsonville district properties are showing up well and the owners have great confidence in them. This is close to Granite Creek district.

The Nelson placer mine, seven miles west of Baker City, is one of the richest placers on the coast and was sold for $300,000 about a year ago. The final clean-up this summer was the largest ever made. It is worked by hydraulicking.

The general prospects of mining in Oregon are, in the opinion of Mr. Small, improving very rapidly. The mines are attracting Eastern capital, and as capital has been badly needed its advent in some of the camps has raised the hopes of others.

Baker City is the center of supplies for a large mining section and the place is growing rapidly, there being now a population of about 4000. There is one $30,000 brick block, and a $30,000 school-house, while a three-story brick hotel costing $40,000 is being built. A new bank is being built and a franchise has been granted for a street-car line. There are gas works and a contract has been let to extend the water supply over the whole town. The main interests of the people are mining, agriculture and stock-raising.

Delinquent Co-Owners.

It is a wise provision of our mining laws which simplifies the method of getting rid of partners in mining claims who do not contribute their share of the assessment work in either money or labor. In the old days it was hard to define abandonment of a claim, and difficult to get rid of partners who neglected to do their work. They could at any time throw a cloud over the title and prevent a sale. Now, however, delinquent co-owners can be given legal notice in a newspaper without personal service of any papers. It is true, the notices must be published three months before other action can be taken, but proof of the publication will prevent any complications of title in case the delinquent tries to make any fuss.

Miners who do their assessment work for the year in the various districts, and who are associated with co-owners who neglect or refuse to contribute their proportion, should give legal notice in the nearest paper, and do it immediately, so that the delinquent can be got rid of at once, and not be liable to interfere in case of a strike in the mine or a prospective sale.

Crushing and Screening Ore.

On page 355 is an engraving showing the general arrangement of one set of crushing and screening apparatus in the new dressing works of the St. Joseph Lead Company. There are 10 such in the new mill, each crushing about 80 tons in 24 hours, consisting of a 7x15 Blake crusher, lever pattern, with corrugated jaws; a pair of Cornish rolls, 14 inches by 30, with chilled tires; a revolving screen, 3 feet in diameter by 8 feet long, with perforated steel plates, a bucket elevator for the material coarser than 6 mm., and a centrifugal pump.

The jaw-crushers are set to crush about 38 mm. or 1½ inches, and the rolls to crush about 16 mm. or ⅝ inch. Of the material passing through the rolls at any time, about one-third is too coarse to pass through the screens; consequently the ore passes through the rolls one and one-half times. The crushers are fed by hand, one man to each machine. The feed must be regular, as on this depends the amount of material going over the jigs, tables, etc., which must be kept uniform.

THE report of Superintendent Kincaid submitted at the annual meeting of the Occidental Mining Company shows that from August 1st, when the new 20-stamp mill was accepted, to November 1st, the mill worked 4389 tons of ore of the average assay value of $18.37 per ton, from which bullion was extracted of the assay value of $33,985.84, and concentrates were produced of the assay value of $33,071.90, aggregating $67,057.74, of which $18,412.92 was in gold and $48,644.82 was in silver. The yield was 83 per cent of the assay value of the ore.

UTAH MINES.—In his report, the Governor of Utah says: The mining industry has been generally prosperous. The miners believe that there would be a great increase in the mineral products were it not for the erroneous construction of the law relating to lead ores by the Treasury Department. The product of the mines was as follows: Copper, 2,886,816 pounds; unrefined lead, 44,566,167 pounds; fine silver, 6,178,855 ounces; fine gold, 13,886 ounces.

ALASKAN GOLD.—The steamer Corona from Alaska brought down $50,000 worth of gold from the Treadwell mine, $12,000 from the Cassiar, and about $13,000 from other claims. The discovery by an Indian of a shallow creek said to be rich in gold, in Omineca district, is causing old miners to flock there.

ARTESIAN WELLS.—The article on "Artesian Wells in California," printed on page 357, was originally prepared for the State Grange, and read by the author at the late session in Sacramento.

NAME WANTED.—If the person who mailed us a postal note without any letter from Auburn, on the 7th inst., will send us his name, he will receive proper credit on our books.

Amador County.

[Written for the Press by RICHARD WERT.]

This county, which took such a prominent place at the State Fair, taking the capital prize for the best general exhibit, is one of the smallest in the State. It is about 70 miles long from east to west, with a varying width of from four to 20 miles. Almost every condition of climate to be found in California is to be met with within its borders, from the semi-tropic temperature of the valley to the ever-present snows of the summit of the Sierras. Its population at the present time is estimated at 13,000, which is confined to the western portion of the county, embracing an altitude of from 200 to 2000 feet above sea level. This populated foothill region possesses a climate which cannot be surpassed for geniality and healthfulness. There is a buoyancy and lightness in the air of the foothills which is not to be found elsewhere, and which in time will make them the health resort of the Pacific Coast. The mercury seldom rises above 100 degrees in summer, and as rarely falls below the freezing point in winter. Indeed, its sanitary advantages are recognized by many capitalists of the East who have invested in mines, who regularly repair there every winter to avoid the rigors of the Atlantic States.

At the recent State Fair the county made by far the best mineral exhibit. Back of the minerals was a large painting representing the topography of the county, with the location of the various mines from which ores were displayed. It is stated that no finer exhibit of gold ores was ever made in this State. Aside from the ores, there were many fine nuggets of gold shown. The cut given herewith is a photo-facsimile of the exhibit at the fair.

EXHIBIT OF MINERALS AND ORES BY AMADOR COUNTY AT THE STATE FAIR AT SACRAMENTO.

Resources.

Amador is principally a mining county. Gold mining is its main industry. It has been the chief occupation of its people from its earliest settlement to the present, and will undoubtedly continue to be for many years to come. In the early days the placer mines contributed most of the gold supply, but this class of mining has long since been superseded by quartz mining. Amador ranks second among the counties of California in gold production. Since her organization her yield of gold is roughly estimated at from $60,000,000 to $80,000,000. The main quartz belt, commonly called the "mother lode," traverses the county north and south a distance of 20 miles, at a mean altitude above sea level of about 1000 feet. Unlike the generality of mining regions, this section is as pleasant and desirable a spot for human habitation as it is possible to imagine. It is a common thing for an orchard to be yielding its wealth of fruit on the surface while underground workings are surrendering their metallic treasures. The mother lode consists of a succession of ore deposits or chimneys of varying size and richness. The principal mines at present working, and the number of stamps and men employed when in full operation, are as follows:

	No. men.	No. stamps.
Plymouth Consolidated	200	160
Gover	40	20
Bunker Hill	80	40
Keystone	100	40
South Spring Hill	70	30
Talisman	10	10
Wildman	30	20
Kennedy	80	40
Zeile	110	40
Iowa	10	10

The Plymouth Consolidated has proved a bonanza to its stockholders. For many years it yielded from $75,000 to $100,000 per month. It has been worked to a depth of 1700 feet, the ore averaging from $7 to $8 per ton.

The Gover has been explored to a depth of 1000 feet. Ore running up into hundreds of dollars per ton is frequently met with.

The Keystone at Amador City is the oldest producing mine in the county. For 30 years it has held its place as a steady yielder, its output varying from $20,000 to $40,000 monthly. It has been developed to a depth of 1300 feet, and the quartz has averaged from $5 to $25 per ton at different periods of its history. The gross yield is over $10,000,000.

The South Spring Hill is a comparatively new mine, but stands to day at the head of the list in bullion production. It is down less than 800 feet, yields about $20,000 per month, and has a long career of activity before it.

The Wildman at Sutter creek is an old property, abandoned for 20 years, and recently restored to active operations. The history of this claim shows it became a mine and was given up in the early days of quartz mining as a non-remunerative property. Over 20 years back a shaft was sunk 600 feet, and drifts run in several directions, and the outlook was not considered encouraging, so the mine was abandoned. Two years ago Eastern capitalists purchased it, and under the supervision of John Tregloan, a thorough practical miner, the property was reopened. Good hoisting machinery has been erected, and a 20-stamp mill equipped with the most approved gold-saving appliances has been built and started, and the money necessary to pay for these improvements has been taken from the mine. It is now regarded as one of the most substantial and prosperous properties on the mineral belt. The ore yields from $6 to $8 per ton, which leaves a handsome margin of profit. There are scores of claims on the same belt, now idle, which are just as likely to develop into rich productive mines as the Wildman was considered to be at the date of its reopening.

Another instance is the Kennedy mine near Jackson, which has recently been opened by San Francisco capitalists, and is now fully equipped with all the modern improvements and gold-saving appliances, and will, without doubt, in the near future, return many dividends to the fortunate shareholders.

The Zeile, at Jackson, furnishes an illustration of what can be done with a low-grade proposition. It is, perhaps, the lowest grade ore worked in the county, if not in the State. In free gold and sulphurets the yield does not exceed $3 or $4 per ton. There is an immense ledge—30 to 40 feet wide in places—and a 40 stamp mill crushes from 130 to 140 tons per day. The quartz is remarkably even in its yield. By an economical management the property has been successfully worked for the past ten years, and will probably continue to run for a generation to come. It is not a great many years ago that rock was looked upon as worthless for mining purposes if it did not give up from $10 to $12 per ton, and many prospects were abandoned because they did not come up to this standard. Now such quartz is looked upon as high-grade rock. The average of all the paying mines now in operation is from $6 to $7 per ton, and such figures leave fully 50 per cent profit.

Besides these there are several mines with excellent prospects of turning out paying properties which are idle, owing to litigation or want of capital to place them on a working basis. Among them may be mentioned the Loyal Lead, 10 stamps; Lincoln, 40 stamps Mahoney, 40; Moore, 10 stamps; Potosi, 10 stamps; Amador Queen, 20 stamps; Mammoth, 10 stamps. All of these have in years past yielded gold in paying quantities, and most of them will surely take their place among the active mines of the future.

The development of this great mining-field is steadily going on. At the present time the New London Company, whose property is near Plymouth, is building a fine 40 stamp mill; the South Cosmopolitan, owned by Massachusetts capitalists and located a couple of miles south of the New London, is putting up a 30-stamp mill; the Amador gold mine, near Jackson, has a 60-stamp mill nearly completed. All these mills are warranted by underground developments as far as anything short of actual milling tests can justify them.

There is still an unlimited field for mining development. Not one-hundredth part of the mother lode has been adequately prospected.

Outside of this lode there are many fields for mining enterprise. At Volcano, a cement-gravel claim has lately been opened with flattering results, the yield far exceeding per ton any quartz mine in the county. There is a vast channel of this gold-bearing cement, and other companies are preparing to commence operations thereon.

Other Mineral Resources.

In addition to gold, Amador is rich in other minerals. In Ione and Jackson valleys coal is found in large quantities. The coal is somewhat inferior in quality, but the bed has been prospected only 200 feet deep.

Fine sandstone for building purposes is found near Lancha Plana, of which stone the new Sacramento bank building has just been constructed. Marble suitable for mantel-pieces, monuments and other purposes is obtained near Plymouth and Volcano. The Newton copper mine between Ione and Jackson has been profitably worked for years. Iron ore exists in abundance. Splendid granite for building is found a few miles east of Jackson.

There are located at Sutter Creek two large machine-shops and foundry, Knight & Co. and Donnelly & Howard, who manufacture all kinds of mining machinery, water-wheels, etc.

Voorhies & Barney have chlorination works; one located at Sutter Creek and one at Drytown, and they treat ore from nearly all the mines in the county. The capacity of both works is 7½ tons per day, and the yearly production of gold is nearly $250,000. Prompt and correct returns have gained for these gentlemen an enviable reputation in their business.

Another great advantage this county possesses is the magnificent water-power afforded principally by the Blue Lake Water Co., which has a large canal running nearly the entire length of the county, affording power for nearly all the mines on the mother lode both for hoisting works and the running of mills, and by a system of reservoirs in the mountains are able to store water in the winter to last the entire summer through, as the last season was a very dry one and the company had plenty of water for all.

Agriculture.

The agricultural resources of the county are of a high order. The display of fruits, cereals and vegetables at the State Fair was a surprise to the rest of the State, as the general idea on the outside was that Amador was a mining section almost exclusively. Ione and Jackson valleys will compare in fertility of soil and range of production with any portion of the State. Also for several miles east and west of the main mineral belt, the soil is very productive for all kinds of fruit and grain. A large farming community exists in the very heart of the mining region, and a ready market is found for their produce.

Much of the soil is specially adapted to grapes, which are a very profitable crop, whether for table or wine purposes. Wine grapes thrive without irrigation. Indeed, the finest wines are made from grapes grown without irrigation throughout the entire summer, and on upland soil. A few years ago a vineyard was planted a few miles east of Jackson, on a slaty bedrock soil. Blasting had to be resorted to in preparing holes to plant the cuttings. Many laughed at the idea of vines growing, much less thriving, under such conditions. But it has proved, without the least effort at irrigation, one of the thriftest and healthiest vineyards in the county, and bore an excellent crop the present season.

Land is comparatively cheap. In the valleys it ranges from $20 to $50 per acre. In the mining section and above, there is plenty of land to be had from $8 to $20 per acre, according to improvements. In the eastern part of the county there are vast forests of pine and spruce—as fine timber as can be seen anywhere—comparatively untouched.

Its local government, in efficiency and economy, will bear comparison with that of any county in the State. Amador is practically out of debt. The last outstanding interest-bearing warrants are expected to be redeemed by next year's levy. Last year the tax rate for State and county purposes was $1.50 on $100. Her educational and social privileges are all that could be desired.

The principal towns are: Jackson, the county seat, population 2500; Sutter Creek, 1500; Amador City, 1000; Plymouth, 1200; Drytown, 400: all on the mining belt; Ione City in the western part of the county, the terminus of the Amador Branch railroad, with a population of 1000. This town has also been selected by Act of the Legislature for the location of the Preston Reform School for juvenile criminals.

The great need of the county is railroad extension to the populous mining section. This would undoubtedly give an impetus to all branches of business, and enable this favored county to vie with any portion of the State in the inducements held out to the homeseeker.

Academy of Sciences.

At the meeting of the California Academy of Sciences on Monday evening, F. Lambertigni, the Italian Consul for this city, who has recently returned from Italy, gave an account of the condition of affairs there and the improvements going on.

T. S. Brandegee, a member of the Academy, read a paper on the flora of Baja California. The document was almost entirely of a technical character of interest to expert botanists.

Mr. Brandegee arrived in Magdelena Bay, Lower California, on January 11th of the present year, from which time until the following May he dedicated himself entirely to making a collection of plants and flowers. Though the country is in many places arid and sterile, it has a great variety of plants and some beautiful flowers. The different forms of cactus are met with in almost every part of the territory in endless variety, while fine woods are found in some sections. Mr. Brandegee found the country quite thinly populated, sometimes journeying for two weeks at a time without encountering a human habitation. When he had concluded his researches he returned to this city with his collection, which is believed to contain the largest number of specimens of Lower California flora yet gathered.

In the discussion which followed the reading it was stated that the annual output of the orchilla from Lower California was valued at about $300,000. The orchilla is a lichen much used in the manufacture of the finest dyes. It is found on the coast of Zanzibar, but the conditions for gathering it there for commercial export are most unfavorable. Its presence on the peninsula of Lower California was discovered some years since by an intelligent wanderer who had amassed a fortune by exporting this valuable lichen to London and other centers of industry.

LAST week's ore yield of the Comstock mines aggregated 3874 tons, divided as follows: Con. Cal. and Virginia, 2577 tons, assay value, $28.75 per ton; Yellow Jacket, 455 tons, assay value, $26.50; Occidental Con., $318 tons, assay value, $20 50; Justice, 214 tons, assay value, $26 50; Alta, 310 tons, assay value, $30 75. The total bullion yield of the above was about $95,000.

THE large granite base of the Stevens memorial statue has been placed in position in the Sacramento city plaza. The statue will be completed and dedicated on Thanksgiving Day. This monument is being erected by railroad employes to the memory of their late master mechanic, A. J. Stevens.

ONE HUNDRED AND FIVE pounds of gold, valued at $21,000, representing the yield from ore crushed in a hand-mortar in two weeks by three men, was brought to Nevada City last Saturday. It came from Chipp's Flat, near Alleghany City, Sierra county, the province of bonanzas.

RUBBER FACTORY.

Monarch Belting.

The Plies of this Belt are
UNITED by COTTON RIVETS
Which hold them firmly together.

Each Rivet is Independent
And Follows the Stretch.

THERE ARE NO STITCHES
TO BREAK, and
The Belt has a Smooth Surface.

Hose, Belting, Packing, Etc.

ALL KINDS OF RUBBER GOODS MADE TO ORDER IN A FEW HOURS.

The Tunnel Horse.

The tunnel horse (or mule) is an institution in mining, and very much more useful in the economies of civilization than the record-breaking trotters or runners of which we read so much in the papers. Yet he has not been immortalized in verse or any class of literature. He is not an equine aristocrat. He has no elegant stable and careful trainer like the horse used for speed only. The condition of his health is not telegraphed all over the country from time to time; and even if his virtues be many, there is seldom a possibility of their being handed down to posterity by descendants. Yet he fulfills his destiny with patience and perseverance. Mole-like he pursues his path in damp and darkness. Whatever intelligence and training he may have are entirely at his master's service and expended for his good. With a good grade out, his duties are lightened; but whether he works both ways or only hauls the empties in and follows the loaded cars out, he goes from mouth to face and from face to mouth day after day, in the ceaseless round of duty. Used to the splash of water, the thud of blasts and the roughness of his track, he patiently plods on, unmindful of the busy world without. The sunlight is not for him, since, if not kept inside a hundred feet or so, he is blindfolded when coming to the light of day while on duty.

A tunnel horse, well trained and experienced, is a most useful animal. His type is seen in all the well-developed camps of the coast, and, although of humble station, in many places they could do better without a superintendent than without him. It is his duty to carry away the rock from the face and often to supply the mill. He takes the men in and out, hauls timbers and supplies, and makes himself generally useful. He is intelligent, too, and while accustomed to the ordinary scenes and sounds of the mine, realizes anything unusual. We have in mind an old mule that had worked some years in a very long tunnel in one of the northeastern counties of this State. He had to haul the empties in and walk back without a load to a point a few hundred feet from the tunnel mouth. At this point the outcoming loaded cars were stopped, he was blindfolded, and then hauled the cars out and round a curve to the ore-hoppers of the mill, or to the waste-dump. The cars came to where he was stationed by gravity. He usually had to wait awhile at his station for his cars to come, and had never tried to come past that point unles blindfolded and driven. One day, before he had quite got back to his station, he heard the cars coming very fast, and evidently realizing that something was wrong, started on the dead run, passing his station and getting within 100 feet of the tunnel mouth when the cars overtook him. Just before they did, he suddenly stopped, squeezed himself up against the timbers as close as possible, and escaped with a skinned side. The cars had broken loose and run off loaded without any brakesman. A miner on the way out, on foot, witnessed the occurrence. That mule must have realized that those cars were coming too fast for his good, and he did his best to get out of their way, yet he was accustomed to their rattling every day as they came, with the grade, toward his station.

Sometimes the tunnel horse gets into mischief, especially if hungry, when his appetite will, as in the case of human beings, lead him into indiscretion. An instance occurred, only a week or so ago, when the barn of the Indian valley mine, Plumas county, this State, was burned, together with a horse and phaeton, some hay, grain, harness, saddles, etc. The mine is supplied with hydrants and hose, and the water was turned on in a very short time, but the whole building had burst into flames and the fire had gotten such a start that it was impossible to do more than protect the property near by. The theory of the fire's origin is that the tunnel horse, carrying a lighted candle at his breast, after coming out of the tunnel unattended, went to the barn, and finding the door open, walked in and up to the manger containing hay. His lighted candle started the hay burning, with the results stated. If he had been an ordinary horse, he would have stayed in the fire or run in where it was hotter, but, being a tunnel horse, he was too smart for this. When the fire was discovered, the tunnel horse was standing outside, not far from the door. The superintendent's driving horse, hitched to a phaeton, stood in a stall and was suffocated.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING OCT. 29, 1889.

413,642.—COMBINED PULVERIZER AND CULTIVATOR—G. W. Bassett, Lower Lake, Cal.

413,820.—CONCRETE-MIXING MACHINE—Chatain & Gilletti, S. F.

413,821.—WASHING MACHINE—Enos Churchill, Tulare, Cal.

413,712.—CORN-PLANTER—J. De Rose, S. F.

413,823.—FLOUR SIEVE AND SCALES—Adeline T. Evans, St. John, Cal.

413,938.—SOLDER-MELTING FURNACE—E. Hawes, Sacramento, Cal.

413,829.—OVERDRAW BRIDLE ATTACHMENT—P. L. Nash, Hollister, Cal.

413,830.—ROTARY STEAM PUMP—E. I. Nichols, S. F.

413,831.—FRUIT-PITTING MACHINE — E. I. Nichols, S. F.

413,804.—LIFTING JACK—E. I. Nichols, S. F.

414,119.—CONCENTRATOR—A. B. Paul, S. F.

413,732.—INSECTICIDE—J. Reeder, Fresno, Cal.

414,177.—PACKING-BOX—W. H. Snow, Oakland, Cal.

413,836.—CULTIVATOR — I. Sylvester, Colusa, Cal.

The following brief list by telegraph, for Nov. 6, will appear more complete on receipt of mail advices:

CALIFORNIA.—William Wainwright, S. F., lawn irrigator; Eugene Urbanic, S. F., ground-bone furnace; Wm. Tenyck and G. Green, Oakland, seal lock; Gustav F. W. Schultze, Alameda, coin-operated punching or striking machine; Thos. A. Pudan, Sacramento, plate or dish-washer; Edmond Pait, Berkeley, assignor of two fifths to B. C. Turner of S. F., coal-du-t feeder; Wilfred Page, Penn's Grove, two-wheeled vehicle; Milton W. Lipe, San Jose, wood-sawing machine; Wm. S. Herrington, S. F., miter-box; Wm. J. Gorham and M. A. Graham, S. F., pulley; Thomas R. Garnier, San Jose, ore-concentrator; Wm. C. and S. Freeman, Bidwell's Bar, animal gun; Ferdinand Espel, S. F., cable-car stopper; Alfred Dudden, Santa Barbara, door-spring; Edgar B. Badlam, S. F., device for supplying and measuring air for carburetors; John Bean, Los Gatos, pump; Charles E. Bigelow, S. F., truss.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable prices, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT-PITTING MACHINE.—Emory I. Nichols, S. F., assignor to the Nichols Manufacturing Co. No. 413,831. Dated Oct. 29, 1889. The invention relates to that class of machines for extracting the pits or stones from the fruit in which a winged punch is employed which is brought in contact with the fruit, whereby the punch drives out the pit, while the wings thereof sever the fruit and lay it open; and the invention consists in a fixed bracket carrying the winged punch and a rotary wheel mounted on the fixed bracket and carrying sockets or seats for the fruit, so that by the rotation of the wheel the fruit is brought into contact with the fixed winged punch and its pit thereby driven out and its flesh out open. The object is to provide a fruit-pitting machine in which the operation is accompanied by a rotary motion, the advantages being greater convenience and more rapid operation than in those machines in which the winged punch has imparted to it a reciprocating movement against a fixed bed.

WASHING MACHINE.—Enos Churchill, Tulare, assignor of one-half to W. L. Morrow of San Luis Obispo. No. 413,821. Dated Oct. 29, 1889. This invention consists in a rocking or oscillating vessel having peculiarly constructed ends, whereby a chamber is formed at each end in which air is compressed by the rocking action of the vessel and the movement of its contents, the compressed air acting on and through said contents and driving it back, thus more effectually agitating it. The object is to provide a machine adapted for washing clothes or for churning cream, in which agitation of the material acted upon is effective in the case of washing, the water and suds being forcibly driven back through the clothes by the compressed air, and in the case of churning, the fatty globules being thoroughly broken up.

ROTARY STEAM PUMP.—Emory I. Nichols, S. F., assignor to the Nichols Manufacturing Co. No. 413,830. Dated Oct. 29, 1889. This is one of that class of rotary pumps in which the sliding pistons are successively projected into and withdrawn from the water space. It consists in a shell or casing having a steam inlet and a steam outlet, an annular rotary piston-carrier mounted within and having its periphery eccentric to the inner circumference of the shell, whereby on one side the contact of the two forms an abutment and on the other side a steam space, a fixed center within the annular piston-carrier, and having its periphery eccentric to the inner circumference of said carrier, whereby at one side it forms an abutment and at the other side a water space, said center having an inlet and outlet port, and sliding pistons mounted in the carrier and extending between the inner circumference of the shell and the periphery of the fixed center. The object of the invention is to provide a rotary pump adapted to be operated by steam, the whole machine being practically a combination of a rotary steam engine and a rotary pump, the former being the motive power of the latter.

LIFTING-JACK.—Emory I. Nichols, S. F., assignor to the Nichols Manufacturing Co. No. 413,864. Dated Oct. 29, 1889. The invention consists in the novel construction and arrangement of the hollow standard ratchet lifting bar mounted therein, vibrating operating lever, spring-controlled pawls carried thereby and stop-piece for releasing the pawls. The object is to provide a simple lifting-jack of that class in which a ratchet-bar is raised by the alternate engagement of opposing pawls carried by a vibrating lever.

OVERDRAW BRIDLE ATTACHMENT.—Potalba L. Nash, Hollister. No. 413,829. Dated Oct. 29, 1889. This is a check and overdraw for horses. It consists of a padded base or bridge supported upon the face of the horse below the eyes and having standards or posts upon each side extending outwardly from the horse's face, and provided with guides or runners through which the check-rein from the bit may pass, these reins leading backwardly through the terrets and being connected with the driving-rein. As many guides may be employed as may be found desirable to suit different horses which are to be trained.

COMBINED FLOUR-SIEVE AND SCALE.—Adeline T. Evans, St. John, Colusa Co. No. 413,823. Dated Oct. 29, 1889. This kitchen utensil consists in a combined flour-sieve and weighing scale, the object being to provide a simple utensil for readily weighing and sifting flour, and also for weighing other materials.

CONCRETE MIXING MACHINE.—Evariste Chatain and Secondo Gileti, S. F. No. 413,820. Dated October 29, 1889. This apparatus for mixing materials for the formation of concrete consists of a vertical tube with a receiving hopper at the upper end and a series of transversely-arranged swinging-chains by which the material is mixed as it falls from the top to the bottom of the tube.

CULTIVATOR.—Isaac Sylvester, Colusa, assignor of one-half to R. A. Gray. No. 413,836. Dated October 29, 1889. This is one of that class of cultivators known as a weed-cutter. It consists in a frame having a wheel on each side mounted upon an independent crank axle whereby the frame and the cutting blade which it carries may be raised and lowered, a cutting blade secured adjustably under the frame and carried by said frame at an angle extending from one of the forward corners to the rear corner diagonally opposite, and a rake attachment on the rear of the frame.

Thanksgiving Proclamation.

The following proclamation was issued by the President on the 1st inst.:

A highly favored people, mindful of their dependence on the bounty of Divine Providence, should seek a fitting occasion to testify their gratitude and ascribe praise to Him who is the author of their many blessings. It behooves them to look back with thankful hearts over the past year and bless God for His infinite mercy in vouchsafing to our land enduring peace, our people freedom from pestilence and famine, our husbandmen abundant harvests, and to them that labor recompense for their toil.

Now, therefore, I, Benjamin Harrison, President of the United States of America, do earnestly recommend Thursday, the 28th day of this present month of November, to be set apart as a day of national thanksgiving and prayer, and the people of our country, ceasing from the cares and labors of their working day, shall assemble in their respective places of worship and give thanks to God, who has prospered us on our way and made our paths the paths of peace, beseeching Him to bless the day to our present and future good, making it truly one of thanksgiving for each reunited home circle as for the nation at large.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

W. B. FROST—Monterey and San Luis Obispo Cos.

Michael McMahon, better known in Plumas and Sierra counties since 1851 as "Black Mac," died at the home of his only brother, near Ann Arbor, Mich., last month. The Plumas *National* says: Himself and nephew still own some claims near the Buckeye mine, this county, and quartz claims in Oregon. He acknowledged before his death that he had gold buried near his old cabin on the Golden Gate claim.

THE Porterville *Enterprise* says: A great many Chinese are at work in the placer mines on Grizzly gulch. The diggings are deep, and most too much work about them for a white man, but the Chinamen work them and make lots of money.

The Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

* With $60,134 in unsold bullion and further shipments to arrive.
† Bullion on hand not sold valued at about $5000.
‡ Bullion unsold valued at about $36,000
§ With unsold on hand valued at about $4768.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Jas. F. Wardner, who is identified with large lumbering, banking and mining enterprises at Fairhaven, Bellingham bay, is in the city. Mr. Wardner was the founder of the present prosperous town of Wardner, Idaho, and in conjunction with Gov. Hauser of Montana, he afterward sold the Sullivan mine at Wardner for $1,000,000. He has accumulated large wealth in less than five years, and is one of the most pushing men of the North.

DEL NORTE COUNTY CHROME.—The Del Norte *Record* says; The mountains of Del Norte abound in chrome enough to supply the wants of the United States for years to come. A Baltimore company has been working a chrome mine near this city for years, the ore being hauled to Crescent City in wagons, then shipped by either steamer or sailing vessel to San Francisco, and from there re-shipped to Baltimore.

THE trustees of the Mechanics' Institute are discussing the feasibility of putting up a fine permanent structure for their annual exhibitions. If it is decided to do this, the old fair building will be torn down and a new one erected on the site.

TOMBSTONE, ARIZONA.—Letters from our correspondent at Tombstone, Arizona, descriptive of the town, will be published in the PRESS as soon as engraving now in preparation is completed.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Mechanical Engineer wishes an interest in established business. State full particulars and capital required. Address, CAL., Box 2517, San Francisco.

The Pittsburgh Boiler Scale Resolvent.

☞This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & Co., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one **is the only good thing we have ever used.** Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as **sulphate of lime, carbonate of lime, mud, and everything that is bad.** Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern; Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }

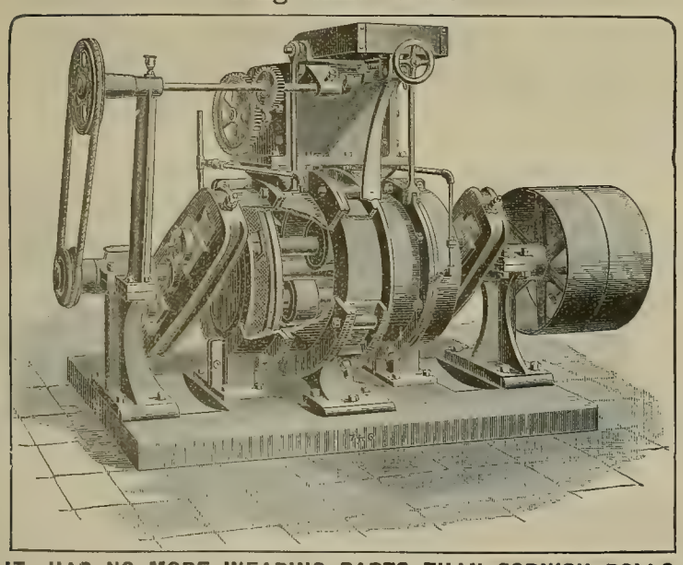
FOR SALE ONLY BY

TATUM & BOWEN,

Sole Agents for the Pacific Coast,

Dealers in Improved Wood-Working Machinery,

Saw Mill Machinery, Engines, Boilers, Iron-Working Machinery, Supplies, Etc.,



Sole Agents for Hoe Chisel-Tooth Saw, Gardner Governor, Schultz Leather Belting, Etc., Etc.

34 & 36 Fremont St., San Francisco. 85 Front St., Portland, Or.

☞If in want of Machinery of any description, write us for Descriptive Circulars and Prices.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

E. E. EYRE, President. JAS. H. GRAHAM, Vice-Pres. & Manager. G. M. PINCKARD, Sec'y.

VULCAN IRON WORKS,

135 to 145 Fremont Street, San Francisco, Cal.

MINING MACHINERY,

Stamp Batteries, Pans, Settlers, Etc. "Dodge" Rock Breaker Pulverizers, Concentrators.

SAWMILL MACHINERY,

Refrigerating and Ice Machinery

Cable-Road Machinery,

STEAM ENGINES,

CORLISS, MYER'S CUT-OFF, PLAIN SIDE-VALVE

Shafting, Pulleys, Hanger and Boxes, Etc.

Special machinery of all kinds. We have a large list of Standard Patterns, Gears, Pulleys, Boxes, etc. REPAIR WORK SOLICITED.

L. C. MARSHUTZ T. G. CANTRELL.

NATIONAL IRON WORKS

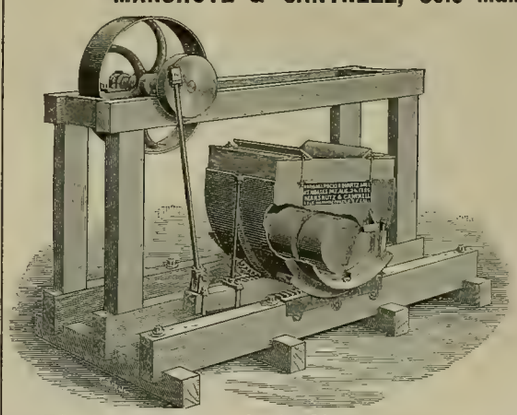
N. W. Corner Main and Howard Sts., San Francisco,

—MANUFACTURERS OF—

Stationary and Compound Engines, Flour, Sugar, Saw and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.



IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

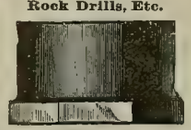
MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.



SOLE AGENT FOR

Adamantine Shoes, Dies and CRUSHER PLATES,

—AND—

Chrome Cast Steel for Rock Drills, Etc.

ADAMANTINE.

H. D. MORRIS,

220 Fremont St., San Francisco,

MANUFACTURERS' and PURCHASING AGENT.

Special attention given to purchase of

MINE and MILL SUPPLIES.

ADAMANTINE SHOES AND DIES.—Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.

H. D. MORRIS.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

AMALCAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❋ BOILERS HORIZONTAL, VERTICAL ... AND SECTIONAL. ...

IMPROVED STEAM STAMPS

Hoisting Engines, Safety Cages, Safety Hooks,

ORE CARS, WATER & ORE BUCKETS,

Air Compressors, Rock Drills, Etc.

GENERAL MILL AND MINING SUPPLIES, ETC.

Sectional Machinery FOR MULE-BACK TRANSPORTATION.

Pumping Engines and Cornish Pumping Machinery,

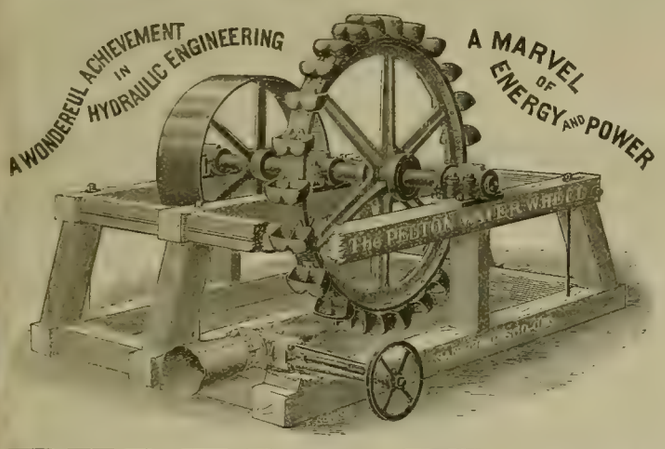
IMPROVED WATER JACKET

Blast Furnaces for Galena & Copper Ores,

SLAG CARS AND POTS,

Roots & Baker Pressure Blowers,

SUSPENDED TRAMWAYS.



General Offices and Works: FULTON AND UNION STS., CHICAGO, ILL.

BRANCH OFFICES: NEW YORK, Room 43, No. 2 Wall St. DENVER, COLO., 1316 Eighteenth St. SALT LAKE CITY, UTAH, 7 W. Second South St. LONDON, ENG., 23 Bucklersbury, E. C. CHIHUAHUA CITY, MEXICO, No. 11 Calle de Juarez. LIMA, PERU, South America. JOHANNESBURG, TRANSVAAL, South Africa.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.

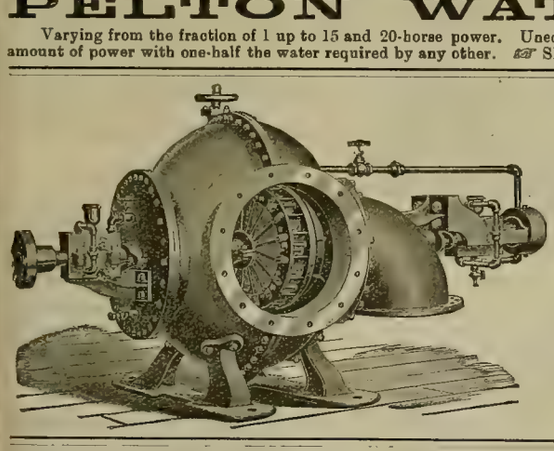
Adapted to heads running from 20 up to 2,000 feet.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS



Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

120 FIRST ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,

Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1869

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for th most suitable Process for Working Ores.

Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,

(Formerly Huhn & Luckhardt,

Mining Engineers and Metallurgists.

J. KUSTEL. G. KUSTEL.

METALLURGICAL WORKS.

313 Pine St. (Basement),

Corner of Leidesdorff Street, - - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my Process.

Assaying and Analysis of Ores, Minerals and Waters, Mines Examined and Reported on.

Practical Instruction given in Treating Ores by m proved processes.

G. KUSTEL & CO.,

Mining Engineers and Metallurgists.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

21 & 223 First St., San Francisco, Cal.

JOHN W. QUICK, Proprietor.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 7, 1889.

General trade is reported to be increasing in volume. Since the rains the feeling is very confident that 1890 will be a more prosperous year than had for all of four years past.

The October dividends disbursed in this city compare as follows:

	1888.	1889.
Banks	$131,250	$120,000
Gas and Water Co.'s	135,650	133 000
Insurance Co's	64,000	55,000
Street R. R. Co.'s	26,000	12,500
Powder Co.'s	27,000	27,000
Mining Co.'s	424,891	385,369
Miscellaneous Co.'s	66,250	87,750
Totals	$874,041	$820,619

S. H. Brooks, Assistant Treasurer United States at San Francisco, reports cash on hand Oct. 31, 1889, as follows:

National Bank Notes	$12,320 00
United States Notes	65,975 00
Gold Certificates	5,640 00
Silver Certificates	86,135 00
Gold Coin	41,457,775 50
Standard Silver Dollars	17,865,671 00
Fractional Silver	6,409,598 80
Minor Coin	3,380 28
Total	$65,906,495 58

The shipments of silver from the Sub-Treasury into the interior of the State and elsewhere for the month were as follows:

Standard Dollars	$232,260 00
Fractional Silver	56,830 00
Total	$259,090 00

MEXICAN DOLLARS—The market is active at higher prices. Sales from first hands are given to-day at 78 cts. for gilt-edged.

SILVER—The market has been steadily advancing throughout the week, closing to-day as follows: London, 43⅞d.; New York, 95¼ cts.; San Francisco, 96½ cts. The scarcity of the metal and growing wants for commercial purposes are the prime factors in producing higher prices, although the movements in this country and abroad to force silver to the front have much to do with it.

QUICKSILVER—The market is easy with a light demand reported. Receipts for the past week aggregate 350 flasks. Receipts in last month compare as follows:—1889, 1404 flasks; 1888, 1369; 1887, 3033; and the exports, 1889, 1787; 1888, 244; 1887, 1915.

BORAX—Receipts the past week aggregate 1089 ctls. For the month of October the receipts compare as follows:—1889, 61,700 lbs.; 1888, 672,500; 1887, 659,500. The market is firm, with a continued good demand. Exports the past week aggregate 20,786 lbs. to New York.

LIME—Receipts the past week aggregate 4007 bbls. The consumption and shipping demand the past week was a little more active.

GYPSUM—Imports the past week aggregate 250 tons from Port Moritto. The market has held fairly steady, with the consumption increasing.

CHROME ORE—There was a shipment the past week of 384,380 lbs. to New York. The market is without particular change. Eastern advices report a better demand, but no higher prices.

COPPER—The market has shown more vitality, with higher prices obtainable at the East. It now looks as if Lake will be advanced to 12 cts,, the figure at which it was first contemplated to keep it. European advices continue to report an active consumptive demand. A shipment of nine tons of refined was made the past week from this port to Germany.

TIN—The market has held strong in sympathy with the European, where there is a good speculative and consumptive demand. Imports the past week aggregate 100 bxs. plate.

LEAD—The market is inactive, at former quotations. Large consumers at the East do not appear to anticipate their wants.

IRON—Imports the past week aggregate as follows: From Oregon, 20 tons; Irondale, 175 tons. The market for spot parcels is essentially unchanged, although there appears to be a firmer tone. For shipment higher prices are asked, although we retain last week's.

The following are the latest comparative quotations f. o. b. at Glasgow:

	Oct. 23, '89.	Oct. 30, '89.
F. o. b. Glasgow,		
No. 1 Coltness	75s	76s
" Langloan	72s 6d	75s
" Summerlee	72s 6d	75s
" Gartsherrie	72s	75s
At Ardrossa.		
No. 1 Eglinton	58s 6d	61s
" Glengarnock	70s	72s
" Dalmellington	60s 6d	62s

POWDER—The four active local powder companies have formed a combine. The compact is to last for five years, and the percentages are as follows: California Powder Company, 37½; Giant Powder Company, 37; Safety-Nitro, 16, and the California Vigorit, 9½. The price of powder to the trade has been established by the combination as follows: 40 per cent powder, 18 cts. per lb. net in carload lots, and 20 cts. per lb. for less than carload lots; 50 per cent powder, 23 cts. for carloads and 25 cts. for less; 70 per cent powder, 28 cts. for carloads and 30 cts. for less; 30 per cent. powder, 15½ cts. for carloads, 17½ cts. for less. This is an average advance of about five cents per lb. over previous rates.

COAL—The imports the past week aggregate as follows: From Union Bay, 3500 tons; Departure Bay, 4200; Seattle, 4595; Port Moody, 1360; Tacoma, 2300—total, 15,955 tons. The market for steam, both spot and to arrive, is very strong, but with no higher prices established. The imports of Coast are again on the increase. It now looks as if any deficiency from Australia will be more than supplied by this coast, for our advices indicate an increasing output by the collieries on Puget Sound and in British Columbia.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Nov. 7, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	43⅛	94⅜	$11 00	$3 80	$22 00
Friday	43⅜	94⅜	11 00	3 82½	21 80
Saturday	43⅜	94⅜	11 00	3 80	21 80
Monday	43⅜	94⅜	11 50	3 82½	21 95
Tuesday	43⅜	...	.....	.....	...
Wednesday	43⅜	95	11 50	3 82½	22 00

NEW YORK, Nov. 6.—Copper has shown continued strength at an advance. Tin holds strong under a speculative movement abroad. Lead is steady at current quotations. Quicksilver shows a firmer tone. Borax is unchanged. Iron is very stiff under a strong demand.

Mining Share Market.

The mining share market the past week was fairly active under livelier but small fluctuations in the Comstocks than witnessed for some time. The market, as usual, puzzles those outsiders who are always on the alert to win success against the odds they necessarily must encounter with insiders knowing a long time ahead what there is in the mines and how to have them, the outsiders, and the market worked to the best advantage, so as to bleed the street of all the available money. As usual, "decoy ducks" are brought into requisition, so as to lead the more credulous of the outside public into traps set to catch them either on the short or long side—which makes very little difference to the pool so long as money is put into their already-overflowing exchequer. With the break in prices, on last Friday and Saturday, the majority of outsiders had the market going still lower, and even now they are daily looking for a break, and at each setback they feel confident that it is at hand. In this opinion they are confirmed by the levying of more assessments, with reports of others to follow at an early day. They also think they are confirmed in their views by an almost entire absence of news from the mines, for they think if there was anything important it would leak out. The few remaining bulls, although somewhat discouraged, express greater confidence than ever in the situation. They think that assessments are being levied to force them to sell their stock. They also say that the absence of news from the mines is in keeping with the levying of assessments, so as to disgust them with their holdings. They also say that every means is being used in this city and other places where stocks are traded in, to get the public to sell, and as the pool have been free buyers through outside selling, they are not apt to sell at a loss. In outside stocks there has been only moderate trading, although toward the close the Tuscaroras begin to show more life.

It is rumored that a conference is shortly to be held in this city between the mine-managers, mine and mill superintendents of the Comstock mines and representatives of the ranchers controlling the water supply at the head of the Carson river, relating to the distribution of water in the channel of the river to supply power to the mills. If this rumor be true, and an amicable arrangement be arrived at, we may look for a very active season in the extraction and milling of Comstock ores. It is claimed that, with all the stamps dropping, all of 6000 tons of ore will be milled daily.

Reliable news from the Comstock mines is difficult to get. There is no doubt but during the late dry spell the various mines were systematically and quite thoroughly explored, with several put into the best possible position for work during the rainy season. With cold weather, work on lower levels can be advantageously resumed; and it is confidently believed by experienced mining men that in several mines running from the 1000-level down to the 1800-level, rich ore will be run into with proper work inaugurated. Our latest information reports running into $40 and $60 ore in Best & Belcher, on or about the 1000-level, toward the Con. Virginia line. Since then work is reported to have been stopped, The work now going on in several of the mines deserves careful watching, as they are nearing interesting ground. From the outside mines our advices are not essentially changed from last week's reports. Many dealers are confident of better results soon in the Tuscarora, Silver King, Eureka, Candelaria and Quijotoa districts.

Market opened this (Thursday) morning topheavy, under outside selling on bear points—all stocks offered were taken in at drooping prices. Official information reports resumption of work in joint Challenge-Confidence-Con. Imperial, west crosscut on 500-level. The Mexican mill has started up on Crown Point ore; the Nevada mill on Hale & Norcross and Chollar ore, and Rock Point mill on Savage ore. Part of the Brunswick mill stamps will soon commence dropping Confidence ore.

THE Mayflower gravel mine near Forest Hill has yielded $392,809.57 in gold since Dec. 11, 1888.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE Redding Reduction Works at Redding, Shasta county, have not been running this summer, but will be at once started by Wm. R. Conant, W. H. Fowler and others. They are intended to work custom ores.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Assessment Notices.

Gray Eagle Mining Company. Location and principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 16th day of October, 1889, an Assessment, No. 15, of Six (6) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, Room 11, No. 303 California St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of November, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 10th day of December, 1889, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
Office, Room 11, No. 303 California St., San Francisco, California.

DEEP WELL PUMPS

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

BY P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Cicular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

PRACTICAL
Books on Mining
AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warnford Lock. 788 pages, with 8 plates and 271 engravings in the text. 4to, cloth, $15 00, express prepaid.

IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Ross. This work embodies the information, collected during four and a half years, of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrages, flood protection, methods of regulation, locks, etc., have been treated in detail. 367 pages, large 8vo, with 26 plates and numerous engravings in the text. Price $15.00, express prepaid.

MEXICAN MINES.—Dahlgren's Historic Mines of Mexico, *only a few copies left*; price $25 00. Handbook to the Historic Mines of Mexico, price $1.00.

Descriptive Catalogue and Circulars of Books relating to Assaying, Mining, Electricity and Mechanical Engineering, sent free on application.

E. & F. N. SPON, Publishers,
12 Cortlandt St., New York.

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.
SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Xanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F.

AMERICAN MINING AND STOCK CODE
"KELLOGRAPH."

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

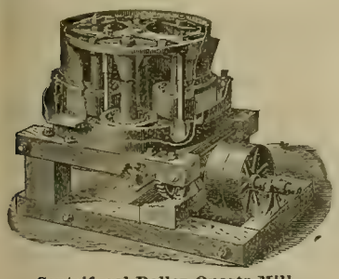
PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

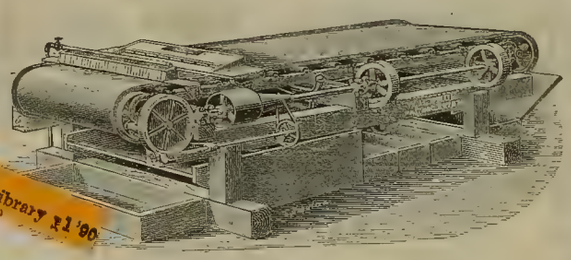
Smelter For Sale or Exchange.



One 50-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

IMPROVED BELT FRUE ORE CONCENTRATOR

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900,
Price of Plain Belt Frue Vanner, $575, f. o. b. [illegible]

For Pamphlets, Testimonials and further information apply at office.

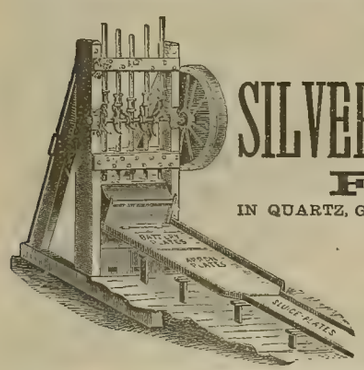
BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.



All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

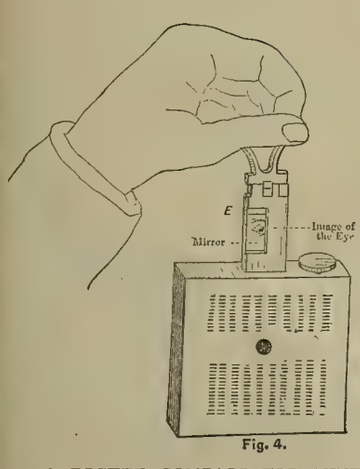
Miners and Geologists' Pocket Compass.

On this page is illustrated an improved French pocket compass, useful for miners, explorers, geologists and engineers. The frame is a double-bottomed box, 2½ inches square. The graduation for the needle is engraved on the upper face of a ring connected with the flat disk, in which the center pin is inserted; between this disk and the box-bottom is a hollow space one-quarter of an inch deep. The stopping of the needle is effected by a screw *A* near the handle *H* (Fig. 1). There is also a clinometer attachment the graduation for which is engraved on the upper face of the silver-plated disk. The compass has two sights. The north sight, *B*, is a simple pin, which folds down and is protected by the exterior sliding-plate, *C*. When raised for use the sight is stopped in a vertical position by a projecting pin attached to the side of the box. The south sight, *D*, is connected with the handle *H*, and the sight and handle together are hinged to the extremity of a plate, *E*, which can be slid through a slot in the side of the box. From one side of the plate, *E*, a rectangular piece of metal has been cut for use in leveling. When the compass is not in use, the sight is folded down. The sight itself, *F*, is a rectangular piece of glass, so set in its frame that it has two reflecting surfaces, one on each face of the sight; the slit cut in the center lies in the vertical plane passing through the north and south line of the compass. The distance between the two sights may be made longer than the side of the compass by sliding out, to its full length, the movable plate, *E*.

Fig. 2.

Fig. 1.



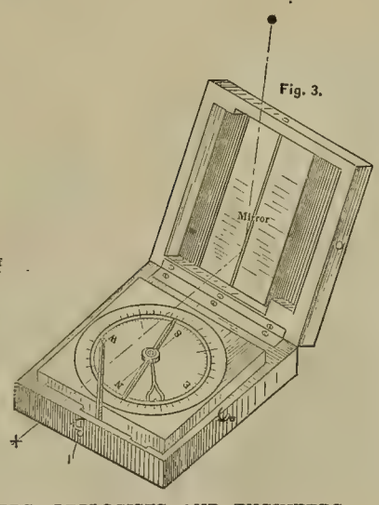


Fig. 4.

Fig. 3.

A POCKET COMPASS FOR MINERS, GEOLOGISTS AND ENGINEERS.

The handle, *H*, is flat and pear-shaped, and is movable about its hinge so as to be capable of taking various positions. The opening on the north side of the box, shown in Fig. 1, but not lettered, leads to a chamber in the hollow space beneath the disk. This chamber serves as a place of storage for a small ball-and-socket joint, one end of which can be screwed into a hole in the compass bottom directly under the center-pin, while the other end is provided with a screw by which the instrument can be attached to any convenient wooden support.

When the compass is used for rough work, the cover of the case is opened and the eye so placed as to see on the red line of the mirror the reflection of the object sighted to, additional accuracy being obtained by raising up the north sight *B*. Closer results are obtained when the compass is taken from the case and put on a flat surface and both sights used; to secure the maximum of accuracy, the socket joint must be used.

When used as a leveling instrument, the sliding plate *E* must be drawn out and the south sight must lie flat on it, the compass being held by the handle and allowed to hang freely from the hand (Fig. 4). In this position the sight will be on a vertical plane and consequently the object seen through the vane, and the image in the mirror will be in the same horizontal line. The square form of the instrument facilitates its use as a clinometer. On the back of the compass a table is engraved giving the percentage of rise corresponding to angles. R. A. Bergier of Butte City, M. T., described and exhibited this compass at a meeting of the American Institute of Mining Engineers a few months since.

A MOUNTAIN GRAVEL MINE—See page 331.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

On Mining Frauds.

The Various Kinds Known.

EDITORS PRESS:—To write intelligently, impartially and comprehensively on such a complicated subject, which has so many side issues, and in which ethical principles are interwoven with business considerations, it is necessary to proceed systematically, and thus to divide the different phases, balancing between mere "bilk" and downright robbery into several classes, according to the diversity of interests and occupations more or less closely connected with the mining industry. This article may thus be divided into four departments—that of assayer, that of prospector and his agents, that of mining expert, and that of director of company and superintendent of the plant.

It is not claimed that this article should be a complete exposure of the various frauds ever practiced by and on miners and those connected with mining, for it seems scarcely possible that all frauds committed in any form, shape or manner, coming under one of the different heads, could be known to one single individual (unless he claims omniscience or clairvoyance), nor that they could all be condensed into a newspaper article; neither shall they embrace a longer period than the last 40 years, nor more territory than the Pacific Coast.

It is not easy to decide or to determine

What Constitutes a Fraud.

Much depends on the elasticity of conscience of those concerned therein or affected thereby, or on the amount invested, for many would not care to mention or to think about the loss of a few hundred dollars, while they would be highly incensed if the loss goes into thousands. Much, too, depends on the perspicuity or short-sightedness of the victims, for it often happens that such a one is in happy ignorance of a fraud, while a knowing one detects it. If a wrong statement—in plain English, a lie—should be called a fraud, then we fear that 99 per cent of mining transactions, particularly the representations of prospectors and their agents, would have to be called fraudulent; yet nobody would call a prospector a liar or a fraud when he represents his find or his claim richer than it really is, even if the average assay of the ore is 90 per cent below that of the specimen a miner brings for inspection. One is so much used to see the prospectors with only rich and exceptional specimens that by common consent one never accepts their representations.

Assay Returns.

He is considered "square," anyhow, merely too much excited, etc. Yet it not infrequently happened in the loose olden times that the specimens produced and alleged to come from a certain locality were from other places. It happened, too, that "my honest prospector" or his agent tried to induce (and, may be, succeeded occasionally) some assayer to give him "a good return," particularly when they had some one on hand who might buy a mine on an assayer's certificate. (This race has died out.) Then the assayer was told, in confidence, that it "would be to his advantage" to give high returns; it was even sometimes specified how many dollars per ton were "expected," and great was the disappointment, often even indignation, long the faces, when the returns were too small, or nil. "Oh, he is a no-good assayer; let us go to another one." This impression, that only that assayer giving the highest returns is *eo ipso* the best one, was formerly the current one. Even at this late day it is not yet eradicated with some operators who ought to know better, and may be taken advantage of by some assayer by regularly adding a few dollars to the amount found by assay, and thus satisfy and attract customers.

A good story happened in the early "sixties," when ore-assaying was going on at a lively rate. Here it is: One day a Mr. B. brought a crushed sample for assay, saying he expected it to go $115 silver per ton. By assay it proved worthless, and the returns were accordingly: "Contains neither silver nor gold." But Mr. B. produces a certificate of assay by a San Francisco firm, showing a crushed sample, left by the same party, with a result of $118 50 silver per ton, and Mr. B. says it is the result of half the sample left with me. "I can't help it. I give whatever I find, not what you expect; yet as you are an old customer I will make a re-assay, though convinced beforehand that no other result will be reached." Quoth old customer: "Well, well, never mind, my good friend; I am satisfied now, for I crushed a cobblestone, brought one sample to M. and one to you, with the same remark of expecting $115 silver per ton, and here have we the result." Comment is useless. After all, an assayer's opportunity to commit fraud is limited to false returns.

Salting Claims.

A prospector's occupation affords a wider and more interesting field of operations. To produce some rich ore and to pretend it came from his claim when it did not, is too clumsy a deception to deserve mention. A "smarter" way is to take a buyer or expert to an adjoining claim in the owner's absence, and to represent, possibly to sell, the neighbor's claim as his own. Of course, in this as in other similar transactions immediate disappearance after a sale is or was the order of the day (or of the night). The "salting" of a claim is more ingenious, and allows several modifications. If a placer claim, nothing is more simple than to sprinkle some gold-dust on some spots and then to lead the examining party nonchalantly up to it, or to introduce by sleight of hand some gold-dust into the pan or sample.

Such a thing was done on a grand scale some years ago by some "sharps," who sowed many thousand dollars worth of rough diamonds over some out-of-the-way place down in Arizona or Colorado, and then let an unsuspecting and innocent M. E. scrape it up and report accordingly.

The "salting" of a ledge or vein is done on the same principles, by dumping into the drift or shaft a quantity of good ore from the neighborhood, and letting the examining party pick it up. Some years ago it happened in Nevada that this operation was practiced, by throwing a few sacks of rich ore into an abandoned shaft, and then on the strength of the good returns of the samples taken therefrom, selling the claim to its present proprietor. The seller left the State in a hurry, and the buyer put some men to sink the shaft a few feet deeper, and was not at all astonished when a rich ledge was struck, which, by its size and value of ore, justified the erection of a large mill. A year or two afterward the seller ventured to return, and then his astonishment was not small. A similar occurrence, where the would-be biter was bitten, happened lately in El Dorado Co. Two tons of quartz was crushed as a test and its owner introduced two ounces of gold into the battery, and is said to have uttered some pious exclamations when the result showed half an ounce for the two tons. The balance of the gold was lost by wrong management or poor condition of the mill.

The "salting" of rock can be done in the mine itself without introducing any ore, by sprinkling a solution of gold or of silver, as the case may be, on the walls, on the face of the tunnel or on the bottom of the shaft; and when the examining M. E. breaks off samples with his own hand and assays them himself, he gets high, yet incorrect returns, and reports accordingly, if he is "not up to the trick." As remarked, it is an easy and occasionally practiced way to add some precious metal to a lot of ore which is sent to a mill for a test on a large scale; therefore suitable precautions ought to be taken. It cannot be called a fraud, when a mine-owner picks out the best spots and hands to the would-be buyer the stuff for examination; any one may expect this and must therefore rely on his own judgment, irrespective of the talk and advice of the owner.

"Mining Experts."

A mining expert is not subject to manifold temptations, yet occasionally these may be great in proportion to the importance and value of the property examined. A fraud can be and is perpetrated by listening to the wily talk of the seller, and then by knowingly misrepresenting the value of ore, conditions of mine, water facilities, title, and in general of everything which is of interest to be known, or by willingly neglecting to report what ought to be known. A contingent commission is a strong incentive to put on the brightest colors.

"Presidents and Superintendents."

And what of presidents, of directors of companies and of superintendents of plants? The committing of fraud often goes on by combination of the three—sometimes of only two parties—yet not a few instances are known when one party only did the evil deed. Where a company is small or unorganized, the management of the mine is left to the moving spirit of the concern, and as experience in the past teaches, in the majority of cases, fraud or incompetency was the cause of total loss to the stockholders. Such a fraudulent spirit collects what assessments he can; if there is a ledge and the ore is valuable, he goes to work. If the locality is far away or not easily accessible, the better for him and the worse for his victims. And he works so assiduously, writes encouraging letters, directs all the work, takes out good ore as long as it lasts, sells it—and keeps all proceeds, too. If he informs the stockholders that the expenses were equal to the yield, he thinks he has done all that is required. If such a game is "played out," he tries another locality, and repeats a similar operation till he cannot find any more credulous persons, and till all who know him shun him, as "fraud" in large letters is stamped on his face. Then he begins epistolary operations, and woe to the Eastern or European correspondents that listen to his propositions. This pen-picture can be recognized by and applied to many individuals.

Or where a mine is important, the shares numerous and quoted in the Stock Board; suppose a rich ore body is discovered by diamond drill or otherwise — absolute secrecy is enjoined by the superintendent. The few miners who know of it are either bribed not to say anything, or they are made to believe that the ore is base and worthless; yet the spot is covered by debris and deadwork done in other parts of the mine. Poor ore is sent to the mill, and as the returns are below the expenditures, assessments are levied until the shares go low enough to enable the "knowing ones" to rake them in, and only then the good spot is worked for all that it is worth. We all, out here, know the rest.

Such fraudulent operations admit of several modifications, and were practiced formerly all too frequently, as a few gainers and many losers will remember too well.

Mining at Long Range.

Or suppose a mine is worthless—a real "sucker" on the shareholders. In that case the superintendent or his secretary must be a good writer, must know how "to put it on" irrespective of his incapacity in the business he ought to conduct. His weekly reports speak regularly of good indications, and when an assessment becomes necessary, the tone of his letters rises to "excellent indications, sure to strike a large body in a short time," etc. And so it goes on and on until the stockholders become tired of being bled for the benefit of the "popular secretary" and a few "capable" ones, and out goes the flame.

Again, suppose the "mine" is somewhere in an out-of-the-way place—Mexico, for instance. We have a nice, plausible superintendent. He writes often enough and gives full description of the mine, states what work is done and has to be done, how promising the indications are and how much money is needed per month. Thus it goes on month by month; his letters are encouraging and regular—so are the assessments and remittances to him. But it happens that a shareholder wants to see for himself, and visits the place unheralded. Whom and what does he find? The superintendent swinging in a hammock playing the guitar to some fair senoritas—and the mine (?) a small hole in the ground; no work, no ore, no indications of any. The superintendent's business (!) consisted of writing letters and fictitious reports, riding to the next town to post them and to receive remittances and to spend time and money with the women.

These and other similar frauds were practiced, and may be yet attempted to be practiced with more or less modifications or success or impunity in all mining States and Territories, Mexico not excluded. In Sonora, for instance, such practices may only be called "smart," when a foreign, particularly an English company, is concerned. Their agent, consulting engineer and superintendent may have some stock of the company which he wants to sell. A report is sent, showing a large and profitable mine. The company is induced in some manner to put up a mill, and when ready, lo! no ore is in sight. But this makes no difference at all. A cablegram is sent: "Mill running; plenty rich ore in sight," and based on such representations, the agent's stock is or may be sold. So are the stockholders.

And when remonstrated with, the answer of the worthy may be (as it was in reality): "D—n the English to Hades! We are here to make money out of them." This was a plain statement, easy to understand. It is not often one is obliged to witness such barefaced fraud; the race of gullible Englishmen is dying out, even if that of the rascals and frauds is not. Yet if the supply of victims fails, the latter have to starve, and will starve, let us hope.

THEO G ED. WOLLEB.

A Stage-Road Through the Sierras.

EDITORS PRESS:—The traveler who makes an early start from Truckee is thrice rewarded for his early rising, though, to be sure, when traveling by stage in some directions he has no choice for his breakfast-hour. The overland train which leaves San Francisco at 6:30 P. M. reaches the wildest beauty of the Sierras at about 5:30 A. M., threading its way through miles of rock and pine land, passing Donner lake, lying like a long dazzling mirror of brightness between the purple hights, just at sunrise, and reaching Truckee about 7:15. Then he whose way lies toward the interior fastnesses of the mountains has just time for a hasty breakfast before the stages start on their long, rough journeys through the hills. But in truth the early morning is the perfect hour. Then all the bright glory of the day is new and sparkling; then the sweet mountain air holds its best freshness and purity.

Two lines of stages leave Truckee for Sierra valley at the same hour—one owned by Nichols & Co., the other by Abbe—making about the same time to their destination. The driver of the Nichols stage, Mr. Richardson, is in all respects a most agreeable and competent driver, having traversed this route for a number of years and remembering anecdotes of interest about every furlong of the way. He drives regularly the year through, making daily trips from Truckee and back in the summer and three a week during the snowy months. Few passengers travel in the coldest season, and Mr. Richardson often drives the 30 miles into Sierra valley alone, through clouds of driving snow-storm and over grades half filled with drifts. There are hillslopes which in summer the spirited horses ascend in a few minutes' time, where often a half-hour is spent in persistent struggles when the snow lies deep and fine along the road. Strange indeed is the contrast of that white, silent world of winter, wild and majestic in its loneliness, to the bright stirring days of summer when the tourists bring a spice of the life from the outer world into this far mountain retreat to redeem it from its quietude and settled peace.

In the fresh early hours of summer mornings there is an exhilaration even in the atmosphere, when one starts forth for a journey through this country wild and wonderful. The inspiration of a new strange world sheds its romantic glamour over all the shifting landscapes and the chill sweet breath of the mountain air, but adds its bracing keeness to enhance the charm. One is reminded of some fanciful distorted dream of mountain life in the experience of this early journey, so rare and striking are the features which nature has assumed to charm us here.

The road leading out of Truckee to Sierra Valley, after ascending a low hill just outside the town, stretches away for miles across a long level plateau through the hills. At this fresh hour the sky droops low above us in dainty tints of cloudy pearl, and all the far-off line of hills that fringe the dim horizon fade to pale encircling walls of smoke, while the slim-pointed crests of endless pine groves melt away in seas of pearl-like summery haze.

Much of the timber in the vicinity of Truckee has been cut, and large quantities of it destroyed in the early years, so that the heavy pine forests are somewhat thinned, and fallen trees, charred and decaying, and jagged stumps, add a new feature to the picturesque desolation of the frontier scene.

After a few miles the country becomes more bare and rocky, breaking into rolling hills, where the celebrated Daily dairy is situated near the margin of a stream. This is considered the coldest spot in California during the winter season, vast quantities of ice forming on the stream about half a mile above, where it is cut and prepared for shipment to all parts of the coast.

A few miles beyond Daily's the country begins to grow more rugged and the pine forests heavier and more majestic. The very secret beauty of the woodland, the wild, sweet mystery of the mountains, there unfolds and inspires a troop of dreamy thoughts as delightful and as fragrant as the odors shaken from the whispering pine-crests. Vain, almost, would be the effort to imagine such a world of pine! Far as the eye can see stretch the vast forests—rising tall and beautiful all around us in the nearer groves, and showing, in bright surprising pictures through the openings, miles on miles of shivering trees that cover the hights with straight, slim stems of black, against the depthless seas of green, and fringe the far horizon with myriads of spear-like points. In one spot a wayside spring wells over its rocky basin and flows across the road. Its waters are as pure and cold as melted snow-flakes—coming as they do out of the very deepest, stoniest heart of riven mountains. The water of these high altitudes is justly celebrated for its purity and delightful coolness, yet one can scarcely appreciate its value till he drinks from some such roadside spring where the water comes bubbling and sparkling from the gravelly crevices, clear and cold and beautiful as earliest dew-drops. It is the ideal draught, the magic elixir, that flows through pine-tree hearts and distills in liquid music from the boughs the very wine of Nature's purest gifts.

It is in this depth of woodland that much of the lumbering for the Truckee market is carried on. Several sawmills are kept busy through the summer season, some of them being only the small portable mills which remain in one spot just long enough to exhaust the timber best suited to their capacity and then remove to another locality. However, these portable mills do comparatively little work, and one large milling company have maintained at large expense a log float to transport logs from higher sections to their mill. It runs in sight of the stage-road for long distances, a high trestled flume, filled to the brim with swift and irresistible floods. The logs are only floated down to the mill between the hours of 11 and 2, owing to the scarcity of water, but even then large quantities of timber are thus transported from one point to another.

After a time the deepest heart of the pine country is passed, and no more the heavy timber crowding close to to the roadside obscures the view of distant mountain chains and the nearer rugged hills. About 15 miles from Truckee a pleasant wayside house is reached—pleasant even in its rudeness—where tourists to Independence lake leave the Sierra valley stage. The lake is only three miles distant, a lovely sheet of crystal resting placidly in a deep hollow of the piney hills, but hidden from the view by the dense intervening groves. At this small half-way station near Independence lake the stages in winter stop for the midday meal, while in summer it is reached before 11 o'clock and only a short stop is made to water the horses and exchange the mail. After leaving Daily's dairy this is the first house built beside the road which winds its lonely path through that wild density of woodland left behind.

A few miles farther on a large sawmill is passed, with its huge piles of new clean lumber around it, sweet still with the piney breath of forests in them. A short stop to exchange the mail, and the stage is off again on the dusty road that winds a rugged way down the descending slopes; through openings in wayside thickets, framed by interlacing sprays thick hung with scarlet choke-berries, long chains of piney mountain ranges, blue and draped in pearly smoke, stretch away into the west. But soon these roadside brambles grow more dense as we descend into the flats, and the smooth road leads through deep, high walls that flaunt aloft long, dusty, whip-like branches spangled bright with glassy sun-kissed berries. Still farther on, a mile or so, and the scattering homes of Sierra valley rise to view, growing thicker and more pretentious until the stage rumbles up beneath the locusts that guard the hotel door, and broad noon reigns shadowless over the valley.

MAY BLOSSOM DAVIS.

Artesian Wells in California.

[By C. E. GRUNSKY, C. E.]

(Continued from last issue.)

Thus the two waters are prevented from commingling. The inner-tube supplies water for domestic use; the other fills a reservoir, from which an overflow pipe, 11 inches in diameter, leads into a well, bored down to a layer of gravel at some depth below the surface, and into this gravel the waste water is discharged and is greedily absorbed. The improvement of the well is a complete success.

It thus becomes evident that it is of great importance to prevent the opening of channels by way of leaks in the well-casing or along the outside of the casing from a pervious stratum, bearing artesian water, to one that is dry or carries its water under less pressure than that required to raise it to the surface of the ground.

The artesian-well casing in ordinary use is sheet-iron pipe, in sections two feet long. The casing is made double, consisting of inside and outside joints, which overlap each other one-half of their length. The ends of the successive inside and outside joints are supposed to fit snugly together. Horizontal seams of simple contact thus succeed each other at intervals of one foot along the casing, those of the inside member of the casing alternating with those of the outside member. All longitudinal seams are single-riveted, rivets being set about three inches apart. Perfect contact between inside and outside casing cannot be secured on account of the rivet-heads.

Such casing is not water-tight, and can only be recommended for use when only impervious material is encountered from the surface down to the artesian water. When under other circumstances such casing is used, the supply of artesian water must be ample to supply the loss due the leakage before it will cause the water to rise above the surface of the ground.

By removing the surface soil to a depth of about four feet around the casing of an artesian well in the Kern river delta and inserting a water-tight wooden box, there was as much leakage water caught in this box as rose to the surface within the well-casing.

The artesian well at Hill's Ferry, from which a water-supply for the town is secured, discharges its water at a hight of about eight feet above the surface of the ground. The stand-pipe in which the water rises is of galvanized iron, and is water-tight. The well-casing is of the kind in ordinary use. Leakage from it is so great that the water entering the surface-soil above a layer of firm clay, generally designated as "hardpan," rises to the surface and keeps two small ponds, now used as fish-tanks, well supplied with fresh water.

Other instances of loss of water through well-casing could be cited. It occurs wherever the casing above described is used, and may increase or decrease by reason of chemical action of the ingredients in the water on the iron casing. A peculiar example of the loss of water from a well-casing is the following:

At the old waterworks on Hunter street in Stockton, a well was bored in 1879. It is 1100 feet deep, and at the time it was completed had a good flow. Its flow, however, decreased gradually, and in 1884, when the well had ceased to discharge water, a well-borer was called upon to clean it out, it being presumed that sand had accumulated in it, to the obstruction of the upward flow of water. No sand was found in the well. It had retained its full depth. It was noted, however, that the water-surface in the well-casing was about five feet below the surface of the ground while the waterworks pumps were in action, drawing water from three wells within 12 feet of the artesian well, ranging in depth from 146 to 200 feet, and that its water-surface, as soon as there was an intermission in the pumping, rose to within one foot of the surface. This phenomenon explained at once the cause of the failure of the well. Its water all passed through the casing into the water-bearing strata from which the pumps were drawing water.

Two hundred feet of the casing was pulled up, and seams that had been greatly enlarged were discovered. In one joint there was a notch of one and one-half inches. When replaced by better casing the original flow of the well was restored.

Screw-joint casing, though much more expensive, is gradually superseding the double casing above described.

Sometimes the water-cap where it is perforated by a well is a very thin stratum, or lacks the firmness required to close in tightly against the well-casing. Under such circumstances, a part of or perhaps the entire flow of an artesian stratum may be lost, by an upward discharge of water outside of the well-casing into dry sands above the water-cap. When the depth of 800 feet was reached in a well bored for D. Rhoads, about two miles northwest of Lemoore, in the Kings River Delta, in 1885, a good flow of water was struck, which rose from beneath a water-cap of slushy, sandy clay only about six feet in thickness. Not to exceed 50 feet of firm clay, in a large number of layers, had been encountered in making this boring. The well discharged large quantities of sand with its water, and after a short time ceased to flow. There was no doubt that the fine sand at the bottom of the well gradually lost the power of sustaining the layer of soft clay above it, and, when the clay broke down and away from the well-casing, the artesian water found a capacious recipient in the layers of sand above it. By reason of the opening of this vent, its pressure was so reduced at that point that it could no longer rise to the surface of the ground. This well was subsequently deepened to 960 feet, but no other artesian flow was struck. A loss of water from artesian wells into pervious strata, which do not themselves bear artesian water, is not always the result of accident or defective casing, it is sometimes due to the ignorance or carelessness of the well-borers.

I know of an artesian well of small flow which had been only 335 feet in depth, and which was deepened in 1882 to 635 feet, in order to increase its flow. Eighteen strata of sand were bored through. They were separated from each other by firm clays. Some of the sand yielded artesian water in greater or less quantities, others, though wet, held their water at less pressure than that required to cause it to rise to the surface. When the full depth required was reached, the well-casing was perforated at each of the eighteen strata of sand, and the well-borer, as well as the well-owner, was surprised that the well did not yield as much water as had been indicated by the several separate artesian strata. It is to be hoped that by this time the well-borer, at least, has learned that water always prefers to flow in the direction of least resistance, and if a channel is opened from a well into any other body of water in which hydrostatic pressure is less than that of a column of water to the desired point of outflow, that its water will surely, in part at least, flow in that direction.

It frequently happens that the casing is carried entirely through the stratum from which a supply of water is to be taken, and that it ends at some point in the water-bed. To admit water, the casing must be perforated. Perforations generally consist of slits cut into the tubing after it is in place. If these be distributed from top to bottom of the water-bearing stratum, then, because water will naturally enter through all under equal pressure, the upward flow of water in the casing will be more rapid above the upper perforations than above the lowest one. Sand is likely to be brought in through the perforations, and it may be that the current caused by the lowest perforation is not sufficient to carry the sand upward. Some sand, therefore, sinks to the bottom of the well. It may accumulate in quantity sufficient to choke off the lowest perforation, and in time the next one above it, and so on, until possibly a copious flow is entirely sacrificed.

In answer to the question, which is often asked, "Shall all the strata bearing artesian water be tapped, or shall the weaker flows be excluded?" I have to say that by tapping any stratum from which water rises above the proposed hight of water-delivery, with the friction-head for velocity from the strong flow added, the discharge of the well is increased; but it is not policy to tap any weak flow if one or more strong ones have been struck. A slight decrease of the pressure in the stratum which yields only a small amount of water (and such decrease must always be expected) may decrease its hydrostatic pressure to less than that required to produce velocity to overcome friction and to raise it to the point of outflow; and as soon as this occurs, a flow of water from the well into the stratum of weak flow will result, and a loss of water occurs that it will be extremely difficult to detect or to check. If water is admitted into a well from a number of strata and the lowest flow is a weak one, then it frequently happens that the sand brought in through perforations in the upper strata sinks and chokes off the lower flow. The water from the next artesian stratum may be lost in the same way, and so on, to the great injury of the usefulness of the well.

When once the borings in any locality have determined, approximately at least, the relative amount of flow from different depths, it is always wise to adjust diameters of tubing to amount of water expected; for no sand deposits will ever occur in the tubing of any well from the bottom of which water rises upward with a velocity of more than two feet per second.

From the practical application of what I have here set forth, it follows that the amount of water that can be secured from any stratum which yields artesian water is limited, and that there must be an interdependence of all wells which draw upon the same source for their supply.

In some localities where this interdependence has been established by practical experience, as at San Bernardino and in the county of Santa Clara, it is required by law that wells be capped when water is not in actual use. Every artesian well when opened reduces the hydrostatic pressure of the water in its immediate vicinity at once, and a consequent reduction of pressure gradually extends to the extreme upper edge of the subterranean reservoir; but with distance from the well, the effect decreases.

So slowly does water sometimes move through its subterranean passages, clogged as they are by sands and gravels under great pressure, that it may be years before the effect of the reduction has ceased to extend. It is not a frequent occurrence, then, to note an immediate effect upon the flow of any well when another is sunk to the same stratum. Changes in the amount of flow due to such cause usually extend over such long periods of time that they are not readily detected.

I measured the flow of about 100 artesian wells in Tulare county in 1884. Of these, 20 had been examined by me in 1882. Two of the deep borings, which were discharging water above the surface of the ground in 1882, had ceased to flow altogether in 1884. Both of these were near the eastern or upper edge of the artesian-well belt of San Joaquin valley. One of these had been sunk in 1878 and maintained a good flow until 1882, after which time—while the number of wells in the vicinity was being increased from 20 to about 100—it gradually failed, and ceased to flow entirely in the summer of 1884. The other was sunk in 1882, and its flow was then about 18,000 gallons per 24 hours.

The flow of 12 other of the 20 wells that were thus visited twice had in each case decreased. The aggregate flow of the 12 wells in 1882 was 272 miners' inches; two years later it was only 114 miners' inches, showing a loss of 56 per cent in two years. Yet the decrease had been so slow that but few of the well-owners would admit that a material change had occurred.

It cannot be hoped to establish the interdependence of wells in artesian belts of such great extent as those of San Joaquin valley by means of experiments made in capping or uncapping wells. The great time required in producing an effect must needs make it impossible to establish with certainty a connection between cause and effect.

This effect is necessarily small even when two wells are close together and are known to draw water from the same source. It is precisely the same as when two relatively small hydrants are connected by means of two separate pipes with a common large water-main. The closing of one produces no perceptible effect on the other, because the hydrostatic pressure in the main is barely affected by opening or closing so small a vent. Yet, as every one knows, the many taps and hydrants distributed throughout a city provide escape-ways for the entire water-supply in the city main, and all combined are limited in their discharge to the amount which from some source is supplied to the water-main.

Whenever the flow of an artesian well is checked, the hydrostatic pressure in the stratum from which it draws water is raised, and the longer the well remains closed, the nearer will the same approach to that pressure which existed before the well was sunk. To this fact is due the phenomenon of the increased flow whenever a well is uncapped. In some cases such increased flow continues for hours, in others for days or weeks, and there is no doubt that, after first being opened, an artesian well in the central or lower part of San Joaquin valley must flow for months before it settles to a constant or normal flow.

The long period required for such adjustment, which is in conflict with hydrostatic laws governing the flow of water in closed conduits, is due to the influence of the friction to which water is subjected in its flow through pervious formations toward the point of discharge.

Stratification is not so well expressed in Sacramento valley as in the San Joaquin valley. Clay beds of great extent have yet to be found. Without one to form a water-cap, no great development of artesian water need be looked for.

Beyond a doubt there are many points in Sacramento valley where artesian water exists, but unless some extensive deposit of clay be discovered at greater depth than yet attained at any point near the valley's trough, the artesian districts will be of small extent and their yield will be limited.

If clay beds analogous to those which dip westward in San Joaquin valley from the base of the Sierra Nevada foothills had been formed on some of the gravel deposits of Stony, Cache and Putah creeks to cap the water sinking from these streams, what volumes of flow from subterranean sources might not be expected on the west side of the noble Sacramento! But, far from yielding a satisfactory supply of artesian water, this great west-side plain is often almost barren of even soil water.

Within the last few years an experimental boring for artesian water was made near Red Bluff. According to the latest accounts which reached me, at the time the boring was in progress, there seemed to be little hope of success. The probability of failure would have been predicted by any one familiar with the conditions required to produce an artesian flow, even though no other facts had been known except that Red Bluff lies near the head of the valley.

The well-known fact that artesian water near the central part of our great valley rarely develops a pressure greater than 20 feet, guides the intelligent engineer in his advice when he cautions the inquiring that, though possible, it is not probable that artesian water will be struck on our plains near the base of the foothills.

The boring at Arcade 2160 feet in depth at a point about eight miles northeast of Sacramento, which was made at a cost of about $30,000, is invaluable in demonstrating the folly of boring high up on the plain for artesian water before the experiment has been tried nearer to the valley's trough. Here in fair Sacramento the experiments thus far made have been limited to depths of less than 600 feet, and they indicate that there is but little hope of finding a continuous bed of clay, even at greater depths, and without such a bed of clay there will be no spontaneously flowing water.

At a point about four miles north of Chico a well was sunk to a depth of 686 feet without striking artesian water.

The well at the Woolen-mills at Marysville is 306 feet deep; another in Sutter county, about 16 miles southwest of Marysville, is 360 feet in depth. Neither of these flows. Many water-bearing strata were found in the latter, but the water not only did not flow, but it is strongly impregnated with mineral matter.

At Norman, in Colusa county, where the surface of the ground is only about 20 feet higher than the lowest point of the valley trough, artesian water, a very weak flow, was found at a depth of about 1000 feet.

The water-works well in Woodland is 600 feet in depth. The only good water-bearing stratum there found is at a depth of 155 feet, and from this alone is water drawn by the pump.

The La Rue well, about three miles west of Davisville, though 200 feet in depth, supplies very little water, which rises in it to a point about 17 feet beneath the surface of the ground.

About four miles east of Woodland are two periodically flowing wells. Their discharge, which is very small, continues for about nine months of each year, then ceases. One of these is 180 feet in depth; the other 204 feet.

At Isleton, at the California Beet-sugar Manufactory, water of a well 106 feet in depth rises to within four feet of the ground's surface.

As early as 1858 the celebrated Court-house well at Stockton was completed. From notes by Charles D. Gibbes, it appears that a stratum of clay, sand and gravel at a depth of 92 feet contains traces of gold. At 340 feet, in a 14-feet-thick layer of sand, a redwood log was bored through. At 560 feet, water that would flow spontaneously, and which would rise five feet above the surface, was found; a better flow was struck at 913 feet; and the best, with which the boring stopped, was found at just 1000 feet, beneath 11 feet of firm clay. In a stand-pipe, water rose 11 feet above the surface of the ground, and the gas which collected in the pipe above the water would burn with a flame about 18 inches over the top of the pipe.

The discovery had thus, very early, been made of a subterranean source of gas, but, until recently, no benefits have resulted to Stockton from this discovery.

(To be Continued.)

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

UNION AND PAUGH MINES.—*Dispatch*, Nov. 9: A large body of ore was struck in the old Paugh quartz mine at Irishtown, at a distance of 375 feet from the mouth of the main tunnel, which came in contact with the old workings, which was done some 18 or 20 years ago in the shape of a tunnel which was run its entire length in quartz along the vein or lode. The present company have run some 50 or 60 feet along the lode and crosscutted, with the result of finding it from 15 to 18 feet in good paying ore and carrying a large percentage of sulphurets. The rock is estimated to pay milling process from $8 to $10 per ton, not including the sulphurets, some of which are very rich, especially the galena, of which there is a large percentage. The work on the mines is progressing nicely, the company sparing no expense both to prospect and also to put the mines on a paying basis when properly opened. On first striking the old works of the Paugh mine, 2000 inches of water burst into the main tunnel and run steadily, the average discharge of water being from 3½ to 4 inches from the Paugh mine. As there is no connection with the Union as yet it cannot be told what the discharge of water is. The mines have a very fine location, the formation being slate and greenstone.

THE MCKENZIE MINE, which is located one-half mile southeast of the Union and Paugh mines, is running in full blast, employing quite a number of men and keeping the mill running steadily on rich ore.

SUTTER CREEK.—Cor. Amador *Ledger*, Nov. 6: There is renewed activity noticeable about the mines. Mr. Stewart has got the ore bin at the Lincoln almost full of rock, and the mill will be started in a day or two. The Wildman is moving along in its usual groove of prosperity, improving gradually right along. Their winter supplies are nearly all in. The Sutter Creek mine, which is under lease, is running in good shape, and the lessees expect to make it pay well this winter.

Calaveras.

RICH STRIKE.—Angels *Echo*, Nov. 7: An immensely rich strike was made in the Cloud quartz mine, situated near Albany Flat, some two miles south of Angels. This mine was located about four years ago, but was not prospected to any extent until recently. The shaft in which the bonanza was uncovered is about 18 feet deep and the vein or ore body is over four feet in width. Average specimens of the ore have been assayed, none of which yielded less than $103.35. It is the intention of the owner, Mr. Otto Dolling, to ship a few tons of ore to the smelting works at San Francisco when big results are expected. The ore contains at least 60 per cent of sulphurets. The specimens shown us are indeed exceedingly rich, and in our judgment, would, by the ordinary process of milling, yield from $400 to $500 per ton.

PEET.—We understand that the Peet mine is making a splendid showing. Mr. Peet is working it on an economical scale, and will, we think, in the end realize a fortune from it. If pluck, energy and push goes for anything, Mr. Peet is entitled to success.

GOLD CLIFF.—The mill at the Gold Cliff mine has been thoroughly renovated and twenty stamps were put in motion last Monday. This mine has been lying idle for several years, owing mostly to bad management. The ore is of a low grade, but the facilities for extracting as well as milling it are unsurpassed.

Inyo.

A RICH REGION.—*Index*, Nov. 6: Messrs. Hannigan & Gallagher, who have been prospecting in Panamint district, are in town. They say the country is rich in gold, silver and other minerals, and the advent of the proposed railroad will open up the most extensive and most promising mineral belt on the Pacific Slope. Speedy and cheap transportation is all that is needed to develop and make it a large producer of precious metals.

El Dorado.

CEMENT GRAVEL MINES.—Placerville *Observer*, Nov. 12: The general mining outlook of our county seems to be decidedly encouraging. The Sierra Water and Improvement Co. are making extensive developments on their mining property in several places. From the 700-foot level at the Pacific shaft they have about completed a crosscut drift to strike the Rose ledge, several hundred feet west, where a large body of ore of good grade is known to exist. They keep their 20-stamp mill running from the works on the Pacific ledge. At the Linden mine they have a large body of cement gravel of excellent grade, and keep their 10-stamp mill going day and night. At the Rogers mine they are now running on a bed of good cement gravel, two and a half feet thick, from which their 10-stamp mill is kept constantly running. Supt. Coughlin considers the mine in a more promising condition now than at any time since he has had charge of it. The Chili Ravine cement gravel mine is showing better than it has for many years. They have now a fine bench of gravel in the tunnel from the Chili ravine side, from which they keep the 10-stamp mill running regularly. At the Bassett cement gravel mine at Weaver hill a new tunnel has been run in to strike a lower vein channel, the gravel in which is showing exceedingly well, yielding as high as $6 to the pan. The channel from which the rich gravel is now being taken out at the Cedar Ravine mine, evidently runs through the Bassett claim, and it is possible that Mr. Stewart, (the owner) may be on an outer vein of this channel. Work at the old Granite mine at Smith's Flat is being prosecuted with vigor and fair results are being obtained. The gravel being extracted is too hard for ordinary sluice washing and in order to work it thoroughly, some kind of reduction works will be required. The owner is making encouraging developments at the Gentle Annie mine, at Poverty Point. Openings already made show a continuous vein of soft material, containing gold which prospects to pay from $4 to $6 per ton, for a distance of 1200 feet along the vein, showing a width of about 20 feet, and from the level of a point where a mill can be erected, will give backs in some places to the extent of 120 feet, and the mine worked as an open cut to that level, as the material pays from top to bottom. It is reasonably estimated that there are over one hundred thousand tons of this ore in sight, above the level of the proposed mill-site, which can be worked without sinking on the vein. This mine can be worked so very cheap that it must become of great value, and the large amount of available ore will justify the construction of large reduction works. The sulphurets contained in the ore are very fine and assays prove them to be valuable.

Nevada

REOPENING AN OLD MINE.—*Tidings*, Nov. 9: Superintendent Stoddard of the Hartery mine informs us that there were perhaps 100 miners at his office when bids for contracts were opened Saturday. Morris Lynch & Co. will drive the No. 1 level, north, 100 feet, for $3.72 a foot. Samuel Curnow & Co. will run the No. 2 level, north, 100 feet, for $3.42 a foot. Joseph Rodda & Co. will receive $3 a foot for driving No. 2 level, south, 100 feet. The three contracts will give employment to 12 men. The highest price bid was $8.50 a foot. In addition to the 12 contractors, the mine has 27 men at work on day's pay. Twenty-five additional tributers will go on within a week. In the meantime the mine will be developed, and 50 men will be subtracted from the idle element. It pays to reopen old mines.

KAOLIN.—*Tidings*, Nov. 7: A vase standing six inches in hight, supported by two columns and the whole neatly embellished with artistically wrought designs, was laid on our table at noon by Mr. D. D. Thrasher of Limekiln. The vase was carved out of a block of kaolin by the donor. Mr. Thrasher stated that the kaolin of which the vase is composed was taken from a large bed of the material discovered on the Golden Gate mining claim, situated 2½ miles from Limekiln and owned by Messrs. Levi Sanford, Alex. Ridinger and himself. The kaolin was first struck at a point only five feet from surface and was mixed with a "gritty matter." A shaft was put down 30 feet, and the pure kaolin discovered. The bedrock is supposed to be porphyry. It is not known how extensive is the find, but a shaft sunk 100 feet distant also reveals the bed. Messrs. Thrasher & Co. have a quartz ledge on the Golden Gate claim that is from 6 to 8 feet in width, ore from which has yielded at the rate of $6 and $8 per ton by mill process.

BRIEFS.—There are 22 men at work on tribute at the Hartery and more to go on. About one-half of the Idaho miners have been laid off pending the repairs in the mill. It is likely that the remainder of the force will also enjoy a brief enforced vacation. The men may be out a fortnight. The Peabody machinery has not yet been started up. After repairing the wheel, the foundation of the hoisting machinery was examined and found to have rotted badly. New timbers are being put in, and it is anticipated that operations will be resumed Monday. Messrs. Geurne & Gamble, the Santa Rosa gentlemen who have a bond on the Good Hope mine at Cabbage Patch, have returned from a visit to the property and express themselves as well satisfied with the outlook.

A RICH RIVER CLAIM.—*Transcript*, Nov. 7: J. Wood, who has been working the Hathaway river claim on the South Yuba, a short distance east of Washington, brought down with him Tuesday a magnificent collection of nuggets ranging in value from $3 to $40 apiece. The mine is an old one and has produced much wealth in years gone by; but Mr. Wood found unworked spots that paid on a '49 basis. It is claimed that one pan of dirt from a crevice yielded over $600. There is yet in the hills and vales of Nevada county five times as much gold as has ever been taken out.

COMING TO THE FRONT.—*Tidings*, Nov. 13: A clean-up from 57 tons of ore from the W. Y. O. D. mine has just been completed at the company's mill, and the yield is $18.70 per ton. Ore of this grade is highly profitable, as the cost of extraction is minimized by the size of the ledge and the comparative softness of the ground even at the depth of 500 feet. The drifts at this level are being driven with profit, and the vein in the shaft, which is being sunk for the 600 level, affords the most encouraging indications.

GOLD POINT.—Grass Valley *Union*, Nov. 9: The new dry-house and blacksmith-shop at the Gold Point, to take the place of the one destroyed by fire some time ago, has been completed. Underground work has also been resumed. The vein in the drifts and stopes is very strong and is of good milling quality, as proven by several large crushings of the ore which have been made. The company have in contemplation important improvements at the mine.

GOOD ORE AT THE PITTSBURG.—*Tidings*, Nov. 9: There are now 30 men at work at the Pittsburg, on day's pay and tribute. In the three weeks in which Supt. Stocks has been in charge the shaft has been sunk 25 feet. Tests of ore, made Friday, indicate that the quartz will yield $20 a ton. Mr. Stocks is hopeful of developing the Pittsburg into a profitable property.

Placer.

TWO OF OPHIR'S MINES.—Placer *Herald*, Nov. 9: Work is progressing satisfactorily at the Eclipse mine. The main slope is down 100 feet and is timbered for that distance. It is 4x8 feet in the clear and is timbered with sawed lumber. The hoisting works will be finished the latter part of next week. The hoisting will be done by water-power. The water is taken from a branch of the Bear River ditch, and for the last 1000 feet will be run through a pipe upon a four-foot Pelton wheel. The mill will be 46x100 feet. The battery will at first contain 10 stamps, but will be increased to 20. The stamps will also be run by water, at a pressure of 165 feet. The ledge has been prospected by shafts for 600 feet of its length. These prospect shafts are from 40 to 150 feet in depth, and the rock taken from them has paid from $18 to $125 per ton in free gold. The ledge occupies all the space from the incline to the eastern shaft. There are two other ledges running diagonally in an easterly direction to the main ledge, which runs in a northwesterly and southeasterly course. These three ledges unite below the surface. The ledge is of "ribbon" formation and has an inclination of 35 degrees. The company is well satisfied with the prospects and will make a thorough test of the ledge. Twenty-five men are employed. The mine is in charge of J. B. Patterson.

THE HATHAWAY.—A visit to this mine shows that it is paying well. S. D. Valentine, one of the owners, and G. T. Taylor, the superintendent, both wear a smiling look when questioned, and a look at the ore reveals the cause of their satisfaction. Forty men are now at work there, and more are being put on as fast as room can be made for them. The principal part of the work is now being done in the lower level (250 feet down). A few men are at work at the 50-foot level. The lower level pays the better, and there is every indication that the rock will become richer as they go down. The rock has the same appearance as in our last report. Twenty stamps are run day and night. The output is a carload a month of the slick or slime from the sulphuretted ore. The output will be increased when the concentrators are put in. The company intend to put in four Woodbury concentrators. The old-fashioned blankets have been used since the mill has been running, and have, from tests made, saved all the gold but 35 cents per ton. This is close working, but the concentrators are cheaper to work and will handle more material than the blankets. By means of the concentrators two carloads of slime will be caught each month. This slime is shipped to the smelting works in Denver. It averages about $150 per ton. Some of it has paid $729 per ton in gold and silver. The cost of shipping it that distance is $30 per ton. The rock also yields good returns in free gold.

Plumas.

THE LITTLE JAMISON.—*National*, Nov. 2: At a meeting of the stockholders this company accepted a proposition of compromise, made by the Daly interest. This stops all litigation and combines the two titles. The mine is one of the very best prospects in the State of California, the ledge being very wide and extremely rich. A 1600-foot tunnel will be started soon, which taps the ledge at a depth of 100 feet. As soon as the ledge is cut, a mill will be placed upon the premises, and then we may expect to see a second Eureka.

Shasta.

NOTES.—Shasta *Democrat*, Nov. 6: The Little Nellie mine in the Iron Mountain district has been sold to Mr. Hart of the Texas and Georgia. The Riley & Bliss mine, we are informed, has again started up under the superintendency of a Mr. Roberts, an expert miner. Shasta county is attracting considerable attention abroad to her mines. Experts are arriving every day, and prospecting is extensively carried on. The Calumet mine is receiving a large quantity of machinery for its new plant. One of the pieces is an immense pulverizing barrel of 20 tons capacity.

IGO.—Cor. Shasta *Courier*, Nov. 9: At the Crystal they are drifting from the shaft. About a carload of high-grade ore is on the dump, and more coming out every day. At the Chicago they are timbering the old shaft near the surface before sinking deeper. The owners of the North extension now talk of opening their claim in the spring. The shaft at the Red Warrior is being sunk deeper, and some good ore found. A shaft is going down on the Gem—the gold ledge near Muletown—on the Igo side of Clear creek. The gold is in the sulphurets, which are rich enough to satisfy the owners. The Muletown ledges are turning out well, Doc Dunham's particularly so. J. P. Wright has bonded his sulphuret ledge to the Chicago folks; and it is being followed into the hill with promising results. Mine claimants on Section 10 are being put to some trouble on account of would-be purchasers of the same as agricultural land. Excepting a few acres in the southwest quarter, it would seem to be a stretch of imagination to call it agricultural—"barren and worthless" would hit the mark so far as anything but mining is concerned. Shirland's arastra is running on a large deposit of pay granite filled with small rich ocher seams. The general average is quite satisfactory. E. L. Ballou's arastra is running on Hope ore. Considerable prospecting is being done in various parts of the district.

FROM FRENCH GULCH. — Several of the quartz mines were compelled to cease operations during the storm, but have resumed work again. The new America mine on east fork of Clear creek has been bonded to San Francisco parties for $15,000.

Sierra.

GOLD VALLEY.—*Mountain Messenger*, Nov. 9: The Garibaldi mine is running its 5-stamp mill at Gold Valley, and the owners appear to be well satisfied with their prospects. This mill is on the East Fork nearly two miles from the mine. The ore is transported from the mine to the mill on a wire rope of two spans, each span of which is about one mile long without any support. The ore is dropped at the center station and picked up and carried on again. We believe this is the only tramway of the kind in the county. Mr. Giles H. Gray, the owner of the Empire mine at Gold Valley, informs us that several men will be kept at work this winter running ahead to develop the ledge. There is a great deal of good ore now in sight in the mine, but Mr. Gray is anxious to place its prospects beyond question before he builds a mill, which will be next summer, if things continue to look as well then as now. This mine was located and worked away back in the '50s, but the rock was considered rebellious. The ore is not so considered now, because its nature is better understood.

WILLOUGHBY.—The owners of the Willoughby mine, near Gold Lake, are industriously at work putting up a mill, and if the weather holds good for a few weeks, will have it running. The company is sanguine of a good mine and is putting up its buildings in the most substantial manner. Three tunnels have been run on the ledge, the lowest 500 feet long, and in good ore. Those competent to judge say the property is very promising.

CLEAN GOLD.—In our last issue we spoke of Grant and Apple taking out 100 pounds of quartz, mostly gold. We wish to amend by saying that they took out 100 pounds of gold dust cleaned as clean as gold is usually cleaned. It does not set us back any to make a correction of this kind. The boys deserve their good luck.

JERSEY.—Sierra *Tribune*, Nov. 8: Work has been commenced at the Jersey mine, situated a short distance northwest of the Young America. They have a well-defined ledge, showing free gold in considerable of the rock. It is the intention of the company to put up a small mill at the mine in the spring.

San Bernardino.

THE BLACK HAWK MINES.—*Courier*, Nov. 9: From the report made by Mr. Rising we take this concerning one of the best mining districts in the county, the Black Hawk: This district is situated about 35 miles from the California Southern railroad, with Hesperia and Victor for its stations. It was found some two years ago, after the important discoveries made by J. B. Cook and O. G. Leach, two intelligent prospectors well known in this county. J. B. Cook is the recorder for the district. The Black Hawk mines (23 in number) with water rights, have been formed into one company called the Black Hawk Gold Co. of Los Angeles. This company's mines are all in one body, an immense canyon having cut the ledge for some two miles in length, exposing an ore body past description. There are exposed on this ledge some six ore bodies, ranging from 400 to 1000 feet in length and varying from 30 to 100 feet in width, the whole mass carrying free gold and assaying from $4 to $500 per ton. Some experts value the whole body at from $10 to $12 per ton without assorting. There are two tunnels of 100 feet each run in ore, and numerous cuts, drifts and openings all along the ledge at various points, all showing free-milling gold ore.

San Diego.

JULIAN DISTRICT.—*San Diegan*, Nov. 7: Developments at the Helvetia mine are reported to be very satisfactory. Messrs. Murray & Smith are in possession. They have run a tunnel 200 feet in length to a connection with the old works, finding everything just as stated by old-time miners, and have at the connection of the tunnel with the old works a fine body of ore in sight, but it will require some timbering before it can be stoped out, as the ground in the old works is somewhat treacherous; the timber will soon be on the ground for the work. They have just completed a good wagon-road to the mine for the purpose of supplying timbers and wood, and are now down nearly 100 feet on a new shaft, and have followed the ledge all the way from the surface; the ledge is getting larger and larger as they go down; work is being pushed day and night in this shaft, and it is the intention to sink to a depth of 300 feet before doing any stoping or drifting. They now have about 50 tons of good-milling ore on the dump. Hoisting machinery is being purchased, and a crew of men is now at work leveling off the ground and preparing for the same. Another force of men is grading off the hillside for a mill, which it is the intention of the owners to erect at once; a portion of it has already been received, and the balance will arrive shortly.

Siskiyou.

GRAVEL AND QUARTZ.—Yreka *Journal*, Nov, 13: Jillson & Co. at Henley are now able to get three or four hours' supply of water each day to run their giants under 300-foot pressure. With more rain and snow they will be able to accumulate sufficient during each 24 hours to run longer every day. They have very rich ground in the famous blue gravel lead on the Klamath river at the mouth of Printer gulch, and with a good supply of water will be able to secure a great amount of the glittering ore. The manager of the Warren quartz-mill on Yreka Flats expects to start up the mill again in a short time, or when the donkey engine is brought back from the new sawmill at Klamath City, where it has been used for running a saw in making pulley blocks. McCook's quartz-mill at Forks of Humbug is to be started up again in a few days, to be run by a steam engine purchased from W. D. Shelly of Scott valley. Hutchins & Clark of Humbug creek have taken out about ten tons of quartz from a new ledge they have lately discovered, and will take it to mill this week to be tested. Mr. J. F. Boyle has shipped his new quartz-mill from San Francisco, comprising a carload or more of machinery which will be hauled from Yreka to Humbug this week. It is of a different style from any used in this county, and of the class used in Arizona with the greatest success.

Trinity.

STRUCK IT GOOD.—*Journal*, Nov. 9: The Ridgeway Mining Co. of New River have struck the ledge they have been running for, and found it 6 to 10 feet wide and sufficiently rich to pay handsomely. The tunnel is over 700 feet long and taps the ledge at a depth of 200 feet. This is the most encouraging of anything that has come to our notice since the camp first started up. This proves that the ledges go down and retain their paying quality. We congratulate Messrs. Dean and Toms on their success and brilliant prospect for future operations.

CANYON CREEK QUARTZ.—W. J. Grigsby was in town this week, and informs us that his prospects on Canyon creek are looking first-rate. With Ed Shock he has eight locations, all of which carry free gold and look well for the amount of work done. They have put up an arastra and will be crushing ore in about a week. The arastra will crush ore from the Buck Ranch mine, on which is a ledge 14 feet wide that prospects well—the quartz is good milling ore. They will begin right away on a 100-foot tunnel, to tap the ledge at a depth of 80 feet. They will develop the mine this winter and crush the ore taken out, so that by next spring they will have made a fair test of the property. Mr. Grigsby is very sanguine in regard to the outcome of the mines on Canyon creek, and says that there are undoubtedly some very rich ones there. In prospecting for ledges he found places where he could get 25 cents to the pan. The indications point to a first-class camp on Canyon creek.

Tuolumne.

SUMMERVILLE.—Cor. *Independent*, Nov. 9: The Mother Lode mine, formerly New Albany, still continues to make valuable developments under the efficient management of Mr. Whorf, the gentleman in charge. Water is expected soon at the Consolidated Eureka, when everything will be started again in full blast. There has been considerable and very annoying delay in its coming, but still it is better late than never. The town has been very quiet of late, and a return to its accustomed liveliness will be very welcome.

NEVADA.

Washoe District.

UTAH.—Virginia *Chronicle*, Nov. 9: On the 600 level the southeast drift is advanced 222 feet from the shaft station. Formation hard porphyry. Have repaired 110 feet of the main south drift.

OCCIDENTAL CON.—During the week extracted and milled 300 tons of ore showing an average assay value of $21.04 per ton.

NORTH OCCIDENTAL.—Extracting ore from the 300 and 400 levels. On the 300 level a south drift is advanced six feet from west crosscut No. 2 and is in ore of a fair quality.

CON. CALIFORNIA AND VIRGINIA.—From the stopes of the 1300, 1435, 1500, 1600 and 1650 levels continue to extract ore sufficient to supply the Morgan and Eureka mills. On the 1950 level operations are suspended, the ore in the south drift having

pinched out. During the week 1067 tons and 370 pounds of ore were shipped to the Morgan mill, 1216 tons and 490 pounds to the Eureka mill. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $27.10. Bullion valued at $140,335.17 shipped to San Francisco during the week.

GOULD AND CURRY.—On the 200 level, the southwest drift is extended 98 feet. Formation soft porphyry. On the 400 level west crosscut No. 1 is extended 454 feet. Formation porphyry.

BEST AND BELCHER.—All work on the 550 and 1000 levels for the past week was confined to repairs.

SIERRA NEVADA.—On the 520 level from the main east drift, 1185 feet from the shaft station, a south drift is advanced 480 feet, continuing in porphyry.

UNION CON.—On the 1405 level the north lateral drift is advanced 605 feet, and has reached the north line of the mine.

MEXICAN.—On the 1465 level from north drift from west crosscut No. 1, 50 feet in from the lateral drift face, a west crosscut is advanced 87 feet. Formation porphyry, clay and a little quartz.

OPHIR.—On the 1300 level the east crosscut from the shaft station, to connect with the top of the raise above the 1465 level east drift, is extended 315 feet, continuing in porphyry showing some quartz.

SCORPION.—The 520 level south drift is out 400 feet and is showing vein matter.

SAVAGE.—Shipped 320 tons of ore to the Rock Point mill. Stopes yielding as usual.

HALE AND NORCROSS.—Shipping 150 tons of ore daily to the Nevada mill. Explorations progressing as usual without any notable change in formation.

CHOLLAR AND POTOSI.—Crushing 60 tons of ore daily at the Nevada mill. The 500 level northwest drift is in low-grade quartz.

NORTH GOULD AND CURRY AND EAST BEST AND BELCHER.—The west drift from the northwest drift is showing vein matter.

IMPERIAL.—The joint Confidence-Challenge 500 level north drift is out 1140 feet from the Yellow Jacket shaft. The face shows porphyry and quartz. The west crosscut from this drift is in the same material.

YELLOW JACKET.—Daily ore shipments continue to average from 65 to 70 tons, battery samples showing an average assay value of $24.75 per ton.

ALPHA.—Opening a station on the 600 level. The 500 level west crosscut is showing quartz and porphyry.

CHALLENGE CON. AND CONFIDENCE.—Advancing the 500 level west crosscut, which shows quartz and porphyry in the face.

OVERMAN.—Shipped 352 tons of ore to the Vivian mill during the week.

CALEDONIA.—West crosscut No. 2 is in 118 feet. Advancing a southwest drift on the same level.

CROWN POINT.—A raise above the 400 level west crosscut is showing quartz of milling grade. An east drift from the bottom of the winze below the 800 level is showing spots of ore. The 900 level south drift is reopened 574 feet. Repairing the incline below the 1400 level.

BELCHER.—No. 2 east crosscut on the 1200 level continues in soft porphyry. East crosscut No. 3 continues in low-grade quartz. The 1000 level east crosscut is in porphyry and low-grade quartz. The 850 level south drift is in porphyry and quartz. The 200 level west crosscut has tapped a slight flow of water.

SEG. BELCHER.—The 1200 south drift from the Belcher is still showing streaks of quartz.

SILVER HILL.—The 160 level east crosscut is in porphyry. The 260 level northwest drift continues in porphyry.

JUSTICE.—Crushed 213 tons ore, assays showing a value of $24.67 per ton.

ALTA.—Crushed 320 tons of ore, assays showing a value of $31 per ton. Opening the 1030 level station is nearly completed.

NEW YORK CON.—Fair-grade quartz is still showing in the raise above the 800 level crosscut.

Ely District.

A TIMELY WORD.—White Pine *News*, Nov. 9: Letters of inquiry come pouring in on us from miners and persons anxious to engage in business as to the prospects for them here. To all such we must answer: There is not now, nor is there likely to be this winter, any demand for miners or other workmen, and as for business, the field is amply supplied. Mr. Watson is now working only about a dozen men in both mill and mine, and he does not intend to increase this force. What this district needs at present is capital to take hold of some of its promising mines and open them up. Until this is done, the field for both labor and business here will not materially expand.

Jumbo District.

SHIPPING ORE.—Virginia *Chronicle*, Nov. 5: Josephine is the name of a mining location in Jumbo district, which, the *Chronicle* is reliably informed, promises to prove as prolific in gold bullion production as the Pandora, which latter joins its boundary lines. The locators and owners include the following veteran local mine experts: William English, William Woodward, Hon. William Wootburn, H. Clements, and James Loughran. The location is usually designated as the Water company's claim, from the fact that three of the owners are attaches of that company. L. S. Coffin is about to make an ore shipment from the Pandora which, if careful assays are reliable, will produce larger gold bullion returns than any heretofore extracted from the mine. The value of the ore can be inferred when it is stated that it is carefully sacked to prevent the loss of any particles in transit. The owners of the Blizzard location are also shipping ore to one of the Six-mile Canyon mills. The Dunlop mill is dropping its five stamps on Wild Goose ore and the prospect is promising of a profitable cleanup in gold bullion. The mill crushes about seven tons in 24 hours.

Morey District.

RICH ORE.—Belmont *Courier*, Nov. 9: From County Assessor Charles McGregor, we learn that the lessees of the Morey mine are taking out rich ore. The lease will end in two months. Mr. H. A. Cohen is pushing the work of development west of the lessees' ground, and the mine is looking splendid at this point. He has ordered three concentrators which will be used in concentrating some of the ore of that district. There are 40 men working in the mines of that camp. Mr. McGregor feels confident that Morey will be a booming camp in the near future.

Tuscarora District.

BELLE ISLE.—*Inter-Mountain*, Nov. 8: West crosscut on the 250-foot level extended 18 feet, passing through vein matter.

NAVADA.—The stopes on the west vein above the 150-foot level are looking better. The usual amount of ore has been sent to the ore-house.

NORTH BELLE ISLE.—The shaft has been sunk and timbered 14 feet, total depth below the 400-foot level is 195 feet. Water flow about the same. Concentrator still running satisfactorily.

NORTH COMMONWEALTH.—Joint crosscut, 225-foot level, extended 11 feet, face looking favorable. South drift on the same level extended 21 feet, total length 62 feet, face still producing high-grade ore.

DEL MONTE.—East crosscut No. 2, 100-foot level, extended 12 feet, total length 68 feet; face continues to show high-grade ore.

GRAND PRIZE.—400-foot level: Winze in the east drift from the north crosscut has been sunk 16 feet; ore 3 feet in width. In the ground, above the east drift, being stoped for the extraction of concentrating ore, a 2-foot streak of $400 ore has been encountered, which promises to develop well. Other stopes yielding as usual. Everything at mine and concentrator running well.

COMMONWEALTH.—100-foot level: North drift has been extended 17 feet; total 245 feet. A crosscut has been started near the face to cut the ore on the east side. No. 1 east crosscut, from north drift, has advanced 12 feet; total, 75 feet. The ore continues to look well, being solid and of high grade.

ARIZONA.

GOLD ORE.—Mohave *Miner*, Nov. 9: E. E. Tourtellotte will next week put through an arastra about a ton and a half of gold ore (mostly specimens) from the Harrison mine near Cerbat. At the Rip Van Winkle, Layne Springs, Sample & Jamison are taking out considerable good ore from the lower tunnel, which is being driven to the Nighthawk line, some 50 feet yet to run. Chas. Cummings has six men at work in his mine at Wallapai Springs. The ore streaks are small and irregular, but of high grade. The mine is down about 100 feet, yet something over $19,000 has been extracted. E. F. Thompson and G. W. Beecher made a trip to the Empire mine, Chloride, the first of the week. The mine is looking better than ever before, and Mr. Thompson will not cease drifting, nor in fact do any other work until the extent of the ore body is known, when such arrangements as are justifiable will be made for its extraction. There are about 50 tons of fine ore on the dump. C. H. Park is in from the Queen Bee, Mineral Park, and reports the mine as looking better than ever, and producing some very high-grade ore. There is a force of nine men employed; the south drift has attained a length of more than 200 feet, and is still in good ore, and a winze is being sunk from this drift. Mr. Park will ship to-day to the Denver Public Sampler a lot of high-grade ore. The Arizona Sampling Works have worked since our last report the following lots of ore: N. C. Amer, 7½ tons high-grade ore from the Silver King; Robert Gray, one carload of low-grade ore from Stockton Hill; J. S. Crafts, a little over a ton from Hackberry; Brown, Rule & Kilburn, about four tons from the Rural mine; Burke Bros., two tons from the I X L; Marshal & Jamison, about nine tons; four carloads from the C. O. D.; De Bourdage, a small lot; Thos. Burch, a small lot from Cedar district.

COLORADO.

CLEAR CREEK GOLD BELT.—Denver *Republican*, Nov. 7: The Centennial mine has opened up two feet solid ore at the depth of 350 feet in the main shaft, which yields 80 ounces silver and 27 ounces of gold per ton. The workings of this mine are within the limits of Georgetown and it lies in the midst of the gold belt, commencing on the north side of Leavenworth mountain, running southeast across Burrell hill, Griffith mountain, the southeast slope of Columbian mountain and on toward the Lamartine and Freeland mines. The Pulaski, Big Injun, Burrell, Coatney, Gold and Silver Coin, Edna, Centennial, Griffith, Hood, Anglo Saxon Extension, High Girl and Lamartine are the developed paying mines on this belt. Much attention has been turned to it this last year. The Centennial has a depth of 350 feet below the level of the valley, while the Highland Girl and others are at the crest of the mountain, showing that the belt is strong, well defined and continuous throughout. The gold belt will add materially to Clear Creek's gold quota this year. The Big Injun mine, which the Exchange has listed, is just above the Centennial on Burrell hill.

ASPEN.—Much interest is felt here in the forthcoming silver convention, and Aspen will be well represented at that gathering. Every cent added to the price of the product is so much added to the net profit, and free coinage would mean an aggregate additional profit of something like $300,000 per month for the mine-owners of Aspen who are now producing from their properties, while a great number of mines would be made profitable that are now scarcely more than paying expenses. The Aspen and Compromise mines have not resumed their regular shipments, and it is not known yet how soon the management will be able to make satisfactory contracts for the output. In the meantime development is progressing very satisfactorily and both properties are looking wonderfully well. The fourth level of the Aspen has come into a fine body of ore near the southern end of the claim, while the old ore bodies are improving constantly. Senator Teller, who visited the mine last week stated that he never saw so much mineral exposed in one property during all of his 25 years' experience among the mines of Colorado.

BRITISH COLUMBIA.

THE COTTONWOOD MINES.—Kamloops *Sentinel*, Nov. 7: Mr. M. S. Davys, manager and shareholder of the Cottonwood gold mines, 7 miles from Nelson, Kootenay, has returned to Nanaimo after being away for the last six months. These mines are now closed down for the winter. Mr. Davys states they have been engaged all summer in extensive operations on the mines and putting in a 25-ton Huntington mill, which he intends to run in the spring. There have been 27 men working there all the summer, and the average output of rock has been 25 tons per day. He states there are a great number of American capitalists there who have bought many of the claims, and he states that Mr. Mackay, the famous Nevada operator, has also bought a few rich claims there and commenced to work them. There is plenty of water, so they experience no difficulty in washing the rock. There is also another ten-stamp mill being erected on the Eagle creek mine, owned by Mr. Davenport, which will also be running in the spring. Mr. Davys expects to employ about 200 men next spring, provided everything turns out as he anticipates. The claims of the Cottonwood Gold Mining Co. which they have been engaged on, are 4500 feet above sea level, and there is another claim called the Silver King, which is owned by the Kootenay Bonanza Mining Co., and is supposed to be the richest mine in the camp, which is 6000 feet above sea level. The Spokane and Northern Railway Co. are engaged in laying down a railroad which they intend to bring through Colville, where the trains are at present running; provided they can get the charter they intend to bring it into the Kootenay country. This will prove a great boon to the gold mines.

DAKOTA.

SYNDICATE SMELTERY.—Deadwood *Pioneer*, Nov. 7: Construction superintendent, Harry Damon, had a force of nine men working at site during yesterday. Grading and excavation necessary are already well under way. More men had been engaged but failed to show up, severity of the weather probably keeping them at home

DESIRE M. COMPANY.—A meeting of the directors of the above company was held last night, at which there were present Messrs. Wringrose, Coe, La Chapelle, Burns & Bonham. Reports of the treasurer and superintendent showed the company to be in good condition financially, and the mines looking well with every prospect of becoming self-supporting at an early date. The superintendent was directed to continue work until the annual representation work was completed, when it is confidently believed that ore shipment can be made.

IRON HILL.—The Iron Hill smeltery blows in today for another test run of dry or pyritic smelting. Length of the run depends largely upon success that is met, but in no event is likely to be more than 10 to 12 days. Pyrites for flux were obtained from a galena location belonging to William Delaney.

IDAHO.

ASSESSMENT DEVELOPMENT.—Ketchum *Keystone*: Nov. 9: J. C. Murray made a fine development while doing the assessment work on the Tenbrook mine, situated on the west fork of Warm Springs creek. This mine belongs to Hicks & Co., of Nevada, who have been working it several years and expended a considerable sum of money in explorations.

BLACK JACK.—*Avalanche*, Nov. 9: Messrs. Irvin, McKay and Little, the purchasers of the Black Jack and Empire State mines, are getting acquainted with all things necessary to the development of those mines. Six men have already been put to work by Supt. Dewey in the upper works of the Black Jack. Contracts for furnishing wood and running the tunnel from Blue gulch to cut the Empire State and Black Jack mines are being made, and ere long the west side of Florida mountain will present a lively appearance.

GARFIELD.—We are credibly informed that Mr. H. C. Anchor, the lessee of the Garfield mine, is now running a drift on the lode above named, and that he is extracting a good quality of ore. It is large, easily worked, and will prove of great value.

THE DE LAMAR.—The mill at De Lamar still continues to run on Wilson ore, not having shut down since it started up about two weeks since, and we understand that the mill will be kept running as long as a stamp can be lifted, except while cleaning up.

THE SOMMERCAMP.—The group of mines at Wagontown is showing up splendidly—good ore being found wherever a drift on the lode is run. Mr. Sommercamp superintends the working of them himself, and of course works to the best advantage, and is opening a fine property.

LOWER CALIFORNIA.

ALAMO.—Cor. San Diego *Union*, Nov. 7: The El Paso Co.'s new 10-stamp mill is complete in every particular. They will begin crushing ore from the El Paso mine first. The ore is not selected, and their first run will be an average one. The International Co.'s mill has shut down for a few days to complete improvements at the mill, Ulysses and Princesa mines. It will start up this week. The houses over the Princesa and Ulysses hoisting works will be completed this week. The machinery at both mines is working admirably. The Princesa shaft is down 76 feet, and Ulysses 43 feet. Superintendent Sutherland is having the shafts on these mines sunk straight down (not following the veins). The Princesa vein was struck at 68 feet and left it at 73 feet. The ore taken out at this depth was remarkably rich. This shows that there is depth to the mines beyond all question. Superintendent Sutherland will drift on the Princesa from the 100-foot level. The Temecula mine continues to be the pride of the camp. They are working a shaft from the 50 foot level and drifting east from the same level. The International Co. put several men to work last week on smaller leads, the Cocenero, Indian and others. Superintendent Moore of the Torres Co. is expected home this week. It is rumored that he has purchased the interests of the other partners and on his return will be sole owner. He will have no difficulty in supplying his mill with ore. The Lane mill is amply supplied with custom ore. Your correspondent saw a cleanup from a small lot of ore to-day—3600 pounds—which weighed five ounces two pennyweights. The parties took the ore from one of Milton Santee's mines—the "Never Give Up"—on contract.

MONTANA.

PONY DISTRICT.—*Inter-Mountain*, Nov. 7: Harry Daley has just returned from the Pony mining district. At present there are a number of men searching in this district for work. It is about 23 miles in a northerly direction from Virginia City, Montana. Most of the prominent mines are owned by Helena parties, and they are conducted on a very saving basis. The Rose Bud is the most prominent mine in the district, but at present is giving employment to but six miners. There are many other prospects, but this is the only one of any consequence doing any work. The average assays of ore throughout the camp are about 30 ounces and about 25 per cent lead. The company has now in course of construction a 50-ton capacity concentrator, and a Ball steam stamp will also be added to the works. Many have to lie idle, paying nine dollars per week for board alone, with beds at a premium. The best mechanics command only four dollars per day and a majority three and a half, and there are a number who say that it is very necessary you come from Lake Superior mines to procure employment. The country is in a lime formation between two well-defined walls. The camp is 22 years old, but has only of late come prominently into the mining world.

MOOSE CREEK.—Dave Robinson, a former successful miner in this camp, has just returned from the Moose Creek district, and from him it is learned that the Sunset has made a shipment of ore taken from the 100-foot level to the Parrot smelter. The returns were very satisfactory to the owners, Messrs. Whitford and Sanders of this city, netting them 60 ounces per ton. The Moose Creek district is about 22 miles south of this city, and the country is completely laced with veins that go on an average of about 30 ounces per ton. It is too far to make shipments to Butte, and what is most needed is a custom mill to bring the country into prominence. Some prospecting is being conducted.

MINOR NOTES.—John Cabbage at Woodville has discovered a very promising lead. The ore is being removed to the mill for reduction as fast as taken out. The shipment of ore from the Antelope mine near Anaconda netted C. F. Brant, the owner, $109 per ton. The Glengarry has started up again in the old workings. More miners are at work in the Alice than for many months past. Ten additional men were put on Sunday morning. A large number of miners are daily seeking employment at the different mines of the camp, showing that the demand is fully supplied. It is rumored that some of the mines of the Oro Fino district have had to close down, pending the settlement of the dispute in regard to mineral lands, where the Northern Pacific is a party.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City *Enterprise*, Nov. 8: The Bennett shipped 11 cars of ore in the month of October. The shipment this month will be much larger. Ed Dickenson has a force of 22 men on the Union in Hanover district; also two mines in the same district, owned by the Rio Grande Smelting Co. James Carr from Black Hawk states that the camp is looking up, and reports having struck horn silver in paying quantities. A strike has been made on the Signal mine, located near the Ruby, Gold Hill district. The ore runs 72 ounces in silver, as shown by assays made by Mathews & Black. The machinery formerly used in the Peerless mine was this week, by arrangements of the owners, to clear the indebtedness of the mine, sold to W. H. Newcomb, and is being transferred to Pinos Altos, where it will be used. The latter part of the present month work will be resumed on the Jewel mine, Cow Springs district. A big body of gold ore has been discovered. Work on the Colchies mill is progressing rapidly. Julius Wellghausen and Thomas Henry of Central City were in town Monday. During the past month Mr. Wellghausen has sunk a shaft 60 feet and drifted 12 on the Cuero de Sibolo, an old mine on which the Spaniards many years ago did an immense amount of work. There are huge dumps on the mine, larger than houses, while the excavations now partially caved in indicate many years of patient toil.

UTAH

CRESCENT.—Park *Record*, Nov. 9: The Crescent seems to be doing somewhat better under the new management. As fast as possible the ore reserves in the lower levels are being opened up, but the water is not very easily managed. The tramway has been kept running all along, as has also the concentrator. This week a shipment of first-class ore was made.

THE NEVADA-NORTHLAND.—Everybody was congratulating the owners and leasers of the Nevada-Northland property this week on hearing that they had cut ore in the shaft which is down about 275 feet. The leasers broke into some ledge matter the early part of the week, but expectations were not quite realized.

THE HIMALAYA.—No little amount of development work has been done on the property this season, and the results are considered very encouraging for a big mine under Scott Hill at no distant day. A four-foot ledge of fair-grade ore is exposed in one of the drifts from the shaft.

THE WHITEHEAD GROUP.—A representative of the *Record* saw some ore Thursday from the Whitehead group which assays upward of 20 ounces silver to the ton. It was good-looking rock and came from a drift run from the bottom of the shaft which is about 150 feet under the grass roots.

THE COMSTOCK.—Less than 30 feet remain to be driven through before making connection with the tunnel level from the old shaft at the Comstock.

CAMP CROSSCUTS.—The rough condition of the roads has interfered somewhat with ore-hauling the past week. The leasers of the Wasatch are fast getting their property in shape for production of ore. J. S. M. Jackson has been doing considerable development work on a limited scale the past season in Blue Ledge district. His group of claims, consisting of the Silver Kay, Boulder King, Blue Jay and Champion, which lie about a mile south of the Glencoe, is expected to come into prominence in due time.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped 140,100 pounds of first-class ore and 60,000 pounds of concentrates. For the week just ended the Mackintosh sampler received and forwarded 265,960 pounds of Ontario ore, 139,000 of Daly; 78,610 of Mayflower No. 7 leasers; 60,330 of Alliance ore, and 215,480 pounds of Woodside concentrates from the Union concentrator; total, 759,380 pounds. The Ontario is making up its regular bullion shipment to-day.

SHUT-DOWN AT STOCKTON.—Salt Lake *Tribune*, Nov. 8: A report comes from Stockton that the Calumet & Muscatine Co. has drawn off all their force except eight men, who will continue work during the winter. In making this reduction the single men were discharged, leaving only married men to do the work.

MECHANICAL PROGRESS.

Mechanical Observations Abroad.

In the numerous reports on manufacturing enterprises in Europe made by the more intelligent and observing members of the mechanical delegation which recently visited the Paris Exposition, we find many items of practical interest. The general result of the observations made upon this trip should settle beyond a doubt the question as to whether the United States or Europe possesses the greater all-round advantages for success in mechanical operations. The 50 men who made up that delegation represented as many trades and specialties, and they declare unanimously that there is no country like our own for the mechanic. Their evidence tends to show that our mechanics have better food, better clothes, better homes, better wages and greater opportunities for advancement than any other nation. Also that a greater number of our mechanics own homes and other real estate and have more money deposited in savings banks to provide for rainy days. We find the following brief summary of some of the reports in one of our contemporaries credited to "The Press":

The pilgrims say they were allowed free access to the factories in England and France. In Germany they were not so fortunate, and when they got to the Krupp gun works at Essen they were positively refused admittance. They were welcomed at the Woolwich arsenal, and were shown how the big guns were made. In Paris, the municipiality, through the labor board, gave them the freedom of the city.

In only one industry—that of the manufacture of military paraphernalia—do they find that English-made goods are superior to American. In many cases our goods are more tasty and better made than theirs. Particularly do we lead them in machinery. Their machines, as a rule, are cumbersome and lack ingenuity and speed.

Cheney, the miller of the party, says that by long odds the best mill machinery he saw at the Paris Exposition was that which he helped to pack before he left home. Anderson, the tinner, in one factory in England saw the process of making tin buoys. They had to be put through the nine processes, while in America they go through only three, and the American product is better than the English.

Hanna, the iron and steel worker, when asked what he thought of the iron and steel-working machinery in the big works in England and Scotland, said: "It is all out of date, and in the mill I work in, in Cleveland, we would break it up for scrap. I saw nothing in my line that we could not beat. As for the condition of the working-men, there is no comparison."

Hugh Cavanagh, the shoemaker, says that in his line the men only do about 65 per cent as much work in England and France as they do here. There seems to be a marked indisposition to use improved machinery. What they have is very crude. "They work shorter hours than we do," he said, "only 54 a week, and have more holidays. It costs more to turn out a good shoe either in England or France than it does here. In England the shoemakers are well organized, but in France they are not. Rents in England are fully one-half less than we pay. In France there is not even the progress in the use of machinery that there is in England. I was talking to a large manufacturer in France and asking him why he did not use improved machinery, he said, 'Why, I employ 1200 men, and if I used much machinery I should have to discharge many of them. I am making a good profit and they are satisfied. What more do you want?' This knocked me out completely. The shoe machinery on exhibition at the Exposition is all of American make or design. I noticed that with the exception of a few factories in Paris neither the French nor English manufacturers go in for style so much as they do for usefulness."

Edmund Vail, the blacksmith, finds his trade in England well organized and prosperous. The English are the best off. Then come the French, with the Germans behind. In Holland, the shops are generally in the dwelling-houses and the smith's wife acts as the helper. In none of the European countries are the blacksmiths as well off as they are here.

W. T. Lewis, the coal miner, found his craft pretty well organized and making better wages than for 20 years past. The wages are low as compared with those paid to miners here, but this is in a measure compensated for by the fact that work is more regular. Joseph Thorpe, locomotive engineer, found his trade totally unorganized. Many engineers told him that the only reason that they did not come to America is because they could not save money enough to pay their fare. Wages are 50 per cent lower than they are here. The open cabs are still used; and the companies have recently taken the engineers' seats away from them, they say, to prevent them from going to sleep. Wm. Delaney, the bricklayer, finds that an American bricklayer does double the work that a French or English one can, but wages here are just about twice as much.

Mrs. Lenora M. Barry said: "The condition of female wage-workers in all the countries we visited is deplorable. In every branch of industry, except perhaps in clerical work, they are infinitely worse off than American women workers. Their pay is much less for the same work, and to live in the same style that our women do, would cost more. In the black district, in Devonshire, I saw women working at the forges making nails and chains. Among sewing women there is not much to choose. We have the same sweating system and the same starvation wages. Women there make shirts all by hand, at ninepence each. For machine-made shirts they get three shillings sixpence a dozen."—*The Press.*

The Value of Mechanical Literature.

The value to the mechanic of good periodicals and papers pertaining to the business in which he is engaged is often underrated by him, and he is apt to consider that he is none the worse for a lack of knowledge about the experience, opinions and work of others. This, says the *Master Mechanic*, is a most serious mistake on his part, and one which in the end will be suicidal to his best interests. One great reason why so much progress has been made in recent years lies in the fact that the ease with which men can give the results of their labors and experience to their contemporaries or leave them to posterity has resulted in a much greater diffusion of knowledge.

In the mechanical field this circulation of knowledge has enlarged and is still enlarging the circle of men who are well posted and fully alive to all that is going on. How then can a man neglect those very means of advancement by which others are progressing? It matters not whether he be a fireman, engineer, machinist, foreman, master mechanic or superintendent of motive-power, or whether his natural abilities be great or small, if he wishes to advance with the rest of the world he must know what it is doing, and this knowledge must be derived from the pages of papers devoted to mechanical affairs.

We recently heard a gentleman connected with one of the most progressive roads in the country say: "I am personally acquainted with a good many engineers on our road, but I must confess that I don't know a single one who takes any mechanical paper regularly." We know that such an assertion would be too sweeping for general application, but there is no road on which a very large percentage of the engineers are readers of papers pertaining to their business. Nor is this state of affairs confined to the trainmen, for we know of master mechanics who "never have time to read the papers." In some cases, however, they do the next best thing; they turn the papers over to the "boys." We think we could suggest a still better method of procedure, namely, to read them first and then turn them over to others. There are many young men who would be glad to get such reading, but who may not be able to pay for it, and there are others without any desire for it who would wake up to a realization of the possibilities in life before them if their views were enlarged. For these reasons a man is to be highly commended for putting into the hands of those in his employ good engineering and mechanical journals, but he is not true to his own interests if he himself neglects to read them.

SOME PECULIARITIES OF IRON.—Scientists are constantly developing new and interesting peculiarities of iron, many of which are being turned to useful account by practical mechanics. One of the latest developments in this direction is found in some French experiments, which show that if a bar of hard iron be allowed to cool from a white heat to a dull redness there is a spontaneous disengagement of heat, and its magnet properties suddenly change. In order to ascertain whether this result might be due to the heat set free by the modification of the iron, or if it required the presence of iron, iron was operated with containing from 0.16 to 1 25 per cent of carbon, by which means the first phenomenon above mentioned was found to be due to the molecular transformation of the iron, and the second corresponded to a change in the relation of the iron with its carbon. It takes place at 675 deg. C., when the thermometer suddenly stops and rises some 6 deg., afterward resuming its regular fall, as the metal cools. This was observed with steel containing 0.57 per cent of carbon, while with only 0 16 per cent of carbon a much slighter effect of the kind was noticed at about 749 deg.; with 1 25 per cent of carbon, the two effects appear to confound themselves. When the proportion of carbon is increased, the temperature of the transformation of the iron seems to be lowered, and that of recalescence raised, so that both come to coincide in the hard steel.

ELECTRIC WELDING NOT A NEW IDEA.—It was stated at the recent meeting of the British Iron and Steel Institute that the process of electric welding was successfully used in connecting one of the Atlantic ocean cables 12 years ago. It seems difficult to discover anything that has not at some time been known to mankind. The system of electric welding, however, has just been revived in a manner that will give it an importance that it never before possessed, and this is one of the characteristics of American enterprise, that it readily adapts old systems to the wants of this later age, and on a scale which few nations attempt.

PRESSURE VS. HAMMERING.—A new process in steel manufacture will shortly be tried at the works of the Barrow (Eng.) Hematite Steel Company. Instead of cogging or hammering the ingots into the form of slabs, the operation will be performed by the hydraulic press that has already been erected.

SCIENTIFIC PROGRESS.

The Comparative Insensibility of Animals to Pain.

The careful observer of nature must often be struck by the apparently enormous amount of pain and suffering inflicted on the lower animals by each other and by man. The bird tears to pieces the worm, the fly, or the snail, and is itself torn to pieces by the hawk, the cat or the weasel, while these in turn fall victims to the gun or trap of the sportsman. So it is with insects, and so with fish. There is very strong reason for believing that the lower animals are far less sensitive to pain than is supposed. It would seem that a large section of the public believe that the worm and the slug, the fly and the beetle, are quite as sensitive to pain as man; indeed, an article appeared in the *Spectator* a few weeks ago on the "Pitilessness of Angling," in which the writer affirmed that he could not see how the aphorism that the lowliest insect "feels a pang as great as when a giant dies" could ever be disproved. The suggestion that animals are less sensitive to pain than man is generally regarded as a weak apology for cruelty, but when we remember how little able, in comparison with man, they are to defend themselves from their numerous foes, and how many countless myriads daily meet with a violent death, such a suggestion should surely be hailed with pleasure and every piece of evidence in its favor carefully weighed. Our investigations have taught us that the source of pain is the brain, and that if the connection of any part of the body be cut off from the brain, that part becomes destitute of feeling. It occasionally happens that one of the main nerves to the hand or foot is cut through by accident, in which case the portion of the hand or foot supplied by the nerve immediately loses all feeling. Or, again, it happens that in severe accidents the spinal cord becomes so badly crushed as to prevent all impressions below the seat of the injury being conducted to the brain, and as a result the parts of the body supplied by nerves coming off from the spinal cord below the injury at once become insensitive. Now, as the general type of the nervous system is the same in all the vertebrate animals, and as we can prove that many of the functions of the brain in the lower animals are similar to our own, we have every reason to believe that the brain is the source of pain in their case just as it is with us. It is further certain that the sensation of pain originates in one definite part of the brain, and no amount of stimulation of other parts can give rise to it. Many painless operations are recorded in the pre-chloroform days for severe fractures of the skull attended by protrusion of brain tissue, and necessitating the removal of such tissue at the hands of the surgeon. And, again, it is a common experience to find tumors and abscesses developing in certain parts of the brain with an entire absence of pain, while in other parts the growth of such tumors gives rise to a good deal of suffering.

It would appear that as far as man is concerned, the more highly developed, the more active, the more wide-awake the brain is, the more sensitive does it become; and if this be true of man, why not of the lower animals also? Although the general type of the nervous system is the same in all the vertebrate animals, it is well to remember that in all the lower animals the brain is, in proportion to the rest of the body, very much smaller than in the case of man. It appears, too, that those animals whose brains are most developed and most exercised by their constant intercourse with man, as the dog and the horse, are more sensitive to pain than wilder and less domesticated animals. In dealing with animals it is necessary to consider carefully what signs may be depended upon as proofs of their suffering. Certainly their struggles and cries are not always true indications. All wild animals struggle under restraint. With many, cries indicate fear rather than pain. A hare when shot rarely cries; when closely pursued by dogs it often does. Animals when trapped rarely cry until some one approaches the trap. Frogs will cry out loudly on the appearance of anything at all resembling a snake; when injured with stones or cut by the scythe in mowing they rarely do so. Every gamekeeper knows that it is a common thing for a rat or a rabbit, when caught by the leg in one of the ordinary steel traps, to gnaw off its limb and so escape, while other animals when kept short of food, will readily eat their own tails. Another proof that animals are less sensitive to pain than man is their comparative freedom from shock after severe injuries. When a man meets with a very severe injury of any kind, a train of symptoms follow, which are collectively known by the name of shock. A striking pallor takes the place of the natural color, the skin becomes covered with a clammy moisture, the eye loses its natural luster, and the extremities become deadly cold, and while the ear may detect the fluttering action of the heart, the pulse at the wrist is often quite imperceptible. All these symptoms point to a great disturbance of the nervous system, whereas the lower animals often sustain the severest injuries without exhibiting any of the symptoms of shock. In man and animals the skin is certainly the most sensitive tissue of the body; we can hardly imagine that the scales which cover the bodies of fishes are equally sensitive. When we pass to the invertebrate kingdom, represented by shell-fish, snails, worms, insects, etc., we find an entire absence of brain, the nervous system being represented by two nervous cords running the whole length of the ventral surface of the body, and having a pair of small masses of nervous tissue, known as ganglia, developed at intervals. The extraordinary mutilations these creatures will successfully endure prove that their nervous system is but little influenced by shock, and render it almost certain that it is equally insensitive to pain. When we remember that the worm when cut in half does not necessarily die, but has the power of reproducing the lower portion of its body, and that in some orders the lower half develops a new mouth and becomes a new animal; again, when we remember that other members of the same sub-kingdom, such as lobsters and crabs, will frequently, when frightened, throw off a limb or two, we must conclude that their sense of pain is very small, and yet they are repeatedly spoken and written of as though they were as sensitive as man.—*Dr. W. Crollier in Nineteenth Century.*

THE DISCOVERY OF OXYGEN.—"Fixed air" and "combustible air" had been speculated upon, and "the air that is left after combustion" had attracted attention. But the phenomena of this kind, inconsistent as they were with the phlogistic theory, had not been sufficient to overthrow it. The first germ of Lavoisier's theory on these matters was embodied in a sealed packet which he deposited with the French Academy in 1770. Recognizing that the calcination of metals could not take place without the access of air, and that the freer the access the more rapid the calcination, he "began to suspect," as he expresses himself, that some elastic fluid contained in the air was susceptible, under many circumstances, of fixing itself and combining with metals, and that to the addition of that substance were due calcination and the increase in weight of metals converted into calxes. From this thought came, after much groping with erroneous conclusions, the idea that air is a compound containing a vital part and another part and that it is the vital part that is absorbed. The behavior of charcoal when burning in oxygen pointed to the nature of that substance and to the true theory of combustion. This new vital substance, which, uniting with metals, formed calxes, and with other substances generated acids, he called "oxygen" or the acid producer; the air that was left after combustion was *azote*, or lifeless. The inflammable air which, combining with oxygen, was found to form water, was called "hydrogen."—*Ex.*

THE ASTEROID recently discovered by Professor Peters has an orbit which is nearer to the sun than that of any like body now known. At first it seemed as if the orbit of the newly-discovered asteroid was within a portion of the orbit of Mars. But new computations may show that, like all the known minor planets, its path through the heavens is outside that of Mars. Our neighbor, Mars, moves around the sun in a track about equally remote from the earth and the zone of asteroids. Some of these tiny bodies, possibly the one recently discovered, may be of very great importance to astronomy, as affording better means for determining the earth's distance from the sun than even Venus or Mars.

HEAT.—Every one is familiar with the sensation of heat, at least. Heat is supposed to consist of the motion or vibration of the molecules of a body, and is produced by chemical action by the combination of certain chemical elements; by the mechanical work of friction or percussion and by the passage of an electric current. When a body is heated, the heat may increase the agitation of its molecules, raising the temperature of the body, or it may expand it against external resistance, thus doing external work, or it may overcome the attraction one molecule has for the other and change its condition. In this case the heat does internal work, and it can do all of these things at the same time.

ANIMALS BECOMING EXTINCT.—Fifty years ago the United States was the home of a large number of peculiar wild animals. Unless a National Preserve comes to the rescue very soon, another decade will see them nearly all extinct. The grizzlies are disappearing from the Rockies. A live buffalo is now worth from $500 to $1000, which three years ago cost scarcely one-fifth that amount, and they are found almost nowhere but in a corner of Texas and in the Yellowstone Park. The caribou has been hunted almost out of existence. The mountain sheep, the moose, the beaver and the antelope are all disappearing.

AN IMPORTANT DISCOVERY.—What purports to be an important discovery has just been made near Duddo, New South Wales, of a mineral which has by analysis been proved to contain all the properties of the very finest sienna, and which experts who have tested it in every way have found to be suitable for painting, staining, dyeing and for ink purposes. It is estimated that on the surface alone 20,000 tons of mineral was in sight; as a shaft has been sunk to 30 feet and the mineral improves in quality at that depth, there is evidently an inexhaustible paint mine.

WHAT IS A WEED?—A plant whose virtues have not yet been discovered.

GOOD HEALTH.

Remedy for Diphtheria

As diphtheria is becoming somewhat prevalent in California, the following would seem to be a timely piece of information. The article was communicated to the *Iowa State Register* by the practitioner, Dr. W. A. Scott of Pleasantville, Iowa:

The years that pass only confirm me in the fact that this is as near a specific in diphtheria as medical skill can reach. It doesn't fail if used in time and as directed. I use it successfully to this day. The recipe can be filled at any drug store, and used by any person without danger:

Take ten grains of permanganate of potassium and mix with one ounce of cold water. As soon as dissolved, it must be applied with a rag or sponge mop or swab to the whitish places in the tonsils, and other parts that have the diphtheria membrane on them. Do this very gently, but thoroughly, every three hours until better; then every six hours until well. It does not give pain, but is rather nauseous to the taste.

If the tongue is coated white, mix one dram of hyposulphite of soda and five drops of oil sassafras in four ounces of syrup made of sugar and hot water, and give a teaspoonful every one to three hours, as needed, when awake.

If the tongue is not coated white, I mix 20 drops of tincture of phytolacca in four ounces of cold water and give a teaspoonful every one to three hours, as needed, when awake. (The phytolacca is the common poke root of the South, and as it loses its strength by drying and age, the tincture should be from the fresh root, or it is worthless.)

It is well to apply a little sweet oil or cosmoline to the outside of the throat to protect from the action of the air, as the patient must be protected from all danger of getting chilled.

In the beginning of the disease in mild cases, the above solution of permanganate of potassium is all I use, and all that is needed, as the disease is local at first, but rapidly affects the whole system when seated. In the stinking form of diphtheria this solution soon destroys all smell, and in every case destroys the diphtheria membrane without leaving any bad effect behind.

Treatment of Wounds.

A few years ago it was the custom in the treatment of wounds to remove every day the dressing on the same and bathe the affected parts in castile soap and water. Cleanliness in that way secured was then considered an absolute essential to a cure. The consequence was, all wounds in those times were more or less inflamed, pus formed, and often weeks passed before a simple cut healed, and unsightly scars were common relics. But all that is now changed. It is the effort of the surgeon in any recent wound to shut out the air from the same, the fact having been recognized that there is something in the air which induces inflammation and suppuration. The something in question is recognized as microbes. For a time it was believed that they alone were capable of producing suppuration, but that theory was disputed, and evidence has been brought forward to show that it can be induced by certain chemicals. But that point can be of little interest to the layman, who needs simply to understand the general principles of wound treatment. If he of the average sort has an injured hand dressed by a surgeon to-day, he is quite sure, unless plainly forbidden to do so, to remove the bandages to-morrow and wash the wound—one of the worst things he can do. Under the old-fashioned treatment a simple cut scarcely ever healed inside of two or three weeks, but now if rightly treated it is likely to be perfectly well in a week or ten days. In fact it is surprising how quick it heals. So if a surgeon says to a patient, "Let the dressing alone and come to me in a week," he need feel no uneasiness; the apparent indifference and neglect is simply evidence that the operator understands his business and is up with the times. In the dressings now used by physicians there is incorporated some disinfecting agent, which when rightly applied, precludes all possibility of the troublesome microbes reaching the wound.

How Drunkards are Treated in Norway.—The London correspondent of the *American Practitioner and News* says that a well-known medical man who has recently been in Norway gives a glowing description of their manner of treating dipsomaniacs. An habitual drunkard in Sweden and Norway is treated as a criminal in this sense, that his inordinate love of strong drink renders him liable to imprisonment, and while in confinement it appears he is cured of his bad propensities on a plan which, though simple enough, is said to produce marvelous effects. From the day the confirmed drunkard is incarcerated, no nourishment is served to him or her but bread and wine. The bread, however, it should be said, cannot be eaten apart from the wine, but is steeped in a bowl of it and left to soak thus an hour or more before the meal is served to the delinquent. The first day, the habitual toper takes his food in this shape without the slightest repugnance; the second day he finds it less agreeable to his palate, and very quickly he evinces a positive aversion to it. Generally, the doctor states, eight or ten days of this regimen is more than sufficient to make a man loathe the very sight of wine, and even refuse the prison dish set before him. This manner of curing drunken habits is said to succeed almost without exception, and men or women who have undergone the treatment not only rarely return to their evil ways, but from sheer disgust they frequently become total abstainers afterward.

Leprosy.—The following description of how this terrible disease develops and affects the patient is taken from the Hankow (China) Medical Mission report: Leprosy is common. It chiefly affects men who work in the field; we have met with it in brothers; it is occasionally met with in women. The age varies from 10 to 50 years. Often the first symptom complained of is some localized anæsthesia—which is sometimes quite accidentally discovered—in the feet, hands or face, which are the parts that are most commonly affected. The sensory nerves are first affected and sensation as a rule absent partially or completely. The anæsthesia is followed by want of free use of affected parts; the circulation is also impaired in those parts; the hair on the eyebrows falls out. A peculiar punched-out looking ulcer with a very fetid discharge is often met in the feet, sometimes, but not so often, in the hands. As the disease advances, which it does very slowly—it often apparently remains stationary for years—the face broadens, becomes square, glazed, irregular and nodular; nodules are also found in the mucous membrane of the lips and in the nerves; perspiration is absent; the natural expression of the face is completely changed; the patient looks old and sad. As the disease further advances the toes and fingers drop off, and by and by part of the limb. The general health is never affected. Treatment is not very satisfactory; symptoms appear to be controlled for a time, but never cured.

Baldness and Dandruff.—The Cincinnati *Lancet-Clinic* says that a solution of chloral hydrate, five grains to the ounce of water, will clear the hair of dandruff and prevent it falling out from that cause. In many instances, where the patient is nearly bald, the application of the above-mentioned solution will restore the hair. Arnica oil is also an admirable remedy to promote the growth of hair. A small quantity, well rubbed into the scalp three or four times a week, can be tried with expectations of benefit.

Causes of Typhoid Fever.—Dr. Elson sums up the causes of typhoid fever in the following words: First, typhoid fever never infects the atmosphere; second, it never arises *de novo;* and third, the causes of the disease, in order of their frequency, are as follows: First, infected water; second, infected milk; third, infected ice; fourth, digital infections; fifth, infected meat.

USEFUL INFORMATION.

To Restore the Freshness of Worn Clothing.—The mystery to many people how the scourers of old clothes can make them almost as good as new is explained in the *American Analyst* as follows: Take, for instance, a shiny old coat, vest, or pair of pants of broadcloth, cassimere or disgonal. The scourer makes a strong, warm soapsuds and plunges the garment into it, souses it up and down, rubs the dirty places, if necessary puts it through a second suds, then rinses it through several waters, and hangs it to dry on the line. When nearly dry, he takes it in, rolls it up for an hour or two, and then presses it. An old cotton cloth is laid on the outside of the coat and the iron passed over that until the wrinkles are out, but the iron is removed before the steam ceases to rise from the goods, else they would be shiny. Wrinkles that are obstinate are removed by laying a wet cloth over them and passing the iron over that. If any shiny places are seen, they are treated as the wrinkles are; the iron is lifted, while the full cloud of steam rises and brings the nap up with it. Cloth should always have a suds made specially for it, as if that which has been used for white cotton or woolen clothes, lint will be left in the water and cling to the cloth. In this manner we have known the same coat and pantaloons to be renewed time and again, and have all the look and feel of new garments. Good broadcloth and its fellow cloths will bear many washings, and look better every time because of them.

Tinware.—The majority of our readers are well aware that the tin of common use is not real tin, but only sheet iron or steel, with an infinitesimal covering of tin on the surface. It is this fact that, in a measure, says a cotemporary, works to the disadvantage of reputable manufacturers. In a box of good tinplate which weighs 112 pounds there are only about five pounds of tin, so you can see how delicate the film is. Yet tinplate is imported constantly that weighs but 90 pounds to the box. Besides, there is a difference in the quality of the filling, or black sheets, as we call them. Coke-finished iron sheets are much inferior to charcoal finished, and these, in turn, to Bessemer's steel. Hence there is a wide field for inferior manufacture, and the market is glutted with goods that retail at a lower price than serviceable articles could possibly be manufactured for. When the public can get neat-looking stamped ware made of inferior plates at a mere song, the better staple of goods is run out of the market. The cost of manufacturing poor stamped ware is approximately the same as it is for the best. The difference in the retail price of the two lies in the stock. Poor plate tin requires more intermediate steps before the manufactured article is finished, since the brittleness of the filling will not bear much of a strain without being seamed and cracked.

Imparting to Wood the Characteristics of Metal.—The recent process by which wood is made to take on some of the characteristics of metal, says an exchange, has been turned to practical account. By this process the surface becomes so hard and smooth as to be susceptible of a high polish, and may be treated with a burnisher of either glass or porcelain, the appearance of the wood being then in every respect that of polished metal, having, in fact, the semblance of a polished mirror, but with this peculiar and advantageous difference—namely, that unlike metal, it is unaffected by moisture. To reach this result the wood is steeped in a bath of caustic alkali for two or three days together, according to its degree of permeability, at a temperature of between 165 and 197° F. It is then placed in a second bath of hydrosulphate of calcium, to which a concentrated solution of sulphur is added after some 24 or 36 hours. The third bath is one of acetate of lead, at a temperature of from 95° to 120° F., and in this latter the wood is allowed to remain from 30 to 50 hours. After being subjected to a thorough drying, it is in a condition for being polished with lead, tin, or zinc, as may be desired, finishing the process with a burnisher, when the wood apparently becomes a piece of shining, polished metal.

How to Tell Good Oats.—Good oats are clean, hard, dry, sweet, heavy, plump, full of flour, and rattle like shot. They have a clean and almost metallic luster. Each oat in a well-grown sample is nearly of the same size. There are but few small or imperfect grains. The hard pressure of the nail on an oat should leave little or no mark. The kernel when pressed between the teeth should clip rather than tear. The skin should be thin. The size of the kernel will be less in proportion than the skin is thick. The color of the oat is not very material, but white oats are generally thinner in the skin than black. Again, black oats will grow on inferior soils. Short plump oats are preferable to large, long grains. Bearded oats must have an excess of husk. Oats are not necessarily bad because they are thin skinned or bearded; but they must contain a less amount of flour per bushel than thin-skinned oats without beards.

A Red-Boiled Egg.—It is something unusual to find the white of a fresh, hard-boiled chicken egg of a red color, after taking off the shell. But a German chemist writes to the *Weekblad Drug Bulletin* that he has met with such an occurrence which he attributes to the presence of micro-organism. He writes as follows: "I presumed that I had to do with a micro-organism; tried to cultivate it, and was not disappointed. A potato substrate was in a short time covered with an intense growth of bacillus prodigiosus. We have here a bacillus that not only withstood being boiled for a certain time, without impairing in the least its vitality, but one *inside* of fresh eggs."

The Weight of the Whale.—Nillson remarks that the weight of the great Greenland or right whale is 100 tons, or 220,000 pounds, equal to that of 88 elephants or 440 bears. The whalebone in such a whale may be taken at 3360 pounds and the oil at from 140 to 180 tons. The remains of the fossil whale which have been found on the coast of Ystad, in the Baltic, and even far inland in Wangapanse, Westergothland, betokens a whale which, although not more than between 50 and 60 feet in length, must at least have had a body twenty-seven times larger and heavier than that of the common or right whale.—*Scientific American.*

An Ancient Strike.—Strikes among workmen are not altogether a modern idea. The antiquity of strikes is attested by an incident in the history of mediæval Strasburg, in Alsace. In 1409 the millers of Hagenowe (suburb of Strasburg) banded themselves together to get better terms from the bakers. All the millers took an oath by which they bound themselves not to grind without the leave of the union. He who transgressed was to be sent to Coventry—that is to say, with him no miller was to work, eat or drink. The journeymen were included in the union.

The First Telegraph Office was opened in Washington in 1845, and the receipts from April 1st to 4th, inclusive, were one cent. On April 5th the receipts rose to 12½ cents and on the 6th and 7th fell off to nothing. April 8th the office took in $1.32, and on April 9th, $1 04.

The Two Expositions.—Very few people are aware how many more people have visited the Paris Exposition than were admitted to the Centennial at Philadelphia in 1876. This had 9,875,625 visitors, and the Paris Exposition is in a fair way to have 35,000,000.

ENGINEERING NOTES.

Canal Works for Electrical Conduction.—If the project relating to a new canal at Rheinfelden, Germany, be carried out, an enormous stimulus will be given to electrical engineering, since the power rendered available through the construction of this canal will amount to not less than 11,000 horse-power, and will have to be transmitted electrically to Basel, Sackingen and other places. The project has been worked out, and the undertaking is promoted by three of the best Swiss engineering firms. The plans are ready, the capital is available, but the concession has not yet been obtained. Work is to begin in the present autumn, and the whole undertaking will be completed in 1891. The length of the canal is 1½ miles, its width is 165 feet, and there will be erected a turbine house containing 23 turbines, each of 750 horse-power. Each turbine will drive its own generator. The pressure adopted will be sufficiently high to enable the distribution of power to be effected economically within a distance of 15 miles. The power of the turbines being 17,000 horse-power, a total of 11,000 horse-power will be available to the consumers.—*Engineering and Mining Journal.*

The Jet Propulsion of Boats.—Another attempt at jet propulsion is to be made—a 100-foot boat, named the Evolution, has been built for the experiment. The Chicago *Journal of Commerce* pretty effectually takes the life out of the project in the following manner: The jet in this case is to be only three-fourths inch in diameter, but is intended to issue at a pressure of 2500 pounds to the square inch. It is a pity that sanguine inventors, like the originator of the above scheme, are so frequently ignorant of elementary mechanics, as a simple calculation must show that even if all losses from friction were eliminated, and he succeeded in driving his boat at 19 knots, nine-tenths of his power would still be totally wasted; and, similarly, to get an efficiency of one-half, his boat must travel at the rate of 120 knots. On the other hand, to maintain a pressure of 2500 pounds to the square inch in the jet would require about 1500 indicated horse-power, a large amount for a boat of the size; still the inventor has apparently succeeded in getting capitalists to back him.

Not Discouraged.—Quite undaunted by the failure of the Panama Canal, and possibly stimulated by the progress of the Manchester Ship Canal, the French are seriously considering the question of a ship canal from the sea to Paris. There appears to be no question that the commerce of France is seriously suffering from the competition of Antwerp, whose trade has been steadily increasing, while French interests have lost proportionally. A commission appointed to examine the matter has presented a report of a decidedly favorable nature, and states that no serious difficulties present themselves in the way of the execution of the project. The estimated length of the canal is about 112 miles, and the maximum cost $40,000,000.

Theory and Practice.—Some one has tersely remarked that after all theory is but the aristocratic offspring of practice, and dependent upon its staid and commonplace progenitor for its reputation. Engineers who are confronted with the realities connected with a marine engine, realize what it is to see the burnished and glittering theory of a student lost beneath the shower of facts that ever present themselves at critical periods, such as is found when attempting to improvise some way to tide over a difficulty.

Government Acquisition of Canals.—The British Board of Trade are taking active steps to obtain from the various canal companies and trusts of the kingdom information as to the practicability of a scheme for the acquisition of the entire canal system of the country by the State. It is understood that leading men of all parties, in view of the railway rates difficulties, are in favor of the principle of the State acquirement of the canals.

Japanese Progress in Engineering.—*Indian Engineering* says: For the last eight or nine years the Japanese men-of-war have been commanded entirely by Japanese, but in the engineering department foreign aid has still been retained, but it is now expected the whole of the foreign engineers employed by the Naval Department will be dismissed early next year.

The Canal at Corinth, Greece, which will shortly be completed, was actually commenced more than 1700 years ago. When completed it will be four miles long, with a depth of 26½ feet. It was projected by the Romans during the reign of Nero. The original contractor has been dead for several years.

The Enterprise of Science is admirably illustrated in the fact that a party has gone from this country in a man-of-war to Africa, a distance of over ten thousand miles, to witness a four minutes' eclipse of the sun, and will at the same time run the risk of a cloudy day.

A Bee's Work.—Some ingenious arithmetician has calculated that it requires 3,650,000 visits from bees to 62,000 heads of flowers to collect one pound of honey.

TABLE OF CONTENTS.

ILLUSTRATIONS.—A Pocket Compass for Miners, Geologists and Engineers; A Mountain Gravel Mine, 373. Automatic Dumping-Cradles for Mine Cars, 387.
EDITORIALS.—Miners' and Geologists' Pocket Compass, 373. Passing Events; An Advance in Metals; The Geological Survey; Insulating Material; Hydraulic Mining, 380. Dumping-Cradles for Mine Cars, 381.
CORRESPONDENCE. — On Mining Frauds; A Stage-Road Through the Sierras, 374.
MISCELLANEOUS.—Artesian Wells in California, 375.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 376-7.
MECHANICAL PROGRESS.—Mechanical Observations Abroad; The Value of Mechanical Literature; Some Peculiarities of Iron; Electric Welding Not a New Idea; Pressure vs. Hammering, 378.
SCIENTIFIC PROGRESS.—The Comparative Insensibility of Animals to Pain; The Discovery of Oxygeo; Heat; Animals Becoming Extinct; An Important Discovery, 378.
GOOD HEALTH.—Remedy for Diphtheria; Treatment of Wounds; How Drunkards are Treated in Norway; Leprosy; Baldness and Dandruff; Causes of Typhoid Fever, 379.
USEFUL INFORMATION.—To Restore the Freshness of Worn Clothing; Tinware; Imparting to Wood the Characteristics of Metal; How to Tell Good Oats; A Red Boiled Egg; The Weight of the Whale; An Ancient Strike, 379.
ENGINEERING NOTES.—Canal Works for Electrical Conduction; The Jet Propulsion of Boats; Not Discouraged; Theory and Practice; Government Acquistion of Canals; Japanese Progress in Engineering, 379.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 368.

Passing Events.

The silver and lead conventions in the interests of those metals are sure to be beneficial to the mining industry, even if Congress does not do all that is hoped for. Silver is gradually rising in value, and it is pretty certain that Congress will stop the free admission of lead ores now going on under an ill-advised ruling of the Treasury Department.

It will be good news to the copper miners that this metal is again rising in price, and has nearly touched 13 cents. With increase in value of this product many mines now idle can start up with profit.

With certain changes recently made, the electric-motor plant of the Nevada mill is now working to the entire satisfaction of the management. This is the largest electric-motor plant in the world. The dynamos now furnish above 200-horse power of the total required to operate the mill.

An Advance in Metals.

When a few months ago the English Government gave out large contracts for iron and steel vessels of war, the iron market abroad was at its lowest. With these contracts, followed by more from other nations, together with contracts for large and more effective ordnance, the market began to gain strength. As prices crept up, contracts for building iron merchantmen and also steamers began to increase, which caused quite an upward movement in the English iron markets, that gained in importance even up to the present writing. With the improvement in the iron market, coal began to appreciate, and gradually other industries were drawn into line, until today our advices report general trade very active and higher legitimate (not speculative) prices paid for iron, tin, copper, steel and other metals than for several years past.

The advances appear to be for the present upon solid basis, which insures good prices, if not still higher, for some time to come, while the advance in metals is felt in all other industrial pursuits, but probably to none more so than the banking institutions in England. This is reflected in the following from a leading Eastern paper: "The general improvement of business in Great Britain is shown in the fact that without any increase in the paid-up capital of the London Joint Stock bank there has been an appreciation of over £7,000,000 in their market value in the last six months. Their total capital is a little less than £70,000,000. The market value of their stock is £204,200,000, an increase of a little more than three per cent in six months. Bank deposits have increased very largely, and naturally the amount of their discount and advances has also rapidly increased."

All the above has a direct bearing on the markets in this country, and are already stimulating them into greater activity.

Insulating Material.

THE Work of a California Electrician.

James B. Williams, M. D., a member of the American Institute of Electrical Engineers, and a former resident and practitioner of this city, has recently completed at Oakland an examination of all obtainable materials which are used for electric insulation, together with the best methods of preparing and using the same. This examination has probably been the most thorough ever made by a single individual in this country, and has had for its object the production, by practical experiments and tests, of compositions which would afford the most efficient insulation for electric wires and cables for outdoor, indoor and underground use.

The work was commenced in this city over three years ago, and finished in Oakland, in a factory provided with mixing, tubing, wrapping, taping, stranding and braiding machinery, and vulcanizing apparatus, all of the machinery being of new and improved design.

The materials examined include resins and gum resins; paraffins, solid and liquid; India rubber and gutta percha; bituminous matters; petroleum residua and their distillates; oils, vegetable and mineral; fibrous substances, such as cotton, jute, asbestos, parchment, etc., and various carbonates, oxides and silicates.

The above substances, after having been carefully purified and prepared for use, were taken singly and in combinations of two or more, amounting in all to about 500 combinations. They were used, hot and cold, vulcanized (when vulcanizable) and in solution in various solvents; and were examined and tested microscopically, chemically, and electrically, and the effects of moisture, time, heat and cold, gases, etc., upon them, when in thin sheets and on wires, carefully noted and recorded.

Insulated wires and cables, made by every manufacturer in this country, from the simple "bell wire" to the costly vulcanized wires, were also carefully examined and tested, the details of their manufacture noted, and their comparative values determined.

The efficient protection of wires and cables was also carefully studied; and various paints and varnishes, compositions applied hot and cold, and metallic substances were tried. A liquid preparation, which, when dry, is flexible and elastic, has been selected for application upon fiber and metal. This preparation will protect substances upon which it is applied against the action of commercial acids and alkali for a considerable period of time; and it is insoluble in almost every solvent used in the manufacture of paints and varnishes.

At the beginning of the investigation it was found that the testing instruments at present used to measure insulation resistance were not sufficiently delicate, and it was therefore necessary to design and make an instrument which would enable the comparative insulation resistance of any known substance or composition when placed on short lengths of wires which were charged to potentials of over 5000 volts—at which potentials all of the tests were made—to be rapidly determined.

This particular instrument—as well as the rest of the costly and elaborate electrical apparatus used by Dr. Williams during the past nine years—was designed and made by himself in his laboratory, and consists of a modification of Sir William Thompson's quadrant electrometers with an "induction plate." Its needle system is suspended by a long bifilar suspension, with means for adjusting the same, which allows the needle and its mirror a wide range of motion. The accessory apparatus consists of a replenisher and idiostatic gauge contained in a vessel with a Leyden jar; an improved discharge key, and supports for wires while being tested; an air-condenser; and a six-inch spark coil for charging the apparatus and wires to high potentials.

The insulation of the instrument is so perfect that its quadrants will remain charged at very high potentials for hours without any perceptible leakage taking place; and such is the delicacy of the instrument that the presence of fine dust or moisture on insulated wires two inches long, differences of their temperatures and variations of their capacities are immediately detected by the image of the crosshair moving along the scale. As far as is known, this is the only instrument of this kind in this country; and it is the only kind of testing instrument which can be used to enable the comparative insulation resistance of short lengths of wires charged to very high potentials to be rapidly determined. When a well-insulated battery is substituted for the coil, and the replenisher and gauge connected to the instrument, the latter can be used in the same manner, and for the same purposes, as a "White pattern" quadrant electrometer; and if the "Induction plate" be used with the coil instead of the quadrants, potentials of many thousands of volts may be used.

The result of the investigations thus briefly outlined has been the production of wires and cables which are insulated with compositions having an exceedingly high insulation resistance, which are durable, and which can be easily and cheaply manufactured by the improved machinery which has been designed for this purpose.

Particular attention has been devoted to the manufacture of underground cables during this investigation, and such cables have been made which, in addition to having an unusually high insulation resistance, have a very low capacity, which makes them particularly adapted for underground use.

Samples of some of the wires have been exposed for months—in one instance for three years—to dampness and marsh gas without cover or protection of any kind over the insulation, and yet no lowering of the insulation resistance or deterioration of the composition could be detected.

The insulation on all of the wires, except the weatherproof and some of the vulcanized indoor wires, is protected by a metallic layer, and this layer further protected by a braid which is saturated with the protecting composition before referred to. This method of protecting the insulation has been found to be very efficient, and when properly used the insulation will be preserved for an indefinite period of time.

A company having its headquarters in New York City will manufacture all kinds of electric wires and cables which are insulated and protected with compositions invented by Dr. Williams and manufactured with his improved machinery. They will be insulated with vulcanized and unvulcanized compositions, and there is every reason to believe that they will have a large sale as soon as placed upon the market.

Dr. Williams has been assisted throughout this investigation of materials used for electric insulation and the methods of manufacturing and using the same by his brother, R. W. Welty; and, in addition to this work, they have invented several useful devices and processes.

We may add that descriptions of various electrical apparatus invented and made by Dr. Williams during the past eight years have been published in this journal, and were afterward extensively copied by other scientific journals. His electro-medical apparatus — subsequently enlarged and improved—which was illustrated and described in this journal in March, 1881, was considered the first complete apparatus of its kind ever invented and made.

THE Supervisors of San Francisco have created the position of elevator inspector at a salary of $150 per month.

The Geological Survey.

The local branch of the United States Geological Survey which has been in this city, in charge of Prof. G. F. Becker, for some years, will be abolished, and on the first of the month the specimens and instruments will be shipped to Washington. The members of the survey here have been for the past three years engaged upon a geological survey and map of the California gold belt. This work is not yet complete and will be resumed next summer. It is the opinion of Major Powell, Chief of the survey, that he can do better by centralizing his forces, and will send field parties to California in summer, keeping them in Washington in winter.

This "centralization" is rather a fad with Washington officials, and they want all the work possible done there, spending large sums of money for transportation of parties back and forth in preference to keeping the active members where their work lies. From the nature of the case it is hardly practicable for Major Powell to make geological surveys of California without at least sending a few geologists to this State to do it, but if it were possible, doubtless he would like to keep them "under his immediate supervision."

Of course it is very well understood that this "personal supervision" is all nonsense. The chief knows nothing whatever of details, which are worked up by subordinates, and he must depend entirely on these assistants for the conclusions reached. Their names are incidentally mentioned, and he gets the glory.

The U. S. Geological Survey branch which has work to do in California ought to stay in California and do it. There is no good reason for its being removed to Washington and then sent out here periodically to make a show of field work, losing more or less time every season. The branches have been withdrawn from Colorado, California and other mining States, and the parties recalled to Washington, where there is no geology to study except that of the pavements. There are scarcely any men from the mining States or Territories employed on the U. S. Geological Survey, most of them coming from Washington or thereabouts, and possibly the director would rather have them spend their incomes where they belong instead of in the uncivilized regions of the "Wild West."

A Worked-Out Mine.

The Sierra Buttes mine, Sierra county, is called a worked-out mine because it is now only turning out about $8000 a month. It is among the oldest of California quartz mines, having been worked continuously for some 30 years or more. Prior to 1870, when it was acquired by the present company, it had produced $1,955,050. From 1870 to June, this year, the value of the gold produced was $6,369,425, and dividends paid during the same period amounted altogether to $1,574,665, or $15.16⅔ per share. The total production of gold from this mine has been $8,324,475.

This is a pretty good record for any one mine. Of late its force has been reduced, for its ore in the lowest levels has been poor for a year or more. Several hundred men were formerly employed. The company, however, owns a fine producing mine in Plumas county, and lately purchased another producing one in Shasta county. The owners are English capitalists. There is a fine 60-stamp mill with all modern appliances belonging to the Sierra Buttes mine, as well as an old mill up on the mountain side. The company also own valuable water rights in Sierra county. The Sierra Buttes is the deepest gold mine in the world. Its lowest workings are 3000 feet below the surface on a vertical line, and its lower, or No. 9, tunnel is about 9000 feet in length. The ledge is still of good size and well defined at the face of the lowest tunnel, but is of low grade. It is possible, however, that a "chimney" may be struck in some portion of the mine which will yet pay. But even if the mine is closed altogether, it has made a good record and a lot of money. The town of Sierra City was supported for years mainly by this mine. Now the Young America, producing $30,000 a month, is looked upon as the mainstay of that section.

NAME WANTED.—If the person who mailed us a postal note without any letter from Auburn, on the 7th inst., will send us his name, he will receive proper credit on our books.

Dumping-Cradles for Mine-Cars.

The accompanying figures illustrate the dumping device used at the new dressing works of the St. Joseph Lead Co. at Boone Terre, Mo. It is a dumping-cradle permitting the car to be turned upside down to discharge its load. The main advantage of this type of dumping apparatus is that it permits the use of cars of simple construction not weakened by hinged doors or bottoms.

The wheels of the mine-car run between the upper and lower arms of the curved rocker-irons *B* (Figs. 1 and 2), the lower arms forming a continuation of the track. The apparatus is so constructed that the axis *D* is below and back of the center of gravity of the loaded car, but above the center of gravity of the empty car. The dumping of the car and its return to a normal position are both automatic. A chain, not shown in the sketch, prevents the cradle from turning too far, and the catch permits the car to be held upside down till the load is completely emptied.

The body of the car is made of 3-16" boiler-plate, the sides and ends in four separate pieces, bent at the corners and riveted. The top edge is strengthened by a 3" piece of strap-iron ⅜" thick, riveted to side and ends. The bottom is attached to the sides by a piece of angle-iron riveted through flanges and placed inside the sides and ends and below the bottom-plate. The car-body is supported on two oak sills, 4"x8½" by 22" long. These raise the bottom of the car high enough to allow it to project over the wheels. This description was written by H. S. Munroe of New York, for the American Institute of Mining Engineers.

Mr. Edward F. Wiokes of the School of Mines, Columbia College, describes a dumping-cradle employed at the Chapin mine, Lake Superior. One disadvantage of dumping-cradles is that they are ordinarily fixtures and a separate cradle has to be erected at each dumping-place. This difficulty is overcome at the Chapin mine by the simple device of mounting the cradle on wheels. The iron ore cars are 6 feet 1 inch long, 3 feet 4 inches wide at the top, 2 feet 4 inches wide at the bottom and 2 feet 4 inches deep. The wheels of 8-inch radius, 3 feet gauge, are set 2 feet apart.

There are two 3-inch x 3-inch iron bumpers, 4 inches long, at each end of the car. The capacity of the car is two tons.

The endless wire-rope used for hauling the cars, moving about three-fourths of a mile per hour, is carried between the rails on grooved rollers.

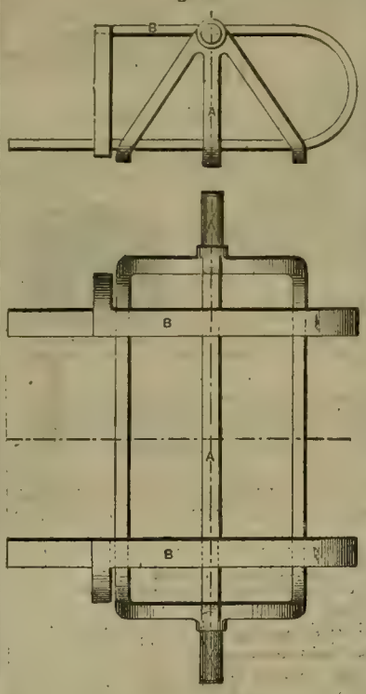
The cars are attached to the rope by a clutch or grip (Fig. 5), which extends seven inches below the car-bottom. The rope is gripped between a piece bolted to the car and a lever held in position by an elbow-joint.

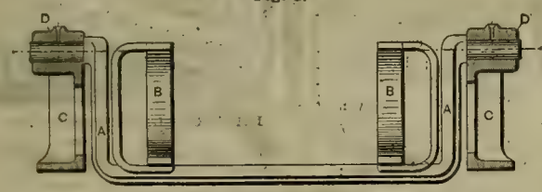
At 20 feet above the ground level a trestle about 120 feet long leads from the shaft-house to an ore-pocket. From about 25 feet in front of the shaft to directly over the ore-pocket extends the automatic dumping cradle, shown in Fig. 3, which is an end view, with the portion *a b* removed, and Fig. 4, which is a plan. The frame (8 feet 4 inches wide and 9 feet 8 inches long, made of 7½ inch x 2-inch channel beams with two four-inch I-beams of the same depth set across the frame 7 inches from each end) rests on four wheels of 8-inch radius, running on a track of 8 feet 11 inch gauge. The cradle proper consists of two iron rings 5 feet 4 inches outside diameter, 3 inches wide, and three-fourths inch thick, held apart by two angle-irons, so set that the horizontal distance between them shall be the width of the top of the car (See Fig. 3).

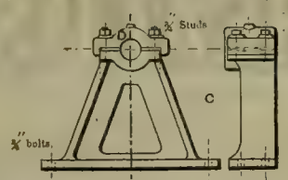
The track rails are carried on iron cross-pieces. The cradle, which is also strengthened by two iron rods diametrically opposite each other, rests between the I-beams, on four wheels of nine-inch radius, the axles of which are supported on bearings on the under side of the two end cross-beams. The distance between the centers of these wheels is such that the rails on the cradle correspond with the rails which project over and rest upon the frame when the cradle is in position to receive a car. The cradle is free to revolve on these wheels.

There is also a catch for the wheels of the car. Fastened to one end and revolving around the central axis of the frame, with the bearing shown in Fig. 4, is a square iron rod, which projects 18 inches beyond the side of the frame. On the end of this rod is a wheel five inches wide; and over the side channel bar is another wheel of the same size. The part of the rod between these two wheels is round. At a point on this rod opposite the end ring is a hinged piece which projects under a catch on the cradle-ring (see *D* and *E*, Figs. 6 and 7); the inner wheel is confined in an inverted U-shaped guide, fastened on the side channel and beam set inclined; a plank running lengthwise, on the other side of the frame, acts as a platform. An endless 5-inch wire rope, carried from each end of the frame over a system of pulleys to the engine-house, more than 750 feet away, moved the apparatus. The 12-inch x 36-inch Corliss engine, driven by compressed air, runs the truck at shaft *B* and the cradle at shaft *C*.

Fig. 2.







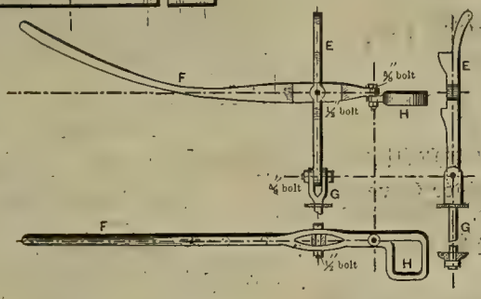


Fig. 1.

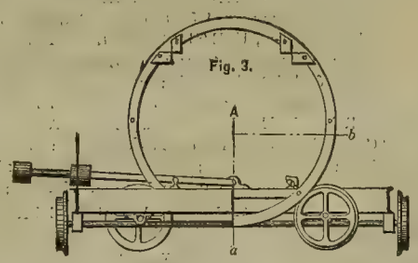
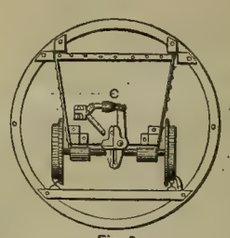
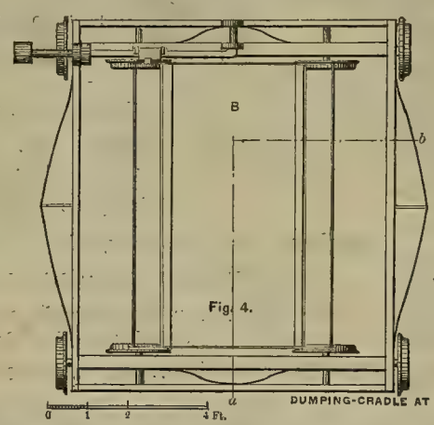
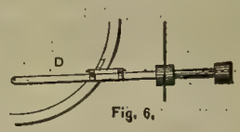




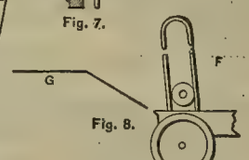


After the car is brought to the surface on the cage it is pushed off the cage and upon a truck 5 feet long, running at right angles to the track, and is then shifted to a track midway between the two cages. From this track it is pushed upon the cradle (the track projecting over and just clearing the cross-beams of the cradle-frame, and meeting the rails in the cradle). The cradle is now moved on its track until directly over the ore-pocket, at which point the wheel on the end of the rod projecting beyond the side of the cradle, strikes an incline *G*, Fig. 8 (the incline is not drawn to scale), which gives it a sudden upward movement and starts the cradle revolving. The center of gravity of the loaded car and cradle being above the axis of the cradle insures the completion of at least a half-revolution, which would dump the ore; but the momentum carries the cradle beyond this point. A workman, who always rides out on the platform of the frame, now rights the cradle, and it immediately returns to the shaft. The incline mentioned above is made of wood covered with a piece of inch half-round iron, which acts as a track.



Hydraulic Mining.

On page 373 is given a view made direct from a photograph of a hydraulic mine in one of the northern counties of the State. It is a typical scene and one that until a few years ago was common in many counties of California. The prevention of hydraulic mining in those sections where the resultant debris passes into navigable rivers has closed most of the mines, but in portions of Siskiyou and Trinity counties this class of mining is still carried on, no injury being done to any one by the debris. There are still many thousands of acres of auriferous gravel unworked in California. The banks in some cases are hundreds of feet high. Large expenditures are made to bring in a water supply, and the water is often allowed to flow down over these banks, as shown in the engraving, gold being concentrated from the gravel by the heavy volumes of water.



DUMPING-CRADLE AT THE CHAPIN MINE, LAKE SUPERIOR.

AUTOMATIC DUMPING-CRADLES FOR MINE CARS.

Bullion Production.

Report of the Director of the Mint.

Edward O. Leech, the Director of the Mint, has submitted to the Secretary of the Treasury a report on the operations of the mints and assay offices for the fiscal year ended June 30, 1889.

Deposits and Purchases of Gold and Silver.

The value of the gold deposited was $48,900,712.04, of which $31,440,778.93 consisted of the product of the mines of the United States, against $32,406,306 59 deposited during the prior fiscal year, indicating a falling off in the gold product of about a million dollars. Foreign gold coin and bullion were melted down of the value of $6,583,992.65.

The silver received aggregated 35,627,273 69 standard ounces of the coining value of $41,457,190.97. Of the silver received, 32,895,985 50 standard ounces of the coining value of $38,278,964.79 was classified as of domestic production. The silver purchased for the silver-dollar coinage during the year on offers to the Treasury Department aggregated 28,557,109.79 standard ounces, costing $23,998,763 47, an average cost of $0.9337 per ounce fine.

The average price of silver in London during the year was $0.9316 per ounce.

The total amount of silver acquired for the silver-dollar coinage, including small purchases and partings, aggregated 29,409,845.59 standard ounces, costing $24,717,853.81.

The profit on the coinage of silver dollars during the year was $9 370,062.20, and on subsidiary silver coins $32,987.65; total seigniorage, $9,403,049.85.

The total coinage of silver dollars under the "Bland" Act, to Nov. 1, 1889, was $343,638,001, and the total profit on the silver coinage to July 1, 1889, $57,378,254.18. The net profit (after deducting expenses for distribution and wastage) for the 11 years ended June 30, 1889, was $56,349,737.57. The number of silver dollars in circulation Nov. 1, 1889, was 60,098,480, and the amount held by the Treasury in excess of certificates outstanding was 6,219,577. The number of silver dollars distributed from the mints during the year was 14,141,319, an excess of 2,089 215 over the amount transferred in the preceding year. Forty-two million silver dollars were transferred from the Mint at Philadelphia and 8,000,000 from the Mint at New Orleans to the Treasury at Washington for storage during the fiscal year. The coinage executed at the mints was as follows:

COINAGE OF FISCAL YEAR 1889.

Denomination.	Pieces.	Value.
Gold	1,639,235	$25,543,910 00
Silver dollars	33,793 860	33,793,860 00
Subsidiary silver	6,477,134	721,686 40
Minor coins	51,516,861	906,473 21
Totals	93,427,140	$80,965,929 61

Gold and silver bars were manufactured as follows:

Gold	$22,241,121 42
Silver	6,709,246 13
Total	$28,950,367 55

Medals were manufactured at the Mint at Philadelphia as follows:

Gold	75
Silver	546
Bronze	188
Total	809

Gold bars were exchanged for gold coin, free of charge, principally at the assay office at

BOILER INSPECTION.—At the meeting of the Fire Committee of the Board of Supervisors this week, the order providing for the inspection of boilers was discussed. Ex-Supervisor Gibbs addressed the committee in opposition to the plan. He claimed that the order was superfluous and would in no wise prevent the explosion of boilers and the consequent loss of life. The only result its passage would achieve would be to entail unnecessary expense upon local manufacturers. F. Dundon said that he was not opposed to the principle of the order, but desired to see it amended. He suggested that the aspirants for the position of inspector should be examined by a committee of nine persons, comprising three boiler-makers, three machinists and three steam-users, the committee to be appointed by the Board of Supervisors. He also objected to the exemption of insured boilers from the provision of the order. Arguments in favor of the order were made by representatives of the National and Pacific Coast Associations of Stationary Engineers, after which the committee decided to lay the matter over for a week for further consideration.

FRANK A. HUNTINGTON is sending his Huntington quartz-mills to Australia by every steamer. He is also selling a number of them in Mexico.

New York during the year, mainly for export, of the value of $57,507,812,42.

The Director sets forth at some length the causes of the recent large movement of gold from the United States.

Appropriations and Expenditures.

The amount appropriated for the support of the mints and assay offices during the fiscal year was $1,095,650, of which $994,989.71 was expended. In addition there was expended from the appropriation for the coinage of the standard silver dollar $224,155.05, and from an unexpended appropriation $116.60, making the total expenditures $1,219,261.36.

The net expenditures of the refineries was $153,022.12, against earnings amounting to $130,755.91. The total earnings of the mints from all sources amounted to $10,351,701.47, and the total expenditures and losses to $1,502,665 60, leaving the net profits for the year, $8,849,035.87.

Imports and Exports of Gold and Silver.

Imports: GOLD.		
Foreign bullion	$ 1,705,450	
Foreign coin	7,175,789	
Foreign ores	87,287	
Total foreign	8,968,526	
United States coin	1,403,619	
Total gold imports		$10,372,145
Exports:		
Bars	$50,786,393	
Domestic coin	4,143.939	
Domestic ores	80,961	
Total domestic	55,011,293	
Foreign bullion re-exported	31,933	
Foreign coin re-exported	4,990,020	
Total foreign	5,021,953	
Total gold exports		$60,033,246
Imports: SILVER.		
Foreign bullion	$ 5,713,049	
Silver in foreign ores	6,004,165	
Foreign silver coin	12,687,823	
Total foreign	24,405,037	
United States coin	277,343	
Total silver imports		$24,682,380
Exports:		
Domestic bullion	$25,217,903	
Domestic coin	66,759	
Total domestic	25,284,662	
Foreign coin re-exported	11,373,972	
Foreign bullion and ore re-exported	58,149	
Total foreign	11,432,121	
Total domestic and foreign		$36,716,783

Loss of gold and silver to the United States by export, 1889:

Gold	$49,661,101
Silver	12,034,403
Total	$61,695,504

The imports of silver-lead ores into the United States during the fiscal year amounted to 118,322 tons containing 58,679 609 pounds of metallic lead, valued at the custom-houses at $931,229, and silver $4,871,116.

The director estimates the metallic stock of the United States to have been on July 1, 1889:

Gold	$680,063,505
Silver	420,548,929
Total	$1,100,612,434

The amount of paper and metallic money in circulation in the United States (outside of the Treasury) on July 1, 1889, was $1,380,413,091, against $1,372,240,256 at the close of the preceding fiscal year, an increase in the circulation of $8,177,835.

The total metallic stock on Nov. 1, 1889, was estimated to have been:

Gold	$684,194,686
Silver	431,184,953
Total	$1,115,379,639

The consumption of gold and silver in the United States in the industrial arts for the fiscal year is estimated to have been:

Gold	$16,000,000
Silver	8,000,000
Total	$24,000,000

Of the gold, about $10,000,000 represented new product used for industrial purposes.

The product of gold and silver in the United States for the calendar year 1888 was:

	Fine ounces.		Value.
Gold	1,604,841		$33,175,000
		Com'l value.	Coining value.
Silver	45,783,632	$43,000,000	$59,195,000

The product of gold and silver in the world for the calendar year 1888 was:

		Value.
Gold		$105,894,150
	Commercial value.	Coining value.
Silver	$103,556,000	$142,439,150

The coinage of the world for the calendar year 1888 was:

Gold	$134,720,639
Silver	149,737,442

Deducting recoinages reported as the coinage of Mexican dollars, the net coinage approximated:

Gold	$109,000,000
Silver	95,000,000

Of the latter, about 80 per cent was full legal tender coins executed by the mints of the United States, India and Japan.

The director recommends legislation looking toward the discontinuance of the coinage of the $3 and $1 gold pieces and the 3-cent nickel piece, and the withdrawal from circulation of pieces of those denominations now outstanding.

The report is replete with interesting statistics as to the coinage, production and movement of the precious metals in the principal countries of the world.

The Pittsburgh Boiler Scale Resolvent.

☞This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one **is the only good thing we have ever used.** Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as **sulphate of lime, carbonate of lime, mud, and everything that is bad.** Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Allegheny Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern; Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

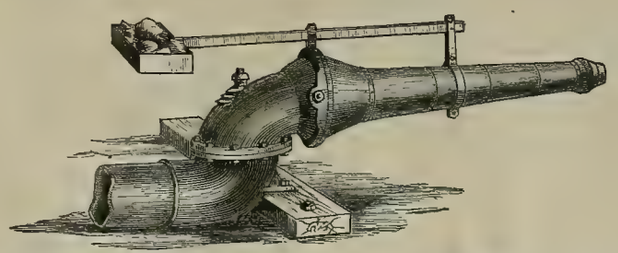
{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }

FOR SALE ONLY BY

TATUM & BOWEN,

Sole Agents for the Pacific Coast,

Dealers in Improved Wood-Working Machinery,



Saw Mill Machinery, Engines, Boilers, Iron-Working Machinery, Supplies, Etc.,

Sole Agents for Hoe Chisel-Tooth Saw, Gardner Governor, Schultz Leather Belting, Etc., Etc.

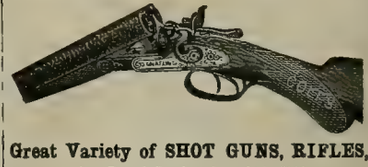
PRACTICAL

Books on Mining AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warnford Lock. 788 pages, with 8 plates and 271 engravings in the text. 4to, cloth, $15.00, express prepaid.



IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Ross. This work embodies the information, collected during four and a half years, of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrages, flood protection, methods of regulation, locks, etc., have been treated in detail. 367 pages, large 8vo, with 26 plates and numerous engravings in the text. Price $15.00, express prepaid.

MEXICAN MINES.—Dahlgren's Historic Mines of Mexico, *only a few copies left;* price $25.00. Handbook to the Historic Mines of Mexico, price $1.00.

Descriptive Catalogue and Circulars of Books relating to Assaying, Mining, Electricity and Mechanical Engineering, sent free on application.

414,608.—GROUND-BONE FURNACE—E. Urbain, S. F.
414,346.—LAWN IRRIGATOR—W. Wainwright, S. F.

The following brief list by telegraph, for Nov. 13, will appear more complete on receipt of mail advices:

California—Ulrich Bachmann, St. Helena, cartridge loading machine; Guy W. Campbell, San Jose, assignor of one-half to J. Wood of Chico, fruit-pitting machine; Arthur H. Dauchy and P. Roberts, San Diego, pocket-folding rule; Frederic Euphrat, San Francisco, sight-exhibiting machine; Joseph R. Finney, National City, assignor by mesne, assignment of one-half to overhead conductor electric railway company, Pittsburg, Pa., electric locomotor; Benjamin Kenoyer, Huron, propelling mechanism for boats; Henry G. Kraspy, E. E. Lummatzsch and J. Kneffer, assignors to Golden Gate Automatic Street and Station Indicator Co., San Francisco, automatic station for railway cars; Laura S. McDonald, St Helena, easel; James P. Mighell and F. E. Gladwin, San Francisco, type-writer drop cabinet; John L. Stevens, assignor to Stevens' Fruit-Packing Case Co., fruit-packing case. Oregon—James W. Green, Albina, saw-filing machine. Washington—George W. Ansley and C. J. Schenck, Medical Lake, combination tool for carpenters' use.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DEVICE FOR SUPPLYING AND MEASURING AIR FOR CARBURETORS—Edgar B. Badlam, S. F. No. 414,276. Dated NOV. 5, 1889. This is a machine for proportioning the mixture of air and hydrocarbon gases. It is employed in connection with carburetors in which an inflammable vapor or gas is produced by passing air through light gasoline or naphtha, this vapor, when properly mixed with atmospheric air, being suitable for illuminating purposes. It is a well-known fact that vapor produced from the liquid, when air is first passed through it, is very much richer and stronger than it is after a considerable amount of vapor has been taken away; and that in order to properly burn this vapor and make an equable and steady light it is necessary to mix a suitable proportion of air with the vapor, this proportion of air being greater as the vapor is richer and being reduced as the vapor becomes more impoverished. The object of this invention is to provide an apparatus by which a variable amount of air may be accurately supplied to the carburetor, and another volume simultaneously mixed with the vapor after this has been produced from the carburetor, the amount being increased in one instance in proportion as it is decreased in the other.

COIN-OPERATED PUNCHING OR STRIKING MACHINE.—G. F. W. Schultze, Alameda. No. 414,330. Dated Nov. 5, 1889. This is one of that class of machines which normally remain inoperative but are called into action by the operation of a coin deposited in a suitable receptacle in connection with the machine. The machine is intended for testing the striking or punching power. It consists in a hinged swinging padded flap, adapted to receive the blow, a spring or springs for resisting the force of the blow and controlling the movement of the flap, a register, and a connection between the register and the flap whereby the amount of its movement is determined, a locking device for holding the flap normally inoperative, and a tripping mechanism adapted to be operated upon the deposit of a suitable coin whereby the flap is allowed to come to an operative position. The patent also covers various minor details of construction and arrangement.

TWO-WHEELED VEHICLE.—Wilfred Page, Penns Grove, Sonoma Co. No. 414,439. Dated Nov. 5, 1889. This is one of that class of two-wheeled vehicles commonly known as "carts." The improvement consists in the novel connection and arrangement of parts, the object of which is to provide a cart in which the "horse motion" is obviated, so that the vehicle becomes an easy-riding, practical conveyance.

PULLEY.—Wm. J. Gorham and Marcellus A. Graham, S. F. No. 414,307. Dated Nov. 5, 1889. This improved construction of pulleye is more especially adapted for use upon small pulleys which receive a belt from a much larger one for the purpose of producing high speed, such as are used upon planing machines, generators for electric-lighting purposes and other machinery. In the use of very small pulleys it is almost impossible to prevent the belt from slipping and so causing irregular work. In this invention the pulley is composed mainly of what is known as "fibrous stock," which forms the exterior surface and body, and in connection therewith is employed a spider or core of iron or other metal, which forms a center, and a peculiar means for uniting the two together. A pulley made in this peculiar way presents a surface which will hold the belt so strongly that it will slip upon a large driving pulley sooner than it will upon this small pulley. The corrugated or channeled surface of the core prevents the material from crawling or working loose, as is the case where pulley-covers are placed upon the ordinary smooth pulleys.

COAL-DUST FEEDER.—Edmond Pait, Berkeley, assignor of two-fifths to B. C. Turner, S. F. No. 414,322. Dated Nov. 5, 1889. The operation of the feeder is as follows: The coal having been previously pulverized, is deposited in the hopper, and by the action of stirrers is fed positively into a communicating pipe. The blower draws in air through the inlet pipe, and said air passing through a portion of its course within the smokestack is thereby heated, and, being driven out through the discharge pipe of the blower, creates a suction in the communicating pipe and carries the powdered coal or dust with it through the discharge pipe and the branches thereof into the nozzles, by which it is discharged into the fire-box from each side. Here the heavier particles, dropping on the grate-bars, soon accumulate and keep the fire alive, while the dust igniting at once, furnishes the necessary heat for the boiler. After steam is first gotten up, which can be done quickly by this device, the operation is continuous.

PUMP.—John Bean, Los Gatos, Santa Clara Co. No. 414,667. Dated Nov. 5, 1889. This invention consists in a novel improvement in the plunger, a novel improvement in the bottom or check-valve, and a novel improvement in the outlet from the cylinder and plunger in connection therewith.

ANIMAL GUN.—W. C. and Stanton Foreman, Bidwell's Bar, Butte Co. No. 413,306. Dated Nov. 5, 1889. This invention relates to that class of guns for killing gophers, ground-squirrels, moles and other burrowing animals, in which the hammer is released by the action of a trigger-connection projecting in front of the muzzle of the gun and into the burrow and path of the animal. The object of the invention is to provide a simple and effective gun which, though adapted for killing larger animals, is especially intended for burrowing animals, such as gophers, moles, etc.

WOOD-SAWING MACHINE.—Milon W. Lipe, San Jose. No. 414 421. Dated Nov. 5, 1889. This is a machine for sawing wood into short lengths and carrying away the severed lengths as fast as they are cut off.

TRUSS.—Charles E. Bigelow, S. F. No. 414,281. Dated Nov. 5, 1889. This invention consists in the combination with a suitable frame and a pad for the relief of femoral hernia, and the novel connection of said pad with the frame, whereby the latter is guided, directed and held well in place. The object is to provide a simple and effective truss for the relief of femoral hernia, said truss being incidentally adapted also for the relief of inguinal hernia when required.

LAWN IRRIGATOR.—Wm. Wainwright, S. F. No. 414,346. Dated Nov. 5, 1889. This improved adjustable lawn irrigator consists of a socket having one or more discharge openings, either vertical, horizontal, stationary or rotary, and a means for adjusting and regulating said openings. The adjustments of the sleeves will also increase or diminish the amount of water which will be thrown by the arms.

CABLE CAR STOPPER.—Ferdinand Espel, S. F. No. 414,304. Dated Nov. 5, 1889. The object of this invention is to automatically stop a cable car; this result being effected upon contact with an obstructing body of any kind, whereby injury to the said body or to the car or to the passengers in the car may be prevented.

Thanksgiving.

The Governor of the State has followed usage and President Harrison's example by issuing the following proclamation:

STATE OF CALIFORNIA,
EXECUTIVE DEPARTMENT.

To all to Whom the-e Presents shall Come, Greeting:

In accordance with the time-honored custom that one day in each year be set aside and devoted to prayer and thanksgiving to the Almighty Creator and Ruler of the Universe for the manifold blessings He has vouchsafed the people of these United States of America, I hereby appoint Thursday, Nov. 28, 1889, as such day, requesting the people of this State to abstain from all their usual vocations and consecrate that day to the worship of God.

In witness whereof, I have set my hand and caused the great seal of the State to be hereunto affixed, at the city of Sacramento, on this the eighth day of November, Anno Domini one thousand eight hundred and eighty-nine.

R. W. WATERMAN, Governor.

Attest: W. C. HENDRICKS, Secretary of State.

Mining Personals.

R. W. Waterman, Governor of California, on being asked if the anti-debris decision would ever be overcome and the miners allowed to work gold out by hydraulicking, said: "I have given that matter a good deal of attention. I am an old prospector myself, and labored four years with the pick and shovel after I came here. It is my idea that the only solution of the silt problem is to build great flumes high up on the Feather, Yuba and American rivers, and let these flumes bear the debris far below to the swamp lands and deposit it there. In two or three years, by exposure to the air, the debris would become fertile and thus gold-mining could go forward while large areas were reclaimed. The rivers would not get filled up, and thus good would result to everybody. This is the solution of the problem that I have thought of. There should be some means to relieve the miners, and flumes seem to be what should be adopted. The miners are loyal to the State's interests in every way. They won't employ Chinese at all, and in many of the mountain regions you won't see a Chinaman within a hundred miles."

Work on the Alexander mine at Grantsville, Nev., is pushed with energy, under the superintendence of Thos. Mitchell.

Major E. A. Burke is on the way from New York with Wm. Hodding, agent of the Rothschilds, and mining engineers Douglas, Brown and Phillips, for San Francisco, and from here will go to Honduras to work mines owned by an English company. Eugene A. Tucker of this State will accompany the party and have charge of the placer mining operations. It is said 2000 native laborers will be employed by the London companies. The party will sail from here to Amalpa, on the Pacific Coast of Honduras, and thence proceed to Juticalpa, the nearest town to the mines.

Major Frank McLaughlin of the Golden Gate river mine, Butte county, has gone East on his way to London. The English owners are anxious to know details of the recent disaster by which the flood carried away the dam. A great part of the flume was saved, however. The dam will be rebuilt next season.

Assessment Notices.

Gray Eagle Mining Company, Location and principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 16th day of October, 1889, an Assessment, No. 15, of Six (6) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, Room 11, No. 303 California St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of November, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 10th day of December, 1889, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.

J. M. BUFFINGTON, Secretary.

Office, Room 11, No. 303 California St., San Francisco, California.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

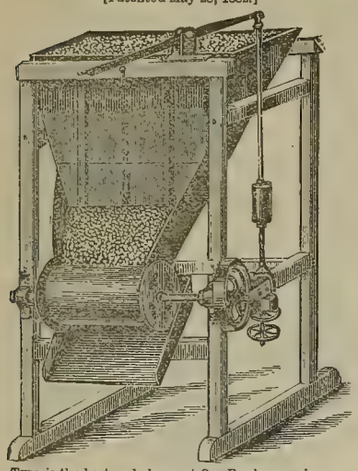
IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

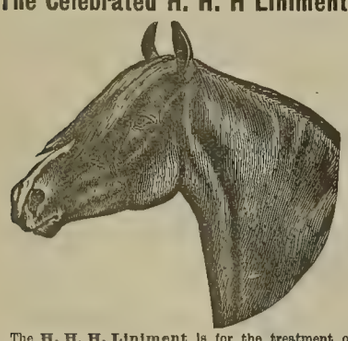


These Plates can also be purchased of **JOHN TAYLOR & CO., Corner First and Mission Sts.**

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

THE ROLLER ORE FEEDER



[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

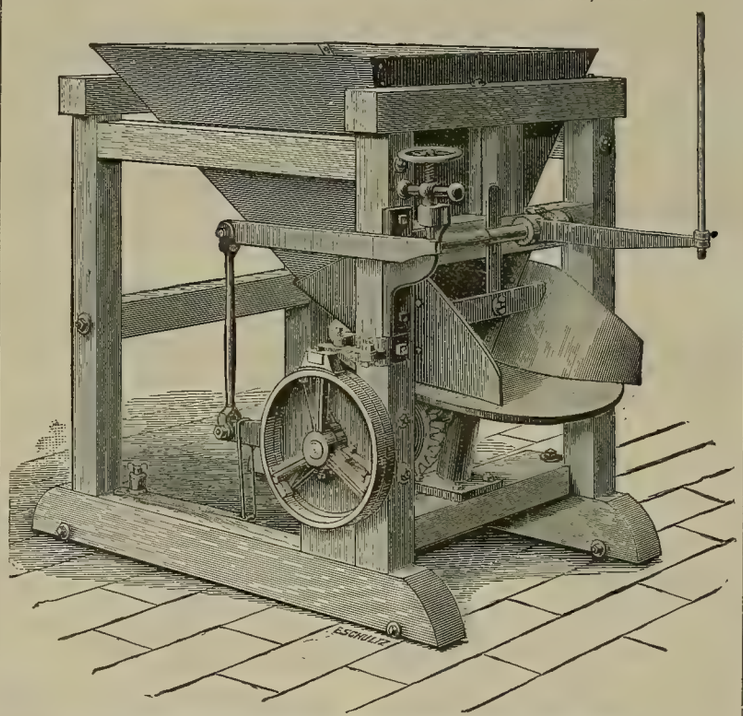
Golden State and Miners' Iron Works,
Sole Manufacturers,
827 First Street, San Francisco, Cal.

The Celebrated H. H. H Liniment.

The **H. H. H. Liniment** is for the treatment of the Aches and Pains of Humanity, as well as for the ailments of the beasts of the fields. Testimonials from importers and breeders of blooded stock prove its wonderful curative properties. No man has ever used it for an ache or pain and been dissatisfied.
H. H. MOORE & SONS, Stockton, Cal., Proprietors.
FOR SALE BY ALL DRUGGISTS.

FOR SALE.

One 10x13 inch Clayton Belt Air Compressor.
One 8-inch Sergeant Drill.
One 6-ft. Double Screw Drifting Column with Arms.
One 4-ft. Single Screw Stoping Bar.
One 8½x13 ft. Air Receiver.



The above are in first-class condition and will be sold cheap. For price apply to the PAYMASTER MINING CO., Yuma, Arizona Territory.

"WITTER'S SPRINGS." 16 miles from Lakeport, 20 miles east of Ukiah. Comfortable Hotel. Quiet Cabins. Lovely Scenery. Low Charges. Its waters are a sure cure for Dropsy, Scrofulous and Skin Diseases, Rheumatism, etc. Address **H. L. DENIO, Upper Lake.**

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.

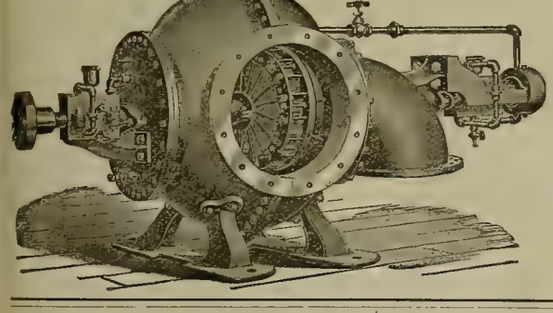
Adapted to heads running from 20 up to 2,000 feet.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS



Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

120 FIRST ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 14, 1889.

General trade continues fairly active. Iron-workers and manufacturers in general are doing a fair business, but in 1890 they look forward to a large increase in orders. The money market shows continued ease under free remittances from the interior, and only a slight outward flow of coin. The growing ease in the European and Eastern money centers is an important factor in producing ease with us.

The British steamer Arabic, hence Nov. 9th, for China, etc., carried the following shipments of treasure:

TO HONGKONG.

Chinese, Mexican dollars	$163,443 00
Chinese, gold coin	46,470 00
Chinese, gold dust	1,596 00
Anglo Californian Bank, Mexi an dollars	185,000 00
Hongkong and Shanghai Bank, Mexican dol.	370,000 00
Hongkong and Shanghai Bank (bullion)	250,000 00
Total	$1,015,509 00

MEXICAN DOLLARS—Following the sailing of the last steamer for China, the market has been quiet, with a slight shading in prices, quotable at 77c. The advance in silver bullion, no doubt, caused freer buying by the Chinese last week, but at the close they are holding off.

SILVER—The market after advancing in London to 43 15-16d, fell back yesterday to 43 11-16d. This decline was generally expected after so rapid an advance, but well informed financiers look for still higher prices. Their views coincide with the writer's, which are based on the following: Increased prosperity and more general activity in trade in Europe calls for an increased metallic currency, which is naturally met by the issuing of smaller silver denominations so as to pay off the working hands. The minting of silver brought the English Government in the market as a buyer of the bullion. This, with the demand from the East Indies, caused a livelier buying competition. The English Government is paying off its employes in silver, so as to retain in bank as much gold as possible against the heavy withdrawal of that coin from the European center for shipment to Brazil and other countries. As stated last year by the writer, India's Council bills will lessen each year, which will have to be met by heavier purchases of silver. Russia's improved financial standing takes out of the market the rouble, and it will also cause that country to coin more freely in the near future. A renewal for six years of the "Latin Union" has a strengthening effect on silver, as has the favorable effect of the agitation in this country on the silver question. It is now generally accepted that the incoming Congress will authorize the minting monthly of $4,000,000 of silver, and possibly legislate still further in the interest of the metal. The bugaboo raised by some of a very large increase in the silver mined in the event of higher prices for the bullion is nonsensical, and evidently put out so as to boom what is called outside mining stocks. It would surprise many of these theorists if one or more outside districts should develop a large body of rich-paying gold quartz, and that the Comstock's ore gave a much larger percentage of gold than of silver.

In connection with the above we give the following just to hand from New York: "Great Britain is beginning to feel the necessity of doing what is possible to prevent further depreciation of gold, and has begun calling in all the half sovereigns, with the intention of replacing them with silver, so that there will be no gold coin of a value less than a sovereign."

London cables came through to-day at 43⅝ to 43 11-16d. In our market there is a good inquiry with buyers naming 95¼c, but sellers say 96c is obtainable. The supply is light, owing to the market having been well cleaned up for shipment on the last outgoing China steamer.

QUICKSILVER—The market is strong at an advance, with more business doing. Receipts the past week aggregate 435 flasks, and exports, 127 flasks to Mexico.

BORAX—Receipts the past week aggregate 242 ctls., and exports by sea 400 ctls. to New York and 115 lbs. to Mexico. The market is very strong at unchanged quotations.

LIME—Receipts the past week aggregate 7805 bbls. and the exports by sea 800 bbls. to Honolulu. With improved weather the consumption shows a large increase.

TIN—The market for both plate and pig is quiet but strong. European advices report a strong and active market, due chiefly to the advance in iron having stimulated the movement. China is still said to be a large buyer. During the past week the imports aggregate 250 boxes plate by railroad from the East.

LEAD—The market is reported unchanged. There was a stronger feeling under an advance at the East, but at the close it is easier. Several large parcels are reported to have been closed out at the East.

COPPER—The market is very strong in sympathy with higher markets in Europe and at the East. The strength of the market while in part due to more attention given to the metal since the boom in iron, is more directly owing to the large increased consumption throughout the world. This is reflected in the lessened visible supply, which was on Nov. 1st, 2561 tons less than on Oct. 1st. Present advices warrant the assertion that the visible supply will be largely reduced this month. Chili is resuming shipment, the advance in copper allowing shippers to pay the increased freights.

IRON—Imports the past week aggregate 100 tons from Irondale. The local market is quiet but strong at an advance. Importers claim that further advances can be looked for in the near future. Eastern advices report orders booked into February, with all consumers buying freely. The sales of Lake Superior iron ore up to Nov. 1st aggregate about 1,000,000 tons more than for the like time in 1888. English mail advices report a strong and active consumptive market, while later advices by cable report that a jump in prices caused more or less of a panic with large consumers who had ships on the stocks.

The following are the latest comparative quotations f. o. b. at Glasgow:

	Nov. 6, '89.	Oct. 30, '89.
F. o. b. Glasgow.		
No. 1 Coltness	75s	76s
" Langloan	75s	75s
" Summerlee	75s	75s
" Gartsherrie	76s	75s
At Ardrossa.		
No. 1 Eglinton	62s 6d	61s
" Glengarnock	75s	75s
" Dalmellington	62s 6d	62s

COAL—Imports the past week were as follows: From Coos Bay, 1750 tons; Nanaimo, 3004; Seattle, 7266; Sydney, 7197; Overland, 40; Departure Bay, 2400; Tacoma, 2700; Iquique 629; Newcastle, N. S. W., 11,224. Total, 36,210 tons. Cannel coal has been advanced, but other kinds are unchanged, with perhaps a slightly easier tone ruling for household. The weather, while favorable for steam coals, is against household coals. There are conflicting reports regarding the stock in the yards, but the general advices concur in stating they are only fair; while consumers are reported to have bought more freely than usual. Unless severe cold weather sets in soon, it is thought that coast coals will shade off some.

Eastern Metal Markets.

By Telegraph

NEW YORK, Nov. 14, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	43⅛	95½	$12 00	$3 92½	$22 15
Friday	43 15-16	95½	12 10	3 92½	22 10
Saturday	43 15-16	95½	12 10	3 92½	22 10
Monday	43 15-16	95½	12 25	3 92½	22 15
Tuesday	43 15-16	95½	12 50	3 87½	21 95
Wednesday	43 11-16	94½	12 75	3 82½	21 90

NEW YORK, Nov. 13.—Borax steady, with a fairly free supply. Quicksilver quoted at 68@69c; good market. Copper has a boom, closing strong at an advance. About 1,500 000 pounds of Lake Superior ingot sold during the week at 11½@12¼c. The latter price is now bid for both near and distant futures. Of the casting brands the sales reach as great if not a larger total, at prices ranging from 10¼@11¼c, considerable Arizona bringing 10⅞@11¼c. Pig lead partakes of the general activity pervading the metals. Spot, $3.90 bid. Sales, 2000 tons. November and December, $3.85@3.90; January to April, $4.02½. At the close the market is easier.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Mining Share Market.

The mining share market for the Comstocks showed general activity up to the close of business on last Saturday, but for the remainder of the week under review trading was exceedingly light. The market has had, throughout the week, every indication of going to pieces, giving comfort to the short interest and carrying consternation to the longs, particularly those on a margin. As yet, the long-talked-of and very generally expected setback from 10 to 20 per cent from last Saturday's prices, has not materialized. There is no doubt but many outsiders sold in expectation of it, while others are waiting for the lower prices so as to buy. The action of the market warrants the assertion that a master hand is at the helm, for a more puzzled lot of outside dealers has seldom been seen. It acts as if the manipulators had been studying to advantage one of ex-United States Senator Fair's successful deals of days gone by. To guess his deals or tell where an ore development would be made, the very best were more often wrong than right. There can be no doubt but the pool has taken in large lines of stocks, and when they have all they want to make a successful upward move without expending many twenty-dollar pieces, a small ore development is likely to be made, so as to peddle out the stock on those of the public who avoid assessments and buy at higher prices for expected dividends. In outside stocks the Tuscaroras, under the leadership of North Belle Isle and Nevada Queen, made an upward move of about 50 per cent, but soon fell back. It now looks as if the upward move is not through with, for not enough stock has as yet been peddled out, although if many outsiders buy at the setback for another decided upheaval in prices, the stocks may sink to a lower level and not recover before next spring. The other outside stocks were lifeless, owing to assessments falling due and the fears of others to be levied. The Bodie officials appear happy, as the stock has been assessed, which insures the regular payment of their salary, provided the public pays it. Mono is to be assessed soon, probably when Bodie's becomes delinquent.

From the mines reliable private news is hard to get. The scarcity of information, only such as is obtainable from official reports, from the Comstocks has heretofore been a forerunner of a deal in their stocks. Official news from Consolidated Virginia reports lower assays for the ore, which causes the bears to rejoice. Our own advices are confirmatory that higher grade ore can be milled if it is desirable. In Union another west crosscut has been started on the 1465-foot Ophir north drift. It looks as if the managers of the north end mines are thoroughly prospecting the body of ore lying to the west. This ore, it is said, they first found in Sierra Nevada in 1878, afterward they found it in Belcher, then in Crown Point, then in Mexican, afterward in Alpha, and are running for it in Yellow Jacket, Challenge, Confidence and Consolidated Imperial. In the last three mines west crosscuts are being run on the 300, 500 and 800 levels. In Crown Point and Belcher important work to the west is under way. The former mine is shipping ore to the mill for reduction, and assays, so private advices report, over $20 a ton. Well-informed miners are watching with close interest the work going on in and around the Ward shaft, looking to the more thorough development of Potosi, Bullion, Exchequer, Julia and Alpha. The ore milled by the Hale & Norcross assays over $31 a ton and that of Savage over $25 a ton.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

SAN FRANCISCO MANUFACTURING AND IMPROVEMENT CO., Nov. 13th. Capital stock, $100,000. Directors—J. K. Luttrell of Sonoma county, J. W. McDonald, J. J. Scrivner, A. A. Hoyt, E. P. Fish, all of this city, and A. J. Meany of Merced.

KASLUK RIVER SALMON CO., Nov. 13th. Object, to catch and can salmon, also, to mine for gold, silver and coal. Capital stock, $500,000. Directors—T. M. Antisell, Jr., A. J. Rhorer, A. A. Hoy, C. M. Arnold, H. Hoyt, J. M. Day, J. N. Miller, W. B. Benchley, J. F. Harris, J. G. Steele and H. O. Clark.

THE city of Canton, China, is to be lighted by electricity. The plant has been shipped from this city—the first one ever sent to China.

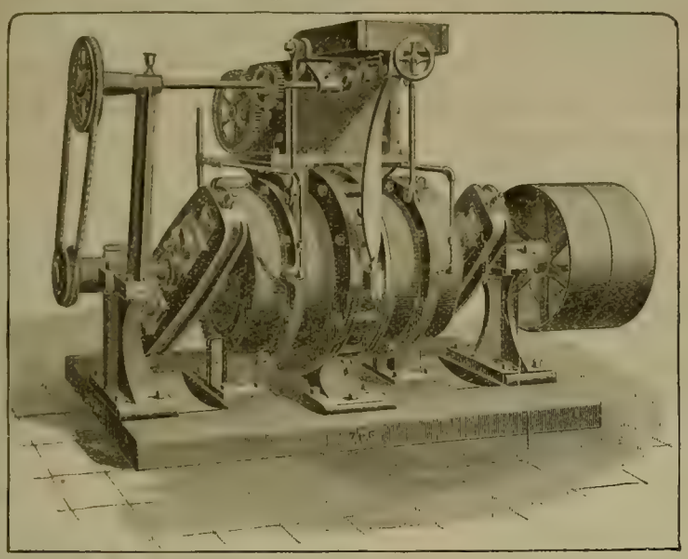
Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.



J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
M. D. SHRADER—Santa Clara and Santa Cruz Cos.
GEO. WILSON—Sacramento Co.
E. H. SCHAEFLE—Calaveras Co.
DR. W. F. DRAKE—Sonora, Cal.
J. H. CROSSMAN—Inyo and San Bernardino Cos.
H. KELLEY—Modoc and Lassen Cos.
C. EDWARD ROBERTSON—Humboldt Co.
H. B. PARKER—Tehama and Shasta Cos.
FRANK S. CHAPIN—Sierra and Butte Cos.
H. G. PARSONS—Central California.
WM. H. HILLEARY—Oregon.
JUAN C. JENS—New York City.
E E. DEMING—Oregon,
W. B. FROST—Monterey and San Luis Obispo Cos.

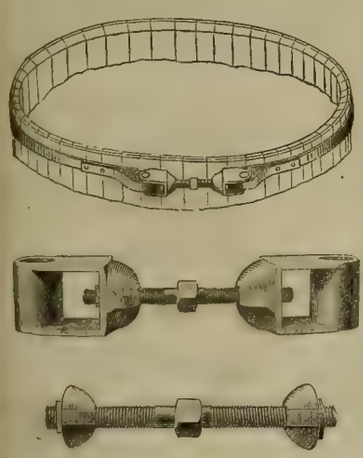
Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS



And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

PATENT BAND COUPLING.

Best Band Coupling in the World.

Most Simple in Application.

Most Powerful—Cheapest.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞ Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

Kodak a Camera with which any one can take pictures. The operation consists merely in pointing the Camera, and pressing a button. The picture is recorded instantaneously on a strip of sensitive film, which may be removed and sent by mail to the San Francisco or Portland agency to be finished by experts. A new spool of film, for 100 pictures (costing only $2), may be inserted by any one. Thus no knowledge of Photography on part of user is necessary. Amateurs may finish their own pictures, if so desired. The Kodak loaded ready for taking 100 pictures, weighs only 1 lb. 10 ounces, inclosed in sole-leather carrying case, with shoulder-strap, and is no larger than a field-glass. Will photograph anything, still or in motion, indoors or out. Invaluable for securing photos of every-day home incidents—children in natural positions and at play, pet or fine animals. For those traveling it offers many inducements possessed by no other instrument, as it is much smaller than any other Camera producing pictures of equal size, and the only Camera which can be carried by any one, anywhere, and at all times, without hinderance. Send 2 cent stamp for Kodak "Primer" with sample Photograph.

A New and Splendid Technical Treatise.

The Manufacture of

VINEGAR AND ACETATES,

CIDER, AND FRUIT-WINES;

Preservation of Fruits and Vegetables.

JUST READY.

A Practical Treatise on the Manufacture of Vinegar and Acetates, Cider and Fruit-Wines; Preservation of Fruits and Vegetables by Canning and Evaporation; Preparation of Fruit Butters, Jellies, Marmalades, Catchups, Pickles, Mustards, etc. Edited from various sources by Wm. T. Brannt, one of the editors of "The Techno-Chemical Receipt Book." Illustrated by 79 engravings. In one volume, 8vo, 473 pages.

Price $5.00, by mail, free of postage, to any address in the World.

CONTENTS. PART I. The Manufacture of Vinegar. CHAPTER I. Introduction. II. Theory of the Formation of Vinegar. III. The Vinegar Ferment and its Conditions of Life. IV. Products of Acetous Fermentation. V. Methods of Fabrication of Vinegar. VI. Quick Process of Fabrication of Vinegar. VII. Arrangement of a Vinegar Factory. VIII. Artificial Ventilation of the Vinegar Generators. IX. Automatic Vinegar Apparatus. X. Operations in a Vinegar Factory. XI. Preparation of the Alcoholic Liquid. XII. Execution of the Work in a Vinegar Factory. XIII. Disturbing Influences in the Fabrication of Vinegar. XIV. Method of the Fabrication of Vinegar in Apparatus of Special Construction. XV. Further Treatment of Freshly Prepared Vinegar. XVI. Preparation of Vinegar from Various Materials. XVII. Preparation of Vinegar Specialties. XVIII. Fabrication of Wine Vinegar. XIX. Chemical Examination of the Raw Materials and Control of the Operation in a Vinegar Factory. XX. Examination of Vinegar as to the Presence of Foreign Acids and of Metals, as well as to its Derivation. XXI. Manufacture of Wood Vinegar. XXII. Preparation of Pure Concentrated Acetic Acid. XXIII. Acetates and their Manufacture.

PART II. Manufacture of Ciders, Fruit-Wines, etc. CHAPTER XXIV. Introduction. XXV. Fruits and their Composition. XXVI. Practice of the Preparation of Cider and Fruit-Wines. XXVII. Cider from Apples and Pears. XXVIII. Fruit-Wines; *a*, from Small Fruits; *b*, from Stone Fruits.

PART III. Canning and Evaporating of Fruit, Manufacture of Catchups, Fruit Butters, Marmalades, Jellies, Pickles, and Mustards. CHAPTER XXIX. Preservation of Fruit. XXX. Evaporation of Fruit. XXXI. Preparation of Pickles and Mustards. Appendix of XVI Tables. Index.

☞ *An illustrated circular, 6 pages, 4to, giving the full Table of Contents of this volume, will be sent free of postage to any one in any part of the world who will apply by letter.*

IMPROVED BELT FRUE ORE CONCENTRATOR

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

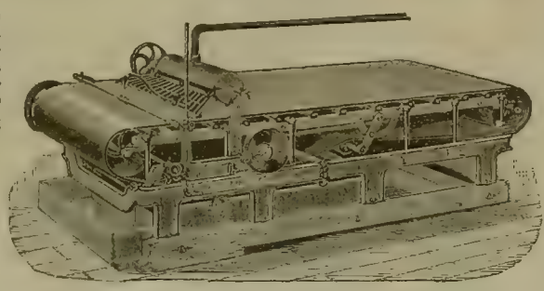
For Pamphlets, Testimonials and further information apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 41 additional Frues and more stamps have been purchased. ADAMS & CARTER.



ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

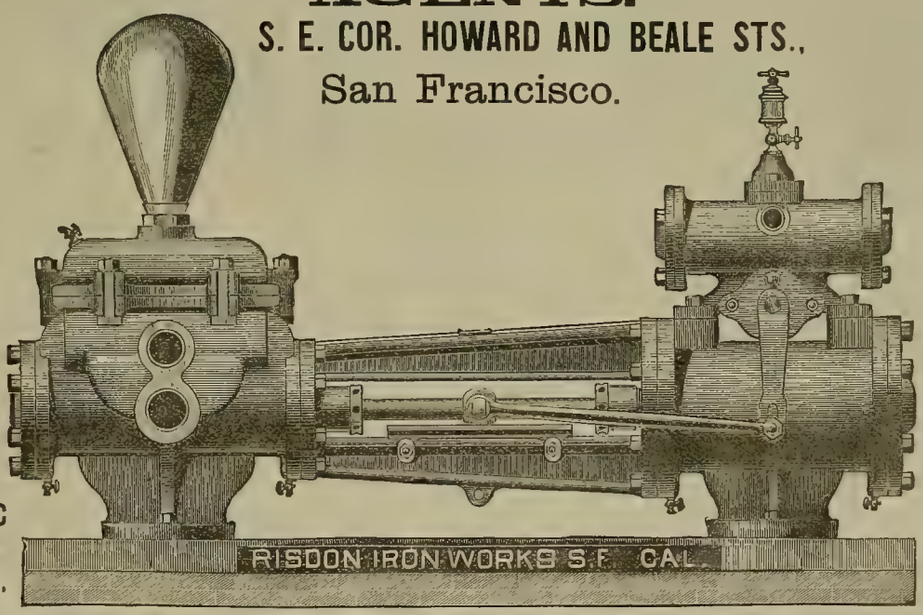
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Emipre Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.



At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

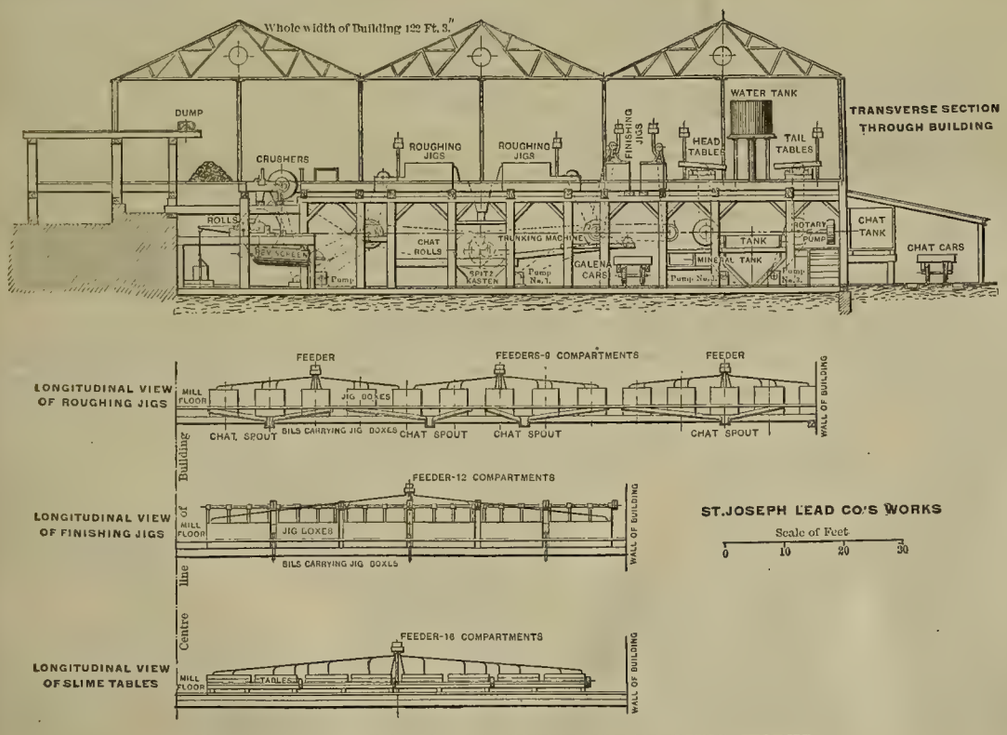
Ore-Dressing Works.

Cuts showing a transverse section of the new dressing of the St. Joseph Lead Co., Bonne Terre, Missouri, are given herewith. The new mill is a two-story structure, and is the result of many years' study and experiment in the old ore. On the main floor are the ore bins, roughing jigs and tables. All the work requiring abundance of light and careful supervision is on the main floor. The roof is a mere umbrella of corrugated iron supported on slender columns. All the jarring machinery is as near the ground as possible. The roll screens, centrifugals, spitzkarten, chat-tanks and galena-boxes are on the lower floor. The shafting, gearing, pulleys and belts are below the main floor. By this arrangement the heavy framing is confined to one story, and there is an absence of overhead machinery and apparatus. All the clarifying and settling tanks, with their enormous weight of water, rest directly on the ground. We take these cuts from a paper read before the American Institute of Mining Engineers, by H. S. Munroe of the School of Mines, N. Y.



Moving Ore From Open Workings.

The methods devised at the Tilly Foster iron mine, Putnam Co., N. Y., for the rapid removal of rock and ore are worthy of consideration. At the narrow ends of the ore body steam-derricks are in use, and across the intervening space of about 300 feet, four cables have been stretched. Two of these, shown in the accompanying engraving, are horizontal cables two inches in diameter, supported at each end by well-braced towers, and strongly anchored into the rocks. On each cable a trolley is moved back and forth by a traversing rope, passing around one drum of the engine, while another drum of equal diameter carries the fall-rope which hoists the rock and ore out of the pit. As the engines are combined "link-motion" and "friction," the engineer can move his load horizontally or vertically at will. The other two cables are inclined, one end being anchored in the footwall about 100 feet from the surface and the other, after passing over a tower, on the bank. In this system the movement of the trolley in its descent is regulated by a stop-block, the location of which on the cable is controlled through a tail-rope by the engineer, one drum being made to raise the load vertically out of the pit and along the incline cable to the surface.

METHOD OF MOVING ROCK AND ORE FROM OPEN WORKINGS.

To save time and handling, the car bodies are lifted from the trucks, lowered into the pit, and exchanged for loaded ones, which are hoisted to the surface, lowered upon the trucks, and run out to the dumps by horses. In this way 1000 tons of material have been handled every ten hours. To expedite the work of loading the car bodies, light auxiliary cables are used, by means of which pieces of rock too large for the men to lift are readily hoisted into the bodies, while the main cables are kept busily employed in removing those already loaded.

TRANSVERSE SECTION OF ST. JOSEPH ORE-DRESSING WORKS.

IRON AND STEEL WORKERS.—At a late meeting of iron and steel-workers held at Metropolitan hall, steps were taken toward the organization of a trades union. The movement involves some of the employes of the Pacific Rolling-Mills of this city and the Judson Rolling-Mills, Emeryville, Alameda county, and the permanent organization is expected to start out with at least 250 members.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Mines in Sierra County.

At Sierra City.

EDITORS PRESS:—The Sierra Buttes mine, after 30 years or more of very profitable work, employing most of the time several hundred men, has recently discharged most of its force. It is hoped that better prospects or the purchase of some of the neighboring claims may soon encourage the company to increase their force and again utilize their splendid milling plant.

The Young America continues in vigorous operation and is regarded as a solid and permanent enterprise. A large force of men are working in the several levels. The scenery, with its variety of beautiful lakes, frowning cliffs and green forests, is something to be remembered for a lifetime. The bearing of the superintendent will be long remembered. He has a great reputation as a successful mining man, but this happened to be one of his "off days," when he was out of sorts with everybody.

The Saddle Back is just being prospected, and is exciting great interest. Mr. J. Rice crushed five tons of rock from this mine at the Kentucky mill. We formed his acquaintance, and found him very thoroughly posted on mining matters. He said the rock yielded $60 per ton. As we notice that he has since taken the contract to sink 100 feet of shaft on the property, taking his pay in stock, it looks as though those who had a good chance to know had faith in the mine.

The Marguerite mine has considerable water to contend with in the shaft, but has a Knight's water engine in operation, of which the superintendent speaks in very high terms, and says he knows of nothing else that would raise half the water with the same power.

All along down the stream to Downieville more or less work is being done. The Keystone mine has been very productive, and Mr. Mead thinks that by utilizing through electric transmission the immense water-power they can command, the mine can be very profitably reopened.

Downieville

Remains by far the most thriving town in the county. As headquarters for supplies and county seat it has great advantages, and then nearly all its citizens are interested in mines scattered all through the mountains.

Eureka North

Once polled 700 votes; now it is almost deserted. Yet, bad as it looks, one claim cleaned up about one hundred pounds of gold last spring. We have heard of almost all sorts of condensing plants, but here they have something new in the way of enterprise. Mr. Thomas has gone into house condensing. He took the best of the material from six houses and put it all into one, making a very comfortable home.

Port Wine

Is beginning to revive again since the opening of that splendid drift mine at Happy Hollow. Here W. S. Chapman and a syndicate of English capitalists have run a tunnel into the old river channel and are putting up substantial improvements as though they had come to stay. The bookkeeper informs us that the dirt is cleaning up $5 per ton and costing 75 cents per ton to mine and wash. As the supply of this channel is immense, the people of that vicinity are anticipating a long era of prosperity. They propose to increase the force to 100 men for the winter. Another sign of revival is that the gamblers are beginning to make weekly visits to collect their *dividends*.

Scales

Was once a prosperous camp but now in mourning. Their quartz-gravel reaches to the surface and pays well for washing, but not for drifting. For miles their claims extend up toward La Porte and past Poverty Hill. Millions are in them, but under the present construction of the anti-debris law the citizens hardly know which way to turn from starvation. When a man has mined for thirty or forty years he seems to be very certain that he cannot do anything else. Mr. J. V. Bean, who is a mining man of great experience and referred to as authority in that section, says it is perfectly practical to impound their tailings so that they can never reach a point to do any damage.

At La Porte

The town seems resting "between hay and grass," as the old saying is—too late for the old mines, too early for the new. There is some prospecting going on and a few large enterprises. Among these is "The Clay-bank," where a heavy Eastern company is running a very extensive tunnel to open a drift mine.

At Gibsonville

Things are looking a little brighter. A Scotch syndicate has let a contract for sinking 500 feet of shaft on grounds about two miles from the town. Contractors are to receive $27,500 for shaft and machinery. The latter is already on the ground and nearly in place. They are rapidly housing in the works and will employ twenty to twenty-five men this winter. The drill showed seventy feet of gravel above the bed-rock, which is 497 feet from the surface. Buckeye mine is also reported in a prosperous condition.

Whisky Diggings

Used to be a lively camp and traces of heavy work are to be seen everywhere.

At Potosi

The Virginia and Lincoln companies are running in a tunnel and are now fitting up the works at the mouth for a good winter's work. It is composed of practical miners, who are putting in their own time and who have faith in the prospect, but have experienced much trouble arising from the *public spirited* (!) efforts of that class who enjoy sitting around barroom stores claiming superior wisdom by running down enterprises of the more industrious.

Howland Flat

Was once the liveliest of mountain camps and headquarters for snow-shoe racing. For a week at a time every house in the town has been crowded with eager sporting-men as only Western hospitality knows how to crowd a house. Now the hydraulics are abandoned and there is only a little drift mining going on. Mr. Cox is running a tunnel for a French company just below the town. He seems to have little faith in any system of mining except hydraulics.

At Poker Flat

Are many small claims being worked by companies of one, two or three men. If local reports are true, the ground has been phenomenally rich. The hotel-keeper, who has been long in that section, pointed out one miner who had drank "a thousand barrels of whisky." As this had been bought at retail over the bar, the money paid represents a princely fortune. Then to think that one man should have leisure enough to dig that money from the earth after all the hard work and long hours required to drink the amount.

At Goodyear's Bar

There is some work going on along the streams and things have a comfortable look, considering the general depression.

Forest City.

The Bald Mountain mine had been the main dependence of the place for many long years. Since that has been abandoned many have left town and the pressure to sell sometimes becomes desperate. One lady who wanted to join her husband lately sold quite a comfortable little house with lot, furniture and all, for $40. Now talk about your boom prices in California! The house was fairly located and one that would ordinarily rent at $10 to $12 per month.

Bald Mountain Extension

Is being opened by a company composed largely of Downieville people and has very favorable indications. For the last hundred feet their tunnel has been running through swelling bedrock. Citizens are expecting to hear that they have struck the lead at any day. Should anything like the old mine be discovered, Forest City property would go up like a rocket. At the Forest House they have a specimen from the old mine about the size of a man's fist that is supposed to contain $200 worth of gold.

Big Strikes.

Since giving up hydraulics, people at Allegheny have been prospecting for drift diggings and quartz. Half a mile south from the town, through a very rugged canyon, flows Kanaka creek. This was very rich in early days and people have always thought there was a good quartz lead somewhere.

The Mariposa Mine.

Thirty years ago a tunnel was started on the south fork of this creek just above the junction. One company after another got tired. The last crowd gave up work in '81 after having driven the lower tunnel in some 180 feet. In October, '88, along came Grant and Apple, two practical miners, who had worked all over the coast in all kinds of mines, and, thinking like the rest that something must be there somewhere, threw off their coats and began work. They had a placer claim and another quartz claim, where they worked. They have only hired one man. On this claim it is said that one or two men have been working the past year. After going 15 feet they struck rock in January, '89, that yielded $10,000. Again in August, '89, they struck another $10,000, and on Oct. 31, '89, they took out from 1000 pounds of quartz 105 pounds of gold dust. Returns from the mint have given them a little over $17 per ounce net at the mine for the dust already shipped. Here have been $41,000 realized for less than 500 days' work. Mr. Apple informed your correspondent that he thought his neighbor, John Fessner, whose claim is a little higher up the creek, was doing equally well.

The latter gentleman is noted for reticence. Upon going into the mine your correspondent was not surprised that so many companies should have faltered. The country rock is gneiss and anything but nice to work. Here and there you find a very thin vein of quartz running a few feet, but no gold for almost 200 feet. Finally a talc footwall begins to raise until it strikes a quartz vein about 16 inches thick lying in two seams. In the lower seam they found this hard white quartz, just about enough to fill a good cask or half a car. Mr. Apple saved a specimen weighing 12 pounds that probably has more than $1000 worth of bullion. He means to crush it after showing to a few more of his friends. The Board of Trade ought to have it for their car. Such a piece of rock we never saw and never expect to see again.

Between this talc dyke and the ledge is a conglomerate that looks as though the cooks that mixed the rocks had made a Thanksgiving mince pie and put in everything good. Among them are greenstone, slate, gneiss and talc.

They are now running an air shaft up the ledge at an angle of about 45°. Mr. Apple says they may strike it again the next blow of the pick and may never. He was a machinist before he began to mine, and his partner is the millwright who built the Treadwell mill in Alaska.

The method of treatment is to roast the rock at a little higher than cherry-red heat for six hours. Then they crush it with a little hand-crusher made by Taylor of San Francisco. The work sounds like a boy eating soda crackers. The sand is quite fine, but has been laid away to be worked over again for more gold at some future time.

FRANK S. CHAPIN.

The Proposed Mining Law.

EDITORS PRESS:—Apropos of the proposed new mining law presented by Senator Stewart of Nevada, the questions presented by your correspondent, Mr. Brown, some little time since (issue of Sept. 7th), have considerable force. If a portion of the public domain, being mineral land, after appropriation under the mineral laws, has become again vacant and unappropriated public domain, there is, I conceive, no practical reason for any further limitations upon the right of location, then applied to its original appropriation. The limitation of the right of relocation proposed by Senator Stewart, if intended by him to prevent the monopoly of mining ground by persons unable or unwilling to develop their claims. I am disposed in agreement with Mr. Brown to hold that in actual practice the restriction would have an effect directly opposite to that intended.

However, discussion upon the several points involved in the Stewart bill is desirable. The interests involved are too important to be committed to the uncontrolled disposition of a single man, even if he be a statesman as enlightened and devoted to the interests of the Pacific Coast as Senator Stewart undoubtedly is. Nor is there any question but that Senator Stewart will very cheerfully adopt amendments and corrections recommended to him by a concensus of mining opinion. No changes of moment in the mining laws should be lightly made. No one familiar with the history of mining law and mining litigation is ignorant of the uncertainties surrounding the subject until very recent times. Owing to the magnitude of the interests involved, mining suits have commonly gone to the court of last resort. Questions arising out of the crudities of original legislation have remained open ones until settled by the judgments of the Supreme Court of the United States.

The construction of portions of the Acts of Congress of 1866 and 1872 has remained in doubt until comparatively recent years, and it is not too much to say that, in some respects, remains still in doubt.

No lawyer needs to be reminded that after the Legislature has acted we rarely know what the law actually is until, as one has irreverently remarked, "the Supreme Court has had its guess upon it."

Now, while it is undoubtedly true that our original legislation relating to mines and mining might have been improved upon, we have, at all events, reached the point where we know substantially what the rule of law actually is as construed by a tribunal, the conclusions of which are binding upon all.

This is an advantage not to be lightly lost.

Hasty or inconsiderate legislation will certainly throw us back into the very condition of doubt and uncertainty from which we have so recently escaped.

Amendment of the mining laws is perhaps desirable, but what are desirable amendments may be open questions. Amendments should, whenever possible, be in harmony with existing constructions.

A free discussion of the various features of the Stewart bill and of the general subject; a discussion in which both practical miners and lawyers of experience in the project join, will certainly have the effect of enlightening not only the distinguished gentleman from Nevada, but many of those who might participate in the discussion. I know of no place so fit for such discussion as your columns. My own experience in mining law and litigation has been confined (in this country) to nine years' past in New Mexico and Arizona. I can perhaps contribute little to the general stock of experience and learning upon which such a discussion should draw, but such as I have, I shall be glad to throw into the common stock.

D. J. M. A. JEWETT.

White Oaks, New Mexico.

A Black Sand Lode.

EDITORS PRESS:—In accordance with the promise made your readers several months ago, I visited the so-called black sand lode, on Rattlesnake creek in Tulare county, and will give you the result of my observations.

The so-called lode trends to the northward, parallel with and west or southwest of the pudding-stone slate described in a previous letter. Southwest of the lode is a formation of plumbaginous rock, very hard in its outcrop, but soft enough below the water line to soil the hands a glistening black. Between this plumbago and the lode there is occasionally some barren quartz or quartz carrying a trace of gold. The gold-bearing rock closely resembles mica-slate, when viewed at a distance of ten feet. But a close inspection of the cross-fracture discloses the structure of sandstone alternating in yellowish and black layers. It looks hard enough, but when a lump the size of a hen's egg is given a sharp squeeze in the hand, it looks like so much fine sand from the ocean beach. If this sand is tested in the horn-spoon it will show a high percentage of black sand, and behind the black sand there will be a trail a half-inch in length of very fine and very bright gold. Occasionally a piece the size of a small mustard-seed is met with, but this is a rare occurrence. The gold-bearing rock is four or five feet wide, and merges into something like talcose slate in the hanging-wall, and this in turn into the pudding-stone, a few feet farther to the northeast.

There are several belts of this pudding-stone—two at least, and it might suit the convenience of the young geological student to regard them as parts of one antediluvial curve; but the little time I had to devote to the question tended to convince me that they were probably parts of two distinct eras of formation. The hard black rock from the plumbago outcrop has a very uniform texture, and becomes waxy at about the temperature of melted cast iron.

I look upon the formation as worthy the attention of geologists, and as probably without a representative among the older rocks.

Kernville, Cal. STEPHEN BARTON.

Power Transmission.

EDITORS PRESS:—Your article relating to the Sutro Tunnel on page 342 of issue of Nov. 2, 1889, would indicate that both electric and wire cable transmission are now "blooming successes" on the Comstock. When your correspondent was there in September the best information he could get convinced him that electric transmission was still an experiment at the Chollar. He saw very fine machinery, but it was explained that certain obstacles arising from condition of the atmosphere in the lower levels were yet to be overcome before a satisfactory percentage of power could be transmitted.

At the C. & C. shaft the very costly wire cable transmission was in a state of "innocuous desuetude" and was represented as a cause of profuse profanity on the part of those who "put up" for it.

Reasoning from cost of fuel for steam-power at Virginia City, the success of water works already in operation, the immense power required to work the mines and mill the ore on the Comstock, it would seem practical to largely increase the proportion of work done by water-power, even if water was to be brought from Tahoe to furnish power to raise the ore from the lower levels to the tunnel and to drain those levels. Then let the ore be sent to the mouth of the tunnel and the water-power there be put to its best use in milling.

F. S CHAPIN.

DRIFT MINING.—The Mayflower Drift and Gravel Mining Co., Forest Hill, Placer county, is making money. On Oct. 1, 1888, the tunnel was completed 5585 feet, and the first two upraises were made. The mill was completed Dec. 11th, and on that date the first car of gravel was dumped into the mill chute. From Dec. 11, 1888, to Sept. 24, 1889 (the date of the last cleanup), the amount of gravel taken out and crushed was 33,787 tons, rich and poor, with a return of $272,616.56, or an average of $8.06 a ton. Since December 1888, they have worked out 1620 feet of channel, 860 feet north, and 760 feet south. These 1620 feet of channel have produced $272,616 50, and that amount represents about the same average per running foot as in that part of the mine worked through the main prospecting shaft in 1885. The Mayflower Consolidated Company, including the Orono groups, has yet 25,820 linear feet of channel to work, without mentioning the gravel of the raises and the upper channel, known as the Paragon lead, which has been found in the old mine; also the gravel of the Orono claims worked.

A FEAT OF PHOTOGRAPHY.—One of the most remarkable feats of photography on record is the photographing the terrible explosion at Antwerp, or, if not the explosion, the immense cloud of smoke produced at the moment. The current number of *La Nature* gives an illustration copied from a photograph of the huge cloud that shot up in the air, roughly in shape like an inverted Florence flask, when the explosion occurred. It has been estimated as being 1700 or 1800 feet across, and, according to the journal quoted, the cloud remained motionless for about a quarter of an hour, preserving the form recorded by the photograph. A nearby camera by chance happened to be turned in the direction of the explosion just as it occurred, hence the picture.

CONCENTRATING.—A contract has been entered into between the Grand Prize and Commonwealth Companies of Tuscarora, whereby the Commonwealth Company is to have the former's concentrators at the rate of $3.25 per ton of ore worked, provided the Grand Prize Company performs the work, or $1 per ton if the Commonwealth does the work and assumes the responsibility.

Artesian Wells in California—No. 3.

[By C. E. GRUNSKY, C. E.

(Concluded from last issue.)

Interest in boring for gas was renewed when Cutler Salmon's well was completed in 1883. This well is about seven miles southeast of Stockton. The valley at that point is only about 15 feet higher than the natural ground at the Stockton Court-House. Water was struck at 844 feet, with a seven-inch casing. Its pressure is sufficient to cause it to rise 14 feet above the ground's surface. Its quality is good. Though the boring was thus crowned with success, it was decided to explore greater depths. A four-inch core was inserted in the seven-inch casing, and with a four-inch diameter the well was sunk to 1250 feet. Here again artesian water was struck, and with it rise great quantities of inflammable gas.

Prof. Hilgard says: "The amount of mineral matter in this water—over 200 grains per gallon—is far too great to allow of its use for domestic or irrigating purposes, nor is there any method short of distillation by which the saline contents could be materially reduced."

This water steadily rising in large volume has a temperature of 80° F., and is now used for medicinal purposes. A bathing establishment has been recently fitted up, and its vicinity bids fair to become a sanitarium. The potable water which rises around the ou side of the four-inch tube is piped to the dwelling of Mr. Salmon for domestic use. The gas, which is mainly carbonic oxide and carburetted hydrogen, is used for cooking, heating and lighting the premises, while a large surplus is allowed to escape.

At the new waterworks in Stockton the gas rising with artesian water is utilized for lighting purposes. At the Crown Mills in Stockton an artesian well supplies water, light and fuel, at a saving to the Milling Company, it has been claimed, of over $200 per month.

The great gas-well of Stockton, however, is the one recently bored to a depth of somewhere near 2000 feet in the western part of the city. It is owned by a corporation, organized for the purpose of supplying gas for fuel and for light. This company contracts to supply gas at the rate of $1 per 1000 feet, and their mains are being laid throughout the streets of the city. Their well is 12 inches in diameter at the surface of the ground, and the first reduction of diameter was made at about 1000 feet below the surface.

The artesian well of 1883, at the Asylum for Insane at Stockton, also brings up gas at the rate of 36 cubic feet per hour, and other examples of gas-wells could be cited for the same vicinity.

Thus a fact has been established, which Stockton ought at once to take advantage of. Practically, the quantity of gas that she can cause to rise spontaneously from the bosom of the earth is unlimited, and well could Stockton afford to offer gas for light and fuel free to all manufacturing establishments that will make connection with a gas-main to be supplied from a system of city gas-wells, of which the successful gas-wells already bored should become members.

It has been suggested that possibly the gas in the water is the source of pressure which causes the water to rise. This is not the case. At the great depth from which the water rises under a hydrostatic pressure of 1000 to 2000 feet, the gas is a component part of the artesian water. It is pressed into solution, and is liberated when pressure is sufficiently reduced.

The first well in the Merced-county group of artesian wells was bored in 1869. It is known as the "Prophet Well." Much trouble was experienced by the well-borer, who was new at the business of boring for artesian water, but he did finally force his well-casing to 240 feet. From a water-bearing stratum of sand at that depth, water rose to the surface of the ground. The well borer conjectured that if leakage into dry sands and dry soil from the defective casing could be stopped, then water would flow above the surface. He poured some corn-meal into the well, which found its way into seams and decreased leakage. The water commenced to flow over the top of the casing, and the well was accepted by owners of adjoining farms as a success.

Over 100 others have since that time been bored near the central part of San Joaquin valley, in Stanislaus, Merced and Fresno counties. These are all located near the trough of the valley. Most of them are less than 400 feet in depth—while beyond the eastern limit of the district, as at Borden and Modesto, borings of 1000 feet failed to secure the much-desired spontaneous flow of water.

A small amount of gas, barely sufficient for one small jet, rises from a well about two miles south of Merced. This well is near the eastern limit of the artesian district, and is 600 feet in depth. Its water rises from a stratum lying far beneath those drawn upon by the other wells in the district.

Water from the well at Chester, Dickerson's Ferry, on San Joaquin river, has a decidedly saline flavor, and cannot be used for irrigation. Important medicinal properties have been claimed for it by a Merced physician.

The well of E. Asbury, on San Joaquin river, several miles above the well last named, had a large flow, but its water was so strongly impregnated with salts of various kinds, that it could not be used for domestic purposes nor for irrigation. The well has been permanently closed. Other wells in the district supply water of excellent quality.

I have already referred to the wells in Tulare county. These lie between Tulare lake and a line about midway between the lake and the base of the Sierra Nevada foothills. There were 100 wells in this district in 1884, and their number has been steadily increasing. Their depth is generally 400 to 600 feet, and their water-supply is drawn from a series of layers of sand, which are closely confined between clays. Water is uniformly good in quality. It has frequently the disagreeable odor and sweetish taste caused by sulphuretted hydrogen, which is lost after a short exposure to the air.

The characteristic of the Tulare county artesian-well district to which I desire to call particular attention is that here better than in any other part of this valley the records of stratification indicate the continuity of the clays which serve as water-caps and water-beds. From beneath a stratum of blue clay at Tulare, water rises to within seven feet of the surface. It barely comes to the surface from beneath the same clay two miles west of Tulare, but flows copiously at any point farther west at which a bore-hole opens a vent.

The hydrostatic pressure under which water flows beneath this clay and beneath other deeper-lying clays is not great; and here again, as this lack of pressure indicates, the upper or eastern limit of the artesian district is but part way up the eastern plain of San Joaquin valley. In two wells at Visalia 600 and 700 feet in depth no artesian water was found. Another well 700 feet deep several miles northwest of Visalia was bored with a similar unsatisfactory result.

About seven miles northwest of Visalia a boring in the low land adjacent to Kaweah river struck artesian water in very small quantity at 500 and 700 feet. The water rises from beneath a hard cement material. The stratification was not at all analogous to that found on the plain away from the river.

Famous throughout this State, and justly so, are the magnificent wells near the southeastern shore of Tulare lake. These are in the lower or northwestern portion of the Kern county well group, and their source of supply is in the irrigated district of Kern river and probably to some extent along the base of the hills where waters from Poso creek, White river and Deer creek sink.

Among the wells of this group is one of which it is said that its water, rising from a single water-bearing stratum at a depth of 415 feet, spouts water 54 inches above the top of the well-casing which has an inside diameter of five and five-eighths inches. Its flow is about 2,000,000 gallons per 24 hours. In 1886 there were, within two to 12 miles of this well, 27 others, all flowing copiously.

It is needless to say that much of the water thus brought to the surface is used for irrigation purposes. An artesian well of good flow supplies water enough to irrigate from 40 to 200 acres of land.

It is instructive to note, also, that the combined flow of 100 artesian wells of the Tulare county group in 1884 was 30 cubic feet of water per second (1500 miners' inches under a four-inch pressure), and that this water was made available by an expenditure of about $100,000. In other words, the cost per cubic foot of water per second thus made available was $3300, or at the rate of $67 per miners' inch.

When the strongly flowing wells near Alviso in the lower end of Santa Clara valley were opened, it was found that the flow of the wells near San Jose commenced to decrease, and some ceased to flow altogether. Laws were passed to make it incumbent upon owners of artesian wells to check their flow when water was not being used, and on Nov. 29, 1886, Judge Belden in San Jose, in his charge to the Grand Jury, referred to this law as one intended to prevent waste of artesian waters, requiring that wells be capped and defining waste.

Most of the wells in Santa Clara valley have a diameter of seven inches. They are generally from 250 to 500 feet in depth, and the artesian water rises from one or more of the many layers of sand or gravel which there as elsewhere are found between extensive beds of clay.

These wells show a very direct connection with their source of supply, which again lies at the valley's edges.

Thus we read in the San Jose *Mercury* of April 12, 1884, that the artesian wells in the eastern part of the valley are increasing every day; that, in fact, wells which had gone dry and in which water sank to several feet below the surface were again running good streams. The well at the residence of J. Lee on Santa Clara street is referred to as an example of a well which has commenced to flow again. The view is there expressed that recent rains are the cause of the increased flow, and it is hoped that if the wells at Alviso be capped all the other wells will maintain their flow.

Near San Francisco bay many borings have been made which yield small supplies of artesian water. At Dumbarton Point, Alameda county, in August, 1878, a well was bored from the top of a wharf which projects into the bay. It was made 212 feet deep from the top of the wharf, which is ten feet higher than the bay's water-surface. This well discharges a stream of good drinking-water two feet above the wharf.

At San Mateo in 1879 a flow was struck under yellow clay in coarse gravel over which lies a layer of fine beach-sand. The gravel was found at a depth of about 140 feet.

The salt-marsh wells near San Mateo are well known. They are generally but little over 100 feet in depth. Water rises from beneath a stratum of clay. Some of these wells can be cited as examples of artesian flow influenced by the tides in the bay. This phenomenon, which has been noted also for a well 180 feet deep on the Alameda side of the bay, near Mount Eden creek, and for one on the marsh-lands of Mare island, is due to the fact that the clay water-cap is elastic and not everywhere firmly supported from below. It presses with unequal force upon the water beneath it, according to the stage of the water in the bay, and thereby directly influences to some extent, not exceeding the rise and fall of the tide, the hydrostatic pressure in the water bearing stratum from which the artesian wells above cited draw their supplies.

The artesian well of W. H. Sears at Mayfield runs a ram which pumps water for house use. It supplies water for irrigation, and the waste flows into a large pond stocked with fish.

San Francisco has a few flowing wells, all of slight depth. Most borings in San Francisco, which are usually, though improperly, termed artesian wells, are borings from which there is no spontaneous flow, from which water can only be secured by pumping.

Artesian water is found in many of the small mountain-valleys of California. In Scotts valley at a depth of about 80 feet; near Upper Lake at about 50 feet; near Igo, Shasta county, at 20 feet.

In Sierra valley there are now nearly 200 wells, ranging in depth from 200 to 1000 feet. Most of these are cased to a depth of only 20 to 40 feet from the surface. The casing in use is ordinary gaspipe, two, three or four inches in diameter. It is claimed that the flow of these wells is influenced, to some extent, by the seasons, and that in a few instances the opening of new wells has reduced the flow of one or more neighboring wells. Most of the wells of Sierra valley have but a weak flow. The amount of water which each supplies ranges from about 4000 to 130,000 gallons per 24 hours. The aggregate flow of 26 wells, bored in 1886 by the West-side Well-boring Company, in this valley, was reported at 756,520 gallons per 24 hours, or an average of 29,000 gallons a day.

The warmest water reported from any well in Sierra valley in 1886 had a temperature of 190 degrees.

Although the first artesian well in that valley was bored as early as 1863 or 1864, the systematic development of the artesian supply did not commence until about 1883.

At Bieber, Lassen county, hot water was struck at 250 feet, several years ago.

At some points along the Pacific Coast, on the slope toward the ocean, flowing water has rewarded explorations made with the auger.

Artesian wells are numerous near Santa Barbara. There was one within four miles of Guadaloupe only 78 feet in depth, completed in October, 1879.

Even the deserts of California are blessed with artesian water. There are a few wells of moderate flow on the Mojave desert; and there is one farther south, at Indio, in San Bernardino county, at a point where the surface of the desert is below the level of the sea.

Whenever the water-bearing strata of any artesian district crop out at the surface at an elevation less than the points at which water enters them, at a low point of the rim of the clay or rock water-bed, then water received by them in excess of saturation will ooze out of the ground. Cienegas are formed; sometimes springs. Many such cienegas have become fruitful sources of water supply in Los Angeles and San Bernardino counties, and their development as a source of water supply still continues. Very few reliable facts concerning the amount of water which they can be made to yield have as yet become available. It must, however, be presumed that their yield cannot be increased indefinitely, and that here, as elsewhere, an interdependence of wells exists, even where the same cannot readily be detected.

Speaking of the Victoria Cienega, which is about three miles northeast of San Bernardino and in which Mr. Matthew Gage of Riverside has undertaken the development of water by means of artesian wells, Prof. E. W. Hilgard says: "This water-tract is, in reality, merely an extensive (540 acres) tract of cienega land, lying almost entirely within the first bottom of Santa Ana river, here bordered by steep bluffs of alluvial deposits from 15 to 30 feet high.

"In the borings made on the water-tract there was usually penetrated from 20 to 50 feet of alluvial soil and sand, the latter gradually increasing in coarseness downward and bearing more and more and larger gravel, until, at the depth of 90 to 100 feet, the material was largely cobbles of considerable size, rendering boring very difficult, and at times, when a vigorous flow of water was struck, resulting in the forcible ejection of stones almost filling the seven-inch pipe. It being found very difficult to reach any considerable depth with so small diameter of pipe, the ten-inch bore-hole has now been adopted as the regular size on these lands.

"It has been noticed that the size of the cobbles decreases toward the sides of the valley, where greater depths are easily reached, while here 211 feet is the greatest depth attained with a ten-inch bore, and most of the good wells range from about 150 upward.

"The interspaces between the cobbles are everywhere filled with sand and gravel; and the water-bearing gravel-beds alternate with more or less impervious beds of clayey material, or hardpan, at intervals varying from a few to 15 and more feet. As each additional layer of impervious material is penetrated by the auger, the rise of water is more energetic and copious. But the gravel-beds continue to the lowest depths reached; and according to the usual rule, they probably fill the depths of the valley to bedrock."

The wells in the Victoria Cienega, as reported by Prof. Hilgard, had a combined flow of 1091 miners' inches 36 hours after all had been uncapped and had been running their full streams. At the time of this measurement, in April, 1889, 27 wells were flowing. They were bored in four groups. From Prof. Hilgard's account of these wells I have made the following notes:

"The extent to which the discharge of any well or group of wells is influenced by that of others situated at a greater or less distance is a question of great practical interest, since upon the answer depends the aggregate amount of water to be expected from the further development by the boring of additional wells."

He finds that in one group of six wells the shutting down of five wells aggregating a flow of 205 miners' inches (50 miners' inches equal one cubic foot per second) influences the flow of the sixth well to the extent of 18 per cent.

One well of another group which had been running steadily for more than a year (all the rest of the group, as well as those of two other groups, being closed) was discharging 61 miners' inches. After nine other wells of the same group were uncapped, this well was found to have decreased to a flow of 57 inches in the course of about three hours, and on opening a well within 80 feet of it, its flow suddenly fell to 55 inches, and 48 hours later it had reached its minimum flow of 48.4 inches, which, however, five hours afterward had risen again to 51 inches.

These experiments bear out what I have already said about the interdependence of artesian wells, but they were extended over too short periods of time to be made the basis of definite conclusions.

In speaking of the derivation of the water supply for the wells of the Victoria Cienega, Prof. Hilgard says: "What we now see happening during the rainy season at the mouths of the canyons has happened from time immemorial; the original depths of San Bernardino valley have been filled up within 20 or 30 feet of the present surface, with just such masses as we now find surrounding the mouths of the canyons, and this immense mass is filled with water, annually replenished during flood season by the absorption of

(Continued on page 400.)

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD.—*Ledger*, Nov. 16: At the Amador gold mine everything points to the early resumption of work upon the 60-stamp mill, and its prosecution to completion. The tapping of the main west ledge at the depth of 550 feet, showing a fine looking ore body 20 and 30 feet wide, has stimulated getting the mill in shape for active operations. The Frue concentrators constitute the main item of expense in connection with the completion of the mill. There are to be 24 of these. A. P. Minear has returned from London, and reached Jackson this week. The new hoisting machinery works to perfection. It is a model of convenience and power, and gives entire satisfaction; an ore-bin has to be built at the shaft, and also the car track to the mill. Mr. Francis, the foreman, and a thorough practical miner, expresses the utmost confidence in the future of the property. The same ore-body struck at the 550 level was cut at the 250 level, but it was there found to be of a considerably lower grade, and this fact carries the gratifying information that the ledge shows a marked tendency to improve with depth. Another point equally clear is that the ledge is not of a pockety nature. It is low grade, variously estimated to yield from $4 to $5 per ton in free gold.

AT THE MANDICH quartz claim, now operated by Messrs. Pickett and Treadwell, they have been engaged in running a tunnel to tap the ledge at a point considerably below the old works. They have encountered some small seams of quartz, which were followed some distance, but led to nothing important. They are now supposed to be about 20 feet from the ore-body for which they are driving. The McKenzie mill at Irishtown has been running for the last two weeks, under the management of A. O. Wilcox.

AT THE KENNEDY mine, sinking is progressing at a satisfactory rate. A new station is being cut at the depth of 1150 feet. It is intended to open up two new levels by the present sinking.

Butte.

DRIFT AND QUARTZ MINES.—Oroville *Mercury*, Nov. 15: Col. A. P. Frary, the mining man, was seen last evening by a *Mercury* reporter. When asked about the mine in which he is interested, he admitted that the prospects for mining in Willet's Ravine are very bright. "I think," said the Colonel, "that I can say with assurance that we will be able to take out at our mine at least $20 to the pick, and when we get things running smoothly, perhaps more." This is truly a bonanza, but no one doubts the richness of the mines in Eastern Butte. In this same vicinity are the mines of Carr, Kennedy and Murphy; Bracken, Gregory & Doyle, and many others, all of which have proved very rich. Dave Reece has also struck a very promising quartz ledge which he intends to work for all there is in it. Col. Frary thinks that next season Ravine will be a very lively mining camp, and predicts big things in the shape of mining for this county. The one main drawback in these mines is, that they are so far up in the mountains that it is very difficult to work during the winter. But a revival of mining in Eastern Butte would make business lively and boom real estate, and a general prosperous condition would ensue.

Calaveras.

THE ANGELS MINE.—*Record*, Nov. 16: This mine, situated in the northwestern part of Angels, is the property of Mr. James V. Coleman of S. F. He acquired the mine some five years ago, when it had merely history and tradition to recommend it. The mine now has developed and enlarged until the ore bodies are not only of mammoth proportions, but rich in gold and sulphurets. All this and more is due to the management of Geo. Fox, the superintendent, who for four years last past has projected and systemized the plans of operation. The late work has been confined to the south shaft, familiarly known as the Potter shaft. Here the work of pumping water and repairing the old shaft has been under headway for some months, and a point between the 500 and 600 foot level has been reached. On the 300, 400 and 500 foot levels, have been found large and rich bodies of ore, more extensive and general than all of the quartz ever taken from this mine up to the present time. This is saying a great deal, for this mine has yielded in days gone by over $1,000,000. It is expected that the same system of intelligent crosscutting on the 600-foot level will show the same great results. The company will erect in a short time a large mill, and also chlorination works.

NEW MILL.—Amador *Ledger*, Nov. 16: W. T. Robinson is building a five-stamp mill at Sandy Bar, with line shaft for five more. The mine will be supplied with concentrators, self-feeders, and other improved appliances of the latest pattern. It is intended to run with free water-power from the Mokelumne river. The Sandy Bar Mining Co., we are informed, owns four quartz mines and two gravel claims.

THE DORPHINE.—*Chronicle*, Nov. 16: This mine is situated about two miles east of Jesus Maria and was first discovered in the early fifties. Some very rich specimens were taken out at that time. Some prospecting has been done on the mine by different parties, but not to any great extent until about two years ago, when a party from San Francisco purchased the mine and spent in the neighborhood of $2000 in prospecting work. The mine at present is owned by Mr. Wm. Caldwell of San Francisco, who, we have been informed, intends to put up a mill and work the mine on an extensive scale.

El Dorado.

SEAM CLAIM.—Georgetown *Gazette*, Nov. 16: McPherson & Austin, engaged in sluicing and running an open cut in their seam claim, adjoining the Crane's gulch mine on the north, are meeting with good success. Joe Swasey is getting ready to start up his seam mine on the south of Crane's gulch mine. Bill Reed continues to work the Rich gulch pocket mine. The Fredericks Bros. are about to start up their Buffalo Hill mine. Wilsey & Dains have started a new tunnel to work their seam mine to a greater depth. E. C. and Clifford Cheek continue developing work on the claim west of the Crane's gulch mine.

Inyo.

CERRO GORDO.—Inyo *Index*, Nov. 14: Of late years the great drawback to operations in Cerro Gordo has been the entire lack of water except as conveyed to town by pack trains. The new works of the Union M. Co. excel in every respect the old Los Angeles and Belshaw systems together. From the new hoisting works to the Belshaw, Crohn and Mexican springs, a distance of 5¼ miles, a pipe has been laid from town along the western face of the mountain. At some points a ditch had to be broken out of the solid rock, but most of the way through rocks and earth. All is covered two feet in depth. At the springs, on the eastern face of the mountain, three 5000-gallon tanks are placed to collect the water, which is pumped over a divide 365 feet above, where the water reaches a point 600 feet higher than the town. The daily delivery will be 3000 gallons, sufficient for all ordinary purposes. The steam pump will necessarily run only one day in the week to fill the receiving tanks at the works. The new system is a credit to the ability of Wm. Crapo, the surveyor and engineer.

LOOKOUT.—Cor. *Index*, Nov. 8: From October 15th to date, Frank Fitzgerald, lessee Modoc Con. M. Co. has made the following shipments to San Francisco: Ore concentrates, 22,000 lbs; furnace concentrates, 24,300 lbs; ore, 21,000 lbs. Mr. Fitzgerald has leased the furnace dumps to Lambert, Lozano & Elias for six months, dating from October 28th. They are averaging 900 pounds of pay slag and 60 pounds of clean bullion per day. At present 6 miners, 2 laborers, 1 cook, and 1 packer are employed, which force will be increased to 15 men the present month.

ORE SHIPMENT.—The Erin mine will this week ship five tons of ore to Selby & Co., San Francisco, for reduction.

A CARLOAD of ore from Poleta mines came down the road on Monday. It will be worked at the Maxim mill.

TUNNEL CONTRACT.—Messrs. Treglown & Wilmot have been awarded a contract by the Lone Pine M. Co. to extend the tunnel in the San Carlos mine 50 feet.

Los Angeles.

THAT STRIKE.—*Times-Index*, Nov. 15: It appears that the ledge of silver ore that was found early last week in the San Gabriel canyon is likely to realize the expectations which were formed at that time. Recent reports show that the strike is holding out and that very likely it extends downward a considerable distance. Some years ago a tunnel was sent in from the side of the hill and a rich body of silver ore was struck. The gentleman who owned the mine thought he would sell it, and it was at the beginning of the land boom and he thought he could make money faster in land. He took samples East, and at one time nearly effected a sale at a good figure. Then came a heavy storm, and the tunnel, which was not properly braced, caved in. Since then two attempts have been made to strike the ore by parallel tunnels, but beyond an average pay rock, nothing extraordinary was found until early last week, when the superintendent of the mining company owning the mine stumbled across the surface cropping of what appeared to be the same ledge as that found in the caved tunnel. The superintendent had climbed the side of the mountain above the old tunnel and was not looking for anything in particular, when in the midst of the brush he caught sight of the outcropping of the ledge, and broke some of it off for testing. The first sample sent to the city assayed $390 per ton and the next $1549 per ton, and then came the samples from the rich streak, which assayed $7260 per ton and $10,012 per ton. This streak is from 12 to 18 inches thick.

Mariposa.

AROUND COULTERVILLE.—Cor. Mariposa *Gazette*, Nov. 16: Mr. Francisco Bruschi has purchased the five-stamp quartz mill at the Martin and Walling mine, and has a gang of men up there taking the mill down and preparing it for removal to Bruschi's famous quartz mine on Indian creek, about eight miles from Coulterville. Mr. Bruschi has a force of men clearing off and leveling the mill site. So in a few weeks we will hear the delightful music of stamps on Indian creek. Mr. Williams, of S. F., is running a tunnel across the main mother lode near Pino Blanco. He has struck a body of splendid looking ore, near the foot-wall of the vein. The Bondurant mine is still running.

Mono.

MONO.—The crosscut 2 from south drift, 1000-foot level, was advanced 19 feet. East crosscut from south drift was driven 32 feet.

BODIE.—The south drift, 900-foot level, was advanced 13 feet. Upraise No. 11 from south drift, 1000-foot level, was extended 7 feet. Upraise No. 2 from south drift was driven 19 feet. East crosscut from shaft, same level, was advanced 34 feet.

BULWER.—During the past week the north drift from the top of No. 5 raise was advanced 41 feet; total length, 131 feet. We are now starting a crosscut east from face of drift.

Nevada.

THE COE.—*Transcript*, Nov. 9: The tributers who are working the Coe mine above water level are getting out some good ore. Mr. Craig, who obtained a bond on it nearly a year ago and has been prospecting the lower levels with a view to purchasing if the results were favorable, has not been heard from for a long time. In fact, but three remittances have been received from him since last January. The miners on day's pay quit several days ago. The cars have been taken away, and now the water is rising in the shaft. Practical miners who know about the Coe speak of it as a fine property, and say that with the right kind of management they are sure it could be made a dividend-payer. It ought not to suffer for good management with as many experienced and capable mining men as there are in Nevada county.

PUSHING WORK.—*Transcript*, Nov. 15: Alf. Tregidgo, the well-known superintendent, came down Thursday from Ormonde. The various mining enterprises under Mr. Tregidgo's management are being prosecuted with vigor. The 20-stamp mill at the Washington of Ormonde has been started up and will hereafter run regularly. It has been fitted out with all the best of modern appliances, including concentrators invented by the superintendent, and which have been proved by practical tests to be most effective sulphuret-savers. The shaft is being sunk for the 500 level and has a fine 3½-foot ledge in the bottom. The pay chute in the 300 level has been opened and found to extend 700 feet. It is estimated that there is between 20,000 and 30,000 tons of pay quartz in sight. At the Bluebell, near Ormonde, the work of sinking for the 400-level is being prosecuted. The ledge in this mine is very large and the ore of high grade. The water is being pumped as rapidly as possible from the Peabody at Grass Valley, and this promising mine will before long give employment to a large force of men.

THE CENTENNIAL.—The new tunnel at the Centennial drift mine near the Central House is in 40 feet. It has been run at the rate of three feet a day, the miners getting out the timbers they use.

PEABODY MINE.—Grass Valley *Union*, Nov. 16: The improvements at the Peabody mine are about completed, but the starting up of underground work has met with an unexpected delay on account of the matter of the right of way for water to use as power at the mine. The water that is furnished from the South Yuba reservoir has to pass through several residence lots in town, and some of the owners object to the water passing through their premises, while others have granted the right of way.

RICH SPECIMENS. — Superintendent Stoddart brought up a lot of handsome quartz specimens from the Hartery mine yesterday, taken from the No. 2 level, from what is known as the Bays shoot. All of the pieces showed a liberal amount of free gold, and some of them were heavy with the precious metal. The quality of the rock was good milling independent of its specimen character, containing gold-bearing sulphurets. The Hartery is already showing up well, although the water has only been out of the mine a couple of weeks after standing idle for years.

PROGRESS AND DEVELOPMENT.—Nevada *Transcript*, Nov. 17: McCoy & Co. are meeting with excellent success in developing the new ledge recently uncovered by them in the Nevada City mine. It is from one to two feet in thickness and shows well in free gold and sulphurets. Careful estimates indicate that it will pay from $20 to $30 a ton. This is now demonstrated to be a true contact vein, having a granite wall on one side and slate on the other, and as it has never been worked below water level there is a reasonable prospect of developing a rich pay chute entirely independent of any heretofore discovered in the mine. The shaft of the Hudson quartz mine on Deer creek below Newtown, has been put in good condition down to water level. The pump will now be started up and when the shaft is dry sinking will be resumed. The superintendent says there is a good prospect for a mine there, and if he "strikes it rich" work will begin on a number of other ledges in the same district. The Delhi Co. are about to run a tunnel in their claim near Columbia Hill, from a point in the canyon about 50 feet above the river, and this will give them a third level and good drainage. A compressor, pipe, etc., to be used in doing this work are daily expected here. The St. Gothard Co. (stockholders in the Champion mine) will next spring erect a mill on their claim in Columbia Hill district. At the El Dorado mine in the same part of the county, good ore continues to come out. The work of clearing away the debris occasioned by the cave that occurred October 6th at the Manzanita drift mines, is being pushed ahead as speedily as the water obtainable makes possible. It is expected that the mouth of the new tunnel will be uncovered by the end of this month. Twelve prospectors are working in the vicinity of the Half Mile House, just south of town, and some of them are getting good returns. The Champion continues to prosper. The ledge is holding its bigness and richness. About 40 men are employed and the mill is running all the time. The tributers of the Gold Tunnel mine are still finding good ore. The Gray quartz mine on Piety hill continues to pan out well, and will do better when the present development work has proceeded further. The Ebaugh Bros. of Willow Valley on Friday last struck better ore than they have had for a long time, and there seems to be an abundance of it. The Montana recently had a crushing, and the cleanup was fair. Dean & Ragon are taking out another crushing. Lord & Co. at the Spanish will have all their machinery in readiness within a few weeks to begin grinding out gold.

THE DIAMOND CREEK.—*Tidings*, Nov. 16: "Wm. May, A. Shepherd and Wm. Morris returned Friday evening from the Diamond Creek (Eagle Bird) mine, situated a quarter of a mile above the town of Maybert, this county. The gentlemen named have in their absence from Grass Valley reconstructed an old 20-stamp mill on the mine and added ten stamps. Mr. Morris informs us that a long flume from the South Yuba river to the mine has been placed in thorough repair, entailing heavy expenditure and labor of the most arduous nature. Mr. May will return to the mine in a fortnight and superintend the erection of two air-compressors at a point nearly a quarter of a mile below the hoisting and reduction works. The mine is undoubtedly a fine piece of property. The ledge ranges from 4 to 16 feet in width and shows free gold and high-grade sulphurets. Four Burleigh drills supply the 30 stamps with ore. Holes for blasting purposes are put in 10 feet. In the mill the sulphurets-saving system introduced in this city by Messrs. Norton & Cobb, or a system similar, is used in preference to concentrators. About 50 men are at present employed by the company.

Placer.

PICK AND SHOVEL.—*Herald*, Nov. 16: McCaw and Curtis are meeting with great difficulty in cleaning out the old slope at the Bellevue. There is an immense quantity of water to handle, and caving of the walls adds to the trouble and expense. They keep at it, however, and will succeed. The hoisting machinery works admirably. The rock from the last blast in the Moore mine on Duncan Hill shows no falling off in richness, The R. E. Lee mine in the same hill shows very good indications. The shaft is down 25 feet. The quartz taken out looks so well that the owners are greatly encouraged and will sink deeper. The gravel carries considerable free gold. The Hogsback Co. have started a new tunnel 437 feet lower down the hillside than the first. T. B. Harper is running a bedrock tunnel in his claim at Sailor Canyon. He is in over 400 feet. Hartley has started his mill at the Almond mine. Seventeen men are employed.

Plumas.

THE DRURY.—Greenville *Bulletin*, Nov. 13: Standart & McGill are still busy extracting ore from the Drury mine. The force of men is not large, but it has been sufficient to keep 15 stamps of the Kettle mill running. During the past summer, a great deal of work has been done in the line of development. Mr. Standart has given the property close attention. The supply of water in the Round Valley reservoir is good, being about 13 feet deep at present.

THE INDIAN VALLEY MINE.—The water is nearly out of the Indian Valley shaft, and the other work is progressing well. Last week, a flat cable wire rope, 500 feet long, was placed in position. The wire is of the best quality of steel. The large air-compressor, one of the best on the coast, works to perfection. The mine is being opened up and now has a large quantity of good milling ore in sight.

Sierra.

ON THE RIDGE.—*Mountain Messenger*, Nov. 16: The Scotch company which is sinking a shaft on the ridge 2½ miles below Gibsonville, has got its engine and appliances set up, and will in a few days have everything under cover. They have been delayed somewhat on account of lumber, but the sawmill is now finished and at work. The shaft is near the old Goahead shaft, only farther back in the ridge. The old shaft was about 350 feet deep, and had no trouble with water until gravel was struck within about 15 feet of the bottom.

Trinity.

LOOKING WELL.—*Journal*, Nov. 16: Capt. Griffith of San Francisco, who, accompanied by W. R. Fowler, has spent the past week at Taylor's Flat examining the prospecting work done on the river-bed drained by the tunnel, and the other property in that neighborhood owned by the Lower Trinity Tunnel Co., passed through town Wednesday on his way home. He expressed himself as highly pleased with the results of the summer's work. The prospecting done has fully satisfied the company in regard to the richness of the river-bed, and next summer they will work it with a couple of elevators. The ground as far as prospected will pay from $8 to $40 to the hand shoveling in. The company also owns Taylor's Flat and will operate that property in another year. Not much can be done this year, as the claim needs considerable preparatory work. The ditch and flume need considerable repairing; the sawmill belonging to the property will be moved up French creek to a better location for timber. The company realize the fact that they have a good property, and next season will work it on an extensive scale, working the river-bed in the summer and the hydraulic claim on Taylor Flat in the winter.

Tuolumne.

IDLE MINERS.—Sonora *Independent*, Nov. 16: There are a great many idle miners around town at present. Many of them have been at work in the neighboring mines, and have saved a little money, sufficient to permit them to pocket-mine for awhile, if they could find a cabin to live in. But there is not a tenantless cabin to be had, and as they cannot afford to work on chances and pay hotel bills, they will be compelled to go elsewhere. Would it not be a good scheme for some one with a little ready money to build a few cabins to rent? It would surely be profitable to the builder, and a great benefit to the town, not only from the fact that their occupants would leave many a dollar with our business men, but would assist in developing our mineral resources.

LONGFELLOW.—*Union-Democrat*, Nov. 16: Col. Root is the sole owner of the Longfellow pocket mine, two miles this side of Groveland, and is largely interested in the Alameda mine at Rawhide. A mint of gold has been extracted from the Longfellow mine in years past, and the present outlook indicates that a big bonanza is deposited somewhere. A force of nine men has been employed for the past year, and sufficient gold has been taken out to pay running expenses. A mill will be erected shortly on the Alameda mine, which is on the great mother lode. Some 40 or 50 tons are now being treated in the Patterson mill at Tuttletown, which will clearly demonstrate the value of the mine.

THE DUTCH MINE, near Quartz mountain, owned by the Fitzgerald Bros. and Lucas, is reported to be showing very fine rock. The owners have an engine in place, and are now running in two drifts, expecting soon to commence sinking. The property is undoubtedly a very valuable one.

GOLDEN GATE.—A great deal of trouble is being occasioned by the furnace at the Golden Gate mine. The mill was stopped on its account for several days a few weeks ago. The whole furnace has now fallen in and will have to be rebuilt before operations can be resumed.

NEVADA.

Washoe District.

SILVER HILL.—Virginia *Enterprise*, Nov. 16: Are doing a good deal of prospecting on the 260 level.

ALPHA.—The west crosscut, 500 level, 100 feet north of the shaft, is out 330 feet; face in quartz and porphyry. Good headway is being made in the new station at the 500 level.

EXCHEQUER.—On the 382 level the east crosscut, 150 feet south of north line, is out 159 feet; face in porphyry. The west crosscut on the 500 level on the north line is out 73 feet; face in quartz and porphyry.

GOULD & CURRY.—The northwest drift on the 200 level continues in soft porphyry. No. 1 west crosscut on the 400 level is also in porphyry.

HALE & NORCROSS.—Are at work from the 300 down to the 1200 level. About 150 tons of ore are daily sent to the Nevada mill. Some repair work is still in progress.

POTOSI.—Still making some repairs on the 750 level. The face of the south drift on the 850 level continues in hard vein porphyry.

CON. NEW YORK.—The raise on the 800 level is up 132 feet on the stope; the roof in quartz giving fair assays.

WARD COMBINATION SHAFT.—The east drift, 1800 level, is out east from the shaft 37 feet; face in porphyry.

OVERMAN.—Last week took out 278 tons of ore and sent 236 to the Vivian mill. On the 6th of November shipped one bar of bullion valued at $1718.76.

CON. IMPERIAL.—The face of the north drift on the 300 level is showing ore of low grade. An east crosscut from this drift has been commenced, and is out 23 feet. The face is in a mixture of clay and porphyry.

SAVAGE.—Good progress is making in the new southeast drift on the 300 level. Ore is being ex-

tracted at two points on this level. On the 500 level are extracting fair grade ore from the north and south upraises, and also in the east drift from the west upraise and from the north drift. The Rock Point mill is crushing ore from this mine, and shipments are steadily continued.

CHALLENGE CON.—The joint Confidence and Challenge west crosscut from the 300 level north drift is out six feet, having been started during the week. The face is in clay. The other work, joint with the Con. Imperial, is mentioned in the report on the mine.

SEG. BELCHER.—The west crosscut on the 1200 level is passing into favorable ground composed of streaks of porphyry and quartz.

CONFIDENCE.—The work is joint with the Con. Imperial and Challenge Con., mentioned in another place.

CHOLLAR.—The northwest drift on the 500 level is in quartz that gives low assays. Prospecting is in progress on the 850 and 750 levels. Ore is being regularly shipped to the mill.

CROWN POINT.—The 800 winze is down 48 feet and the bottom is in quartz giving low assays. Have cleaned out the 900 south drift a total of 588 feet. Have shipped to the Mexican mill for reduction 335 tons of ore since Nov. 1st. This ore was broken down during the last two months, but was allowed to remain in the chutes and dumps on account of low water in the river. Are now shipping 70 tons of ore per day.

BELCHER.—The east crosscut known as No. 2 on the 1200 level, is out 160 feet. The face of the drift is in porphyry. No. 3 crosscut on the 1200 level is out 100 feet, having been extended 23 feet. The face is in low-grade quartz assaying from $5 to $12 per ton.

JUSTICE.—Have started a north drift from the winze below the 822-foot level. It is out 40 feet, skirting the east wall. Shipped to the mill during the week 230 tons of ore, the average battery assay of which was $31.33 per ton.

CON. CAL. & VIRGINIA.—Are extracting the usual amount of ore from the ore breasts on the 1300, 1435, 1500, 1600 and 1650 levels. The average of the battery samples shows the ore that is being reduced at the Morgan and Eureka mills to be a little over $27 to the ton.

ALTA.—The daily yield of the mine is about 45 tons of ore. This ore is taken from the 852 and 925 levels. The mill is doing its work very satisfactorily.

BALTIMORE.—Still operating on the 225 and 338 levels, and saving up ore for reduction. At several points good streaks of ore have been encountered.

UNION CON.—The north lateral drift on the 1465 level has reached the north line of the mine.

OPHIR.—The east crosscut on the 1300 level has its face in a favorable mixture of quartz and porphyry. A north drift is being pushed from the end of this crosscut to connect with the top of the upraise from the main drift on the 1465 level.

MEXICAN.—West crosscut No. 1 on the 1465 level is in a vein material composed of clay, porphyry and quartz, which is of a promising appearance.

UTAH.—The formation in the southeast drift on the 600 level continues hard. The rock is porphyry. Some water is coming in at the face of the drift.

OCCIDENTAL CON.—The mine continues to look well. The weekly yield of ore is about 300 tons, which is of an average assay value of $21 a ton.

SIERRA NEVADA.—The main east drift on the 520 level still continues in porphyry.

NORTH OCCIDENTAL.—The south drift from west crosscut No. 2, on the 300 level, is now showing ore of good quality.

Jumbo District.

TESTING ORE.—Virginia *Chronicle*, Nov. 13: A shipment by team of 40 tons of ore from the Wild Goose mine has recently been made to the Taylor mill near Silver City. The ore from the Wild Goose is found to contain a large percentage of sulphurets and rusty gold that cannot be saved on the copper plates at the Dunlop mill, which is only equipped for saving the gold in the ore by that process. Should the test run at the Taylor mill show a saving by running the pulp through the pans sufficient to warrant it, the Dunlop mill will be provided with the pan process of amalgamating,

Morey District.

PROSPEROUS. — Belmont *Courier*, Nov. 16: Thomas Graves visited Morey last week and inspected the mines of that district. He says that the mines there are yielding rich silver ore in large quantities, and that the work of development is pushed with energy by H. A. Cohen and by the lessees, Moore and Schendell. Morey is a prosperous camp.

Philadelphia District.

RICH ORE —Belmont *Courier*, Nov. 16: Laity & Clifford are still encountering rich ore in the Laity mine at East Belmont. With the judicious expenditure of money every mine in East Belmont could be made to pay handsomely. Philadelphia district is not half prospected. A railroad through this section would make things boom.

Pioche District.

THE RAYMOND BLACK LEDGE.—Pioche *Record*, Nov. 16: The work of draining the Black Ledge winze on the 1200-foot level of the Raymond mine began in earnest on the 3d inst., and yesterday the water was pumped out to a depth of more than 90 feet, an average of 15 feet per day. In addition to the small pump, water is tanked, both engine and pump being run by compressed air. So far the winze numbers are found in place and in good condition. No caves have been encountered, though in one or two places the winze was blocked with old timbers and waste from above. When work was suspended on this winze by the Raymond & Ely Co. years ago through an accident and rush of water, the indications were particularly good, and we shall soon know what mineral wealth that part of the mine contains. The winze is 290 feet in depth. In another two weeks the bottom will be reached, when a crosscut will immediately be made for the ledge, which it is thought is less than ten feet away.

TRAMWAY.—To facilitate the delivery of ore and supplies at the Reduction works, the present narrow-gauge railroad ending at the Raymond Works, is to be at once extended along the hillside west of town and will terminate at a point in the vicinity of the schoolhouse, where a general delivery station will be established. When it is done it will, when compared with the present method, be a comparatively easy matter to get outside ore, wood and coal to the Raymond, and the Reduction works.

Tuscarora District.

NAVADO.—*Times-Review*, Nov. 15. The stopes are looking fair.

BELLE ISLE.—On the 240-foot level, crosscut west has been extended, through low-grade ore, nine feet.

NORTH COMMONWEALTH. — Joint crosscut east, 225-foot level, extended 11 feet. South drift from same crosscut advanced 16 feet. The face of the drift shows some high-grade ore.

NORTH BELLE ISLE.—A station at the 600-foot level is now being opened. The usual amount of ore has been sent to the concentrator.

DEL MONTE.—North drift, 225-foot level, extended 10 feet. There is a strong flow of water and the formation looks favorable. The face continues to show some high-grade ore.

GRAND PRIZE.—Stopes have improved in quantity and quality of ore yielded during the past week. High-grade streak in east stopes looking well.

COMMONWEALTH. — 100-foot level: No. 1 east crosscut from north drift extended 13 feet—total 88 feet—and continues to expose good ore.

ARIZONA.

RYLAND.—Prescott *Courier*, Nov. 14: Frank Ryland's old mine, the Southern Belle, now the Ryland, has a sterling reputation. Instead of becoming base, the ore is getting freer and freer. A very few men knock out enough ore for the 20-stamp mill.

TURKEY CREEK.—John Holmes of Turkey creek district has put in the past year in drifting into his vein. He has now plenty of ore above, below and ahead of him. He is shipping a few tons to get money to keep up working expenses.

NOTES.—S. G. Turner, from head of Big Bug, says Joe Chambers is doing good milling and concentrating in Walker district. The Dixie Co., in same district, has good ore, and runs its mill when there is water. The Silver King, Groom creek, is now said to be producing rich sulphides. We heard, yesterday, that Mr. Williams, superintendent of the Hackberry, had let a contract for 1500 cords of wood. Owners of placer mines are getting them ready so that when water comes they will be made to yield gold.

TOMBSTONE. — *Prospector*, Nov. 14: The hills around Tombstone are alive with prospectors who are doing their annual assessment work. C. F. Heyne has taken charge of the Fisher group and has several men employed doing assessment work. The Herschell is not producing much ore at present, but considerable prospecting is being done in the north end. No shipments have been made for some time, but the second-grade ore on the dump has been worked at the mill. An important strike was made during the week on the Comet. This mine is proving a bonanza and will, it is said by those who are in a position to know, prove another Emerald. The Turquoise mines are turning out their full share of ore, which is still being hauled to Fairbank by Durkee's teams. The T. M. & M. Co. is doing a great deal of prospecting work at present. The big second-class ore-dump on the Lucky Cuss is growing to immense proportions and the first-class ore is shipped.

PROSPEROUS.—*Silver Belt*, Nov. 16: The Old Dominion Copper Co. is enjoying a prosperous season, seldom if ever equaled in its history. Under the intelligent management of Supt. A. L. Walker and his efficient assistants, work in the several departments proceeds with gratifying success. Their mine, the Globe, seems to steadily improve as depth is attained, and a world of ore is now revealed in the several levels. Two furnaces are in blast and a third is being repaired to be ready in the event of its being needed.

COLORADO.

SAN JUAN.—Denver *Republican*, Nov. 16: E. W. Walters, superintendent of the Sunnyside Extension mine above Silverton, said that the mine he represents is fully as good as its fortunate owner, Mr. Rasenus Hansen, desires, and one would naturally think that that meant a great deal. At the mine 18 men find employment and 10 men are at work at the mill below. It is the intention to keep the stamps dropping until Christmas Day, but the mine will be worked for all there is in it throughout the winter. Mr. Walters refused to say what the grade of the ore taken from the property was, and especially that portion of it which passes under the stamps. However, from outside sources it is learned that it is a little better than one ounce in gold to the ton. Mr. Walters talked in a general way about the entire San Juan country. He says that the winter months are not nearly so much of a drawback to that section as they were a few years ago. Boarding-houses and tunnel-sites are now generally located at some point where they will be free from snow-slides, sufficient provision is packed in early so as to supply the miners with grub for the season, and the boys are generally content to stay through the dismal months so they can have a stake upon which to operate for themselves in the summer.

IDAHO.

BEAVER CREEK.—Idaho *World*, Nov. 14: The batch of ore from the Horn Silver mine, Beaver Creek district, lately crushed in the Elmira mill at Banner, yielded the largest of any surface rock ever crushed in the county. Two or three hundred sacks will be sent to Omaha for reduction in a few days. There are four parallel veins in the district, which is a few miles beyond the head of More creek, and development work will be carried on in the Horn Silver, owned by A. W. Dunn and M. H. Kempner, and the Peep of Day and Mammoth, owned by Mr. Kempner and Dr. Southworth. A 500-foot tunnel will be run to develop the Horn Silver at depth. Six men are now at work in the district.

PLACER CENTER DISTRICT. — Wardner *News*, Nov. 9: Work on the Granite mine is about equally divided in the various tunnels and stopes. The lower tunnel is in 600 feet; at a distance of 550 feet a crosscut has been run 75 feet in a northeasterly direction at the extremity of which the vein was struck, and drifting is progressing both east and west upon it. The east drift has reached 75 feet and the west 30 feet; in both workings a fine body of galena ore is visible. At a point 20 feet distant from the starting in of the east drift an upraise of 40 feet has been made, from the top of which a drift has been run 20 feet to connect with the main shaft for ventilation. A large amount of stoping is going on in this working. The upper tunnel is in 450 feet; an upraise has been made from its face to connect with a drift lately run from the old workings for ventilating purposes. At a point 150 feet from the entrance a shaft has been sunk 200 feet, connecting with the lower tunnel, and through which all the ore is conveyed from above. At the 60-foot level much stoping is progressing. Among the improvements visible near the mine is a lodging-house, which has just been completed, affording ample accommodations for a large number. Sixty-five men are now employed, with Geo. Albright as foreman, Jno. Morgan night boss, and all under the superintendence of W. Y. Williams. The mill, under guidance of D. H. O'Neill, runs night and day, averaging 15 tons of concentrates every 24 hours. Work is progressing on the dam on the south fork for the Bunker Hill & Sullivan Co. as fast as it is possible for the initial operations to proceed. A new wagon-road from the Sierra Nevada mine to a point on the railroad near Day's ranch will be finished to-day. Agents all along the line of the Cœur d'Alene railway and sawmill men are complaining of their inability to secure cars enough to transport ore and lumber. Twenty-five carloads of ore are lying at Wardner awaiting shipment to the smelters.

LOW-GRADE ORES AT ATLANTA.—Wood River *Times*, Nov. 14: Major Frank P. Cavanah, who recently visited Atlanta, says that the new process is a pronounced success. Five stamps only have been dropping at the Buffalo mill, which reduce eight tons of ore each 24 hours—all of which passes over one vanner. The slimes from the bottom of the concentrator run through a series of settlers and the concentrates from these settlers alone have paid all milling expenses. After leaving the settlers the tailings run over burlaps a distance of 115 feet, after which experiments have proven them of no value—showing conclusively that all mineral is saved. Fifty tons of ore are reduced to one ton, and the concentrates shipped to Denver for further reduction. Miners have proposed to take out rock and place it in the ore-house for $1 per ton; from there it costs $1.25 to get it to the mill. So it is evident that with a few more stamps and vanners large quantities of low-grade ores can be worked at a big profit.

DAKOTA.

SYNDICATE SMELTERY. — Deadwood *Pioneer*, Nov. 13: A *Pioneer* reporter yesterday visited the site where the Miller syndicate proposes the erection of a 40-ton smeltery to practically demonstrate the value of pyritic smelting for treating Black Hills refractory ores. Contractor Damon has quite a large force at work and last night practically completed grades for the first or lower wall and the building proper. If machinery is not delayed en route there is no reason why the plant need not be completed and in blast within four weeks.

REDUCTION WORKS.—Col. Carpenter has all the men he can employ to advantage busy in blacksmith shops at the reduction works, repairing machinery, straightening out affairs and getting everything in readiness for carpenters. Col. Pratt yesterday delivered the first installment of the 150,000 feet of lumber to be used in construction of the building. Works are to be pushed to completion as rapidly as possible. While they probably cannot be finished at as early a date as Syndicate smeltery, the difference in time will be comparatively trifling. Both plants should certainly be in operation by or before January 1st.

MONTANA.

A MONTH'S WORK.—Butte *Miner*, Nov. 13: The Boston & Montana Co. is running full blast in all departments. During the month of October the works produced 2,525,818 pounds of fine copper and 2700 ounces of silver. This is a large output for the works, and another large dividend may be expected when the proper time arrives.

ORO FINO.—From a gentleman who came in from Oro Fino district yesterday it was ascertained that the Phœnix company, organized only a short time ago, had succeeded in disposing of the larger portion of its treasury stock, 275,000 shares. The company has three claims, the Beauty, Owl and Phœnix, the latter having the largest vein of quartz in the district. It is not known exactly what the ore assays, but it is said that it is fair. The Phœnix properties are in close proximity to the Champion and are just east of the Oro Fino. The drift from the 100-foot shaft on the American Ruby is now in 40 feet and the superintendent, Mr. Hoyer, thinks that the high-grade ore vein, the one he is now after, will be struck about to-morrow. One body of ore has been already cut, but it was low-grade in character and identical to that found in both the Champion and Mountain Lion, but near which pay ore was struck in both mines.

LOOKS RATHER SUSPICIOUS.—The Big Ox Mining Co., which has its office at Helena and its mine about five miles north of Marysville and the most of its jawbone floating around through the East, is doing an immense amount of business in one sense of the word. It has already sent out 1,000,000 circulars, all of which went East, and has another million ready. No work is being done at the mine, the ore not being rich enough to work.

NEW MEXICO.

A RICH GROUP.—*Southwest Sentinel*, Nov. 12: The recent sale of a three-fourths interest of the Grand Tower group of mines of the Gold Hill mining district, Grant county, N. M., by and through Mr. Geo. H. Utter of this city to Messrs. Forbes and Lee of Ohio, has resulted in the organization of the White Tower M. and M. Co., and the development of this rich group of mines with Major J. L. Pritchard, a Colorado miner of 30 years' experience, in charge. Since the sale of the property in September the company has put up commodious buildings at an expense of about $3000, and done over 200 feet of work in developing the Grand Tower mine. Eighteen hundred tons of free-milling silver ore that will average over $30 per ton has been mined and is awaiting the erection of a mill, which the company proposes to put up on the ground as soon as the 300-foot level is reached and prospected. Ore varying from one to four feet in width and assaying from $50 to $200 per ton in silver is found on one or both of the walls. This rich ore is being shipped and the company is paying the development expenses from the proceeds.

DEVELOPMENT WORK.—Silver City *Enterprise*, Nov. 16: The mines of Silver creek are fast coming to the front as producers. They contain large bodies of high-grade ore, and several of them are returning handsome profits to their owners. Work was resumed by the Deep Down company this week. The mill will be started up when the contract on the shaft is completed. John A. Miller is in from Carlisle district. He has 12 men working on the Nugget, and has leased the Telegraph mill and will soon have a string of teams hauling ore from the mine to the mill. Jo E. Sheridan is erecting buildings at his Cow Springs property, and is otherwise preparing to commence mining operations there on a more extensive scale than heretofore. The Bremen mill, under the management of J. F. Smith, is now running day and night, and from now on will continue to furnish regular shipments of silver bricks. Two hundred tons of ore from the Yankee Girl, Mr. Bremen's new property in the Burros, will be hauled in for treatment, which will average about $40 per ton. The new strike in the Bremen mine is increasing in magnitude as work progresses. The ore is of a leady character, and cannot be treated in the mill, but as it will average from $250 to $300 per ton, it can be shipped to the smelters and treated at a reasonable cost. The closing down of the Aztec mine and mill has been the means of causing no end of talk and surmises as to the next step to be taken by the management. It seems to be the general impression that the St. Louis management is playing a game of freeze-out with local stockholders. It is stated, on what may be considered fairly good authority, that work will soon be commenced on the tunnel, which will be driven in to tap the lead. Had this piece of work been completed at the commencement of the work, thousands of dollars in developing and handling the ore and waste could have been saved, and the 20-stamp mill supplied with ore. There are many in this community who severely criticised the management of the Aztec from the start, claiming that $50,000 judiciously expended would accomplish more than the $150,000 which the present development work has cost the company.

LOWER CALIFORNIA.

CAMP ALAMO.—San Diego *Sun*, Nov. 13: "Yes, I am just back from Alamo," said T. J. Hubbell. "I was greatly disappointed in the mines, as they were much richer than I expected. "I made two locations which are being denounced for me. Forty feet below the surface I took out 200 pounds of quartz, carrying it up in one of the rawhide buckets they use there. I lastly cleaned the bucket out. There was three ounces of dirt left in it, and from that the fine gold you are looking at was crushed out. If three ounces give 48 cents, the average will be very rich. I shall take this rock with me on the boat in the morning, to let it show for itself at San Francisco. It will run from $100 up to $3000 a ton. Before long you will hear of some important sales at Alamo. Since 1859 I have had experience in every camp on the coast, but with the exception of the Comstock I consider Alamo the richest of all. Why, the Peninsula is one big quartz ledge! There are now more fine claims untaken than have been denounced."

OREGON.

CRACKER CREEK.—Baker City *Democrat*, Nov. 11: Manager C. M. Donaldson, of the Eureka & Excelsior Mining Co., at Cracker Creek, is in the city and informs the reporter that the company's new mill will be ready to steam up on the 25th unless some unforeseen accident occurs.

THE VIRGINIA.—Mr. John H. Mitchell, owner of the Virginia mine, of Robinsonville district, was met yesterday by the *Democrat* reporter, and when asked regarding the result obtained from the milling of his ores replied: "Twenty tons of ore milled at the Bonanza mill yielded 142 ounces of amalgam, which retorted gave 91 ounces in gold, and from 15 tons milled in the Golden Monarch mill at Clear Creek, 71 ounces of gold was obtained." Speaking further, he said: "I have upward of 60 tons of the same ore now on the dump and expect this month to crush at least 100 tons. The mine is in splendid condition for work, and besides developing the property, I will have 500 tons ready for the mill by the first of next June."

WHITE STAR.—In conversation yesterday with Mr. J. H. H. Williams, of N. Y. City, one of the directors of the White Star Mining Co., the reporter was informed that it is the immediate intention of the company to place on the Big Aleck mine more extensive machinery, the purchasing of which Mr. Williams will attend to as soon as he returns East. The company have recently had placed at their mine an Oregon amalgamator, the invention of E. L. Giroux, and it has proven itself to do all that is claimed for it, and in the opinion of Mr. Williams and Capt. Baxter, manager of the company, it is the best amalgamator ever invented. The company has purchased the plant and intends soon to add one or two more.

UTAH.

FROM ALTA CAMP.—T. W. Buzzo from Alta reports that during the recent snowstorm the road between Alta and Wasatch was closed for 10 days and only opened by the combined labor of 40 men shoveling snow for several days. There is about 100 tons of ore up there to come down, but the great object for clearing the road was to get in supplies for the winter's work at the various mines. There will be employed at the mines during the winter about 100 men in the camp, chiefly on prospecting work. During the summer Mr. Buzzo worked 12 men on the Montezuma, besides the six men working on contract in driving an upraise. This work will continue through the winter, but the work of stoping has ceased till spring. The Emma is reported as getting fine indications in the eastern part of the property in new ground. The Toledo did well the past season. The City Rocks, Victoria, Imperial, Flagstaff, Vallejo, the Green & Burns property and Prince of Wales will all have work done through the winter, and all have in, or are laying in, their supplies. Over toward Big Cottonwood a number of leasers are busy on various claims and will continue through the winter. Mr. Brant is operating several claims with a small force of men. Wall & Prickett will continue work on the Peruvian during the winter. Next year promises to be a good one for Little Cottonwood.

MECHANICAL PROGRESS.

The Iron Industry of China.

United States Minister Denby of Peking, in a recent report to the Department of State at Washington, communicates some interesting facts in regard to the feeling in China relative to the importance to that people of taking steps to develop the home iron interests of that country. Minister Denby says:

"I have the honor to inclose an imperial decree commenting on the late proposal of the Viceroy of Canton to develop the iron industry in the two Kuang. In order to foster this important industry he has abolished the inland duties on iron and the prohibition against its export. He now proposes to investigate, by a commission, the subject of abolishing the heavy duty now levied on furnaces. Such a plan put into force for three years would not involve a large diminution of the revenue, but would greatly benefit the iron producers by doing away with illegal fees. He proposes also the creation of a joint-stock company to work the foundries with foreign machinery. It would seem that the mind of this distinguished man, Chang Chi Tung, had undergone a change. He now, while still materially seeking to retain for his own people the benefits of industrial enterprises, favors the extensive use of foreign methods in building railroads and establishing electric lights and foundries. I do not doubt that the next process in his mental development will lead him to the only correct conclusion; that is to say, that foreign talent and honesty and will-power are indispensable to the successful introduction of foreign improvements."

The inclosure in Minister Denby's report is as follows:

"The Viceroy of Canton states that iron is the chief mineral production of the two provinces within his jurisdiction. And yet for many years past there has been an immense consumption of foreign iron all over the country. Under these circumstances he considers it absolutely necessary that the native iron industry should be further developed; and with this object in view, he has already procured the abolition of inland duties on iron and the removal of the prohibition against its export. A commission, which he appointed to investigate the whole subject in both provinces last year, reports that the great obstacle to the extensive production of native iron is the heavy duty levied upon furnaces. Of these there are three kinds: Government furnaces, which pay each 53 taels a year to the financial commissioner; local furnaces, which pay an annual fee of five taels to the salt commission; and unlicensed furnaces, which pay nothing at all. It is now proposed that all distinctions should be abolished, and for the period of three years no tax should be levied upon furnaces of any kind. This will only involve a diminution in the revenue of something less than 2000 taels, but the gain to the iron producers will be much larger than is represented by the above sum, for the exemption of the furnaces from all Government taxation will necessarily imply the discontinuance of the illegal fees which have hitherto been exacted, and which have proved the real hindrance to the development of the trade. A scheme is under consideration for the establishment of a joint-stock company to work the foundries with foreign machinery, and great results are expected from the adoption of foreign methods of smelting, which are now receiving careful attention. If only the native industry can be stimulated and the consumption of the foreign article gradually checked, all classes of the community will benefit by the change, and no regret need be felt for the small sacrifice of revenue which it will for the present entail. The viceroy's views on the subject have received the cordial approval of the Governor of Kuang-Si, and the memorial is presented in their joint names."

Indian Iron and Steel

Elate with their victories in the metallic realm, modern European and American metal-workers and engineers are liable to be unduly exalted, and carried away by an entirely comprehensible vanity, and consider that no previous generation and no other people can know anything of consequence respecting the adequate treatment of metals, especially iron and steel.

"What other races beside those of Europe and America," perhaps they will ask, "could erect an Eiffel Tower, or a Forth Bridge, or make a steam hammer, or build an ocean liner?"

The question may be impossible to answer, but it is at least certain that Oriental people—even at a time when our forefathers could hardly deal with iron at all—did marvels with the stubborn metal, and can still do so.

In evidence of the fact may be instanced that immense iron column called the "Lhat" (or pillar) of Delhi, exhumed of quite recent years, a colossal column of nearly 60 feet in length and of proportional diameter, believed by adepts to be an architectural work, and to be of wrought iron. Even with the aid of the steam hammer this would now be held an almost impossible piece of forging, and how the weakly Hindoo could have beaten such an immense glowing mass into form with hand hammers is a crux to all modern technicists.

Then, again, the early Syrians of Damascus forged scimitars of such excellence and of so fine cutting qualities that no modern sword-cutler of Europe can equal, far less surpass, them. Moreover, some of the rude tribes of Central Africa produced cutting weapons of high excellence.

In the same way the extremely thin Chinese cast-iron rice-pans, manufactured at the towns of Samtin-chuk and Fat shan, are unequaled by the work of any English or American iron-founders.—*Ex.*

SHIP BUILDING ON THE PACIFIC COAST.—In the published "Proceedings of the National Institute" we find the following complimentary remarks in regard to ship-building on this coast at a not very recent date: "In 1876 the specifications for the iron steamer Meteor, to run on Lake Tahoe, Cal., called for a speed of 20 miles per hour. She was built and launched that year at Glenbrook, on the lake. The engines were built at Marysville, Cal., and all material and machinery were teamed over the mountains. There was no previous record of a vessel's steaming 20 miles per hour. The Meteor is 64 feet 6 inches long, with 10 feet beam, and a draught of 5 feet aft and 3 feet 1 inch forward, and a depth of hold of 5 feet. She is of 19 5 tons displacement, with fuel and 12 passengers on board, and is divided into water-tight compartments. The boiler is of steel, locomotive type, and carries 150 pounds pressure. The engines are one pair inverted cylinders, 10 inches diameter and 12 inches stroke, and weigh 2600 pounds with all fittings. The propeller is of brass, three-bladed, and finished all over. The Meteor made 21 miles per hour, repeatedly, over a measured mile, and from Glenbrook to Tahoe City she made 12 miles in 38 minutes, or 18.9 miles per hour. The engines made between 270 and 280 revolutions, and were designed and built by W. R. Eckart." In referring to the speed of the Meteor, we presume the writer referred to vessels of the Meteor class, in which relation the compliment would have been sustained by facts. The success which has since attended the Union Iron Works of this city in the construction of iron coastwise and national steamships would more than emphasize the remarks in the "Proceedings" above quoted.

HOW THIRTY-THREE THOUSAND POUNDS WAS MADE A HORSE-POWER.—When men begin first to become familiar with the methods of measuring mechanical power, they often speculate on where the breed of horses is to be found which can keep at work raising 33,000 pounds one foot per minute, or the equivalent, which is familiar to men accustomed to pile driving by horse-power, of raising 330 pounds 100 feet per minute. Since 33,000 pounds raised one foot per minute is called one-horse power, it is natural for people to suppose that the engineers who established that unit of measurement based it on the actual work performed by horses. But that was not the case. The horse-power unit was established by James Watt about a century ago, and the figures were settled in a curious way. Watt, in his usual careful manner, proceeded to find out the average work which the horses of his district could perform, and he found that the raising of 22,000 pounds one foot per minute was about an actual horse power. At this time he was employed in the manufacture of engines, and had almost a monopoly of the engine-building trade. Customers were so hard to find that all kinds of artificial encouragements were considered necessary to induce power-users to buy steam engines. As a method of encouraging business, Watt offered to sell engines reckoning 33,000 foot-pounds to a horse-power, or one-third more than the actual. And thus, what was intended as a temporary expedient to promote business has been the means of giving a false unit of a very important measurement to the world.

NEW AND IMPROVED WATER PIPE.—Mepham Ferguson of Melbourne is the patentee of an invention calculated to be of great service to the mining community, and will also prove very useful in all works where water has to be conveyed for any great distance in pipes for domestic or irrigation purposes, the small cost rendering it an easy matter to overcome the natural surface difficulties that sometimes hamper property-owners when they have to carry the water over gullies and ravines. The patented pipes are made in lengths of three feet, so that they are not only easily handled or transported, but much labor is saved in vertical riveting. Each length of pipe being slightly beveled between the ends and closely riveted, the jointing is effected by heating and expanding the larger end of pipe, and is thus shrunk on. A considerable saving is thus effected in the jointing, for neither lead nor yarn is required, and the pipes can be jointed by comparatively inexperienced men. The pipes are coated both inside and outside, principally with patent prepared Trinidad asphaltum, which renders them impervious to injury, either by the atmosphere or by mineral acids or water. Tests of these pipes have been made in the presence of Mr. Davidson of the Melbourne Water Supply Department, and others, with very satisfactory results, inasmuch as at a pressure of 450 pounds to the square inch the pipe burst, but the joint remained intact. With regard to the laying of the pipes, with the material, on the ground and under ordinarily favorable circumstances, the inventor claims to be able to lay down a quarter of a mile of piping per day.

COKE requires one-third more air for combustion than coal.

SCIENTIFIC PROGRESS.

Modern Extinction of Species.

The relentless destruction of certain animals by man in his greed for gain, bids fair, at no great distance in the future, to add many other names to the already long list of animals which have become extinct; not as heretofore, however, through the revolutions of nature and the law of the survival of the fittest.

Half a century ago New England owned a fleet exceeding in the aggregate 100,000 tons, employed in the whale fishery. So profitable was the business that many flourishing cities and towns were built up thereby. Whales abounded everywhere and every ocean on the globe was regarded as profitable fishing grounds. Now there are not 5000 tons of shipping belonging to New England engaged in this one great and profitable business.

It is curious to note how these great leviathans of the deep have been gradually driven from the open seas of the world and compelled to seek a refuge among the ice-covered waters of the Arctic and Antarctic regions. Two hundred years ago they abounded in all parts of the Atlantic and Indian oceans, and in most of their bays and harbors. One hundred years ago La Perouse declared that he could not remain at anchor in the Bay of Monterey "because the whales spirted their filthy liquid upon the decks of his ships." Less than half a century ago the Bay of Todos Santos, on the shore of which the town of Ensenada has since been built, so abounded with whales that a ship could be filled with their oil in a few months.

Now it is a rare thing to meet with one of these monsters south of Behring's Straits on the Pacific, or Baffin's Bay on the Atlantic. So scarce are whales to-day that our San Francisco fleet of whalers can scarcely make it profitable to hunt them, even in the Arctic Sea. The fleet is now returning from this season's hunt with scarcely enough oil to fill one-fifth of the vessels sent out. They report that even the Arctic is "fished out."

Were it not for the late and fortunate discovery of mineral oil, gas and electricity, the disappearance of whales would be regarded as a world's calamity. Still, there are so many uses to which portions of the whale may be applied, that the hunt for him will be actively kept up so long as a single specimen will reward a year's cruising. Hence it is quite evident that it is the destiny of this largest species of the inhabitants of the ocean to be ultimately exterminated to satisfy the greed of man.

There are also other animals which are now more or less plentiful that must soon go the way of all the preadamite species. The lawless hunters of the seas are pursuing with such relentless perseverance the fur seals, which for so long a time have contributed their warm and beautiful fur for the ornamentation and clothing of their human exterminators, that soon they too will become extinct, unless speedy measures are taken for their protection. The same may be said of the beaver. The buffalo of our great central table lands has also been driven to the very verge of extinction by the remorseless hunters of the plains.

With the opening up of India and interior Africa, we may also look to the gradual extinction of the elephant, which is already being remorselessly hunted out of existence for nothing but his tusks, while almost or quite as good a substitute for all useful purposes may be found in the various chemical preparations which science has devised. There are various others among the larger inhabitants of the forest which are fast going the same way. We may allude to the moose in the woods of Maine, to various species of the bear family, and to the elk. The deer is so easily domesticated and so quiet and beautiful in confinement, that he will in all probability be suffered to survive for the regal chase in kings' preserves or to beautify with his presence the ornamental grounds of the more plebeian landholder.

The Phonograph Suggested Two Centuries Ago.

We often repeat the familiar phrase, "There is nothing new under the sun," writes W. H. K. Wright in *Public Opinion*, and indeed it seems as if the most startling and wonderful inventions of modern days were but old notions clothed in new dresses. I am led to make these remarks by the discovery in an old volume in my possession of what appears very like Mr. Edison's phonograph. The publication of this statement can in no way detract from Mr. Edison's fame, or depreciate the value of his wonderful inventions; but it is due to the Old World writer, from whose works I cull the extract, to place the fact upon record, especially at this time when the perfected phonograph is arousing so much interest among "all sorts and conditions of men."

The volume to which I refer is entitled "The Comical History of the States and Empires of the Worlds of the Moon and Sun. Written in French by Cyrano Rergerac, and newly Englished by A. Lovell, A. M., London." In this curious volume is given a graphic account of the writer's adventures in the sun and moon. While in one of the cities of the moon he meets an inhabitant of the sun, who had also visited the moon on a voyage of discovery. They fraternize and stroll about together, taking note of the strange and wonderful sights there witnessed. After a while the inhabitant of the sun is compelled to leave, but before doing so he gives his companion some seasonable advice, and says further:

"During my absence I leave you a Book, which I brought with me from my Native Country; the title of it is 'The States and Empires of the Sun, with an Addition of the History of the Spark.' I also give you this, which I esteem much more, it is the great Work of one of the Philosophers of the Sun....Having said so, he left me; and no sooner was his back turned, but I fell to consider attentively the Books and their Boxes, that's to say, their Covers, which seemed to me to be wonderfully Rich.

"As I opened the Box, I found within somewhat of Metal, almost like to our Clocks, full of I know not what, little Springs and imperceptible Engines. It was a Book, indeed; but a Strange and Wonderful Book, that had neither Leaves nor Letters. In fine, it was a Book made wholly for the Ears and not the Eyes. So that when the Body has a mind to read in it he winds up the Machine, then he turns the Hand to the chapter which he desires to hear, and straight as from the Mouth of a Man, or a Musical instrument, proceed all the distinct and different Sounds, which the Lunar Grandees make use of for expressing their Thoughts, instead of language.

"When I since reflected on this Miraculous Invention, I no longer wondered that the Young Men of that Country were more knowing at Sixteen or Eighteen than the Gray-Beards of our Climate; for knowing how to Read as soon as Speak, they are never without Lectures in their Chambers, their walks, the Town, or Traveling. They may have in their Pockets, or at their Girdles, Thirty of these Books, where they need but wind up a Spring to hear a whole chapter, and so more if they have a mind to hear the Book quite through; so that you never want the Company of all the great Men, Living and Dead, who entertain you with *Living Voices.*"

A few weeks ago we called attention to the recent discovery of an old book in Italy wherein the fact was mentioned that an Italian had made the discovery that the electric display in a thunder-storm was identical in character with the electricity produced by an electrical machine. This book having been printed several years before Franklin made his kite experiment, it was suggested that the American philosopher might have had some knowledge of the contents of the book.

So the above description of these imaginary books with *living voices* is so nearly akin to the phonograph that one is naturally led to inquire if the story of these books ever came under the notice of Mr. Edison before he began the series of experiments which have resulted in linking his name so indissolubly with undying fame.

ALL OUR COLORS COME FROM NATURE.—We get all our colors from nature, for man cannot create even a shade that did not previously exist. It is a remarkable arrangement of nature that the subdued colors are in the greatest abundance. The neutral tints that wear well to the eye are to be found everywhere; the more brilliant shades are given to us more sparingly. We find them beautifully arranged in the animal, vegetable and mineral kingdoms. In our depraved tastes, sometimes, rarity is mistaken for beauty, while something beautiful that exists in great abundance all around us is ignored by every one. The esthetic Oscar Wilde's trip to this country did much to educate the popular mind to appreciate what was truly beautiful in nature, regardless of its abundance or rarity. Previous to his coming the beautiful ox-eye daisy that blossoms in such abundance was neglected by every one but the farmer, and he looked upon it as a pest to be eradicated, if possible. This is a spring blossom, which is followed in the same localities, and often on the same ground, by the golden-rod, both of which have received considerable attention since his visit to this country, and the latter stands a good chance of being selected as the national flower of our country.

SCIENTIST JOULE, who recently died in England, was almost unknown to the public, though competent men of culture rank him with Newton and Darwin. He discovered the law of conservation of energy and the mechanical equivalent of heat. His scientific achievements should have made him wealthy and famous, but he lived in seclusion near Manchester on a pension of $1000 a year granted him by Lord Beaconsfield. He was 70 years of age when he died. Now that he is dead, England with characteristic enthusiasm recognizes him as a genius and the British press eulogizes him warmly.

"FRICTION HEAT," caused by two disks of heavy iron rubbing against each other, it is supposed by some, will "take the place of steam, gas, coal and oil" at some time in the future.

THE strength of a triple-riveted joint in a boiler may be taken at about 80 per centum, approximately.

GOOD HEALTH.

VINEGAR INJURIOUS.—It is the general belief that vinegar is wholesome and a necessary adjunct to the diet of man. Occasionally, also, one hears of its being used daily in quite large quantities as a remedy for obesity. As a matter of fact, this acid might well be dispensed with altogether; and certainly, if used at all, it should be with caution. As for its being efficacious as a flesh-reducer, it is about as much so as typhoid fever or any severe disease, for it acts simply as a debilitator and impoverishes the system. Several cases of death from its use in small glassfuls daily are on record. A little good vinegar is not likely to do any harm, and when rightly used it seems to favor the digestion of certain foods. But, without doubt, as it is generally used, it does much more harm than good, and lemon juice would be far better. Even a moderately excessive use of vinegar causes internal irregularity, which may show itself either by constipation or diarrhea, also flatulency, etc. One writer considers it capable of inducing cough, flushing of the head and watery eyes. When used very intemperately, it produces blood changes, which may become immediately dangerous; if not, the decline in health is slow but certain. Besides using vinegar with caution, that used should be selected with exceeding care. Vinegar made from apples is very good, but not so good as that made from grapes. The latter is very expensive, but the chances are it will eventually be sold as cheap, and largely displace cider vinegar.

REMEDY FOR FELON.—The trouble is that all felons are not near alike. In some, deeper tissues are involved than in others, and a remedy which might act well in one case would prove absolutely useless in another. The latest addition to the list of abortive methods is recommended by a physician of Algiers. He says it is sufficient to moisten slightly around it with some water, and to pass over this surface a stick of nitrate of silver. A few hours afterward the skin becomes black, all pain disappears, and the inflammation is arrested. The blackened epidermis receives no dressing, and in six days the black color disappears. The author was induced to try this remedy in a case of a fit of gout. The patient had his great toe swollen at its base, it was painful to the touch, a little red, and the seat of lancinating pains, which disturbed the rest of the patient. The painful articulation was moistened and rubbed over with a stick of the nitrate of silver; the next day the joint was diminished in size, and was covered over with a black skin. The pain completely disappeared a quarter of an hour after the painting, and the patient got up to follow his occupations. The victim of a felon can safely try this treatment; it can do no harm. Too much confidence must not, however, be put in it.—*Boston Herald.*

TO AVOID DYSPEPSIA.—It is a mistake to eat fast. Mastication performed in haste must be imperfect even with the best teeth, and due admixture of the salivary secretion with the food cannot take place. When a crude mass of inadequately crushed muscular fiber or undivided solid material of any description is thrown into the stomach, it acts as a mechanical irritant and sets up a condition in the mucous membrane, lining that organ, which greatly impedes if it does not altogether prevent the process of digestion. When the practice of eating quickly and filling the stomach with unprepared food is habitual, the digestive organ is rendered incapable of performing its proper functions. Either a much larger quantity of food than would be necessary under natural conditions is required, or the system suffers from the lack of nourishment. The matter may seem a small one, but it is not so. Just as the man may go on for years with defective teeth, imperfectly masticating his food and wondering why he suffers from indigestion, so a man may habitually live under an infliction of hurried dinners, and endure the consequent loss of health without knowing why he is not well or how easily the cause of his illness might be remedied.—*Medical Classics.*

A GERMAN REMEDY FOR BURNS.—The celebrated German remedy for burns is made as follows: Take of the best white glue 15 ounces, break into small pieces, add to it two pints of water, and allow it to become soft; then dissolve it by means of a water bath and add two ounces of glycerine and six drams of carbolic acid; continue the heat until thoroughly dissolved. On cooling, this mixture hardens to an elastic mass covered with a shining parchment-like skin, and may be kept for any length of time. When required for use it is placed for a few minutes in a water bath until sufficiently liquid, and applied by means of a broad brush; it forms in about two minutes a shining, smooth, flexible and nearly transparent skin.—*Herald of Health.*

DRINKING PHOSPHATE.—"Give me a drink of soda and phosphate," ordered a customer at a well-known drug store, says the Troy *Times*. "Do you know what this favorite phosphate of yours is doing for you?" asked the venerable druggist as the customer drained his glass. "Killing the nausea in my stomach," was the reply. "Yes, and it's killing your stomach, too. Some of these days you'll want it copperplated, and you'll want in vain. Phosphate is something no one should take except after a full meal. Why? Well, I will explain. You wouldn't think that the inflammable ends of matches were a proper thing to eat, would you? But phosphate is derived from phosphorus, and if you use it to excess it will burn out your stomach just as alcohol would if used in excess. You feel benefited by it now, but if you keep on, the time will come when you will wish you had never heard of phosphate. Of course we sell it because there is a foolish craze for it, but I advise no one to use much of the fiery substance." "Should one use it at all?" "In moderate quantities just after a full meal it will not hurt any one; but beware of using it in excess or on an empty stomach, for if you do that organ will need half-soling some time."

CALIFORNIA SCORPIONS AND CENTIPEDES.—Tenderfeet, and even many of those whose pedal extremities have undergone the induration incident to years of existence in these semi-tropic regions, are given to the idea that the sting of the scorpion and centipede is as dangerous to life as the bite of the most venomous reptile, but that this is a fallacy is proven by many of the denizens of this sunlit land who have been stung by them and who do not regard the sting of either as being worse than the sting of a bee. George Hall of this place will pick up a scorpion with his ungloved hand and will handle a centipede that has been goaded to madness till each of its thousand feet are dripping with venom and experience no bad results. Of course George is a little eccentric, but no idiosyncrasy is an antidote for poisoning, and it is natural to suppose that any one could caress a centipede or scorpion as George is wont to do and escape injury; but as long as such experiments are unnecessary to the advancement of the cause of science we do not care to try them.—*Ontario Observer.*

SUPERHEATED AIR FOR CONSUMPTIVES.—Alexander Bowie, M. D., M. S., has tried the inhalatory method of treating consumption. He says in the *Lancet:* "My experience with the inhalation of the superheated air has, so far, yielded results of a favorable nature. The apparatus used was Weigert's, in which the temperature expired by the patient, after a few trials, may reach 120 to 130 degrees. The inspired air, according to the thermometer in the tube, may be as hot as 570 degrees, but I do not think the actual inspired air is ever hotter than from 280 to 300 degrees."—*Exchange.*

USEFUL INFORMATION.

DISCOVERY OF A NEW MIXED ACID.—It has always been the desire of engineers to obtain "black" prints from plans and drawings, in place of the present blue prints. The discovery of a new substance by a French chemist, M. Pechard, may make such a result possible. It is a mixed acid derived from oxalic and molybdic acids, and is, therefore, termed "oxalomolybdic acid." The crystals of oxalomolybdic acid, when dry, may be preserved unchanged either in sunshine or in the dark, but if moist they quickly become colored blue when exposed to the sun's rays. If characters be written on paper with the solution, they remain invisible in a weak light, but when exposed to sunshine they rapidly become visible, turning to a deeper indigo color. It is curious that this effect only happens when the solution is spread over paper or other surfaces, for the solution itself may be kept unaltered in the bottle for any length of time, except for a trace of blue at the edge of the meniscus, where by surface action a little is spread against the interior glass walls. If a sheet of paper be immersed in a saturated solution of the acid, dried in the dark and then exposed behind an ordinary photographic negative, a very sharp print in blue may be obtained by exposure to sunlight for about ten minutes. The color instantly disappears in contact with water, so that if a piece of this sensitized paper be wholly exposed to sunlight, one may write in white upon the blue ground by using a pen dipped in water. If, however, the paper with its blue markings be exposed to a gentle heat for a few minutes, the blue changes to black and the characters are then no longer destroyed by water.

NOTHING WASTED.—In a well-arranged slaughter-house, when a steer is taken in now-a-days, the only thing that is wasted is his dying breath—from the tip of the tongue to the brush of the tail, every part is utilized. The blood is sold to the sugar refinery and to button and other manufacturers for use in the arts. The hide and hair go to the tanner; the horns go to the comb-maker; the contents of the stomach is saved for manure; the scraps and pith of the horns go to the glue manufacturer; the horny portion of the hoofs go to the button maker; the shin bones after their oil is taken out are converted into handles for various purposes; other bones are used for boneblack or fertilizing purposes; the waste goes to the soap boiler. If the salable flesh will pay expenses, the refuse as disposed of as above affords a fair profit to the establishment.

TO SPLIT PAPER.—There are two ways of splitting a piece of paper. One, which has already been given in these columns, is to lay the sheet of paper on a piece of glass. Soak it thoroughly with water and then press it smoothly all over the glass. With a little care the upper half of the sheet can be peeled off, leaving the under half on the glass. Let this dry, and it will come off the glass easily; of course, the glass must be perfectly clean. The second way is a better one, but it requires good practice. Paste a piece of cloth or strong paper on each side of the sheet to be split. When it has thoroughly dried, pull the two pieces of cloth apart suddenly and violently. The paste can then be softened with water, and the two halves of the sheet easily taken off the cloths.

NOW AND THEN.—Sixty years ago railroads were unknown in this country, and the population of the United States consisted of 12,000,000 people. To-day we operate 165,000 miles of railroad and our population has increased to 60,000,000. Sixty years ago the aggregate wealth of the United States was less than $1,000,000,000; at present it is estimated at $56,000,000,000. Sixty years ago there were but three or four millionaires in the entire Union. Now there are several thousand. Forty-two years ago there was but one man in the United States who was worth $5,000,000; now there are not less than 1600 persons, each of whom is worth as much or more. Careful estimates show that there are at least 31,000 persons, each of whom is worth over $500,000, and all of whom possess an aggregate of wealth amounting to $36,250,000,000, leaving to all the other inhabitants of the country an aggregate of wealth of only $23,750,000,000. In other words, two-thirds of our national wealth has been gathered into the possession of only one two-thousandth part of our population. At this rate of individual accumulation, what may we expect to see at the close of another half-century? Is it not time to begin to look around and see if our laws and institutions cannot be so modified as to secure a more even aggregation of wealth?

UMBRELLA MAKING.—Umbrella making, says an English contemporary, is among the most interesting of Birmingham, Eng., industries. Although probably not more than 1000 hands are employed, something like 1000 patents have been taken out during the last twenty years. The most recent inventor, who, if successful, will eclipse all rivals, is a maker who claims to have contrived a transparent umbrella, which, while being equally waterproof as silks and alpacas, will have the great advantage of allowing the wayfarer in a rainstorm to avoid collisions with lamp-posts and other obstacles along the way. A remarkable feature of the East Indian trade is the large number of umbrellas imported. Last year the total received in Calcutta alone was 2,621,745. This was by far the largest import recorded for any single year, and it is not surprising to hear that the trade was somewhat overdone, and a consequent glut resulted. The United Kingdom has virtually a monopoly of the business.

POLISHING MARBLE.—The two following recipes are recommended as yielding satisfactory results: Take two parts of soda, one of pumice-stone, and one of finely-powdered chalk; sift these through a fine sieve, and mix them into a paste with water. Rub this well all over the marble, and probably the stains will be removed; then wash with soap and water, and a beautiful bright polish will be produced. If this does no good, try the following: Clean with diluted muriatic acid or warm soap and vinegar; afterward heat a gallon of water, in which dissolve 2½ pounds of potash and one pound of virgin wax, boiling the whole for half an hour, then allow it to cool, when the wax will float on the surface. Put the wax into a mortar and triturate it with a pestle, adding soft water to it until it forms a soft paste, which, laid on the marble and rubbed when dry with a woolen rag, gives a good polish.

A "SMOKELESS DUEL" is now added to "smokeless powder." A fuel of this character is just now attracting some attention in London, England. "There were two large fires burning in open grates, one fed with ordinary coal and the other with the treated coal. The ordinary coal fire gave, of course, the usual results of smoke and flame, while the fire of the treated coal was all but smokeless, but bright and with plenty of flame. The fire, in fact, was well maintained, and a good heat was thrown out. It is stated that the treatment of the coal costs 6d. per ton, all expenses included, and that the coal is greatly improved thereby, so that one ton is equal to 25 cwt. in use." The coal is treated with chemicals. This is simply an old Yankee idea. A couple of years ago there was some little stir made over it in New York, where this system was put in practice—to make the coal last longer.

CHRYSANTHEMUMS appear to be the floral rage just now. Many of the choice varieties now cultivated are really gorgeous, as was evinced at the late chrysanthemum show in this city. Chrysanthemums in ornamental pots are now introduced into some of the most fashionable drawing-rooms.

A KNOT AND A MILE.—Comparatively few newspaper readers know, or have any special reason to know, that a knot is more than a mile, and that six of the former equal about seven of the latter. Accurately speaking, there are 6086 feet in a knot and 5280 feet in a mile.

SCIENCE cannot yet distinguish as between the blood of animals and the blood of human beings.

ENGINEERING NOTES.

Important Canal Projects.

Niagara Falls Canal.—Several surveys and plans for a ship canal from Lake Erie to Lake Ontario have been made within the past 30 years, and two powerful causes push the project to the front every now and then: 1st. The very natural desire to have a canal of our own between these lakes; and 2d, the fact that the Welland canal, with its 14-foot depth, is not deep enough to accommodate modern lake traffic, a fact which will be doubly emphasized when the improvements at St. Mary's and St. Clair have been completed and a depth of 20 feet obtained. A recent project is for a canal 20 feet deep to accommodate vessels of 3000 tons. The length is about 25 miles and the estimated cost $18,000,000. An alternative route of 19 miles would cost about $1,000,000 more. This canal seems more than likely to become an accomplished fact in the near future.

Lake Erie-Ohio River.—This is a project to obtain a deep-water navigation from the Great Lakes to the Gulf of Mexico. The probable route would be from Beaver, on the Ohio, 28 miles below Pittsburg, via Newcastle and Conneaut by lake to Erie, Pa. Distance, 136 miles; summit, 416 feet above the Ohio and 509 feet above Lake Erie. A thorough survey of the proposed route will be made.

Lower Michigan.—From Saugatuck to Detroit via Kalamazoo river; length, 178 miles; width, 112 feet on the surface, 80 feet on the bottom; depth sufficient to accommodate vessels of 1200 tons; six to eight locks. The canal would give an almost air-line route from Chicago to New York, saving several hundred miles.—*Railway Review.*

ANCIENT BRIDGES IN CHINA.—The Chinese suspension bridges, dating from the time of the Han dynasty (202 B. C. to 220 A. D.), furnish striking evidence of the early acquaintance of the Chinese with engineering science. According to the historical and geographical writers of China, it was Shang Lieng, the commander of the army under Kaen Tsu, who undertook the construction of the roads in the province of Shense, to the west of the capital, the high mountains and deep gorges of which made communication difficult, and which could be reached only by circuitous routes. At the head of an army of 10,000 workmen, Shang Lieng cut through mountains and filled up the valleys with the soil obtained from the excavations. Where, however, this was not sufficient to raise a road high enough, he built bridges resting upon abutments or projections. At other places, where the mountains were separated by deep gorges, he carried out a plan of throwing suspension bridges stretching from one slope to the other. These bridges, appropriately called by Chinese writers "flying" bridges, are sometimes so high as to inspire those who cross them with fear. At the present day there is still a bridge in existence in Shense, 400 feet long, which stretches across a gorge of immense depth. Most of the bridges are only wide enough to allow of the passage of two mounted men, railings on both sides serving for the protection of travelers. It is not improbable that the missionaries who first reported on Chinese bridges two centuries ago gave the initiative to the construction of suspension bridges in the West.

THE USUAL BRAND-NEW SCHEME for utilizing the water-power of the Niagara river is again projected. This time it takes the form of an immense tail-race to be dug parallel to the river for 15 miles, with numerous cross canals or head races running from the river, each one furnishing one or more turbines which will drive dynamos to furnish electric power. It is proposed to excavate the tail-race by hydraulic power, on the same principle that hydraulic mining is done in the West.

THE NEW COG-WHEEL RAILWAY up Mount Pilatus in Switzerland has recently been opened and is said to be one of the most remarkable feats of modern engineering. The elevation attained is 6724 feet, and the roadbed is of solid masonry, the rails being bolted fast into it with heavy irons. The rack in the center has a double row of cogs cut in solid steel, and it is absolutely impossible that any accident should occur. The speed attained is 200 feet per minute.

AN UNDERGROUND MOUNTAIN RAILWAY.—M. Wautweller, a Swiss engineer, has applied for a concession for an underground railway up the Jungfrau mountain. He proposes to reach the summit of the mountain by means of a tubular tunnel. The Eiffel tower as a curiosity will have to take a second place should the scheme be successfully carried out.

MINUTE CIRCULAR SAWS.—The smallest circular saw in practical use is a tiny disc about the size of a shilling, which is employed for cutting the slits in gold pens. These saws are as thick as ordinary paper, and revolve some 4000 times per minute. Their high velocity keeps them rigid, notwithstanding their extreme thinness.

UTILIZING THE FORCE OF THE WAVES.—A pump worked by wave-power supplies salt water from the ocean to sprinkle the streets of Ocean Grove, N. J. The waves push backward and forward a swinging door connected with the piston, thus lifting the water.

Passing Events.

There have been heavy rains all over this State during the week, which are advantageous to the miners and farmers. A good, steady water supply is apparently insured for all the mills.

The Lead Convention began its deliberations at Salt Lake this week. It is expected that this meeting of the lead miners of the country will have the effect of forcibly calling the attention of Congress to the injustice being done in the prevailing system of free importation of foreign lead ores.

The California delegates to the Silver Convention at St. Louis have left for that city. Silver is gradually rising in price and the silver miners of the country are now more hopeful than for years past. A lessening of the discount would have the effect of starting up hundreds of idle silver mines.

A consultation of prominent mine-owners was held this week at Virginia City, regarding the proposed plan of draining the South end Comstock mines for the purpose of resuming operations in the lower levels. With this work carried on, many more men would be employed than is the case at present.

The Supreme Court has decided that incorporated mining companies cannot deviate from the law requiring them to post or publish statements of their affairs on or before the 15th of each month.

The Silver Question Not Complex.

The National Grange honored itself in passing a resolution favoring the free coinage of silver, rightly claiming that the depreciation in the market value of the metal has caused a corresponding decline in the leading farm products of this country. This action of the Grange, representing as it does the different States, in the leading industry of the country, is in keeping with the policy of this paper as set forth in previous issues on the silver question, which is far from being, after all, so complex as many superficial thinkers, journalistic writers, as well as others, assume. While it is true that many propositions are offered and are involved in the so-called problem, it is likewise true that they can be aggregated and thus sifted and simplified.

Free coinage is, of course, a very easy process of adoption, but to the more conservative advocates of the rehabilitation of silver, this seems too sudden and radical for the present moment. These, so far as ascertainable, favor an increase in the monthly minimum of coinage to $4,000,000 a month, or $48,000,000 a year. They claim that allowing for the steady and increasing consumption of the metal in mechanics, arts and sciences, a yearly demand will then exist that will insure such an enlarged market as to surely enhance the price under the immutable law of supply and demand.

Now as to the silver note. This has proven a pronounced success and has entirely overcome the "gold-bug" objection that the silver coin is too cumbersome, and also has given to the United States a paper currency such as is not possessed by any other nation; that is, a paper money based, not on a promise to pay, but on an actual fact—a dollar in paper money absolutely secured by a dollar in coin; a dollar, no matter what its commercial value in bullion, is a one-hundred-cent dollar to all intents and purposes in the channels and marts of trade in the United States, and which, in the event of any great social or political convulsion, would assert itself as a real and actual money, preferable in all climes and by all nations to any monetary representative that is a mere *fiat*, and not only at par but at a premium.

A late rumor telegraphed from the East is to the effect that Secretary Windom intends to formulate for the consideration of Congress a plan for the purchase of silver bullion by the Government and the issuance against such bullion of notes or certificates whose value shall be based on the market value of the bullion. This is impracticable and presents the only real complication in the subject. Its tendency would be to make the note of issue simply a commercial commodity, and that is exactly what the advocates of silver wish to avoid. They want silver recognized as money, and paper issued against it to be money currency and not a mere warehouse certificate with a changeable value.

In connection with the above, we take the following from a late issue of the *Silver Dollar:*

Following the demonetization of silver in the United States in 1873 came the great panic of that year, which brought about widespread ruin. Not again until 1879 did prosperity begin to dawn upon the country. In 1878 we again began the coinage of silver under the Bland bill, which compelled the Government to coin $2,000,000 per month, and permitted any amount above that up to $4,000,000 per month. But strange as it may appear, every Secretary of the Treasury, from 1878 to the present hour, has refused to coin over $2,000,000 per month, and every President, whether Democrat or Republican, has held the mints to limited coinage. With that, however, we have kept even with the contraction of the National Bank notes, and have added a few millions to our circulating medium, merely enough to have kept a great financial panic off of the commercial world. But as the nation has grown, as population has increased, the money volume of the country has grown smaller and smaller per capita until now business is in a measure paralyzed for want of money, and we are again going on into a panic in 1891—*unless* silver is remonetized and the mints thrown open again to free and unlimited coinage.

A HEAVY JUDGMENT.—The chancery suit of M. R. W. Bark et al. vs. Robert H. Hopper, at Hillsboro, Sierra county, N. M., has just been decided in favor of the latter, who secures judgment for $55,000. In addition to the matter of accounting growing out of the mining, shipping and treating of the ore from the Virginia mine, much of the investigation was given to questions of scientific mining. An Edison phonograph was used in taking testimony.

Alaska Lead and Silver.

Reports have recently come to hand from one of the most distant mining districts in the northwestern section of Alaska Territory, known as Fish River mining district. By the arrival in San Francisco within the last fortnight of Mr. J. C. Green from Golovine Bay, Alaska, the latest news is received concerning the mines in Fish River district. Mr. Green informs us that the tunnel started last fall on the Pioneer claim is now in 250 feet, with good indications of tapping the ore body soon, the croppings of which are just above the face of the tunnel. Air is reported bad, however, and the night shift will not be worked on the tunnel until next spring, when air appliances will be sent up. On the Omilak claim, which adjoins the Pioneer on the north, work has been carried on on a small scale by running open cuts wherever the ore body lay, covering a large area of surface. Considerable ore was extracted from these cuts, all of which yielded good returns. Some 82,000 and odd pounds of this ore shipped to and recently sampled by Prof. Thos. Price & Son yielded 142 ounces per ton in silver and 74 per cent in lead; 26,000 pounds of chlorides from the dumps yielded 128 ounces per ton in silver and 61 per cent in lead, carrying some gold. A lot of red, yellow and gray carbonates shipped from the same mine ran much higher than this.

Mr. Green speaks highly of these properties and considers the district one of great importance and thinks it destined to outrival the famous Galena Mines of Leadville, Colorado, in its output of ore.

But little prospecting has as yet been done in this district by outside parties, or rather parties of and under the employ of the Omilak Gold and Silver Mining Company, of which Mr. Green is manager. Some placer gold has been found, but to no great extent and certainly not of sufficient importance to cause an excitement. Mr. Green is of the opinion that this section of Alaska is chiefly a silver and lead district. All the silver lodes thus far located are in limestone formation in contact with slate.

Riches From an Old Mine.

When two men can take out $100,000 in less than a year from a quartz mine, they are doing a pretty good business. Yet this is what two young men, Messrs. Grant and Appel, have done in the Chipps Flat pocket mine, between Moore's Flat, Nevada county, and Allegheny, Sierra county. And they have no mill, either, simply pounding the rich rock up in a mortar by hand.

This mine was abandoned over 20 years ago, and lay idle until these men took hold of it. They ran about 20 feet further in the old tunnel and struck it rich. Since then they have made a number of bullion shipments, the last bar weighing 125 pounds.

Should we read of an occurrence of this sort in a distant region, hundreds of men would be anxious to go to a locality so favored. Yet here it has attracted no special attention. The same may be said of the Bonanza claim, a pocket mine in Tuolumne county, which has yielded very largely of late. In pocket mining there are great chances to be taken, of course, but if the chance is a lucky one there is great reward for labor. Doubtless many others of the abandoned mines in the older districts of the State will be worked again in course of time, when people come to a realizing sense of their good fortune in living in a region where there are such golden possibilities. Sierra and Tuolumne are not the only mountain counties where there are opportunities for energetic and persevering men in quartz mining.

A NEW ARIZONA RAILROAD.—"Diamond Joe Reynolds" has arrived in Phœnix, A. T., with other gentlemen interested in the construction of the North and South railroad through Central Arizona, between Phœnix and Prescott. It is understood that arrangements will be entered into at once for the construction of the road, and it is anticipated that work will be begun December 1st on the construction of this important line which opens up one of the richest and most extensive mining regions on the Pacific Coast.

IT is estimated that 250,000 persons in the United States are engaged in business depending solely on electricity.

Cable and Electric Street Cars.

It may surprise many who suppose electricity to be the coming motor for street-railway traffic to learn that it has been decided to put a cable railroad on Broadway, New York, the most important thoroughfare in the United States. The road will run from South Ferry to Fifty-ninth street. There are already four miles of cable railroad in operation in New York, where it has proven successful, as it has in every place it has been introduced.

In this city and elsewhere the cable roads have practically built up the streets where they were operated. In Broadway the case is different, for that street is already a highly important one and the cable road is merely an adjunct displacing the horse-cars. That such a road is to be built on this thoroughfare proves the estimation in which the cable system is held and the position into which it has forced itself by its practical advantages. It is a great hit for the cable system to be adopted on that street after the popular feeling in the country that electricity is the coming power.

Moreover, the only electric street road in New York—the Fourth Avenue Storage R. R.—closed down its electric plant on the 26th of last month. This road has 120 cars all run by horses, except six or eight, which were run by electricity, on the storage system. Now these electric cars have been discontinued and are running by horse-power. The electric cars have been running about a year and a half, so there has been plenty of time to prove their practicability, but the company has gone back to the use of horses.

Our experience with electric railroads in California has not been favorable; the San Jose, Los Angeles, San Diego and Sacramento roads, on different systems, having all been failures, in one way or another, and none of them are now in operation. Yet we hear of them being successful in other places, though it is difficult to get reliable information as to power used, etc. The impressions conveyed concerning many of these roads are misleading, as is shown by closer investigation. For instance, many persons believe that the great West End Co. of Boston, a consolidation of all the lines, with 1100 street cars, is an electric road. This is not the case, however, the company having only 50 electric motors out of its whole number of cars.

We have no electric roads in operation in San Francisco or in California. The cable system has proven perfect with us. In addition to the older lines in San Francisco, new ones are being built, and more are projected. The builders are men of experience and wealth, who have investigated all the systems, and they continue constructing new roads on the cable transmission plan.

DELEGATES TO THE SILVER CONVENTION.—The delegates from California to the St. Louis Silver Convention left here on Wednesday. They are Frank Pixley, Charles L. Ackerman, Edward Curtis, Robert McCeney, Homer L. King, James A. Johnson, David Jacks, A. V. Butler, Henry Lindley, John Bidwell, James A. McCudden, Asa Ellis, Herbert C. Nash, D Earnest Melliss, C. T. Summers and C. O. Ziegenfuss. The delegates will be given a reception at Denver by the Chamber of Commerce of that city. It seems too bad that Governor Waterman did not appoint at least one bona-fide mining man as a delegate. The nearest to it he got is Homer King of the Stock Exchange.

INFRINGEMENT OF PATENT.—The Reagan Vapor Co. has begun an action in the U. S. Circuit Court against Mora M. Barrett, John Daly and W. A. Cavanaugh to recover $20,000 damages, also to enjoin the defendants from using a certain patent of a gas engine, letters patent of which were secured by D. S. Reagan. The defendants conduct business under the name of the Pacific Gas Engine Co., and the complaint charges them with infringement of the Reagan patent.

A CAVE occurred at the Equator mine, about five miles south of Placerville, on Sunday, wherein William Bolander was killed and three other workmen narrowly escaped with their lives.

NAME WANTED.—If the person who mailed us a postal note without any letter from Auburn, on the 7th inst., will send us his name, he will receive proper credit on our books.

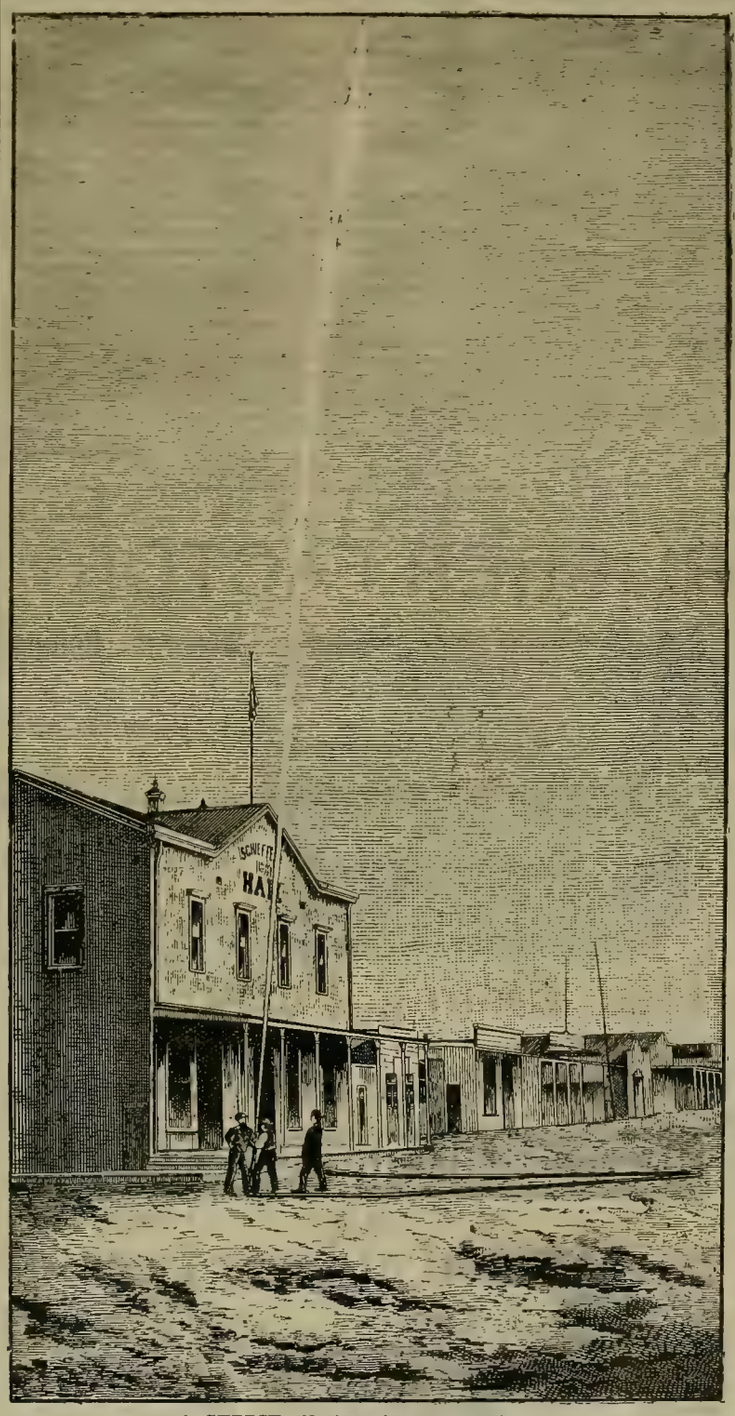
Tombstone, Arizona.

Water Supply of a Mining Town.

(From Our Own Correspondent.)

EDITORS PRESS:—Not intending to abandon the plan of writing up every point of interest visited by your correspondent and traveling agent during his five months' ride over the biggest portion of Arizona, I send you a brief description of Tombstone, and especially of her superb water supply.

Like everybody else, I had formed an idea of the kind of town and mining camp Tombstone might be, judging from meager descriptive hints found occasionally in some newspapers. This being my first visit here, I am really agreeably surprised to find Tombstone such an orderly, well organized and nicely laid-out city of nearly 3000 inhabitants—a strictly American town, built upon a gently sloping plateau girded to the south by a group of hills and about eight miles east from the San Pedro river. The streets are wide, running from north to south and east to west, crossing at right angles between blocks of 360 feet in length and same width, of mostly one-story buildings, many of which are built of adobe, especially the business houses. Several of these buildings are covered with mastic and are decorated, giving them the appearance of stone structures.



Among the dwelling-houses, which are mostly built of lumber, are numbers of cosy cottages, well shaded by cottonwood trees, and often hidden from view by a luxuriant growth of shrubbery, decorative plants and flowers. In the beginning of November I find in many front yards all the popular varieties of garden plants in full bloom, including morning-glories, honeysuckles, tulips, geraniums, hyacinths, dahlias, asters, fuchsias, and scores more, and this at an altitude of 4600 feet above sea-level. The business portion of Tombstone includes not less than 20 blocks, and every branch of business is well represented. The merchants carry large stocks of goods, and trade seems to be brisk, in spite of dull times in general. The inhabitants are, without exception, as far as I could see, a healthy and hardy set of people, the climate being actually as perfect as could be wished for. I find an excellent public school, a fine county court-house, city hall, Masonic hall, named after the pioneer prospector, Schieffelin, four churches, gas factory, foundry, ice factory, Turner hall and skating rink. The following fraternal organizations have flourishing Lodges here: The Masons, Odd Fellows, Knights of Pythias, Grand Army of the Republic, United Workmen, Daughters of Rebekah, and Patriotic Order Sons of America.

Perhaps the most noteworthy fact in connection with Tombstone as a town is the water supply. Situated in a dry country where springs are miles apart, the city is furnished with as pure, excellent water as any town in the United States. The city water works and the Sycamore Spring Water Company both furnish good and sufficient water for domestic purposes. The latter company has a pipe-line eight miles long that conducts the water from the Sycamore springs, near the base of the Dragoon mountains. The Huachuca Water Company, an Eastern corporation, has expended $500,000 in bringing water to Tombstone from the loftiest range of mountains in this vicinity, the Huachucas, a distance of 31 miles. At the mountains is a reservoir holding a million gallons. The pipe leading to the city has a capacity of 45,000 gallons per hour. At the lowest point, where this pipe crosses the valley of the San Pedro, it is subjected to a pressure of 1900 feet. The Tombstone reservoir, with a capacity of 1,200,000 gallons, is 360 feet above the city, and 1100 feet below the level of the mountain reservoir. The pipes lead to all parts of the town. For fire purposes it has a pressure of 160 pounds to the square inch—greater than that of the best fire engine.

The great fires of June, 1881, and May, 1882, which in the aggregate destroyed a million dollars' worth of property, and for the time being seriously crippled the young city, would, with the Huachuca water, have been impossible. Fire now attacking a pitch-pine building is unable to consume it, and when doing its best is compelled to leave the charred framework. Thirty-eight fire-plugs are well distributed throughout the city, and the fire department, with four hose-carts, 2000 feet of 2½ inch four-ply rubber hose and one hook and ladder truck, is a safeguard that makes any conflagration an utter impossibility. An exhibition under disadvantages, a heavy west wind blowing at the time, afforded your correspondent an opportunity to see for himself the tremendous force of the water. From a 1¼-inch nozzle a stream of water was thrown fully 60 feet perpendicular up in the air, and what it will do when calm the accompanying photograph (see engraving) will show and explain for itself. The building near by where the stream of water is shown is the Schieffelin hall, and measures 51 feet in hight from the sidewalk to the top of the flag-pole.

Tombstone has gained her world-wide reputation through the great number of rich silver mines that have been discovered within the last twelve years. Millions of dollars have been produced by them during that period, and millions of dollars have been invested in costly machinery, hoisting works, substantial buildings, mills, etc. Water in large quantities was encountered as depth was attained, and two large and expensive Cornish pumps were put in the Contention and Grand Central mines respectively, which combined were able to manage the water.

Unfortunately, the Grand Central buil lings

A SKETCH IN TOMBSTONE, ARIZONA.

and works burned down a few years ago, also wrecking the shaft, and to rebuild requires an outlay of a great sum of money. The different companies cannot agree on sharing the expense of renewed action, and consequently several of the largest mines are lying idle, although every one of them is in large bodies of good ore. But the time will undoubtedly come when some understanding will be arrived at, new pumps erected, the water raised, and a never-ceasing stream of bullion flow from the famous district of Tombstone. At this day there are about 250 men employed by several of the companies, each of which owns a number of mines, while about 200 more miners are chloriding in the neighboring camps.

Much of the work going on is of a development character, and as soon as operations should assume their proper dimensions—that is, their former scale—the population of Tombstone would double at once and reach its former number of over 6000. JULES BAUMANN.

Colorado's Silver Convention.

At the recent silver convention in Colorado a permanent organization was perfected, with Hon. H. A. Tabor as president and a vice-president from each county in the State. Resolutions were passed strongly urging remonetization. The preamble preceding the resolutions states that it is the opinion of the people that the demonetization of silver 16 years ago by this country and foreign powers was the result of a conspiracy of the few against the many, of the creditor class against the debtor class, of the consumers against the producers, of the idlers against the workers; that since the time mentioned the period has been marked by constantly declining prices of staple commodities and of all the products of the farm and shop, and also taking from the producers 30 per cent of their gross productions; that this condition of things has now been definitely traced by the most careful and reliable observers of the world to the destruction of more than one-half its standard money, thereby increasing the use of and demand for gold; that efforts to remedy this ill-timed action have been met with predictions of evil to the people and to the nation. The declarations are in substance that the time has fully come when a restoration must be made, and that this can only be done by restoring the system of metal money coinage in effect prior to 1878, which in the past has proved so beneficial. That Congress, upon assembling, pass an Act for the remonetization of silver and for the free and unlimited coinage of the same. That until such time, a demand is made for the coinage of $4,000,000 per month, in accordance with the Bland bill. That the time has arrived when the United States can lead the way in the matter of free and unlimited coinage, and that by so doing it will increase the prosperity of its people. That the present stringency of the money market, in connection with the low price for all the products of labor, is convincing evidence that the money volume has not expanded with the increase in population. That the people generally insist upon the enforcement of these last demands.

The Nationalization of Industry.

It is but little more than a year since Edward Bellamy gave the world "Looking Backward," a work in which the nationalization of industry is so attractively put as to lure many adherents. Numerous clubs have been formed for the realization of this idea. Now what are we to understand by this phrase? "The simplest definition of this new term, Nationalism," says Lawrence Gronbound, one of the leaders of the movement, "is National control of all industrial forces." It is that form of socialism that aims to put under State control every form of industrial activity, and make all workers, whether by hand or head, the salaried employes of the Government. The friends of this movement would have the Nation own everything, all the land and all the property of every name and description. It should excavate all the mines, operate all factories, mills, machine-shops, build all the houses, raise all the corn, wheat, oats and barley, breed all the horses, cattle, sheep and hogs; bake all the bread, make all the hats, boots, shoes, clothes, and compound and dose out all the medicine. In short, the Government would be the exclusive landlord and employer, and all the people equally dependent upon its care and protection. This is Nationalism, and its aim is to destroy the whole competitive system of labor and enterprise as the source of all our social ills and financial trouble.

But however spruce and attractive this form of socialism may seem in its new dress, there is very much about it that is decidedly objectionable. Of all the forms of despotism that the imagination of man ever devised, this would be the most intolerable. The effect of it would be to place the whole industrial activity of the people under a uniform drill and control, like an army in which the will, volition and liberty of the individual would be drowned and lost. It would tend to produce idleness, indifference, a disposition to shirk, and destroy all accumulations of property beyond what was needed for daily sustenance, by taking away all the incentives to industry and economy. It would swallow up all enterprise, adventure, all heroic energy, originality, inventive genius and individuality in one vast dead sea of sluggish uniformity. It would level society downward, not upward. This is obvious; for in order to prevent those social inequalities that are regarded as offensive to these easy-chair philosophers, some way would have to be devised to hold back the energetic, the industrious, the men of superior ability and daring adventure. For it would not do to let them acquire and enjoy more than the weakest and dullest, the indolent and improvident. That would let the old order of things back again. Hence the capacity of the lowest would become the standard of equality. Would not this be putting the brakes upon progress? Would it not be taking the advice of Rousseau, who long ago thought the best thing society could do would be to burn the Patent Office and get into a covered wagon and move back to the woods?

But while there is much in this Nationalist movement, taken in its entirety, that we cannot accept, there is much that is desirable and should be encouraged. Modern life demands organized business action, and it is becoming daily more clear that many forms of business can no longer be safe in private hands. The sooner we meet this matter face to face the better. America is now the only important country where the telegraph exists under private management. State railroads have become almost universal in Central Europe. The municipalities of those lands have very generally assumed the control of gas works and water works. It is the proper function of government to assume the ownership of all industrial monopolies, upon which the vital welfare of the people and prosperity of the public depends, but when it is contended that government should manufacture everything, from a gang-plow down to tidies and night-shirts, it is running a good idea into the ground.

ENGLISH MINES.—Great Britain mined almost 10,000,000 more tons of coal, iron and other minerals last year than in 1887, and employed 10,000 more men in the work, but fewer lives were lost in the process. The total number of accidents was 885, and of deaths occasioned thereby 860, being an increase of four in the accidents, but a decrease of 91 in the lives lost.

THE Drumlummon mine, Montana, made last month an output of $87,200 from 6798 tons of ore crushed. The working expenses were $56,000.

Artesian Wells in California—No. 3.

(*Continued from page 393.*)

the portion of the water issuing from the mountains, the rest passing directly to the sea.

"The Santa Ana river issues from its canyon about 12 miles above Victoria Cienega; by barometric measurement it descends about 700 feet in that distance, while Mill creek issues several hundred feet higher still. The water absorbed by the gravel masses, and afterward confined between successive clay-sheets, might, at the cienega in a well 200 feet deep, be under nearly a thousand feet pressure. No such degree of pressure can, however, manifest itself, because of the enormous friction opposed to any movement, and doubtless because of a steady, though slow, seepage toward the sea, which relieves it below."

It is impossible for me, within the limited time allotted for this paper, to enter into a full exhibit of the results of all borings in this State; and I desire to add but a few words more with reference to wells from which water is raised by pumping.

So clearly has the utility of judicious irrigation in the vineyard, orchard, garden and field been established, that we find within two miles of Florin, on the firm red clay upland, over 500 windmills drawing water from depths of 35 to 100 feet, costing in the aggregate more than $50,000, irrigating not to exceed five acres apiece at a first cost of $20 per acre, besides annual cost of repairs.

Within the same radius are four steam-pumps elevating water from pits, to the bottom of which water rises from wells about 80 feet in depth. One of these, a centrifugal pump, has been placed in a pit 20 feet square, 20 feet deep, from which three tunnels, each 12 feet long and eight feet high, are chambered into as many bedrock sides of the pit.

This pump is placed at the water-table 10 feet below the surface of the ground, and has a capacity for supplying water to about 200 acres of land. Eleven borings, of which 10 are four inches in diameter and one is 10 inches, bring water into the pit from below.

These wells become flowing wells when the water-table is lowered by pumping. The capacity of the pump is in excess of that of the wells after the surface of the water is lowered about 10 feet.

On the ranch of R. D. Stevens, about eight miles from Sacramento, on American river, vines are irrigated in June or early in July by flooding, water being raised from a gravel stratum by means of a bored well, 33 inches in diameter, 86 feet deep, to within 11 feet of the ground's surface. When pumping, the water-surface is lowered about six to eight feet.

The circular well, 18 feet in diameter, 25 feet deep, with brick casing, from which R. B. Blowers at Woodland, pumps water for irrigation by flooding, of alfalfa lands, orchard, vineyard, etc., is known to most of my hearers from the many descriptions of the same which have been heretofore published.

Many other such irrigations might be noted, and all bear testimony to a healthful development of our resources, to the onward march of civilization, and to the advancement of agricultural pursuits, from wheat-growing to a more intense cultivation of our fertile lands, which will ever remain the pride and boast of our State.

Famous among deep borings in other countries, is the artesian well of strong flow at Grenelle, in Paris, which is about 1900 feet in depth, and which was bored in the years 1834 to 1841. Its diameter is 16 inches. The well at Passy, in Paris, was undertaken 14 years later, and was completed in 1857. It is reported to have a discharge of over 5,000,000 gallons per 24 hours, from a depth of 1923 feet, and has at the bottom a diameter of no less than two feet four inches.

At La Chapelle, in France, from 1866 to 1869, a boring five and one-half feet in diameter was carried to a depth of 1811 feet. The boring-tool had a weight of four tons and was dropped 25 times per minute. It was the intention to continue the boring to 2950 feet.

There are many other deep borings in Paris, most of which are from two to eight inches in diameter.

In England, where artesian wells are also numerous, they are generally known as "blow-wells."

By reason of the immense number of wells that have been bored in the London district, the hight to which water there rises has been measurably reduced, and many wells which were once artesian have now ceased to flow.

At Kissingen, in Germany, water is thrown up to a hight of 58 feet from a depth of 1878 feet. It is claimed that, in this case, the impelling force is due to carbonic acid gas, generated at a depth of 1680 feet, at a junction of gypsum with magnesian limestone.

The deepest boring in the world is at Sperenberg, about 20 miles from Berlin, where a well penetrates the crust of the earth to a depth of 4197 feet. This depth was reached with a bore-hole 13 inches in diameter, which, in the last 3907 feet, penetrated a deposit of salt. The artesian well at Charleston, S. C., delivers about 29,000 gallons of water per 24 hours at 10 feet above the surface of the ground. Much difficulty was experienced in completing this boring to a depth of 1250 feet, as also one at New Orleans, only 600 feet deep, on account of light sands that had to be penetrated and frequent lateral displacement of the well-tubing. The boring at New Orleans did not strike any water of spontaneous flow.

At St. Louis, at the Asylum for the Insane, a boring stopped at 3843 feet in 1868, brought up only brine. The last 40 feet were in granite.

The well at Louisville, in Kentucky, bored in 1857, had been more successful. It reached a depth of 2086 feet, and brought up a copious supply of good water.

In Mississippi, at the base of the hill on which Columbus is built, a nine-inch well struck a flow which was reported strong enough to run a mill. As soon as this well was opened, the many artesian wells in Columbus ceased flowing. They commenced to discharge water again as soon as the new well was partially closed.

The well at Louisville, Kentucky, is 2066 feet deep, and brings up water decidedly mineral in character.

A recent deep boring in Europe is the well of Buda-Pesth, Hungary, which was commenced in 1868 and completed in 1879. It was bored to a depth of 3200 feet, and delivers about 167,000 gallons of water per day.

The water, which has a temperature of 165 deg. Farenheit, contains small amounts of carbonic acid, nitrogen and sulphuretted hydrogen.

The temperature of the mud taken from the well at 3000 feet was 177 degrees. Before the bore-hole was lined with wooden tubes, its flow was 272,000 gallons per day.

By means of such deep borings, as here enumerated, great treasures of gas, of oil, of coal, of salt, and of water, have been developed in many localities of the United States, as well as in other countries; and it goes without saying that many a discovery remains yet to be made, and many a reward awaits the persistent exploration with the auger throughout the length and breadth of California.

PRACTICAL

Books on Mining

AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warnford Lock. 788 pages, with 8 plates and 271 engravings in the text. 4to, cloth, $15.00, express prepaid.

IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Ross. This work embodies the information, collected during four and a half years, of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrages, flood protection, methods of regulation, locks, etc., have been treated in detail. 367 pages, large 8vo, with 26 plates and numerous engravings in the text. Price $15.00, express prepaid.

MEXICAN MINES.—Dahlgren's Historic Mines of Mexico, *only a few copies left;* price $25.00. Handbook to the Historic Mines of Mexico, price $1.00.

Thanksgiving Day.

Before the next issue of the PRESS, the day annually set apart by Presidential and Gubernatorial proclamation for public thanksgiving will have come and gone. From the Atlantic to the Pacific, from mountain and dale, western prairies and southern savannahs, more than 60,000,000 people have been invited to gather around their family altars or into their respective places of worship and gratefully acknowledge their dependence upon the Giver of all good. It is true this day has come to be regarded as more gastronomic than devotional. Many think more of roast turkey, cranberry sauce, mince pies and plum-puddings, than of anthems, prayers and sermons. Perhaps no better reform could happen to us than a revival of the old-fashioned idea of thanksgiving. The day was born of a deep, sincere religious feeling, and what can be more fit and beautiful than for so great and highly enlightened a people, favored as no nation was ever favored, once a year at least devoting their thought to the recognition of the infinite power that built the world and sends the rain and sunshine upon the just and the unjust.

What if the year has been marked, as it has, by unusual calamity? Thriving towns and thousands of lives have been destroyed by floods, fires have desolated cities, there have been storms and cyclones, and the drought has smitten the hope of the garden and field in some parts of the country. Still, we should cherish the assurance that the highest wisdom and goodness guides the world, and feel it to be our duty to equally remember that Power in our adversities as well as our prosperities.

It is evident at a glance that as a nation we have much to feel grateful for. During the past year we have seen four new stars added to our galaxy of States. Peace reigns throughout our borders. No foreign foe menaces our shores. If we turn our eyes to the most favored lands, the contrast should inspire us with the most grateful emotions. We see the governments of the Old World propped by bayonets and buttressed by cannon. Alarm dwells in the palaces. Fear, like a bloody phantom, haunts the thrones. In South America, Brazil, with its nineteen provinces, and territory quite equal to the United States, has just cast aside monarchy as easily and indifferently as a man throws away an old coat and gets himself measured for another. But amid all these changes, these spectral portents in the air, the population of these States are preserved in peace and happiness, not by standing armies and navies, not by the policeman's club and the fear of the law, but because the people are animated and harmonized by a common spirit of patriotism, love of home and social order.

The farmer especially has reason to cherish a grateful heart. Agriculture underlies all our national wealth. He gives the nation bread. But we have become so accustomed to our phenomenal crops, the immense statistical reports of the wealth of our soil, mines and seas, that we are no longer astonished when we are told that the agricultural productions of the current year have been appraised at four hundred and a half millions of dollars. Our national wealth in 1880 was estimated at forty-four thousand millions of dollars, exceeding the wealth of Great Britain by two hundred and seventy-six millions of dollars. England's wealth is the result of the slow growth of centuries; the wealth of the United States has mostly been made during the last 25 years. Surely these great facts, not to go further into detail, should justify the President in calling upon us as a people to come around our altars with praise and thanksgiving.

But let us come closer home. That is a very poor idea of Thanksgiving that vanishes with the choice viands of the table. To many the day does not come with smiles and gladness. Some are pale and worn with disease. Some are shivering in the byways and alleys of neglect. In some homes there are empty garments and vacant chairs. It may be that the most of us may feel that we have been misunderstood, have been strangely unfortunate and made a failure of our life, but a true retrospect should be taken from a higher and more comprehensive point of view. In doing so we shall most likely see that all the trials, incidents and vicissitudes of the individual or family are the stray fragments of a song that will one day reveal its perfect harmony.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING NOV. 12, 1889.

414,875.—COMBINATION TOOL—Ansley & Schenck, Medical Lake, W. T.

415,074.—FRUIT-PACKING CASE—J. L. Stevens, S. F.

The following brief list by telegraph, for Nov. 19, will appear more complete on receipt of mail advices:

California—Francisco Cavelers, assignor of one-half to F. Stork and A. S. Mackinzie, San Jose, pump; George F. Gray, San Francisco, concrete-mixing and delivery wagon; Shedrach D. Northcutt, Los Angeles, carrier track for cable curve; John P. Simmons, Los Angeles, two patents for steam boiler; John G. Stultz, San Diego, colored fire; Oliver Van Orman, assignor of one-half to C. H. Eason, Los Angeles, divided car axle.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EASEL.—Laura S. McDonald, St. Helena, Napa county. No. 414,987. Dated Nov. 12, 1889. The invention relates to that class of easels in which a canvas-supporting rack or shelf is vertically adjusted. The invention consists in the novel general arrangement and construction of the frame of the easel, the support and guide for the moving rack or shelf, including its attached parts, the adjustable rack or shelf for the design and other details. The manner of adjusting the racks or shelves is a simple and convenient one, avoiding the complications usually present in easels of this class, for by merely loosening the thumb-screws they may be raised or lowered, and then fixed in any position.

TYPE-WRITER DROP CABINET.—James P. Mighell and Frederic E. Gladwin, S. F. No. 414,983. Dated Nov. 12, 1889. This patent covers certain details of construction in those cabinets in which type-writing machines are kept. The cabin is so made that the type-writer, when not in use, drops down into the cabinet out of sight.

CARTRIDGE-LOADING MACHINE.—Ulrich Bachmann, St. Helena. No. 414,964. Dated Nov. 12, 1889. The invention consists essentially in a rotary shell table provided with circular concentric series of holes or sockets for receiving the shells, said table being mounted in a frame and adapted to slide diametrically, whereby any of its concentric rows of holes or sockets, and any hole or socket of each row, may be brought into position. The invention further consists in the construction and arrangement of the feeding devices for supplying the shells, and the novel punch, cap-presser and rammer for decapping and recapping the shells and forcing the bullets home.

FRUIT-PITTING MACHINE.—G. W. Campbell, San Jose, assignor of one-half to Jesse Wood, Chico. No. 414,971. Dated Nov. 12, 1889. This invention relates to that class of mechanism for pitting or stoning fruit in which a reciprocating winged punch is adapted to be forced down upon the fruit so as to divide its flesh and remove its pit, the fruit being held in a suitable socketed bed below. The invention consists in a novel hinged and tilting bed for the fruit, whereby the divided fruit is discharged as the winged punch rises, the novel mechanism for operating said bed, the discharge chute and connections for receiving and guiding the fruit cut, the novel underlying knife for cutting the bottom of the fruit, the novel or removable connection of the operating-bar and winged punch-stem, and other details of construction and arrangement.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

News in Brief.

THE street-cars of Helena, Montana, have to be heated by stoves in winter.

ELIZABETH T. MILLS was admitted to practice law in this State by the Supreme Court at Sacramento last Monday.

THE financial results of the late fair at Portland, Oregon, are satisfactory, $20,000 being left after paying all bills.

THE Palace hotel of San Francisco will hereafter employ white men instead of colored waiters in the several dining-rooms.

DR. TYRRELL of the State Board of Health opposes immigration of consumptives to this State. He says they are a menace to the general health.

THE talk about a bridge to connect England and France is still going on. Skilled engineers report that the enterprise is feasible. The bridge will cost about $80,000,000.

A COMMITTEE from Salinas has been investigating the gas-well business in Stockton, with a view to using what knowledge could thus be gained in seeking gas at Salinas.

THE treasurer of Tehama county paid $382.30 bounty money for October. The tariff on bears is $5, while coyotes come higher—$9.50. California lions are worth $7.50 each.

G. W. LANG is to try an experiment of driving 1000 head of cattle from Tombstone to Los Angeles. He will have to cross the Colorado desert. If he can do the job, Mr. Lang will save $4000 in railroad charges.

CAPITALISTS of Troy, N. Y., are working a mining location near Steamboat Springs, Nev., at a spot selected by J. W. Norrie, the divining-rod manipulator, who claims there is a valuable ore body at a certain depth.

THE salt industry in Southern Kansas is assuming majestic proportions. It is said that the salt taken up at Wellington, in that State, is the purest in the world. A dozen great salt plants are in active operation, and others will soon be established.

THE Vallejo *Times* says the train from Vallejo Junction to Oakland mole will be run through with only one stop—at Sixteenth-street station, West Oakland—in 25 minutes. The distance is 24 miles. The old schedule time was two hours.

SOME experiments were made recently by the Northern Pacific car-builders at Tacoma to test the strength of fir and oak timber. The first-named proved one-third stronger than the Eastern oak, and more than one-half stronger than Eastern white pine.

AN attempt to enlarge the city limits of Visalia was voted down by the outsiders, a few weeks since. The insiders promptly passed an order requiring each child not in the city limits to pay $2.50 a month for the privilege of attending the town schools.

THE Union Iron Works employes are objecting to a new rule established by their employers requiring them to pay 50 cents per month into a fund to be used for defraying the expenses of surgical attendance and treatment of such as are injured while working in the establishment.

THE U. S. Railway Mail Service has inaugurated a fast mail from New York to San Francisco. The fast train arrived here Tuesday, practically gaining a full day. The new schedule gets the mail-matter into San Francisco in 108 hours, 45 minutes, and it is so arranged that it is ready for carriers to distribute the moment it reaches this city.

EGYPTIAN IRRIGATION.—E. & F. N. Spon, the New York publishers, have just issued a work on "Egyptian Irrigation," by W. Willcocks, Indian Public Works Department, Inspector of Irrigation, Egypt, with an introduction by Lieut.-Col. J. C. Ross, Inspector-General of Irrigation. This work embodies the information collected during four and a half years, of the irrigation systems of Egypt, and a *resume* of the works carried out by Sir Colin Moncrieff. From the beginning to the end of the work the author has not hesitated to impress his firm conviction that the modern system of irrigation cannot last in a country where there is no rainfall, unless it is modified by the ancient basin system. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrages, flood protection, methods of regulation, locks, specifications of works, and prices of work and labor, have been treated in detail. Agricultural questions, such as amount of water needed for irrigation, duty of pumps, cost of rearing and yield of different crops, the cotton-worm, manures, and rotation of crops, are freely discussed. The Lake Moeris scheme for storing water is considered, as well as other projects for reclaiming land by basin and summer irrigation combined. The information embraced in this work is applicable to the irrigation plans and systems being carried out on this coast. The experience in Egypt must be useful to all engineers and agriculturists in this country.

LUCKLESS WILD GEESE.—During the storm last Monday night great numbers of wild geese, bewildered and attracted by the electric lights at Grass Valley, settled down in the streets and yards of the town. They were shot at incessantly, and great was the carnage until the lights were put out at midnight.

SHIPPING SULPHUR.—Alex. Wise is shipping sulphur to the Dayton Acid Works. He has contracted to ship 100 tons of refined sulphur to the works, and he has men melting the stuff at the Rabbit Hole sulphur mines, Nevada.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

WM. H. HILLEARY—Oregon.
E. E. DEMING—Oregon.
W. B. FROST—San Luis Obispo Co.

CORROSION OF ZINC.—Recent experience in Germany points to the fact that under some conditions sheet zinc, when in direct contact with brickwork, suffers from rapid corrosion. It appears that in building the Berlin City market halls some sheet zinc work which rested upon brick walls was deeply pitted at a number of places, and particularly where the metal was in direct contact with the bricks. Chemical examination of these showed that they contain as high as 1.14 per cent of soluble salts, capable of producing the destructive effects noted, and stimulated to more energetic action by moisture. The proportion of such salts will vary with different kinds of bricks, and in some there may be nothing to induce such corrosion as that here noted. It would be an advisable, and, in the end, a cheap precaution to avoid immediate contact of sheet zinc and brickwork by inserting a layer of roofing-felt or similar material.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & CO., Publishers, No. 220 Market street, San Francisco

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F.

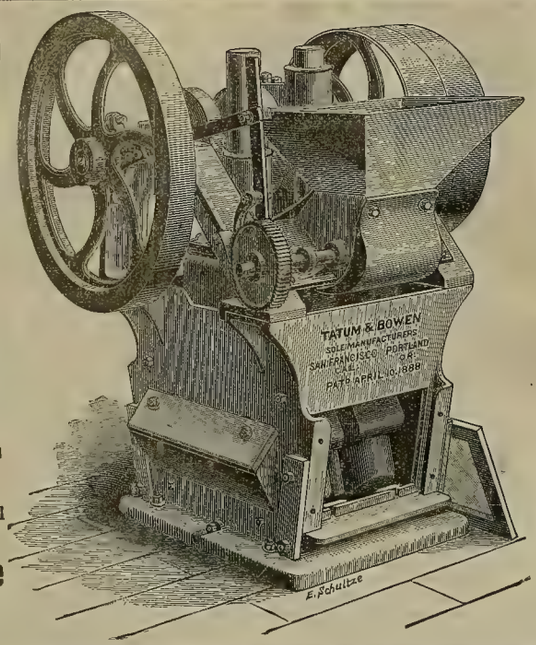
Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.



The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

—THE—

PERFECTED DOUBLE Economic Quartz Mill.

Attached to each Mill is an effective

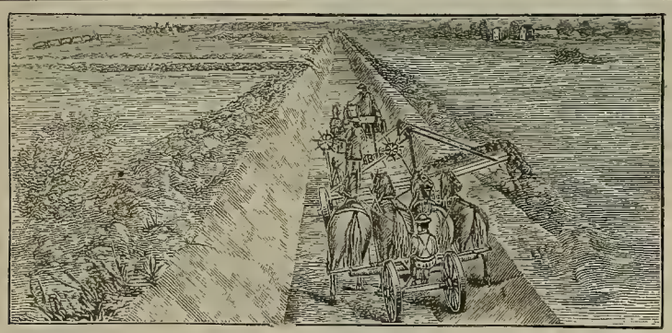
Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with our shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 9 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an



IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 21, 1889.

Rains the past week have given a still more hopeful, confident feeling to general trade. With the older residents the belief is general that the crops in 1890 will be good, while the large deposit of snow on the mountain ranges insures a liberal supply of water in the mining districts. Iron-workers, machinists and manufacturers in general look forward to a more prosperous year than enjoyed for several years past. Money continues easy, with remittances from the interior increasing. The demand for accommodations is only fair.

MEXICAN DOLLARS—The market, after shading off, is showing more strength at the close, with 77½c quoted as the buying price for large quantities.

SILVER—The market remained steady in Europe at 43 13-16d, New York at 94¾c, and here at from 95¾ to 99c up to yesterday, when London suddenly jumped to 44d, New York to 95½c, and this market to 96¾@97c. To-day our market is quoted at 97@97½c, with holders asking 97½c. English advices report more active demand for bullion for the Continent and India, while in New York it is reported that shipment to Rio Janeiro is resumed. Previous to the dethronement of Dom Pedro, free shipments of silver bullion were being made to that country. Receipts of bullion in our market are still light, hardly enough to meet current requirements. Although more ore is being milled by the Comstock mines, yet the gain in silver for this market is light, owing to the Carson Mint taking quite freely.

By referring to the New York *Journal of Commerce* it will be seen that there are two quotations for silver in that market; one is for commercial bullion in bars, and the other for United States Mint bars, the latter being quoted from ¼ to 1c an ounce fine higher than the former. Our New York telegraphic quotations are for the former. Selby's refined silver bars being considered in this market finer than those of the Mint, accounts for the higher quotations we give in this city of bar silver.

QUICKSILVER—Receipts the past week aggregated 413 flasks. The market is reported strong, with a good demand ruling. In last month there was shipped East over the Southern Pacific railroad 2700 lbs.

BORAX—Receipts the past week aggregate 1080 ctls. Shipments East in the last month over the Southern Pacific railroad aggregated 9435 ctls. During the past week 374 ctls. were shipped to St. Paul, via Canadian Pacific railroad. The market is steady, at firm prices.

LIME—Receipts the past week aggregate 4247 bbls., and exports by sea 666 bbls. to Honolulu. The market is slower, owing to rains, but prices are unchanged.

LEAD—The market is slightly easier in sympathy with the East. Heavy supplies from Mexico are against the market. European advices report a weaker market under increasing supplies, with Australia an important factor to draw from.

TIN—Imports the past week aggregate 14,954 boxes of plate. The market for spot is reported firm, but for shipment is easier, owing to a lessened urgent demand abroad and more liberal offering of futures.

IRON—Imports of pig the past week aggregate as follows: From Irondale, 200 tons; Grannock, 305; New York, 100; total, 905 tons. The market is strong for spot. The above receipts are said to have been cared for before arrival. The consumption with us does not show any material increase, but the future is quite promising for a large increase. Both English and Eastern markets are reported quite active and strong.

COPPER—The market gradually shaped itself into better shape for the selling interest, and although the American mines' output show a large increase, yet values steadily advanced under a large increased consumption the world over.

COKE—Imports the past week aggregate 305 tons from England. The local market is without essential change.

COAL—Imports the past week aggregate as follows: From Nanaimo, 4144 tons; Seattle, 4100; Departure Bay, 4570; overland, 61; Newcastle, N. S. W., 1100; Tacoma, 2250; Coos Bay, 1100; New York, 105; total, 17,430. The spot market is reported fairly steady. The consumptive demand for both steam and household has been quite free. Winter setting in earlier than usual, stimulated the demand for household, and as the bulk, for several weeks at least, has been met, there is a quieter feeling. An increased output by the coast collieries is confirmed, which causes some dealers to look forward to a shading in prices, unless we have severe cold weather, in which event still higher prices may obtain.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Nov. 21, 1889.—The following are the closing prices the past week:

	Silver in London.	New York.	Copper.	Lead.	Tin.
Thursday	43 11-16	94¾	$12 70	$3 80	$21 75
Friday	43 11-16	94¾	12 75	3 82½	21 65
Saturday	43 11-16	94¾	12 90	3 80	21 75
Monday	43 11-16	94¾	12 90	3 82½	21 70
Tuesday	43 13-16	95¼	13 00	3 82½	21 30
Wednesday	44	95¼	13 00	3 82½	21 30

NEW YORK, Nov. 20.—Tin has been gradually settling under easier markets abroad. Quicksilver holds strong. Borax is in active demand with full prices paid. Iron is still tending upward. Copper has met with a continued active movement both here and abroad. Sales are readily made at an advance of from ¼ to ¼ cent on last week's prices.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

SAN FRANCISCO ELECTRIC LIGHT AND POWER CO., Nov. 19. Capital stock, $1,000,000. Directors—Martin Bulger, Robert P. Hastings, William McMann, J. N. Chenowith, W. C. Clark, H. G. Platt and J. S. Humbird.

MUTUAL SAVINGS BANK OF SAN FRANCISCO, Nov. 19. Capital stock, $1,000,000. Directors—James Phelan, James G. Fair, Edward Barron, James Moffit and John A. Hooper.

TULARE COUNTY RAILROAD, Nov. 20. Object, to construct a railroad from Porterville, Tulare county, to the city of Tulare, making 22 miles of road. Capital stock, $220,000. Directors—P. N. Lilienthal, W. H. Chickering, Louis Sloss, Jr., and W. Thomas.

BUTTE KING M. CO., Nov. 20. Capital stock, $1,000,000. Directors—S. D. Mayer, V. I. Gadesden, Geo. H. Powers, Walter C. Lewis and L. A. Livingston.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Germania, Nov. 13, $2973; Hanauer, 16, $6350; Germania, 16, $2211; Young America Smith, 17, $17,300; Justice, 17, $12,822; Eureka Con., 17, $14,500; Germania, 14, $2328; Hanauer, 14, $4200; Con. California and Virginia, 18, $65,379; Hale and Norcross, 19, $5000; Mt. Diablo, 19, $7243; Germania, 17, $2686.

AN IMPROVED LENS, in which the intensity of light is equal throughout the entire field and the sharpness of image distinctly uniform, has been patented by an American optician, who calls his new instrument an "electroscope."

THE Oroville *Mercury* says the manager of the Big Bend tunnel is confident that he can clear $10 a day to the man. He has great faith in the value of the property.

Mining Share Market.

The mining share market the past week was flat, stale and unprofitable. Since the "choking off" of the chipping fraternity by the San Francisco Stock Exchange the business transacted there appears small—less than it really is owing to the bulk of the trading being now done quietly after board and not recorded. This allows the market to be more advantageously worked up or down as required by the manipulators. While it is profitable to the latter, it is death to outside traders, and makes margin trading and short selling very risky business. Inside points continue to be put out correctly, and those who followed them lately have made money. It is only a question of time when they are led into a trap. The points are for lower prices.

In outside stocks trading continues light. Fears of more assessments on the Tuscaroras is the scarecrow in that direction, as are the Bodies, Mono and Con Pacific assessments, with others to follow on the Bodies.

The quarterly reports of the bullion-producing mines on the Comstocks are far from reassuring to stockholders. Take, for instance, that of Yellow Jacket, which is given as follows: "Produced 6321 tons of ore yielding bullion valued at $71,471.94; average yield per ton, $11.50; cost of extraction, reduction and transportation, $77,905.72; cost of production above yield, $8433.78. No tax." Reports of the pulp assays, published in the Virginia City papers, gave the pulp assays at $24 and upward a ton. Where did the balance of the bullion, over 50 per cent, go?

News from the Comstock mines continues to be kept back, probably to facilitate stock-buying by the pool. Press telegrams report that a definite compact has been entered into for draining the South End and Gold Hill mines. This will admit of active prospecting on the lower levels where rich and large bodies of high-grade ore are said to be. After getting the water out of the mines, the managers may have to make air connections and do other deadwork before exploiting for ore. On the upper levels, running from Belcher north, drifts are being run to make air connection; with this an accomplished fact the various crosscuts can be more successfully run, and the ore bodies known to lie to the west be opened up. Crown Point is crushing its ore, going a little over $16 a ton. In a short time higher grade ore will be worked. Challenge and Confidence will soon resume the shipping of ore. The storm of the past week has given all the water required for running the mills to full capacity, so that after this more ore will be milled by the ore-producing mines. The prospecting work in the North End mines continues to attract attention, as does that in the Middle and Gold Hill mines. In Alpha, on the 500-foot level they are still running west. On the 600-foot level they either have or will start crosscutting soon. The work in this mine has more than that in any other demonstrated the fallacy of the claim that the so-called syenite is the extreme limit or boundary of the ore deposit lying to the west. The discovery of well-defined veins and ore-bearing quartz in the west country rock called syenite, but closely resembling black granite, has put to rest the false idea regarding the no-ledge theory. In Alpha, on the 500-foot level, they have passed through three veins, the last being 13 feet wide—all bearing ore. It is claimed that these veins, with depth, will merge into one. The west side lode is gaining prominence, and in the near future this gold vein will be turning out bullion. The work in and around the Ward shaft continues to attract attention from experieneed miners, who look for the best of results as explorations are pushed. From the outside mines the news from the Quijotoas and Tuscaroras is of increasing interest, though it looks as if it will take three or four months before much can be accomplished.

From the Bodies the news still continues discouraging, but active work for more extensive prospecting is being done, but whether it will prove a failure remains to be seen.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

CARBON HILL COAL.—John A. Steinberg, general manager of all the Southern Pacific's mines, in speaking of the company's great Carbon Hill coal mine, 34 miles from Tacoma, said: "We are running only a light force now, on account of the large supply of coal already stored in this city. There is some $2,000,000 worth here now. About Jan. 1st we shall resume our regular shipping work of, say 1000 tons daily. Just now we are not shipping more than one-tenth that amount, confining our cargoes to those ships we have chartered. Our new system of washes for fine coal is now complete, and is very satisfactory in every way. It enhances the value of the coal fully 20 per cent by washing out all the dirt and slate. This effects quite a saving, as we formerly had to ship all the coal, dirt and slate together."

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company, Location and principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE. There are delinquent upon the following described Stock, on account of Assessment (No 1), levied on the 16th day of October, 1889, the several amounts set opposite the names of the respective Shareholders, as follows:

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

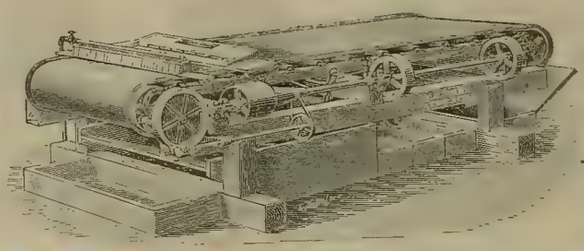
NEW HAVEN CONN.
P. O. Box 496.

Smelter For Sale or Exchange.



One 50-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

A Cheap Radial Drill Press.

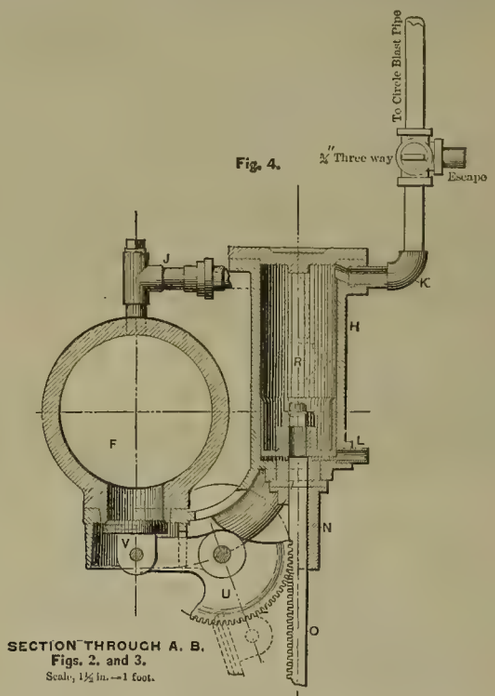
The Keystone radial drill press, herewith illustrated, is intended for a large range of work.

It takes in a pulley up to four feet in diameter, and may be used for boring small cylinders and similar work.

The feed-screw will feed 14 inches, and has adjustable automatic feed. The back gearing is all inclosed. The circular table is 24 inches in diameter, and is bored to receive bushes for boring bars. The table can be raised or lowered without being turned around. The square tilting table is an extra table, slips in the slotted side of the bed, and can be quickly removed. It is convenient for drilling work at any desired angle. It can also be used as a straight table.

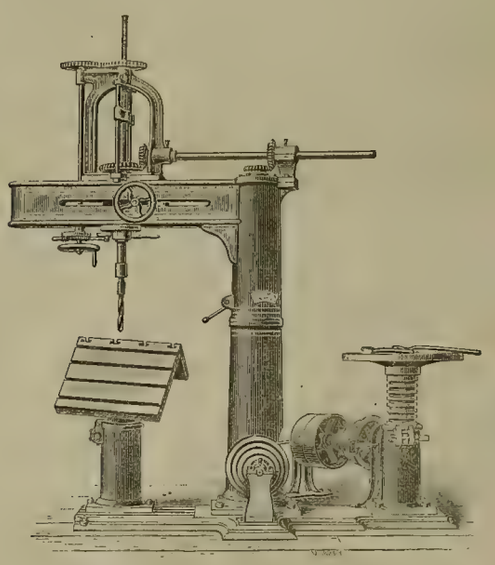
The drill has a radius of 60 inches, giving a distance between column and spindle of 34 inches. The column is 12 inches in diameter and 6 feet high. The entire hight from floor to top of feed-screw is 8 feet 10 inches; weight, 2800 pounds. The drill has strong gearing and the boxes are easily renewed. The lower spindle-box is brass, and is so constructed that in time of wearing lost motion can be taken up by a simple turn of a nut. The Parke & Lacy Co. are agents for this tool on this coast.

A TUYERE SLAGGING-VALVE FOR FURNACES.



THE five-stamp mill being erected near Silver City, Nev., by J. B. Dazet to crush ore from the Lacruits mine in that district, will be completed early in January.

THE "Lead trust" appears to be in a bad way just now, a number of prominent men having sold their holdings of trust certificates.



A Tuyere Slagging-Valve.

Mr. Edgar S. Cook of Pottstown, Pa., has long been desirous of providing a safe and easy method of relieving the tuyeres of slag when the cinder and iron notches are chilling through loss of heat in the crucible, or when, from dropping or jumping of stock, the molten slag is forcibly driven into the belly and leg pipes. The importance of a practicable tuyere slagging-valve impressed him very forcibly in his furnace work, and experience brought into ex-

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Water-Engines and Mines.

EDITORS PRESS:—On a recent visit to Sierra City and vicinity, I was quite interested in some new machinery in the Marguerite mine, concerning which, the superintendent being absent, the clerk, H. P. Parker, kindly gave me the following information:

The engine is a *water* engine. The power is supplied by a ditch five miles long, with a pressure of 360 feet. The engine and pump were made by Knight & Co. of Sutter Creek, Amador county, and are pumping at present at the rate of four strokes per minute, and raising 30 miner's inches of water. The capacity of the engine is 12 strokes per minute, and guaranteed to raise 50 miner's inches of water 1000 feet. The mills and hoist, both operated by Knight wheels, run by the same water-power, and each independent of the other. The engine and pump were put in place and are for 60 days under the control of Mr. E. Post, engineer for Knight & Co.

I am sorry that I cannot explain the working of this powerful engine, the importance of which, in the mere matter of saving wood alone, is very great, as, if I am not mistaken, Mr. Parker told me that the cost of cutting and hauling the wood to run a steam engine formerly used by this company was $100 per month. Mr. Post informs me that there are but four of these engines in use—two at the Plumas Eureka mine, one in Amador county, and this one.

This mine is owned by a Boston company, and under the able management of Mr. Fred Morris, who has had a great many obstacles to overcome, but who bids fair to surmount them all, as there is only about 30 feet to sink to make connection with upraise from drift in fourth level.

This is a 20 stamp mill. The Marguerite mine is about 2½ miles below Sierra City.

Sierra City, in Sierra county, has been one of the best mining sections in the State. It is to be hoped that the present depression is of a temporary character, as owing to some of the mines going into the hands of foreign capitalists, it is probable that more economy will be exercised in working them than has heretofore been the case.

To one deeply interested in the welfare of his country, the great mineral wealth of our State is a subject of deep interest. To the miners of "forty-nine" and the early fifties, who, with the insufficient tools of the times, were seeking to penetrate the heart of the mountains, the extensive mining operations of to-day are stupendous in their magnitude. WILLIAM ARMS.

Beckworth, Plumas Co., Cal.

Hayden Hill, Lassen County.

EDITORS PRESS:—Times are rather dull at Hayden Hill at present, though a few of the mines are looking well. The old Juniper mine is now being worked by Messrs. McLane and Owens, who have a lease of it and have started a new shaft to get down into the old works. The mine has been lying idle for some time, but there is now a small dump of pay ore from the new shaft.

On the southeast side of the hill is the Eclipse mine which was located Jan. 1st of this year (the day of the total solar eclipse) by Messrs. Auble and Dunbar. It was a relocation, the claim having previously been worked by other parties. They are getting a good prospect. Mr. Auble brought up from the mine a horn of decomposed quartz which he crushed in my presence and got a good $80-prospect. He then horned out ore from different parts of the dump and got nearly as good a prospect. He thinks the ore he is taking out will go from $30 to $80 per ton.

The old shaft is 80 feet deep. They are working on the 40-foot level and have drifted 58 feet in a N. W. direction, all the way in good ore. They have also drifted 71 feet in a S. E. direction in the same kind of ore. They will make a run at the mill within the next 30 days; then they can tell better what the mine will pay.

I called at the Evening Star mine, worked by Preston & Howard. The men at the whim told me they were working on pay ore. On the 80-foot level the vein is of decomposed quartz paying from $10 to $20 a ton.

Mr. Norton is working his claim all alone. His tunnel is on the S. E. side of the hill, and running north toward the Brush Hill mine. If he strikes that vein he will have a great advantage over those who are hoisting by hand.

H. K.

The "Silver Articles" in the Press.

EDITORS PRESS:—Copies of your valuable papers containing silver articles have been received and are greatly valued. I find in the issue of July 27th some figures on the relation between the price of wheat and silver. At our recent silver convention I had the honor of being placed upon the Committee on Resolutions and desired to have this feature of the subject touched up in the work of the Committee. Mr. Buchanan, Chairman of the Committee, insisted that my position was wrong; and, strange to say, I could not get my hand on the figures required to prove my position. This will show you how much these copies of your paper are appreciated.

WM. BALDERSTON,
Aspen, Colorado. Associate Editor *Times.*

Re-working Old Dumps.

Working over the old dumps at the mines about Butte will prove to be a profitable business in a short time. In fact, a few of the larger mines are now using to advantage that which they at one time thought they would have no use for. Said a prominent mining-man to a *Miner* reporter yesterday: "When the mines of this camp first commenced to develop, a great deal of good ore, both silver and copper, was thrown over the dumps because the two metals were selling at a higher figure than they are at present. In those days it didn't cost much to operate a mine, because the work was done near the surface. The men who worked mines at that time did not know exactly what they had. They shipped away for reduction a great deal of ore, and, of course, nothing but the very best went, as the crude way of transporting it made the freight charges high. All of the second and third class lots were thrown over the dumps. Now that facilities are handy for working these dumps, it will be only a question of a short time until they will be made to yield up many dollars in silver and copper. You see, the essence of the business is just this: When these mines were first worked, the ore was very rich and easy to get at, but now the shafts are getting deep; and while I am not exactly prepared to speak of the quality of the ore at the lower workings, I will say that the veins are no larger than they were above, nor is the expense of extracting it any less. Where the vein is narrow and the granite hard, as is the case in the deeper workings of some of Butte's mines, it costs considerable money to carry on operations, and the dumps will come in play when this state of affairs is reached, if it has not already been arrived at. There is about as much money in working over some of those dumps as there is in working the rock hoisted from the 1200 and 1300 foot levels, and I believe that in the near future all of the old dumps will be hauled to reduction works and the bullion extracted from them."—*Butte Miner.*

No Right to Use the Timber.

The suit brought by the Government against John R. Hite and John W Snyder, which has been on trial before Judge Sawyer and a jury in the United States Circuit Court, has come to a conclusion. The defendants, who are wealthy residents of Mariposa county, had, it was claimed, been engaged in unlawfully cutting timber on Government land during the greater part of ten years, from 1877 to 1887. The land is located in sections 15, 22 and 25, township 4 south, range 19 east, in Mariposa county, and was up to 1885 unsurveyed. The amount of damages claimed by the federal officials was $91,020, and there was what they deemed positive proof adduced in the trial that from $65,000 to $70,000 worth of timber had been cut and appropriated by the defendants during the ten years. Most of the timber was sawed by a mill owned by Hite, situated near by and about 15 miles from Mariposa.

The defendant Hite claimed that the timber had been used by him chiefly in a mine, and that under the mining laws he had a right to appropriate the trees for that purpose. This point was not, however, favorably received by the court.

The jury, after deliberating for five hours, returned a verdict in favor of the Government, fixing the damages at $5000.

Amador Gold.

On August 31 last we had an article on mining operations in Amador county. The Amador gold mine (limited) came in for an extended notice on account of the magnitude of the work in progress. Much interest has been evinced in the county and also in mining circles generally as to the outcome of the large investment in this property in mine and mill. We see by the *Amador Ledger* of recent date that the ledge, about 30 feet wide, which was cut two or three weeks ago on the 550-foot level, is apparently the same as that on the 250 foot level, but prospecting rather better in gold at the deeper point. The 60 stamp mill, it is said, will be started by the first week in January next, by which time every appliance, including the water supply, will be in order for continuous work.

MINING TIMBERS.—Some idea of the enormous quantities of timber used yearly in the mining industry may be formed when it is known that in the Anaconda mine alone, near Butte City, Mont., 80,000 feet of timber are put under the ground daily, or at the rate of 30,000,000 feet a year. At the smelting works at Anaconda, belonging to the same company, there are 180 cords of wood used daily, or 65,700 cords a year. Nearly 1,000,000 cords of wood are kept on hand. All the timber used for mining purposes can be legally cut from government land.

CANNING FACTORIES.—This country has 1000 canning factories, and leads the world.

Cotton in California.

Experts acquainted with cotton production in other parts of the world and the conditions which favor excellence in the staple have often assured us that many parts of California are well adapted to the growth of the staple. Prof. E. W. Hilgard of the State University, who was selected by the Government as best fitted to expound the cotton industry of the United States in the work of the Tenth Census, made a very careful and comprehensive examination of California soil and climate and a study also of samples of cotton grown here, and shows conclusively that not only is it practicable to grow cotton but that the quality is of peculiar excellence. This fact is also established by the many little experimental patches which have been grown by interested people from the Mexican boundary to Shasta county, and by the production on a commercial scale at several points in the San Joaquin valley. Although there has been in former years some uncertainty about a local market for cotton and there has been difficulty about gathering the crop, there has never been anything to reflect upon the natural adaptation of our soil and climate for the successful production of a most praiseworthy staple in the highest degree acceptable to the manufacturers.

The California Cotton Mills Co. at East Oakland, Alameda county, has been in operation about five years. The incorporation has an authorized capital of $600,000, and a paid-up capital of $330,000. The following constitute the Board of Directors: G. W. Beaver, President; V. D. Moody, Vice President; Wm. Rutherford, Manager; J. C. Ainsworth, John Center, E. W. Newhall, —Crist, M. Leaventreth, E. C. Sessions. The mill is eligibly located adjacent to railroads and navigable water. The buildings are new and substantially constructed of brick and iron. The machinery is of the latest improved styles, and the establishment has a capacity for working up 1,500,000 pounds of cotton and 1,000,000 pounds of jute per year. There are now employed 200 hands; 160 women and 40 men and boys. The establishment is well equipped throughout, and being under the personal direction of Wm. Rutherford, the manager, who is an acknowledged expert in his line, is conducted in the most approved manner.

The Cotton Mills Co. have just issued two interesting pamphlets which should be sent for by all who contemplate trying cotton as a crop. One discusses "Cotton vs. Wheat" and shows the advantage to the individual and to the State which would accrue from the production of cotton. The other treats of "Cotton Culture in California" and gives explicit directions by aid of which any one can begin the growth of the plant in this State. These publications and any other specific information which may be desired can be had by addressing the California Cotton Mills Co., East Oakland, Cal.

There are vasts tracts of land in California, much of it almost unoccupied, capable of producing cotton equal to anything grown in Texas.

STAMP-MILL POWER. — A well-informed stamp-mill employe is authority for the statement that a carefully prepared estimate shows that the Carson-river mills, operated by water-power, handle ore for $1.60 less per ton than the California mill, which latter is operated by steam. Deducting $1.25 per ton, the cost of transporting ore over the Virginia & Truckee Railroad, the difference in favor of the river stamp-mills will be 30 cents per ton. The *Chronicle's* informant says this difference can be reduced to a mere fraction by the exercise of rigid economy in operating mills by steam. If his statement is correct, there will be no need hereafter of suspending the crushing of Comstock ore from four to five months in each year on account of a lack of water-power to operate Carson-river mills, as shareholders in bullion-producing mines will no doubt cheerfully consent to pay an assessment for the erection of steam stamp-mills contiguous to their property where they can be operated at their full capacity as long as the ore resources hold out. The California mill, through the "Boss" process of amalgamating ore pulp, saves 92 per cent of the assay value, whereas 85 per cent is the average of the assay value of pulp saved from ore crushed in Carson-river mills.—*Virginia Chronicle.*

A LADY'S NOSE AS A WORK OF ART.—Mrs. Hoffman, of Brooklyn, has recently had a new nose made for her at the Long Island College Hospital. The bridge of her nose had been destroyed by disease. The surgeon raised the skin that formerly covered the nose, divided it lengthwise, and then inserted a breastbone just removed from a live chicken, with the cartilaginous filament and periosteum adhering to it. The skin was then drawn over the bone and sewed, and the doctor thinks that in a short time Mrs. Hoffman's nose will be as good as anybody's.

AN IMPROVED TRUMPET.—A trumpet producing its musical note by the vibration of a circular steel membrane by means of electricity has been invented by Captain Zinang of the Thirteenth Infantry, in garrison at Domfront, Orne, France.

THE loss to Con. California and Virginia shareholders through the discount on silver since the ore discovery in that mine in 1886, aggregates nearly $2,000,000.

Astronomical Photography.

Its Uses in Observatory Work.

[A lecture delivered Sept. 9, 1889, before the Cosmos Club of San Jose by CHAS. B. HILL of the Lick Observatory.]

Perhaps it is safe to say that fully half of the routine work of the great observatories in future years will depend upon photographic methods. For a great number of years the continuous record of the ordinary physical phenomena, such as the rise and fall of the barometer, the daily curves of temperature changes, the oscillations of the magnetic needle and the variations of the magnetic intensity at any given point on the globe—the systematic observation of which in the usual way would demand the utmost attention and the most trying labor—such record has been tirelessly, faithfully kept by the action of light on sensitive sheets. The observer once a day, or once a week, winds up the clockwork which is to keep a strip of the prepared paper continuously exposed, for example, to a beam of light reflected from a tiny mirror fastened to the extremity of a magnetic needle and properly adjusts the position of the scale; and for the remainder of the 24 hours, or of the seven days, as the case may be, every minute vibration of the magnet is automatically recorded, and for any given time its exact relation may be found. There are many mechanical devices for securing a continuous record from *meteorological* instruments, several of which are now in use at the Lick Observatory, but the photographic method is, I believe, the one invariably employed in the self-registering magnetic apparatus. At Kew, in England, such instruments have been employed for years; since 1883 a magnetic observatory for continuous photographic records has been conducted at Los Angeles, in California, by the U. S. Coast and Geodetic Survey. Many important discoveries owe their confirmation to the existence of such records; the connection—long suspected—between the eruption of spots on the sun and magnetic storms on the earth, was conclusively proved by the sheets from the magnetic instruments. The intimate relation between the *aurora* and magnetic disturbances has been definitely settled by a comparison of auroral observations with the magnetic records—in many instances it has been found that for every outburst of the northern light (even of one observed in this country) there could be detected, at the same instant of absolute time, a vibration of the magnetic needle faithfully registered on the automatic record at the Kew Observatory.

In this, as in many other ways, the photographic art has been utilized as "the *servant* of astronomy." It now seems time, as I will attempt to show you, to accord her at least an equal rank with the sciences of optics and mathematics, in the prosecution of the grand studies of astronomy. Much has been written within the past few years to show the wonderful opportunities for extending the knowledge, not only of "sidereal astronomy" but of astronomical physics which photography offers the student.

Some of the Results

In this new investigation have been really revelations. Without going into special details for the present, but merely as an illustration, it may be instanced that a plate properly exposed in the focus of a photographic telescope, will not only show every star which might be seen by the observer with an equally large object glass and a field of view of the same extent—and show them, too, with a distinctness and accuracy which will admit of the most precise micrometrical measurement—but, what is most remarkable, such a negative will reveal thousands of fainter stars and faint nebulous patches which could not be glimpsed through the telescope by the sharpest eye and with the most persistent efforts!

That advances in this art have been marvelously rapid within the past few years, may be inferred from the following fact: In October, 1886, A. A. Common, Esq., of the Royal Astronomical Society, delivered a lecture before the Royal Institution of London on "Photography as an Aid to Astronomy."

Less than one year later Prof. David Gill, Her Majesty's Astronomer at the Cape, in prefacing his lecture on "The Applications of Photography in Astronomy," delivered June 3, 1887, before the same body, said, after speaking of Mr. Common's lecture, "Given by one who is a consummate master of the art of celestial photography, that lecture (complete as to history, and full of suggestion as it was) would, under ordinary circumstances, have precluded further reference to the subject in these Friday evening lectures for some years to come. But the past year has witnessed such

Developments of the Subject,

And the importance of photography in astronomy has been so much advanced by the conclusions of the recent 'Astro-Photographic Congress,' as to afford a reasonable apology for the present lecture," etc.

The Conference, to which Dr. Gill had reference, was held in Paris, in 1887, principally with the view of enlisting a number of observatories in all parts of the world in the execution of a piece of work which recent experiment had shown to be practicable; namely, that of "making a photographic chart of the sky for the present epoch," etc.

The different resolutions of the Conference, embodying the work proposed to be done, will

be referred to at greater length in due time. The undertaking is worthy of the labors of an International Conference of scientific men; it is proposed among many other things to obtain a series of plates each about 4 square, to cover the whole sky from the north to the south poles, and showing every star, nebula and cluster in the heavens within reach of the ordinary working telescope, and down to the 14th order of star magnitude. In other words, over 10,000 plates; and over 20,000,000 objects!

Here we have a wholly new scheme of work for the employment of our active observatories, in addition to the routine at present carried on; one entirely new in design and even the conception of which has been the outcome of very recent years.

It would be a curious and interesting study to take the files of the astronomical journals for the past 10 or 12 years—which we have in the library of the observatory—and to follow out the history of the successive experimental steps which have gradually led to the present conditions. In fact this has been to a great extent already done by a number of astronomers who have specially interested themselves in the work. I have availed myself of some of these papers, and will invite your attention to a brief resume of what photography has accomplished in this line from the very first picture to the present day, exactly half a century. For the sake of convenience and brevity, I will make an arbitrary division of the history into two periods—limiting the account of the first 35 or 40 years' work to the results obtained in lunar and solar photography; and dealing in the recital of what has been accomplished in recent years, almost entirely with "stellar" photography.

Part I: Lunar and Solar Photography.

The third decade of the present century had nearly run its course before Daguerre's discovery of the chemical action of light and the invention of his "Daguerreotypes" were announced to the world. The story of this remarkable discovery, and of the evolution of the grand art springing from it, belongs properly to a history of photography; nevertheless, each step in that development had an important effect upon its application to the uses of astronomy.

The new study was acknowledged to be of the greatest scientific importance from the very first, and almost with Daguerre's first plates were attempts made to photograph the moon and sun, and to thus apply this unbiased and automatic method of *light-painting* to the delineation and illustration of the "exact science." But the daguerreotype was not sufficiently sensitive to acknowledge any impression whatever of the moon's light when the inventor himself first made the attempt; and Prof. Draper, of New York, in his first trials (as early as 1840), succeeded but little better, and only obtained a few prints, "not altogether characterless of the lunar surface." The sun, as you may readily surmise, was more effective in its action. The first work in solar photography is said to have been done in Paris, April, 1845. All these early attempts were unsuccessful on the whole, and gave not the least promise of the modern achievements.

Ten years and more had elapsed from the inception of the art, when the collodion process was introduced by Archer. The new plates were vastly more "sensitive," and a decided improvement in lunar and stellar photography at once resulted. The pictures obtained from the introduction of this process to the time of the modern gelatine "dry-plate" (Maddox, 1871), while a great advance on all previous work, nevertheless demanded a *long exposure*, and from an astronomical standpoint this is a great difficulty, and when exposures of three or four hours are imperative, it becomes a fatal defect, for the image of the object to be photographed will not remain passively upon the plate as that of a landscape or building, but will move out of range rapidly, as a star out of the field of view of the telescope, on account of the apparent rotation of the heavens caused by the earth carrying the camera or telescope past the object. When the object is a star or cluster of stars, this difficulty is effectually remedied. The clockwork movements of our modern "equatorial telescopes" are able to keep the telescope so accurately pointed on a star, that even with the highest power eye-piece, the star will not appear to change its position in the field.

The Equatorially Mounted Telescope,

As is well known, is able to follow a star in its diurnal revolution by means of a *single movement* of the telescope; for the simple reason that all the stars in the heavens appear to revolve around an axis corresponding to the polar axis of the earth, and the main axis of this special form of telescope is set *parallel* to that. But when we are trying to photograph a planet, a comet, or the moon, etc., the movement of the object becomes very complicated. In this case, in addition to the earth's rotation, we have the actual proper motion of the object itself (not limited to a parallel of declination, either). With the moon this proper motion reaches a maximum, for the moon moves its own diameter among the stars in about an hour; and the brighter planets, while moving at the most less than one-tenth of that amount, would still change their position sufficiently to blur the photographic image after an exposure of more than a very few minutes.

To photograph even the moon it was formerly necessary to make an "exposure" of say half an hour. The modern dry plate is so much more sensitive that better and sharper pictures are now made in 1-50th of a second. Up to very recent times, or about 1882, the difficulty of *movement* was of far less moment than that arising from lack of sensitiveness of the plates. It was a comparatively easy matter for the astronomical photographer to carefully watch the object through the "finder" of his telescope, and, by means of the slow-motion screws, thereby keep the apparatus properly pointed.

But the "wet-collodion" process was open to other objections; the plate had to be prepared immediately before the exposure and developed immediately afterward, and moreover, it had to be used while wet, and that necessarily limited the time of exposure. To sum up the conditions which obtained prior to the "bromo-gelatine" dry-plate epoch, the sun and moon were easy objects; the extraordinary brilliancy of the former permitted a very brief time of exposure; and for the latter the image could be easily kept in position on the plate by an auxiliary telescope; the time required was not too great to utilize the full power of the wet plate, and if there were any trifling irregularities in the motion of the clockwork the plate was not sufficiently sensitive to record them.

First-class photographs of the sun and the moon were made many years ago by Warren De la Rue in England, and by L. M. Rutherfurd and Dr. Henry Draper in New York. About 1852, De la Rue constructed a reflecting telescope of 13 inches aperture especially for photography; the image of the moon on his negatives was about one inch in diameter, and would stand enlargement about eight times. [The corresponding image formed by the Mt. Hamilton lens is 6-inch diameter, and it may be enlarged over 12 times.]

Reflectors and Refractors.

It is the universally accepted theory that light is propagated by waves, not entirely similar to the sound-waves, or air-vibrations, by means of which we hear, but by undulations of a mysterious and all-pervading elastic medium, which is called the ether. By means of the object-glass of a telescope, the rays of light falling on all parts of its surface are brought to a focus at the eye end. The object-glass is given a certain definite curvature so as to achieve this result, and upon the accuracy of this figure of curvature depends the excellence of the glass.

For perfect definition of the image, it is necessary that *all* the different rays from a distant *point* falling upon the object-glass, no matter how large this may be, shall be brought so closely to a focus as to all pass through the smallest hole we could make with a fine cambric needle in a piece of tissue paper. But it is found that rays of a certain "wave-length" have the greatest *visual intensity*, and enable the eye to perceive the object disseminating the light; but those rays which are principally effective in acting on the photographic plate (or the rays of *chemical intensity*) have an essentially different wave-length and do not come to a sharp focus in the "visual" telescope, and this necessitates a different figure in the object-glass. In the case of a reflecting telescope, waves of light of these different wave-lengths (embracing both the *visual* and the *chemical* rays) are all brought to a common focus; hence photographs taken with a reflector are of greater excellence than those taken with an ordinary refractor, or "achromatic" object-glass. But the finest results are obtained by the use of a telescope of the latter construction, the objective of which has been especially corrected for the photographic rays.

Such an object-glass Dr. Rutherfurd constructed in 1864; in other words, "he set the example of deliberately constructing a telescope totally unserviceable to the naked eye." The resulting pictures were highly successful; Rutherfurd's series of lunar photographs taken 25 years ago are probably to-day only excelled by those taken under the great advantages of extra sensitive plates and the "giant telescopes of the world."

But it is not absolutely necessary to destroy the figure of an object-glass in order to adapt it to the wants of photography. The same result may be achieved by the addition of an extra lens placed in front of the crown and flint-glass combination of the refracting telescope, to bring the photographic rays to a focus. The only drawback to this method of correction is found in the loss of light experienced in passing through the additional amount of glass; but with our Lick telescope, this is actually of little consequence, the amount gathered in by this huge light-collector is so considerable.

Photographs not only give most beautiful pictures of the moon—they have greatly increased our knowledge of the sun.

Photographs of the Sun.

Many years have passed since it was first pointed out, as a result of the laborious and long-continued scrutiny of the solar surface by Schwabe, Wolf and others, that the spots which so frequently relieve the white monotony of the sun's surface appeared in regular periods of about 11 years, or rather that a cycle of maxima and minima in the appearance of these spots, possessed such a period. Up to the year 1857 the only data upon which to found these conclusions were obtained from the very irregular and imperfect notes made by a few astronomers who had the necessary leisure to carefully scrutinize the surface for spots, and the method to properly record their observations.

But in the year mentioned, Mr. De La Rue constructed what was called the "photo-heliograph," for the Royal Observatory at Kew, England; others are now in use at many observatories situated in widely different localities of the earth, and at the present time it is likely that not a day passes without at least one perfect photograph of the sun's surface being taken, carefully examined, and filed away for reference. These photographs have been brought to such a state of excellence that not a spot which might be seen by the observer with the telescope, can possibly escape a permanent record on the plate. And they have shown beyond doubt that the suspected 11-year period really exists.

By far the best work in solar photography has been done by M. Jannsen of Meudon, near Paris. His negatives show all the detail of "rice-grain" structure of the surface, and the curious mottled appearances which have been observed in the field of the telescope. In some of Jannsen's photographs the developer found certain large blurred or hazy patches, which were naturally ascribed to defects in our atmosphere. But when these "blurs" were found recorded on several successive plates taken at short intervals, and were seen to be identical in situation and appearance, it was suggested that the camera had thus divulged the existence, previously unsuspected, of *clouds in the sun's atmosphere!* The records of the United States

Transit of Venus Parties

In 1874 and 1882 depend very largely upon negatives taken with the photo-heliograph while the transit was in progress. In the first transit, photography was included in the plans of work of all the various Government expeditions. The results by all the foreign parties were pronounced unsuccessful. The American Commission did not, however, reject photography in the preparations for the transit of 1882, but provided each one of the American parties with a photo-heliograph and a supply of the latest improved plates, and the results far exceeded their expectations. The images are nearly all sharp and good, and admit of very precise measurement; and the position of the planet on the sun's surface can be deduced with the utmost nicety for the epoch of each plate taken. It is said that if no other work of observing had been done by the different parties, the photographs alone would afford the most valuable data for the reduction of the parallax. The advantages of the photographic method in this case are manifest; clouds might be passing at the critical times of contact, which lost, the observations would be valueless, were the sky never so clear during the remainder of the phenomenon. The best of experienced observers are prone to get nervous and excited during the few precious instants at the ingress and egress of the planet. The camera does its work faithfully, methodically, and is not subject to nervous attacks. Its record is unbiased, and can be verified at any time—as some one (the amateur photographer) says in the "Octoroon," "the apparatus can't lie!" The value of the photographic work done by the different U. S. Government parties in 1882 was largely supplemented by a series of photographs taken with similar instruments at the Lick Observatory.

A Total Solar Eclipse.

I will show you on the screen to-night a positive from one of the wonderful photographs taken by Mr. Barnard at Bartlett Springs during the total eclipse of the sun on the first day of January. From what has preceded, you will readily see that a total solar eclipse affords a splendid example of the advantages of photography. The moments of totality are so brief, and the phenomenon itself so rare in its occurrence, that much remains to be done, or that might have been done, or that the careful and hard-working observers wish they could have had the chance to do, when the long-expected event is finally over, and when the blinding light of the sun is no longer screened so completely by our distant satellite. The different things to be done are numerous in the extreme. There are the corona to sketch; the flames to locate; unknown planets to be searched for; all the old-time observations to be verified, and the still more valuable and more recent investigations with the spectroscope and kindred appliances, to be carried out, if we hope to add to our knowledge of the solar surroundings and constitution.

Photography here plays a very important part. Formerly it used to be an invariable result of a total eclipse to have one observer announce the discovery of a new intra-Mercurial planet, and for some one else to as flatly contradict him, and state that the "planet" was really a well-known star. The photographic plate will show a planet that might readily be overlooked in the hasty "sweeps" of the observer, and moreover, this plate may be easily compared with the sky itself when the sun has so changed its position in the heavens as to make such a comparison possible.

Negatives taken by De La Rue in the eclipse of 1860 established the true nature of the "solar protuberances" which had so long puzzled the astronomers; and first proved that they must belong to the sun and not to the moon, for the image of the latter was shown to advance over them in successive photographs.

Photographs of the "Corona"

Are much more complete and reliable than naked-eye sketches. The spectrum of the corona, and of the sunlight at the moon's edge, may be photographed to study the actual nature of the former; and to exhibit how the latter either may or may not be an effect of diffraction, or possibly influenced by passing through what some believe to be an extremely attenuated atmosphere possessed by our moon. And so on, *ad infinitum*. Then we have the interesting episode of the Total Eclipse of 1882, in Egypt, when the British party found on their photographs taken during totality, a comet close to the sun, which had approached that luminary in a line directly toward the earth, so to speak, and which was at no other time beheld by man. You will appreciate the estimation in which the photographic method of eclipse observation is held by astronomers, when I add that the expedition gotten up by the liberality of Hon. Chas. F. Crooker, Regent of the University of California, will take the two senior astronomers of the Lick Observatory, with over a ton of scientific baggage, thousands of miles by sea and land to Cayenne, in French Guiana, solely in order to secure photographs of the total eclipse which will be visible there next December.

(To be Continued.)

CARPET MANUFACTURING IN PHILADELPHIA. Philadelphia is said to be the largest carpet manufacturing center in the world. The *Price Current* of that city says: When we are told that the carpet manufacture of Philadelphia was begun in 1857 by John Bromley with two small looms, and now employs 7350 power looms with a product of 72,500,000 yards, worth $45,000,000, every year, we have cause for proud surprise. The industry of carpet-making in this city is the signal one in the world, for there are here 172 mills employing nearly 18,000 workmen. The Bromley enterprise has branched out into three firms, with 1100 looms and 2800 hands, and the mills of the Dobsons, started in 1872, give employment to 4000 persons. At first only plain carpets were made, but of late years fine goods have been turned out, of such beauty, durability, fine texture and dye that the importation of brussels, tapestry and wilton carpets has been virtually broken up, our manufacturers turning out choice goods of all kinds.

DECIDED TO BE AGRICULTURAL.—The Federal Land Office at Sacramento has received from the Interior Department a decision in the case of F. Wagner. Wagner had pre-empted certain lands in the upper foothills of El Dorado county, which, by reason of their altitude, are covered with snow during the winter months, and at such times are not habitable. In the case of Morrow vs. Clough, decided in 1885, it was held by Commissioner Sparks that such lands were not subject to entry under the agricultural laws, although the decision was reversed by Secretary Lamar. In the Wagner case, the Sacramento Land Office and the Commissioner rejected Wagner's final proofs on the grounds stated in Commissioner Sparks' decision in the Morrow-Clough case, but Secretary Noble has reversed the decisions and has ordered that a final receipt be issued to the claimant. This virtually decides that agricultural claimants have a right to pre-empt such lands.

MINERAL OIL FOR WOOL.—It is claimed by many that aside from any difference in the cost, mineral oils have certain decided advantages over animal and vegetable oils, as lubricants for wool. The principal objection is that they are lacking in "body;" yet the fact is very generally conceded that the finest cylinder and valve oil, the finest machinery, even for hot neck and crank pin oils and for the sides of ferry slips, is now made from the product of oil wells. For wools the superiority of such oils consists largely in its superior penetrative quality and the extraordinary facility with which it is saponified, and the further fact that it holds its saponification for years quite unimpaired.

DIVIDENDS.—For the ten months ended October 31, 1889, the mining companies of the United States whose shares are listed upon the stock exchanges of the country paid a total of $9,119,868 in dividends. The largest amount, $2,000,000, was paid by the Granite Mountain mine of Montana. Next was the Calumet and Hecla of Michigan, with $1,000,000, and next in order were the Con. California and Virginia of Nevada with $756,000, Ontario of Utah with $750,000, Tamarack of Michigan with $640,000, Boston and Montana of Montana with $400,000, the others paying out all the way from $1000 to $375,000.

THE Nevada *Journal* says that since the abandonment of the 1200 level of the Bodie mines, nothing of interest has transpired and the outlook for that district was never so gloomy as at present. Unless an ore development is speedily made it is probable that all the mines there except the Standard Con. will suspend operations.

REMARKABLE STEEL PROJECTILES.—At the Paris Exposition the firm of Holtzer show a shell which pierced a steel plate ten inches thick and landed entire without a flaw 800 yards, or nearly half a mile, distant from the target. Only the point of the shell was slightly distorted.

CREMATION is coming more and more into vogue in Germany in spite of the expense and certain legal difficulties which render its performance in some parts almost an impossibility. In Gotha, no fewer than one hundred bodies have been cremated during the present year.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BINGHAM.—*Ledger*, Nov. 23: The Bingham is a newly developed claim in Pioneer district, lately purchased by Mr. Bingham, who is from the mining fields of Arizona. The prospects of the property are highly spoken of by all who have seen it. There is a large quantity of ore on the dump ready for crushing. It is high-grade rock, estimated to go all the way from $50 to $100 per ton. A mill on the roller principle is being put up. Three heavy wheels revolving in a pan furnish the crushing power. It is calculated to crush from 30 to 40 tons per day. The mill will be operated by steam-power, the boiler and other machinery being already on the ground. The mill is also intended for custom work, thereby supplying a long-felt want in this promising district. A report was current in Volcano this week that ore had been taken out that would go $500 per ton.

CLEANUP.—The last cleanup at the Wildman realized $8000 in free gold. The sulphurets will yield from $1000 to $2000 more. Reckoning the mill to crush two tons per day to each stamp, this would give an average yield of about $8 per ton, a very satisfactory output. There is a large ledge—over 20 feet wide it is said—of the same grade of rock; so that there is good reason to place the Wildman among the solid mines of the county.

Calaveras.

HALLOCK MINE.—Angels *Record*, Nov. 19: Week before last we noticed the Claude mine, the property of Mr. Otto Dolling, which is developing superior values every day, and latterly we have seen some quartz from the same lode and from the claim immediately adjoining it. The samples came from the location of Mr. R. F. L. Hallock, which is the north extension of the Claude mine. We were told, and had good reason to believe from the character of the quartz, that it prospected well. There was a great resemblance between the quartz of the two places, which indicated that a development of Mr. Hallock's property would result in a valuable and permanent mine.

RICH.—We learn from good authority that Mr. Harvy Wood and sons of Robinson Ferry have struck it wonderfully rich in their mine on the river. As much as $50,000 is reported to have been taken out last week. We understand that the lead is four feet wide and the chute thus far 40 feet wide.

Fresno.

COAL.—*Expositor*, Nov. 20: The general agent for the San Joaquin Valley Coal Mining Co., E. Kauntze, informs us that they have just completed four miles of track, connecting the switch at Coalinga on the Goshen branch of the S. P. R. R. Co. with the coal bunkers at the mouth of the tunnels of the Fresno county coal mines. Increase in business and a steadily growing demand has made this important and expensive addition to their mine an absolute necessity. The company run their own locomotive on the branch line, and can at the shortest notice place the loaded cars in position for the regular trains to pull out.

Inyo.

DARWIN.—Inyo *Independent*, Nov. 24: There is very little doing in the Darwin mining district. In the Lucky Jim mine Mr. J. A, McKenzie has a few men at work; in the Defiance there are a few more employed; and this is about all that is doing. Mr. J. C. Eddy is not doing anything in mines at present. Over at Riley, Mr. C. Anthony has got out a good-sized pile of ore for a run at the Riley mill. Late reports from Panamint are to the effect that very little is doing there. At Cerro Gordo, Mr. Farrington is getting tunnels and shafts repaired, and till this work is finished very little else will be attempted.

TAILINGS THAT PAY.—*Index*, Nov. 20: James Rose is working over tailings at Fish Spring that have already been worked three times over blankets and once through a concentrator. He informs us that the result of his last month's run was 10 ounces of gold worth $18 per ounce, and a large quantity of sulphurets estimated at $50 per ton.

Napa.

TEMPORARY SUSPENSION OF WORK.—*Calistogian*, Nov. 24: The Palisade Reduction Works were shut down Saturday night last, and several employes in both mill and mine were informed that their services would not be required in less than a month. Some of them have since left and will not return. Business was suspended, one of the proprietors says, to make needed repairs of machinery, etc. The reduction works had been running regularly for many months, this being the first important suspension of work since their completion. The mine is in good condition, and shows a very large quantity of good ore. The amount that has thus far been mined and milled is exceedingly small in comparison with that "in sight." In fact all, or nearly all, the ore thus far put through the reduction works has come from stopes of the first level.

Nevada.

EMPIRE.—*Telegraph*, Nov. 20: Supt. Geo. Starr of the Empire mine informs us that there is every reason to believe that the Empire has a long and prosperous career before it. The Empire has always been a mine full of surprises and gold. Just when you would think the mine was about worked out, she would soon turn up richer than ever. The ledge opened up in the crosscut of the 1800 level is excellent in its appearance and is the main ledge. The 1900 level will soon be opened up and that alone will give quartz enough for a two-years' run night and day. As soon as the 1900 level is completed, Mr. Starr intends to sink for the 2000 level.

WASHED OUT.—*Transcript*, Nov. 23: The Providence Mining Co. sustained serious damage Friday by the rapid rising of Deer Creek. The rain came down in torrents toward noon, and in half an hour before one o'clock the stream rose a foot. It wore against the waste dump of the Mountaineer mine, sweeping the rock and debris down, and by filling up the old channel diverted the stream into a new one at the south side of the flat. The shifting of the waters undermined the trestle which supports the 20-inch pipe that conveys water from the Snow Mountain ditch to the mine, where it is used for hoisting, pumping and milling. The trestle and pipe for a stretch of 60 feet were washed away and two Chinese cabins on the flat also floated off. This accident will probably occasion a suspension of all operations at the mine for a fortnight or more. The destruction of property and suspension of mining will entail a loss of not less than $5000 or $6000.

THE HARMONY MINE.—*Transcript*, Nov. 24: The local company engaged in developing the Harmony drift claim a short distance from town in a northerly direction are making the best of progress. The contractors have completed sinking the shaft to a depth of 340 feet. A meeting was to be held Saturday evening to award a contract for running a drift due north from the bottom of the shaft a distance of 500 feet, and it is believed this drift will tap the center of the channel. Some gravel, apparently on the rim of the bedrock, was encountered in the shaft above the 200-foot point.

THE FRENCH CORRAL ELEVATOR.—The elevator process of gravel mining is proving a great success at French Corral. The water and debris are raised perpendicularly a distance of 40 feet and run off into settling reservoirs from which the water flows to the river in a comparatively clear state. It took some experimenting to get the elevator to do just what was required of it, but all the obstacles have by patience and science been overcome.

IDAHO MINE.—Grass Valley *Union*, Nov. 19: Some 50 or 60 of the Idaho miners are temporarily laid off, owing to the large amount of quartz that is broken in the mine waiting to be milled. The ledge is large, and the machine drills take down the quartz faster than it can be milled. When the additional five stamps that are being put in the mill are ready to drop, more quartz can be disposed of. The improvements at the mill are going ahead and will be completed at an early day. The excavations for the floor, on which to place the new concentrators, have been completed, and some of the machines set. In all, there will be 16 concentrators placed, ten of which will be the Frue and six Triumph machines. The new improvements will make a valuable addition to the milling machinery of the mine.

Placer.

PICK AND SHOVEL.—*Herald*, Nov. 27: C. F. Reed is opening the Drummond mine. The rock is reported to be very rich. The Oro mine above Michigan Bluff is paying about the same. The present rain will probably start the mill at the Zantgraft mine. This mine, which is situated near the Alabaster Cave in El Dorado county, is one of the best paying quartz mines in the State. The rock has paid steadily and will for years. The pay chute is over 1600 feet in length, the longest in the State. Rock is now being taken from the 350-foot level. The ledge at this depth is three feet in thickness. McCaw & Curtis are fast getting the better of the mud and water in the old shaft in the Bellevue mine at Ophir. The hoisting works at the Eclipse are not quite finished. A contract for sinking the east shaft to a greater depth has been let. F. Aldrich is opening the Black Jack, near the St Patrick. The water has temporarily stopped work at the Moore mine. The owners will put in a whim to raise the water from the shaft. The R. E. Lee mine continues to prospect well. The Baker Divide Co. is still running prospects and drifts above the tunnel.

San Diego.

THE STONEWALL.—San Diego *Sun*, Nov. 21: An expert mining engineer from the northern part of the coast was recently in San Diego, and in speaking of the mines of this county said significantly that he expected to be handling the Stonewall mine in about four months. The matter was brought to Gov. Waterman's attention. "I don't know your man by the description," the Governor replied, "but I might if I were to see him. I have heard that some Englishmen were negotiating for my mine, but can't say what progress has been made. I have bonded the Stonewall mine to ex-Mayor E. F. Spence of Los Angeles for six months, and the time expires on Feb. 11th. The bond is for $2,125,000, and it includes my 21,000-acre ranch, with the mine and mills, the sawmill and from 500 to 1000 head of cattle. Besides, three other ledges have been discovered on the ranch, two of them being very rich, and I may want to develop them. Our new stamp-mill will be in operation by Jan. 1st, I expect, when we shall begin sinking. Although we have not sunk any for six months, there is enough ore on the dump to run the mills a year or two. The new mill will have 20 stamps and the old one has ten. I shall run them both. The ore never showed up so well as it does now. It is worth a trip up there just to see the timbers used for the gallows-frame in the hoisting works. They were all cut from my land. They run 80 feet in length and from 18 to 20 inches in width. The two big engines are now being placed there, the boiler is in and the smoke-stack up. The hoisting capacity is one ton. Each hoisting rope or belt weighs 7500 pounds, and one cage rises as the other descends. The iron cars are loaded with ore, run into the cages and brought up to the platform. Beneath the cage a square and deep iron tank holding from 100 to 300 gallons will be fastened for helping along the two or three steam pumps in getting the water out. This tank has a self-acting valve which opens to let the receptacle fill, and also to permit the water to escape. I am sending two tanks out to see how they will work. The batteries are in place in the mill, which is wholly of corrugated iron, and now nearly done. I am employing now about 200 men, I should judge, which means that from 500 to 600 people are getting their support from the mine."

OWENS.—Julian *Sentinel*, Nov. 24: The Owens mine is now down to a depth of 350 feet and crosscutting to the ledge was commenced yesterday. The shaft is now 50 feet below the old works and it is the first new ground that has been opened up in depth for many years, and good results are confidently looked for by all who are familiar with the early history of the mine.

NEW LEDGES.—Three new ledges, two of which are very rich, have been discovered on Gov. Waterman's ranch near the famous Stonewall mine. The Governor is surely in luck and he is not the man to let those ledges lay there, but he will develop them.

GOLD KING.—Eb Feeler was in from the Gold King this week and reports everything tip-top at the mine.

Shasta.

OLD DIGGINGS DISTRICT.—Redding *Free Press*, Nov. 23; Fourteen months ago Mr. R. G. Hart bought an interest in the Texas and Georgia mine from Mr. Fleming and began the systematic development of the same. Tunnel No. 3 was commenced and is now nearly 500 feet long, having a pay chute 125 feet long and ledge 10 feet wide. Tunnel No. 2 is 320 feet long and has a pay chute of 185 feet. This is a separate pay chute from the one mentioned in tunnel No. 3, which is being pushed forward to connect with pay chute in tunnel No. 2. From tunnel two there is a shaft of 50 feet, from the bottom of which there is a drift 50 feet long where there is a vein of good rock 14 feet wide, part of which is high-grade ore, glistening with free gold. Tunnel No. 1 is 265 feet long and has a 3-foot vein of milling rock. All these tunnels are connected by shafts and upraises, the last upraise being finished on Wednesday, and the mine is in most excellent shape for extracting ore economically and supply a plant of three times the present capacity. This is the deepest mine in the Old Diggings, being 530 feet perpendicular from the apex of the mountain, and the encouraging feature is that the vein is improving in quality as greater depth is attained. Mr. Hart does not propose to stop here, but push ahead tunnel No. 4, which is already 80 feet long, and thereby insure another 100 feet of backing. Yet some people say Shasta county mines don't go down! Mr. Sharp has secured a contract for running a tunnel on the Mammoth mine. Three months ago Mr. Satterlee started the Central mill, crushing ore from the Mammoth dump, and is still running it successfully.

LOWER SPRINGS.—Cor. Redding *Free Press*, Nov. 23; The time is past when late discoveries are looked upon altogether with distrust, and the day is rapidly approaching when the reputation of Shasta as a mining county will entitle all discoveries to a modicum of attention from mining men. Last March there was discovered in Gamblers' gulch, a half mile this side of Shasta, by Messrs. Penrose and Gruber, what seems to be a rich ore vein. Those parties, at least, are jubilant, and shake their heads in a knowing way, showing their confidence in what after hard labor they have discovered. A tunnel 100 feet into the hill has tapped a seven-foot ledge at least 50 feet underneath the earth's surface. The ore extracted is undoubtedly rich in free gold and sulphurets, and has been proclaimed good ore by Mr. W. P. Miller, one of the owners of the Gem, who is perhaps as good a judge of ore as any gentleman interested in Shasta county mines. Of course this mine has not as yet been developed, because the discoverers are poor men, but I am satisfied that under the inspiration of capital this new discovery will develop equally as good as the Gem or Hartman mines.

Sierra.

THE SUN FLOWER.—Nevada *Transcript*, Nov. 21: The mill building at the Sun Flower mine near Pike City is completed and now the machinery is being connected with the power and adjusted. Crushing will begin next week.

Siskiyou.

QUARTZ.—Yreka *Journal*, Nov. 25: The Warren quartz-mill on Yreka Flats, close to town, has been started up again, being run by a portable engine secured from the Prather ranch. Ore from Witherill's mine is now being crushed, and quartz from the lately discovered ledges on Portuguese gulch will also be hauled to this mill soon. The new quartz-mill of the Huntington roller patent, for Boyle & Co.'s Humbug Creek ledge, arrived from below last week, and John Burgess has been busy hauling the different sections from the Yreka R. R. depot to the mine. Besides the mill the company has also several thousand feet of iron pipe for conducting water to mine and batteries. The Shroeder & Werner mine at head of Deadwood creek is being worked more energetically at present by reason of having a better supply of water for the batteries, thus allowing the steam-mill to be kept running day and night. The recent rain-storms have caused all the miners in the dry gulches and hydraulic diggings to get ready for active work, as a very little more rain and snow will give a good supply of water to commence operations. The creek bed and drift miners have a good supply already, and so have the quartz miners, especially those running steam-mills, as they only need a good supply for the batteries. The miners of Hawkinsville, a couple of miles north of Yreka, are hopeful of gaining a good supply of free water, as the mountain-tops along the Humbug range west of Yreka contain snow already, with prospects of more as the winter advances. The miners of this camp have not been able to do much of anything for three years past, owing to the Big Ditch furnishing no water, and the seasons too dry to afford free water.

Trinity.

NEW RIVER.—*Journal*, Nov. 23: G. W. B. Yocum, of New River, gives us the following items: The tunnel being run in on the Uncle Sam cut a fine ledge last week, the quality of which has caused some excitement in camp. Fullmore and Faveren are getting out good ore from the Tough Nut; they have the mine leased. The prospects of the Ridgeway are very favorable. The mill began running last Monday on ore from the mine. The mill is well situated, perfectly appointed and one of the best in Northern California. The Mountain Boomer mill is running steadily on leased rock. The owners of the Sherwood mine are taking out good ore; they have plenty of ore on the dump, but scarcity of water to run their arastra has prevented them from crushing it. This week's rain will probably give them all the water they want.

Tuolumne.

JAMESTOWN.—Tuolumne *Independent*, Nov. 23: The Dutch mine, formerly owned by Messrs. Preston & Hill, and which has lately been purchased by the Fitzgerald Bros. and Lucas, has been leased to Chas. Lane, of Angels Camp. Under the present lessee the mine has started up in full blast, with Mr. Brigham as superintendent, and Mr. Wm. Garrod, of Angels, as foreman. In connection with the mine, the proprietors have purchased an engine, and everything connected with the mine is in first-class condition; even the miners are No. 1, and they are pushing the work forward with great zeal. At present they are drifting, but will soon be engaged in sinking a shaft. The ore is transferred from the mine to the Heslep mill, and rumor has it that the present owners are highly delighted at the flattering prospect. Although this mine has been idle for years and years, still the indications are favorable for large returns of bullion.

ALAMEDA MINE. — *Union Democrat*, Nov. 23: The development work now being done on this mine, situated on the mother lode to the north of Jamestown, speaks well for success in the early future. The shaft going down from the tunnel driven by former owners is in high-grade ore. At the Patterson mill one sample ton was worked last week and gave the large yield of $140, and it is reported on good authority that ore still better has been found at the bottom of the shaft. An upraise from the tunnel has been made and the hoisting works will be placed on the surface at the mouth of the shaft.

RAWHIDE. — Arrangements are being made to work this mine, also situated on the mother lode and near the Alameda, on a large scale at an early day. Mr. Neville, the late purchaser, is expected to arrive in Sonora in a few days to start the work. The mine has a first-class 20-stamp steam mill on it in perfect order. Those who know the mine best speak strongly of its merits and sure success with proper management.

PAGE.—It is reported that the purchase of this mine, situated in this county and near the south fork of the Stanislaus river, is now being entertained by San Francisco parties. The mine has a five-stamp water-mill on it. The mine has yielded largely in the past and has great merit in the opinion of competent mining men. It has a fine water-power, the pay chute is unusually long, and the vein strong and well defined. The grade of the ore is above the average of California paying mines, varying from $15 to $18 per ton in free gold. The mine should be in strong hands and vigorously worked. It is opened by tunnels and no pumps or hoisting works are required.

HYDE.—The superintendent of this mine, Mr. Maxwell of S. F., staid several days at the mine last week and expresses himself satisfied with the good prospect it shows. Work will be energetically pushed on the mine by the owners, who lately purchased it and who are men of large means.

NEVADA.

Washoe District.

SIERRA NEVADA.—Virginia *Chronicle*, Nov. 23: On the 520 level from the main east drift, 1185 feet from the shaft station, a south drift is advanced 552 feet. At a point in the south drift from the east drift, 275 feet from the main east drift, a drift is advanced 52 feet, the face in porphyry and clay.

UNION CON.—On the 1465 level in the north lateral drift 50 feet south of the north line of the mine, west crosscut No. 3 is advanced 53 feet, continuing in porphyry.

MEXICAN.—On the 1465 level from the north drift from west crosscut No. 1, 50 feet in from the lateral drift face, a west crosscut is advanced 134 feet, continuing in porphyry, clay and quartz.

OPHIR.—On the 1300 level from the end of the east crosscut from the shaft station a south drift is advanced 28 feet. Formation vein porphyry.

CON. CALIFORNIA AND VIRGINIA.—From the stopes on the 1300, 1435, 1500, 1600 and 1650 levels continue to extract ore sufficient to supply the Morgan and Eureka mills. During the week 1100 tons and 1820 pounds of ore were shipped to the Morgan mill, 1207 tons and 1140 pounds to the Eureka mill. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $26.05. Bullion valued at $15,500 is now on hand. Shipped $65,379.24 to the Carson mint.

UTAH.—On the 600 level the southeast drift is advanced 324 feet from the shaft station. Formation porphyry.

OCCIDENTAL CON.—During the week extracted and milled 330 tons of ore showing an average assay value of $18.20 per ton. Shipped to San Francisco bullion valued at $6137.50 and have on hand concentrates valued at $12,000.

NORTH OCCIDENTAL.—Extracting ore from the 300 and 400 levels. On the 300 level a south drift is advanced 11 feet from west crosscut No. 2 and is in quartz showing value.

GOULD AND CURRY.—On the 200 level, the southwest drift is extended 138 feet, soft porphyry continuing.

BEST AND BELCHER.—On the 625 level, in the north drift, 70 feet north of the south line, an upraise is carried up 30 feet, the top in quartz and porphyry.

HALE AND NORCROSS.—Shipped to the Nevada mill during the week 1005 tons of ore, showing an average value of $30.07 per ton by pulp assays. Bullion valued at $46,577 on hand and shipped to San Francisco.

CHOLLAR.—Crushed 450 tons of ore at the Nevada mill during the week. The 500 level northwest drift continues in low-grade quartz.

POTOSI.—There is an improvement in the quality of quartz being stripped on the 850 level.

BELCHER.—Nos. 2 and 3 east crosscuts on the 1200 level are in low-grade quartz. From the 1000 level east crosscut, No. 1, a south drift is showing quartz assaying from $5 to $12 per ton. The 850 level south drift is in porphyry.

SEG. BELCHER.—The 1200 west crosscut 20 feet north of the line is in 60 feet, showing porphyry and clay.

SILVER HILL.—No change in formation in 160 and 260 level explorations.

BALTIMORE.—Usual progress is made in advancing 338 and 225 level explorations.

JUSTICE.—Crushed 225 tons of ore showing an assay value of about $30 per ton from pulp samples.

NORTH GOULD AND CURRY AND EAST BEST AND BELCHER.—The west drift from the northwest drift continues in vein matter carrying streaks of quartz.

IMPERIAL.—The joint Confidence-Challenge 500 level east crosscut from the north drift is in clay. The joint west crosscut continues in quartz and porphyry. The joint 800 level north drift is in clay.

YELLOW JACKET.—Daily ore shipments have been increased to 70 tons, battery samples showing an average assay value of $22 per ton.

ALPHA.—The station on the 600 level of the shaft is completed. The 500 level west crosscut continues in quartz and porphyry.

EXCHEQUER.—The 382 level east crosscut is in porphyry and clay and the 500 level north line west crosscut continues in quartz.

WARD COMBINATION SHAFT.—The 1800 level west drift is advanced 48 feet.

OVERMAN.—Shipped 317 tons of ore to the Vivian mill during the week.

NEW YORK CON.—The raise above the 800 level west crosscut continues in fair quality ore.

EAST SIERRA NEVADA.—The 520 level south drift is out 478 feet.

SAVAGE.—Shipped 471 tons of ore, battery sample assays showing an average value of $26.50 per

ton. Daily shipments have been increased to the full crushing capacity of the mill. Bullion on hand valued at $20,948.

CALEDONIA.—The southwest drift is advanced 34 feet, porphyry and clay still showing in the face.

CROWN POINT.—Shipped to the Mexican mill 566 tons of ore, showing a value of $16.85 per ton by pulp assays.

Goiconda District.

CONSIDERABLE ACTIVITY.—*Silver State*, Nov. 20: The probability that silver will advance in price, and that the Demonetization Act of 1873 will be repealed this winter, is having a noticeable effect on the mining industry. At Goiconda, mining men from different parts of the country are looking at old claims, buying some of them and making new locations. The Great Republic has been sold to an English company, and a force of men has been set at work on the Cumberland. A Mr. Choate, an experienced miner, has secured several claims in the district and intends to commence developing them shortly. Should silver go above a dollar an ounce, it will give an impetus to mining in this section that will restore life to depopulated mining camps.

Morey District.

SHIPPING.—Belmont *Courier*, Nov. 23: Rich ore is being shipped to Salt Lake City from Morey, Nye county. The mines in that district continue to look uptop.

Osceola District.

THE PLACERS.—Virginia *Enterprise*, Nov. 22: The Osceola placer mines lie about 30 miles due east of Robinson district, on the western slope of Jeff Davis peak, the highest peak in Nevada. At that place Godby & Hampton have 180 men digging the large canal to bring water from the mountains to the gold placer diggings. The canal will be 18 miles in length, 6 feet wide at the top, 2 feet deep at the lower side, and 4 feet wide at the bottom. Miners are given $2 a day and board.

Pioche District.

RAYMOND BLACK LEDGE WINZE.—*Record*, Nov. 16: But comparatively slight progress was made this week in draining the Black Ledge winze at the Raymond mine. By tanking and pumping, the water was steadily gained upon, and three days ago a depth of about 120 feet was attained, passing the 13th station and emptying the drifts there, when early Thursday morning the new steel cable used in operating the tank parted, and the tank was lost down the winze. During Thursday and part of Friday the small pump alone was relied upon, but though worked to its fullest capacity it failed to hold the water down, and forced a retreat of about 15 feet. The water coming in is thought to be largely seepage from the ledge. It is believed that the small pump now in use will prove capable of handling the water when once the winze and ledge are drained. A new tank was hastily built, and yesterday tanking was resumed. The upraise from the 12th level on the Black Ledge has progressed 110 feet, the character of the ore having steadily changed. From a black base ore it has turned to a yellow or brown free ore, containing no sulphur or zinc, and but little lead. The ore averages 100 ounces in silver per ton. The winze at this point is four feet wide, and the walls of the ledge are not found on either side.

YUBA.—At the Yuba about 12 tons of ore and 38 tons of waste are hoisted daily. This work will be kept up until the station at the 350-foot level is finished, when the capacity for hoisting ore will be about trebled. The hoisting engine at the station is now being placed.

Robinson District.

WHITE PINE'S GOLD CAMP.—Reese River *Reveille*, Nov. 20: J. C. Irvine arrived here from Kingston on Saturday's stage, having returned to Kingston from his White Pine trip last Thursday. Learning that he had spent two days examining the Robinson district over which there has been a big gold excitement, we obtained the following facts from him, as he obtained them from a close personal inspection. He said: "A. R. Watson, the discoverer and owner of the Johanna gold mine, has sunk an incline in the bed of the canyon, on the south side, to the depth of 60 feet, and has stripped 150 feet on each side of said incline on the course of the vein. The ledge averages 5 feet in width, and in 24 hours 20 tons are taken from the mine and hauled to a 10-stamp mill run by water-power. In a run of eight days, the mill shipped gold bullion valued from $2500 to $2800, the gold worth at the mint $17.50 to the ounce. Sol Hilp showed me a gold nugget taken from three pans, washed out of the rich streak, that went $36, that is averaging $12 to the pan. The gold belt is about two miles in length and a half-mile in width, and in it there are many prospects which show gold. I understand that Watson was offered $50,000 for the Johanna mine in cash, and $50,000 more as it was taken out of the mine, which he refused. The mine, as far as prospected, shows the ledge to be uniform and well defined. Watson is working about 15 men, and it is by his endurance, perseverance and energy that he has got it rich to-day. This district is about two miles from Ely, the county seat of White Pine county, the vein running east and west in Robinson canyon. All the outside claims have been located, and as far as I can judge from the present development, it is one of the best prospects for gold in White Pine county or Eastern Nevada. Of course, everybody feels good over the gold strike, and if it turns out to be permanent, White Pine county will be given another start, and prospecting will again be pursued energetically."

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, Nov. 23: The station at the 600-foot level has been cut out, and sinking the shaft for a sump has been resumed.

NAVAJO.—The stopes continue to yield the usual amount of ore; those above the 150 foot level show some improvement.

BELLE ISLE.—West crosscut, 250-foot level, extended four feet, and a drift started south at a point where rich ore was found.

NEVADA QUEEN.—South intermediate drift from 150-foot level of Commonwealth has been run 17 feet, in vein formation, assaying $27 per ton and is looking favorable.

NORTH COMMONWEALTH.—Joint crosscut, 225-foot level, extended 18 feet; the face continues to look favorable.

GRAND PRIZE.—A crosscut has been started north from the west drift, 500-foot level, to intersect the winze put down from the 400-foot level in the west vein. The stoping of concentrating ore has been discontinued.

DEL MONTE.—Joint crosscut, 225-foot level, extended 18 feet. North drift, 100-foot level, extended four feet, showing some high-grade ore.

COMMONWEALTH.—100-foot level: North drift from No. 1 east crosscut, advanced 24 feet; total, 112 feet. Average assay from the face, $314 per ton. This drift is 60 feet east of the upraise from No. 1 north drift, where very high-grade ore has been developed. No. 2 east crosscut extended 22 feet; total, 49 feet. Will have to be driven about 12 feet further to reach the ore, as it has turned to the east in the north drift. The Grand Prize concentrating plant will start on Commonwealth ore Monday.

Tybo District.

GOOD ORE.—Belmont *Courier*, Nov. 23: The Gilmore Bros. are encountering good ore in their mine at Tybo.

DIMICK.—Work in the Dimick, at Tybo, is progressing finely, and the mine is yielding large quantities of good silver ore.

ARIZONA.

MOHAVE NOTES.—*Miner*, Nov. 23: There are five ore assorters at the C. O. D. employed on company ore. Geo. M. Bowers has a force employed on his Golden Stairs gold mine, Layne springs. The Nighthawk mine, Layne springs, has been closed down after one of its most successful runs since it was opened. Theodore Myers, lessee at the C. O. D., is taking out very high-grade ore, and will soon have a shipment that will net him some money. N. C. Amer has the ordinary force at work on the Silver King, C. O. D. basin, and is taking out a good grade of ore and making the usual shipments. McDuffee & Heimrod continue to find ore in their Rustler mine, Blowpipe Flat, Chloride. Although the quantities they get are not large, the grade is exceedingly high. There has been a fine body of ore struck in the gold mine above the C. O. D., owned by John Sandoval, but of the value and extent we are at present unable to learn. John Barry is running his gold mill at Cerbat on ore produced from the extension of the Flores. Everything is progressing satisfactorily, and a good run is anticipated. John Marshall continues taking out considerable quantities of good ore from the Jamison gold mine, Layne springs, a carload of which was worked at the sampler last week and gave satisfactory results. Brown, Rule & Co. are taking out some good ore from the Rural mine, Mineral Park. It would not be the least surprising, and in fact indications seem to point in that direction, that another rich and large body of ore will be encountered. Sample & Jamison are highly pleased with their Rip Van Winkle mine, Layne springs. As the tunnel advances, the ore body becomes wider and of better grade, they now having 12 to 14 inches of good ore, the first class of which will sample 600 ounces. Joe Boland and Joe Prisk have a contract to sink the shaft of the Esmeralda gold mine, Cerbat, 50 feet. This will make the total depth of the shaft about 165 feet. They have encountered two feet of $60 ore which is very flattering. This mine is owned by O. F. Kuencer and Chas. Gross. Barney McCall and Dan McKinnon are prospecting north from the north shaft on the Sunset mine, Chloride. They have out a small quantity of very high-grade ore which will soon be shipped.

YAVAPAI. — Cor. Prescott *Courier*, Nov. 19: Mines in this county are keeping up their ancient reputation for richness. From John Curtin, who came in yesterday from Slate creek, Hassayampa district, we learn that the Mark Twain, Blue Dick and Dosoris mines are yielding a great deal of very rich ore. Mr. Curtin and his partner took $1000 worth of rich ore from the Mark Twain in a very short time. The Blue Dick is also producing fine ore. The Dosoris is looking well, so well, indeed, that the working force was recently increased. Mr. Flint tells the same story about ledges near the head of Hassayampa creek. The Ryland, the Crowned King, Harlan's, the Mocking Bird, the Etta, Dixie and Joe Chambers mills are running. So is the Congress, and only the want of water keeps the Oro Bella mill idle. Chloriders of Tip Top district are shipping more ore than ever before. United Verde mines, carrying gold, silver and copper, are all the time producing bullion. Miners of small means are taking ore from many mines and shipping it to smelters in Colorado, so that everything in the mining line is encouraging. One hundred dollars a week is what Fred Satters has been making in a quartz mine near Prescott.

COLORADO.

THE MOLLIE GIBSON.—Asher *Times*, Nov. 20: The Mollie Gibson proper is one of the very old locations of the district. Very little development had been done on the property until Gillespie & Shear started it up. They ran into large bodies of low-grade lead ore and determined to put up a concentrating mill to treat it. This mill was finished early last spring and work on the mine was then resumed. In a short time after work was started up the wonderfully rich ore that has made the mine famous was discovered. The ore was the richest that had ever been mined in the camp, and it appeared in such quantities that the community went wild over it. The new arrangement is nothing less than an immense consolidation which takes in over 2500 ft of the contact and covers an area of 53 acres. The consolidation has been made between the Mollie Gibson M. & M. Co. and the Aspen Contact M. Co., under the name of the Mollie Gibson Con. M. & M. Co. The territory acquired covers the lode southward from the Mollie Gibson about 1000 feet and takes in a large part of the flat along the river.

FUTURE PLANS.—In speaking of the company's plans for the future, Manager Bulkley stated that the general idea was to gain depth, and in pursuing this plan the energies of the company would, for the present, be devoted to sinking the incline from the bottom of the main shaft. The rich ore chute was found on the first level less than 300 feet north of the shaft. Its trend to the southwest is so sharp that Mr. Buckley believes it will be intercepted by the incline before a very great depth is attained, and it is not impossible that it may again be a bonanza at that point. Crosscuts will be run every 100 feet to prospect the lode to the hanging-wall.

MILL.—The new company also owns the concentrating mill which is located on the Roaring Fork near the mouth of Maroon creek. Since the new company took hold of it the mill has been considerably improved. A new 35-horse power boiler has been added to the plant, two new concentrating tables have been put in, the dryer has been enlarged and some additions have been made to the building. By these improvements the capacity of the mill has been increased, being now about 40 tons per day.

DAKOTA.

HAVE RESUMED WORK.—Deadwood *Pioneer*, Nov. 15: Carpenters at reduction works and syndicate smeltery resumed work again yesterday morning, making excellent headway during the day. It won't be long before at both places buildings will begin to loom up.

SOME GOOD ORE.—John McVeal and associates have completed assessment work on the Sunnyside, Black Moon and Cygnet locations, Terry's Peak. In doing the work required by law, ore of much better quality than the mines were before known to contain was discovered. The average is good enough to stand shipment, while a six-inch vein running through the main ore body returns assays of from $300 to $500 per ton. Present owners were original locators of the properties; have stuck to them for ten years, and deserve the good luck now before them.

MILLER SMELTERY.—Deadwood *Pioneer*, Nov. 26: All machinery and material for the plant is now at the site, the last having been received yesterday. Engineer Shaw has commenced setting up the engine and boiler, having a force of six men employed yesterday afternoon. The building is nearly completed, tinners beginning to-day to put on the corrugated iron roofing. Contract was yesterday let for 100 tons of pyrites to be delivered at the plant. Two galena mines will furnish them reduction works. Col. Carpenter's works are beginning to loom up. It is now believed the plant will be completed in time to begin treatment of ore by the 1st or 10th of January.

IDAHO.

CENTERVILLE.—Cor. Idaho *World*, Nov. 23: A telegraphic dispatch was received here several days ago from the East directing acting Superintendent Cunningham to ship immediately necessary winter supplies for 15 men to the Elkhorn mine. The mine is showing up well. In the upper tunnel they have a fine four-foot ledge, supposed to be a continuation of the ledge Mr. Turner worked last winter, as it is the same character of quartz and prospects fully as well. In the crosscut run 300 feet from the entrance of the lower tunnel a very rich eight-inch seam has opened up and quartz is being run into the mill at a rapid rate. The mill will start up in a week or 10 days and probably run all winter. All outside work is done. Mr. Jordan of Boston, owner of the Gladstone, Oro Fino and Revenue, while here last month, was very favorably impressed with the general outlook of his mines, and will have a force of men at work early in the spring. Bono & Co., owners of the Western Wonder mine, located on Elk creek opposite Ross Fork, and about one mile below the Elkhorn, have, owing to exorbitant rates of exchange between here and the East, suspended operations for the present on this very promising prospect. Oakes & Poncio have made extensive preparations for winter work on their Pioneer mine. Capt. Bruce and Fred Hammersly will run a tunnel on the Sunbeam. This property was discovered the past summer. A number of crosscuts have been run on top for a distance of 800 feet, and in every cut the same rock was found, and it is rated at $30 per ton. Steve Dempsey has his placer claims ready for the spring run. Smith and Williams have finished work on their placer claim near the Golden Star mine.

DEVELOPMENTS.—Silver City *Avalanche*, Nov. 20: Much more development work has been done on the quartz mines in this county this year than for several years previous. Many more prospects have developed into fine properties.

TO COMMENCE OPERATIONS.—*Avalanche*, Nov. 20: Mr. Dan Feour, an old-time miner of considerable experience, has been selected as foreman of the Black Jack and Empire State mines recently purchased by the Pittsburg Co. Mr. Feour informs us that he will commence active operations at once. The force employed now is about 15 men, and more will be added as the work progresses.

MONTANA.

ELKHORN TUNNEL.—Ketchum *Keystone*, Nov. 20: It is reported that the tunnel that Messrs. Gregory & Thomas have been driving for so long a time to tap the old Elkhorn mine at a greater depth, has encountered some ore, and that the face of the tunnel is looking very favorable and encouraging. There is no doubt that ore bodies will be developed in the Elkhorn mine at a greater depth, which will surpass any that has heretofore been found in the upper workings of the mine. We trust that all the sanguine expectations concerning the undoubted wealth of this mine may be fully realized, and that those who have had such unbounded faith in its future may ere long be amply rewarded for their toil and untiring perseverance.

THE OLD LEXINGTON MILL.—Butte *Miner*, Nov. 20: R. B. Wallace has taken a lease and bond on some property in Park canyon, and will in a few days commence hauling ore from it to the old Lexington mill, situated on East Broadway, for the purpose of reducing it. Mr. Wallace has leased the mill, and will not only work the ore from Park canyon, but will do custom work as well.

THE GAGNON.—This is a close-mouthed company, and consequently but little information can be gleaned as to what is going on below the surface. The shaft on the Gagnon is down 800 feet, and a level nearly 1250 feet in length has been run west of the shaft. It is from this level that ore is now being taken, some of which is a high-grade galena. The mine and works above are lighted by electricity, a small dynamo owned by the company generating the current. A small engine has been placed in the works for the purpose of operating the dynamo and the new rotary blower for the forges in the blacksmith shop.

THE GOLDSMITH.—The Goldsmith, the property of George Tong, is only beginning to be developed. The shaft is down 400 feet, and levels have been run only east of the shaft. The ore now being taken from the mine is stoped from the east 220-foot level. From the bottom of the shaft a level is being run and is now in about 115 feet. The ore of the Goldsmith averages all the way through 60 ounces silver per ton. The property is a good one, and thousands of tons of ore will yet be taken from it.

BARKER DISTRICT.—Cor. Great Falls *Tribune*, Nov. 20: The situation has been greatly altered for most of the people in the camp. Before the railroad started, if a miner wanted a grub-stake, he had to go to Great Falls and sell a prospect (if he could) to get it; the purchaser had to come out and look the ground over, see how badly the miner is in need, and give him a layout accordingly. Now we have our own merchants, and mining property is on the rise, with plenty of eager buyers, and a miner can at once look a capitalist in the face as though he were an acquaintance or some one as good.

NEW MEXICO.

COSTLY EXPERIMENTS. — *Southwest Sentinel*, Nov. 23: The Aztec and Pacific concentrating mills just above town are idle and likely to remain so. The Aztec Co. has mortgaged all its property to raise money to build some other form of mill, and it is said the Pacific is raising money for the same purpose. Each of these companies could have determined what kind of mill it needed by shipping large quantities of ore to good mills. The cost of such experimenting would have been trifling compared with the sum which has been spent in determining the fact that the concentrator is not the mill they want.

RUBY SILVER.—Silver City *Enterprise*, Nov. 23: Development work on the Ruby Silver will be pushed with renewed vigor. Machinery necessary for sinking the deep shaft is en route to the mine. Mike McDonald, who is leasing on the Red Cloud at Bullard's peak, was in this week, and bought 200 ore sacks. He has plenty of good ore in the mine. The Aztec will soon resume work under the management of Frank Bell. Jo Sheridan was up this week from his Cow Springs mines. He will push development as rapidly as possible, and before spring will have a Huntington mill in operation on his property. From Henry Brixner, just in from the Mogolions, the *Enterprise* learns that the Silver Creek mines are doing excellently. Frank Vingo, who has leased 500 feet of his mine to Peebles Bros., for one year, is paying them $1000 a ton for selected ore from their ground.

THE BAILEY-EPLEY STRIKE.—John M. Wright visited Carlisle last week, and purchased an interest in the new strike. He is very favorably impressed with the strike, but has had too much experience in mining to be anything but conservative. To an *Enterprise* man he remarked: "There are two leading claims, the Imperial and the Jim Crow. They join each other and together form a 3000-foot section of a great quartz lode that can be traced for six miles by the croppings. There are five openings along an extent of 2000 feet, each showing mineral of high grade. Several parties have sampled the shaft of the Imperial, getting an average result of from $275 to $325 per ton."

OREGON.

CLOSED.—*Bedrock Democrat*, Nov. 20: The Bonanza mill has again closed down on account of the scarcity of water, and the crushing of ore from the Worley mine will be delayed until spring. We were shown yesterday by Mr. Francis Clarno a gold brick valued at $60—the proceeds of free gold from four tons of ore from the Worley.

A NEW FIND.—Francis Clarno of Portland returned a few days since from the Greenhorn district and brought with him a quantity of samples of ore from a new find on Clear creek, a few miles from the Golden Monarch mine. The ores are from a group of mines, viz.: The Straussburg, carrying sulphurets; Little Chief and Big Chief, carrying free gold; and the Big Bluff, Silver King and Kingston, whose ores are wonderfully rich in silver deposits. Mr. Clarno has just closed the purchase of these properties in the interest of the Portland Mining Co., of which he is one of the principal stockholders, and that company will undoubtedly begin extensive development work on these mines in the spring. The properties are as yet but little developed, but the work thus far shows a wonderful deposit, and it is certain that depth will only enhance their value.

UTAH.

CREOLE.—*Park Record*, Nov. 23: On Wednesday a strike was made in the Creole No. 2 mine which it is hoped and believed will develop into a producing mine. This property is situated on Treasure Hill, on the west side of the town. Some time ago Charles and Frank Cole, two Cottonwood miners, obtained a lease on the property and ever since then have been working it.

The property is opened up by an incline tunnel which is in about 250 feet. Recently a west drift from near the face of the tunnel was run and on Wednesday a ledge averaging four feet in width and carrying a six-inch pay streak was encountered. The drift was started in a quartzite formation, and the perpendicular distance from the surface is about 200 feet. The ore is a carbonate, a picked sample of which assayed 53 ounces silver and 56 per cent lead to the ton.

PROGRESS OF THE TUNNELS.—The Ontario three-mile drain tunnel is in a distance of over 2700 feet and the work, under the direction of the veteran tunnel-driver, Mr. John Keetley, is progressing satisfactorily. The Alliance's 4800-foot drain tunnel driven by Contractor Judge has reached a distance of about 1800 feet and the work will be finished by next June. The McCune tunnel on the "east end" is being driven by a double shift of workmen and is in nearly 1600 feet. They are in a quartzite formation, having passed the lime about 25 feet back.

THE RICH WASATCH.—Some ore recently found in the Wasatch assayed from 90 to 884 ounces silver and 10 to 45 per cent lead to the ton, and indeed some of the richest ore ever taken out of the mines here is not much if any ahead of what the Wasatch, the coming bonanza of Blue Ledge district, contains.

ORE AND BULLION SHIPMENTS.—During the week the Mackintosh sampler received and forwarded 20,190 pounds of Woodside ore; 73,360 of Ontario; 156,000 of Daly; 166,290 of Woodside concentrates from the Union concentrator, and 205,930 pounds of Mayflower No. 7 leasers' ore; total, 621,770 pounds. The Ontario bullion shipment for the week was 38 bars, containing 18,953.16 fine ounces of silver,

MECHANICAL PROGRESS.

The Paris Iron Exhibit from an English Standpoint.

A very interesting and suggestive report was taken to England by the party of Black Country workmen who visited the Paris Exhibition. This report deals with the character of various iron and steel goods of British and foreign manufacture. Naturally the operatives must be supposed to speak with some prejudice in favor of the products which they themselves have some hand in producing; but they drew attention to the *defects* of English exhibits as well as to their excellencies, and they admit that in some respects the English have a great deal to learn from their foreign competitors. The English correspondent of the *American Manufacturer* summarizes as follows:

Nuts and Bolts.

These workingmen comment critically upon the appearance of the machine-made nuts and bolts used in Continental machines. Even in some very special exhibits, where the rest of the work was good, the fraise was left in the nut, disfiguring the whole machine. They were also badly fitted, as much as the thickness of the thirty-second part of an inch being apparent in the screwing up; even the best bright-polished nuts would, if turned out of Darlaston or Smethwick in such a fashion, be considered very unsatisfactory. The English nut and bolt maker, it is concluded, has nothing to fear from foreign competition, unless it be with regard to price.

Spades, Shovels and Edge Tools.

The deputation reports that there was a good show of spades and shovels of foreign manufacture of various shapes. These proved the need there is for English manufacturers to keep abreast with the times, so as to adapt their shapes to the various uses for which they are intended. In the edge tool exhibits the delegates think that Sheffield showed itself to be still in the van. In tubes and fittings the English exhibits were disappointing both in quantity and quality.

French Workmanship.

In castings the French are said to be marvelously clever, and some of the fine work scarcely needed dressing. The opinion of the deputation with regard to locks was that to compete successfully, English makers must pay more attention to outside show and finish. English work is more substantial in many respects, but it is not so "eyeable." The same judgment is given in the case of chains, nails, and other iron and steel manufactures. The foreign files and rasps were most beautifully finished, and in this department Englishmen must look to their laurels.

England's Deficiencies.

The general conclusion to which these operative observers have come upon the vexed question of English general industrial efficiency is on the whole favorable to British pretensions. As a nation, England, they say, has little or nothing to learn from the French or from any other nation, in respect of science or its application to industrial purposes. But in regard to the best and most useful adaptations of high art for every-day uses, it has to be confessed that England is still behindhand when placed in comparison with the French. The delegates are nevertheless of opinion that in their own particular trades English workmen can meet the French on their own ground with equal excellence all round.

MORE EXPERIMENTS WITH POWDERED COAL.—Erastus Wiman and others are experimenting with a new process of heating iron with powdered coal instead of natural gas. The experiments are being conducted at the Vesuvius Iron Works, Pittsburg, and are said to be satisfactory. Speaking of the test, Mr. Wiman said: "It is as yet rather limited in its scope, but eminently satisfactory in its results. One heat consumed 684 pounds of pulverized coal. The quantity of iron heated by that quantity of fuel was 4600 pounds. We are confident, from the present results, that we can heat iron at 50 cents per ton, including the cost of pulverized coal, while the existing rates for natural gas at the different mills make the cost of heating iron upward of $1 per ton. While a contrast test was not attempted, the lack of facilities necessary for the perfect operation of the new experiment rendered the test successful in only a limited degree, but sufficient to prove that we can produce the same quantity of iron with the pulverized-coal process in an hour as the natural gas facilities at present afforded can produce in two hours. Of course, while the tests thus far have proven satisfactory, unforeseen difficulties may arise in the future, although we feel confident of ultimate success in a very short time." The tests will be continued in order to remove all doubts as to the success or failure of the plan.

A FAITHFUL MECHANIC.—Jay Harper, a blacksmith of North Harpersfield, has stood by the same old forge in the same old shop almost every week day for 38 years. The old shop and tools show marks of service. The floor where Mr. Harper stands by the forge has worn through twice, the bellows handle that was made when he commenced business is still used, but it has worn off until it is sharpened to a point by the constant wear of his hand upon it. A hickory hammer handle shows the impression of his thumb and fingers from long and continuous use. The brick of the forge chimney have been worn away more than an inch by wagon-tires being turned against it while heating on the forge. The cinders that fall from the hot iron when pounded have been allowed to accumulate around the anvil-block all this time, to the amount of 10 or 12 bushels. The large pine tree that now overshadows his shop was but a sapling when he commenced business. —*Courier.*

UNCONSIDERED STATEMENTS.—Statements in regard to mechanical or engineering matters which are either unconsidered, or which emanate from those who are densely ignorant of the subjects upon which they presume to write, are constantly met with in commercial journals or such papers as are not specially devoted to technical matters. Sometimes the poor proof-reader is made to bear the sins of the writer. As a case in point, we would refer to a communication of a writer who evidently accompanied the late American workmen's delegation to the Paris Exposition, who wrote something in regard to the size of the ports on English engines. Now it is evident that when the intelligent proof-reader came to this passage, he knew at once that posts were what was meant instead of ports, and he changed it accordingly. Of course he knew that no vessels ever sailed into a locomotive, and how could it possibly have any such thing as a port about it? Then the New York *Times*, whose articles relating to the new navy have upon the whole been very creditable, recently informed us that the trial of the "Yorktown was made on 8152 pounds pressure," and that there were "2385 square feet of heating surface horse-power." The Baltimore, we are gravely informed, made "one horse-power for each 1857 square feet of heating surface."

INCREASING THE DENSITY OF STEEL.—In working steel by hammering, or drawing it down by the process of rolling, it is a well-known fact that the steel forming the corners becomes more dense by the operation, or has the appearance of being refined, for where drills for cutting stone are used they are found to work much better by having the bit or cutting edge come in line with these compressed edges. In rolling eight-square steel, the line of dense metal comes in the form of a Maltese cross, and as the bit of a rock drill, where power-drilling is made use of, is something of the same form, care is taken to have them coincide. The etching process must show this action of steel to perfection, if a section could be worked off true and even and polished. After hardening, the etching fluid will take hold of the softer metal with greater freedom, and bring out all the features that can be contributed to the action of the hammering or the refining from the rolling operation.

THE COMPOUND LOCOMOTIVE for the Baltimore & Ohio R. R., recently turned out by the Baldwin Locomotive Works of Philadelphia, Pa., has four cylinders, a high and a low pressure on each side; the former is placed above the latter, and both piston rods are connected to the same crosshead. The cylinders are 12 and 20 inches diameter, 24 inches stroke; driving-wheels, 66 inches diameter. The boiler is 60 inches diameter, with a firebox nine feet long for burning soft coal. The engine is designed for fast passenger service. The plan of construction has been patented by the Baldwin Works.

CHINESE ARSENALS.—The Chinese have established arsenals for the manufacture of cannon; but, according to a report recently made by the Chief Justice of the Province of Canton to the Emperor, not one of the arsenals has yet manufactured a single gun where the metal for the same has been either forged or rolled in China. He concludes his report by urging upon the Government the necessity of purchasing improved machinery from abroad for various industrial purposes now worked by hand, and especially for forging and rolling iron and weaving of cotton.

POWDERED COAL.—The experiments in the economy of burning powdered coal side by side with natural gas, recently made at the works of Moorhead Bros. & Co. at Pittsburg, were limited in extent, but successful as far as they went. The amount of coal consumed in the first test was 684 pounds, and amount of iron heated was 4600 pounds. The charge for natural gas is at the rate of $1 per ton of iron, while the cost under the new process it is claimed would not exceed, including pulverization, 50 cents per ton of iron.

THE EIFFEL TOWER AN AMERICAN IDEA.—M. Eiffel, the designer of the famous French tower, acknowledges that he obtained the idea of building it from the fact that a tower 1000 feet high was proposed for the Philadelphia exhibition of 1876, but the project was abandoned for some unknown reason, probably on account of the cost, which was estimated at $1,000,000.

TEMPERED COPPER.—Copper, tempered by the process lately discovered, is found to possess most remarkable strength and wearing qualities. It will be especially valuable for use in the bearings and commutators of dynamo machines, and also for the journals of locomotives and cars. An establishment in Pennsylvania is now placing the metal upon the market.

SCIENTIFIC PROGRESS.

Coloring Matter of Rocks.

The principal coloring matter in such of our rocks as are used for structural purposes, says Geo. P. Merrill in *Stone*, is iron in some of its compounds, or carbonaceous matter. To the iron oxides are due the buff, yellow, brown or red colors; to the carbonaceous matter the blue-gray or even black colors so common in limestones and marbles. Upon the condition of the iron is dependent the degree and intensity of colors as displayed in both fragmental and crystalline rocks. The buff, red and brown stones contain it in a more or less hydrated sesquioxide state; the gray, on the other hand, often contain it as a protoxide, carbonate, or the form of a sulphide. Now, any of these latter forms are liable to undergo a change on exposure to heat or to ordinary atmospheric conditions. It is to this fact that is due the yellowing or mellowing of such sandstones as those of Berea, Ohio. The stone when quarried from below the water level is uniformly gray. On exposure it becomes yellowish, owing to the absorption by the iron of oxygen from the air, whereby it is converted into the sesquioxide state, which is of a reddish-brown color. If the change is uniform throughout the stone, the transformation is rather pleasing than otherwise, imparting a warmth or mellowness that is in no way detrimental. In sandstone, too, such a change may result in the even dissemination of the ferruginous oxide in such a way as to serve as a cement to the individual grains, thus increasing the tenacity and durability of the stone. In only too many instances, however, this iron oxide becomes disseminated along lines of bedding or in streaks and blotches, which injure the appearance, and do not materially, if at all, increase or better its weathering qualities. It is this fact that renders unsafe the quarrying of light-colored sand or limestones from below the water level, and placing them immediately in the walls of a building.

Iron in these same forms is also present in the limestones and dolomites, but is perhaps more abundant as a carbonate or a sulphide than in the fragmental rocks. If existing as a sesquioxide, it makes its presence known by the hue it imparts to the stone. If occurring as protoxide, carbonate or sulphide, its presence may not at first be suspected, but under favorable circumstances it is very certain to change to the condition of sesquioxide, the stone thereby changing from a gray or yellowish hue to red. This change may be witnessed daily in the process of brick-making, where blue-gray clay, containing iron carbonates or protoxide, is changed, by heating, to hard brick and of a red color. It is apparently this susceptibility to change, manifested by the iron compounds, that has given rise to statements to the effect that the color of a marble may often be intensified by heating. This is undoubtedly true, but it is safe to say that in proportion as the color is intensified, so is the quality of the stone deteriorated. The amount of heat necessary to convert within reasonable time the lower into the higher oxides, and thereby produce higher colors, would, in calcareous rocks, beyond doubt, injure the stone seriously, causing it to become weaker, more porous, and hence more susceptible to atmospheric agencies, even did it not convert a portion of the carbonate into the condition of quicklime.

That the blue-gray and black colors of limestones and marbles are due to carbonaceous matter is shown by their burning white when highly heated, as in the process of making quicklime. It is interesting to note, in this connection, that the almost chemically pure white crystalline limestones do not make the best quicklime. Quarriers long ago discovered this fact, and seek the softer blue-gray and dark-colored varieties. Very dark limestones carrying abundant carbonaceous matter sometimes bleach out on prolonged exposure. The green colors prevalent in certain of the Vermont marbles are due in large part to the presence of a green micaceous or talcose mineral.

LIGHTNING STRIKES THE EIFFEL TOWER.—The Eiffel tower was recently struck by lightning, and the scientific observers who were stationed for various purposes in the tower had, says a cotemporary, an excellent opportunity for studying that sort of phenomenon on the spot. The summit of the tower is protected by a lightning-rod, with a heavy point of bronze, tipped with platinum, and eight other points project obliquely from the level of the third platform. The upper point had shown signs of a dangerous vibration in high winds, and had been removed, leaving the end of the rod, with only the screw-threads cut on it, projecting above the top of the tower. About ten o'clock one evening, while the managers of the electric lighting were busy about the enormous groups of arc lights placed in the top of the tower, a terrific clap of thunder was heard, and the lightning was seen from the outside to strike the summit, while at the same instant, as well as repeatedly afterward, crackling sounds, accompanied with streams of light, were perceived around the undisturbed points at the gallery level. The people in the tower experienced no shock or inconvenience of any sort, but those standing outside on the galleries thought it prudent to get inside without delay. Immediately after the lightning a cloud descended around the upper portion of the tower, and, being strongly illuminated by the huge arc lamps, gave persons in the neighborhood the idea that the top of the structure was encompassed with electric flames, which, as was reported, "surpassed in brilliancy the lamps themselves." At the instant of the flash red sparks were seen to fly from the tip of the upper conductor, and, on examination, it was found that the screw-threads were in places partly obliterated, apparently by melting, and it was necessary to restore them with a file before the point could be screwed on again.

Refrigeration by Electricity.

It is well known, says the *Electrical World*, that the passage of a current across the junction of two dissimilar metals produces heating or cooling, according to the nature of these metals and the direction in which the current flows. This phenomenon, known as the Peltier effect, has been an interesting scientific fact for many years. While the heating of dissimilar junctions by the passage of the current has, it is true, been applied in one or two ways, the cooling effect seems to have attracted little or no attention from a practical standpoint. Our readers will, therefore, be interested in a patent which has just been issued to Mark W. Dewey of Syracuse, N. Y., in which the cooling effect produced by the electric current in the manner above stated is employed for freezing and refrigerating purposes.

Mr. Dewey, in his patent, describes a number of different methods of applying the principle, and shows a general method in which the cooling junctions are placed within a box and connected with a source of current. The heated junctions outside of the box are provided with large radiating plates which dissipate the heat generated there. Another application is also shown in which the heated parts are located in a pipe connected with a ventilator, by which the heat is carried off.

In addition to making use of the Peltier effect, Mr. Dewey shows a form of apparatus, in which the Thomson effect is made use of, in which differences of temperature in different parts of the same conductor are maintained by the passage of the current when the conductor is unequally heated. A continuous wire of iron or alloy is run alternately without and within the receptacle to be cooled. The exterior of warm coils is heated at the commencement of the operation by some external source, such as a gas-jet or an electrical heating device. Once the difference of temperature is established, it is maintained by the action of the apparatus on account of the different rates of cooling between the wire within and without the box, and this difference may also be maintained by making the external wire finer than that within the box, so that its temperature *is* always higher. Mr. Dewey also suggests that this class of apparatus may be used alternately as a refrigerator or heater by simply reversing the current.

A NEW OCEAN CURRENT has recently been discovered by Drs. Kukenthal and Walker in the Arctic region, in the vicinity of Spitzbergen. It is considered a very important discovery, and will be fully reported upon at an early day to the Bremen Geographical Society, at whose expense the exploring party under the direction of the above-named gentlemen, was sent out. In their brief communication announcing the discovery, they say: "One important result of our voyage seems to be our discovery of a strong ocean current which streams through the whole Olga strait from north to south, turning southeastward of King Charles land. It was very strong from the middle of July to the middle of August. On the surface it had a temperature of 1½° Celsius about the end of June, and 2·6·10° from July to the middle of August. But the temperature sank very rapidly in proportion to the depth. We observed this stream everywhere and at all times, from Northeast land to the Ryk Yse and King Charles. It was disturbed only near the flat coasts by the tidal currents." A second note is contained in a letter dated Tromso, Sept. 6, 1889, and runs thus: "This (the presence of driftwood on the shores) is in entire keeping with the existence of a strong ocean current coming from the north about the nature of which we shall fully report later."

EFFECT OF A LIGHTNING PHOTOGRAPH.—Miss Lilian Paul, whose face was said to have been photographed upon a brass plaque by a flash of lightning as she stood by an open window in Plainfield, New Jersey, two years ago, has recently become seriously ill. Her pulse at times is as high as 150 beats per minute. The physicians attribute her condition to the shock she then received.

THE PHONOGRAPH is made to record the inaudible sounds of vital movements in magnified lines on its tablets, by passing the sound waves through a sort of ear trumpet, so that the machine repeats them audibly; and thus movements that the physician never could detect before now report themselves and indicate conditions of the living organism hitherto inscrutable.

STAR CLUSTERS.—When Lord Rosse's powerful telescope was constructed, the far-distant objects, thought to be in formless nebulæ, or masses of gas, were said to be in reality clusters of stars. Norman Lockyer now holds that they are like comets, neither clusters of stars nor masses of gas, but that they consist of meteorites.

GOOD HEALTH.

Health of the State.

The October circular of the State Board of Health states that reports received from 101 localities, with an estimated population of 846,300, give the number of deaths as 1007, which is a percentage of 1.2 per 1000 in the month, or an annual mortality of 14.4, which is a slight increase over the preceding two months, but sufficiently low to indicate a very favorable condition of the public health.

The principal causes of death and the mortality ascribed to each were as follows: Alcoholism, 9; heart diseases, 70; erysipelas, 6; cancer, 48; cerebro-spinal fever, 7; remittent and intermittent fevers, 7; typhoid fever, 48; typho-malarial fevers, 4; whooping-cough, 4; scarlet fever, 4; croup, 10; diphtheria, 25; cholera infantum, 33; diarrhea and dysentery, 20; other diseases of stomach and bowels, 69; congestion of lungs, 9; acute bronchitis, 19; acute pneumonia, 54; consumption, 147; other causes, 414.

Contagiousness of Consumption.

Referring to the last-mentioned disease, the circular says: Our remark in the monthly circular of last month regarding the contagiousness of this disease and the undesirability of inviting its victims to this coast, seems to have given great umbrage to our southern neighbors, who seem to look upon the solicitude of the State Board of Health for the sanitary welfare of the State as a direct blow at their prosperity, and an endeavor to prevent the immigration of diseased persons into their midst. The State Board has no such desire or power; it can only advise the public of the danger incurred from the promiscuous mingling of consumptives with healthy people, which is its duty.

M. Delargy, in a paper contributed to the *Journal Hygiene*, points out that certain mountain regions in Europe, formerly exempt from phthisis, have now become infected since intercourse with cities and phthisical localities has been furnished, and considers the crowding together of a large number of phthisical cases, in the most healthy localities, will soon have an unfavorable effect upon the purity of the atmosphere. Indeed, it may be said that consumption is never contracted except by contact, by association, or by living in close proximity. The length of time consumed by phthisis before proving fatal, enables it to infect all susceptible persons coming in contact with it, hence its great danger when not isolated.

Cadeac and Malet, by experiment, proved that tubercular matter, dried and pulverized, was capable of transmitting the disease 100 days after such preparation, and Pietro asserts that tubercular matter will retain its virulence ten months after drying. Desiccation or drying of the sputa seems to be the most effective way of disseminating the disease. Cornet found that of 311 animals inoculated with the dust scraped from the rooms occupied by phthisical patients, 167 died soon after; of these, one-fifth were found to be tuberculous. He says further that a phthisical patient to be innocuous must never under any circumstances expectorate upon the floor or into a handkerchief, but always into a spittoon cup containing water, which must be disinfected and frequently changed. The danger of contagion from consumption is not exaggerated; preventive measures are as applicable to the South as they are to any other part of California, and the State Board of Health would be derelict in its duty if it did not point out this fact and call public attention to the necessity of caution in dealing with it.

A FORM OF ELECTRICAL SUNSTROKE.—In a recent number of the *Revue d'Hygiene*, M. Maklokoff of Moscow relates his experience of an "electric sunstroke" received at the Bernardos Electric Welding Works at Kolomno, near Moscow, where it seems there is great difficulty in getting the workmen to work more than two hours a day, on account of the injurious effect of the arc, although they are paid very highly. The current at the Kolomno works is obtained from 500 Plante accumulators, and an arc five centimeters long is produced. In order to obtain personal experience of the effects of an "electric sunstroke," and to be in better position to suggest a remedy, M. Maklokoff exposed himself for about ten minutes to the light of the naked arc at close quarters. The outcome of this *experimentum in corpore vili* was, as will be seen, somewhat unpleasant. Two hours later a tingling sensation, combined with burning of the eyes and skin, was experienced. This was followed by a cold in the head and watering of the eyes, tumefaction, discoloration of the skin, of the face, neck and hands, chemosis of the eyelids and photophobia. A feverish night followed, and next day there was an increasing œdema. On the third day there was a deepening in the brick-dust color of the skin, which commenced to crack and peel. This trouble and pains in the eyes disappeared, when a secretion in the conjunctiva began to show itself. Subsequently there was peeling off of the skin, as in erysipelas. M. Maklokoff attributes all these effects to the chemical action of the rays, and suggests that a glazed taffety veil, placed on a wicker headpiece, and provided with gray glass eyelet holes, should be worn by those employed in the Bernardos process and analogous operation.

ICED FISH DANGEROUS.—According to Mr. J. Lawrence-Hamilton, in the *Lancet*, ice spoils the freshness, firmness and flavor of fish by rendering it, prior to putrefaction, insipid, soft and flabby. Experience seems to show that the gravest cases of fish poisoning arise more commonly from eating fish which has been kept on ice than from eating fish kept naturally cool. Where fish is preserved on ice it appears that the ice only favors putrefaction by furnishing a constant supply of moisture, carrying with it the putrefactive bacteria derived from its foul and filthy surroundings, so that this iced fish remains covered with fresh solutions of filth pregnant with putrefactive bacteria. Thus large quantities of those subtile, complex bodies, the animal alkaloids, are probably elaborated, and give rise to those marked symptoms of poisoning which sometimes occur from eating fish preserved on ice. On the other hand, keeping fresh fish dry and cool can in no way favor putrefaction. And although here cases of poisoning may happen, yet the symptoms are much less marked, and pass off sooner, the toxic effects being usually confined to a passing attack of vomiting and diarrhea, while in the case of fish preserved on ice the vomiting and diarrhea may be less marked, though the other symptoms may be much more profound and lasting, and even sometimes fatal. There are various poisons derivable from putrid fish, the detailed consideration of which requires much further elaboration, work, experiment and research. Indeed, as upward of seventy different kinds of food fishes, within a few hours of their death, on being eaten, give rise to poisonous symptoms, the Russian Government, in 1894, will award a prize of $2500 for the best essay upon the nature and cure of fish poisoning.

A GOOD REMEDY SLANDERED.—"A hot lemonade taken at bedtime" is an excellent remedy for a cold, if it *be* taken at bedtime in the early stages of the disorder. This taking should be succeeded by a night's rest in a good warm bed; and a light, quick sponge-bath followed by brisk rubbing with a coarse towel as soon as you get out of that bed next morning. The latter treatment prevents the system from being left in such condition that another and much more severe cold is almost certain to be contracted, and is much more likely to result in restoration to a strong, healthy condition than dosing with any nostrum ever advertised.

SALUTARY INFLUENCE OF FLOWERS.—It is now established that flowers and the perfumes distilled from them have a salutary influence, and constitute a therapeutic agency of high value, and that residence in a perfumed atmosphere forms a protection from pulmonary affections and arrests phthisis. In the town of La Grasse, France, where the making of perfumes is largely carried on, phthisis is unknown.

USEFUL INFORMATION.

COLOR PRINTING ON METAL.—An ingenious and highly effective system of printing direct in colors on metal has been invented and developed into practical use by M. Cesar F. Joez, C. E., of Brussels. In this process, plates of zinc or other metal are specially prepared, and are nickeled or coppered, or both, as may be required. The nickel gives a silver and the copper a gold tint to the plate, to which is also imparted either a dull or a bright appearance, or both, as may be desired. The subject is printed in special enamel colors, which set at once, and embossing is effected by a special contrivance which forms a part of the process, and does not necessitate an engraved steel plate. The printing is performed from stones in the same way that lithographic printing is carried out. The results were shown at a demonstration which took place October 21st at 52 Queen Victoria street, London, when a number of specimens were exhibited. They all showed great delicacy of finish and brilliancy of effect. They comprised show tablets of various sizes and kinds, some being only in plain words, while others were embellished with architectural designs and landscape views. In all cases the subjects were well brought out, and where embossing was employed, the effect was greatly hightened. The further point is that the cost of production is said to be very moderate, so that this, combined with the effective appearance of the plates, will doubtless render the process in all respects a success. A factory has been started in Brussels, and is already turning out work on this system, and the plates exhibited were said to be not simply got up for the occasion, but samples of orders executed.

SILVERING MIRRORS.—A French manufacturer, M. Bory, has recently taken out a patent for silvering mirrors by a very simple and efficient process. The plate of glass, thoroughly cleaned, is laid on a table kept at a temperature of 25° to 30° C. To silver a plate one meter square, two liquids are prepared—the first, consisting of 10 grammes of double tartrate of soda and potash, dissolved in one liter of distilled water, and the other of five grammes of nitrate of silver dissolved in three grammes of pure ammonia, diluted with one liter of water. The two liquids are then intimately mixed, and a small portion of the mixture is spread evenly over the glass, when the remainder is poured on. In the course of 30 or 40 minutes the silver is precipitated in its metallic form, and adheres closely to the glass, which needs then only to be freed, by tilting from the superfluous liquid and slightly rinsed with water and placed upright to dry. A coating of varnish will then protect the mirror from the action of the air.

THE SEWING MACHINE.—In the series of reports on manufactures in Europe made by the men who accompanied the Workingmen's League to the old countries, there appeared an extended description of the sewing machine, in which the interesting fact is noted that the invention never became of practical value until the device of a continuous feed in combination with a horizontal table was added. This was the idea of John Bachelder, now residing at Napa, in this State, who patented his invention and sold it to a sewing-machine monopoly, which controlled it until the expiration of the patent in 1877. As soon as Mr. Bachelder's patent had run out there was an immediate and heavy reduction in the price of sewing machines, a direct testimony to the value of the invention. This explanation is due to Mr. Bachelder, who, like many inventors, got more glory than profit out of his idea, and because it is part of the history of a great invention.—*Ex.*

PHEASANTS FOR FOOD.—It is a curious fact that pheasants, which are now killed in Scotland by thousands, were first introduced into that country only about 90 years ago. The then Duke of Athole attempted to acclimatize them in his extensive woods around Dunkfield, but the Duke of Buccleuch was more successful in the border counties as he introduced them (after a successful trial in Dalkeith Park) at Bowhill, in Selkirkshire, and in Dumfrieshire, both at Langholm and Drumlanrig. The Fifeshire pheasants are now regarded as being the finest, just as Caithness yields the best grouse and East Lothian the best partridges. George IV sent pheasants out of fashion for a long time by repeatedly announcing that he did not care for them, but infinitely preferred a good fowl.

A NEW CEMENT, for securing iron into stone, is described in some of the foreign papers. The cement is made by melting resin and stirring in brick-dust, which must be finely ground and sifted, until a sort of putty is formed, which, however, runs easily while hot. In using, the iron is set into the hole in the stone prepared to receive it, and the melted putty poured in until the space is filled; then, if desired, bits of brick, previously warmed, may be pushed into the mass, and a little of the cement thereby saved. As soon as the whole is cool, the iron will be firmly held to the stone, and the cement is quite durable and uninjured by the weather, while, unlike lead and sulphur, it has no injurious effect on the iron.

INDIAN CURIOSITY.—The story is told how a party of Indians, fresh from the wilds, greeted their first view of a locomotive. They made no comment, and didn't even get up off the ground to examine it. But when a lineman walked up a telegraph pole like a woodpecker up a maple, they fell into paroxysms of enthusiasm. Simply, one thing was within the range of their astonishment, and the other wasn't. The writer was going up the Sacramento river, in 1851, in a stern-wheel steamer. On passing an Indian ranchero, not one of a large party of Indian women and children, who were sitting upon the sand near the edge of the stream, turned a head to look at the steamer.

DO FISH SUFFER PAIN?—There is a widespread notion that fish suffer very little pain in comparison with the higher vertebrates. But it is probable that fish suffer pain to a much greater degree than it suits the angler to believe. "A fly fisherman of 35 years' experience" says the sentiency in a fish depends very much on where he is hooked. If the hook is struck into a horny part, no pain seems to be felt; if it is fixed in the part of the mouth corresponding in man to that between the outer gum and the cheek, he is quite sure that the fish feels very acute pain, for, unless killed first, it quivers horribly when the hook is removed. —*The Naturalist.*

LIME WATER FOR REMOVING KEROSENE.—In cleaning lamps from which it is desired to remove all traces of petroleum, the lamp should be washed with lime water, made by dissolving slacked lime in water. The milky solution forms a sort of soapy emulsion with the petroleum, rendering its removal a simple matter. In order to remove the last odor of petroleum, a second rinsing in lime water to which has been added a little chloride of lime will prove absolutely certain in its effect.

STRENGTH OF THE PULLMAN CARS.—The great strength of some of the modern private, parlor and sleeping-cars was demonstrated in the recent accident on the New York Central, near Palatine Bridge. Here two private cars at the rear of the standing train received the full force of the shock from a train moving about 30 miles per hour, and instead of yielding and crushing, transmitted the shock to the next car, telescoping it for two-thirds of its length.

STEVENS' STATUE.—The pedestal upon which is to be placed the statue of E. J. Stevens, late master mechanic of the Sacramento railroad shops, is now being erected upon the plaza in that city. The statue itself is nearly completed —the finishing touches are being placed upon the work.

ELECTRICITY.

ELECTRICITY IN INDIA.—According to *Indian Engineering*, railway travel in India must be about the safest thing in the world, as the following official figures will show: "The mean mileage open, train mileage run, and number of passengers in millions was 14,379, 50,109,119, and 103,166 respectively during 1888, against 13,578, 15,779,096, and 95 75 respectively during 1887. The number of train accidents per 1000 train miles was 0.06. There were two passengers killed from causes beyond their own control; being an average of one per 51 58 millions of passengers traveling; 26 passengers were injured, or an average of one per four millions. From the total number killed and injured, viz., 28, it would appear that an average of 155.3 millions of miles was traveled for each casualty."

A NOVEL ELECTRIC ROAD.—A novel electric railroad is now in operation in England, which is very different from any road now running in this country. About a foot and a half from the car on the side of the track a flat rail runs, this rail being raised on posts of a foot in hight, the current traveling on this rail, ceasing abrupt on one side of the road and the car propelled by its momentum plying across the road where the rod catches on to the rail once more. The ends of the raised rails are connected by a wire passing under the road. The cars often travel at the rate of 20 miles per hour. The generator is operated by water-power.

NEW APPLIANCES FOR ELECTRICITY.—One Chicago gentleman is a persistent inventor of automatic coin-controlled devices, which include a slotted weighing machine, a testing machine, an opera-glass holder, etc., and is now bringing out a lung-tester; also a combined coin-controlled machine, operated by an electric current, that will permit of six operations on the payment of a nickel, or of any one on the payment of a penny. A new open circuit battery, a gas governor, and a track switch for electric railways, operated from a moving car, are also among his new devices.

ELECTRIC TRANSMISSION has been used in Germany for some years under restricted conditions. It has some advantages, as the conductor is less clumsy than shafting, steam-pipe, or rope, its position can easily be changed, and the motor is compact and less of a nuisance than a small steam engine. Loss of power there certainly is, but not much in the actual transmission between points far apart, if wire of reasonable diameter is used, and the less the power being taken off, the less is the percentage of loss in the transmitter, the opposite rule holding good with shafting.

PHONOGRAPHIC ANTICIPATIONS.—We have already given two or three instances wherein writers of a century or more ago seemed to have premonitions that something was to come in the near future in the character of the phonograph. Count Von Moltke was recently asked to talk into one of Edison's phonographs. The venerable soldier immediately applied his lips to the instrument and quoted from Goethe's "Faust" a sentence beginning with the following appropriate and remarkable words: "Ye instrument, mock me with wheel and combs, with cylinder and handle."

THE NEW LINES OF ELECTRIC RAILWAYS that are being projected in Boston at present are rapidly nearing completion. The digging of holes and laying of steel poles and new roadbeds is keeping a large number of men actively engaged. About 1000 poles have been set in South Boston. Gangs of men are at work on Warren avenue, and other gangs are at work on Shawmut avenue, along Tremont row, Hanover and Portland streets. The company expect to have about 100 more cars fitted up and running before snow falls.

THE WORK OF ELECTRICITY.—Prof. Elisha Gray remarks that electrical science has made a greater advance in the last twenty years than in all the 6000 historic years preceding. More is discovered in one day now than in a thousand years of the Middle Ages. We find all sorts of work for electricity to do. We make it carry our messages, drive our engine, ring our door-bell, and scare the burglar; we take it as a medicine, light our gas with it, see by it, hear from it, talk with it, and now we are beginning to teach it to write.

A NEW ELECTRICAL DEVICE has just been put on two of the electric cars of the Cambridge, Mass., line for experiment. It is called an electric-light coupler and is intended for use when a second car is attached to the power car. By snapping the coupler together at the ends of the connecting cars, electric light is provided for the rear car, thus doing away with the use of oil. This coupler practically solves the problem which the West End railway has been working over in the endeavor to provide some means for lighting attached cars with ease and safety.

ELECTRIC LIGHTING IN LONDON.—Upward of $15,000,000 are, it is said, already invested in electric-lighting companies in London.

BASE-BALLS.—One American manufacturer of base-balls employs 500 hands and keeps 40,000 dozen balls in stock.

Passing Events.

The Silver Convention at St. Louis has commenced its labors, but doubtless a great deal of speech-making will be done before the members get down to real work. Whether the convention really represents the silver-mining interests it is hard to say; but the delegation from California has no mining men at all.

Thanksgiving Day occurring on Thursday of this week gives us all a holiday. The year past in California has been a prosperous one in all those branches in which the producing classes are employed, and the prospects are that the coming year will be even more fruitful of material advancement.

From what is said in other columns, it will be seen that the proposed changes in the mining laws will be injurious to the drift-mining interests of this State unless Senator Stewart, who has the bill in charge, will alter the provisions affecting that class of mines.

A SYNDICATE has been formed to build smelting and reduction works at Los Angeles. The first plant will cost $100,000. At present there are but two smelters in Southern California, one at National City and the other at Colton, but they are not of large capacity.

THE owners of the Good Hope mine, Hawthorne district, Nev., have shipped nine tons of $200 ore to the mill. One ton of sorted ore is valued at $600.

Our Lava-Capped Divides.

There are certain volcanic-capped "divides," or ranges, in this State under which are "dead" channels of ancient rivers filled with auriferous gravel, in some places being mined. The questions as to the mineral or agricultural character of such lands are bound to breed trouble and litigation before long. A short time since one of the drift-mining companies of this State was refused patent to a lava-capped divide because it had been listed to the railroad company as agricultural land; yet mining was being carried on under this ground.

The odd sections listed to the railroad company contain much of such land, and it is difficult for the miners to get good title. It is not that the railroad company charge extravagantly for the land, but that title under such circumstances is not very satisfactory. Some one may jump the land and say the railroad company had no right to it because it was mineral. At the same time, the purchaser has got to do annual work on it required by the mining laws and spend money on it as mining ground, while it was listed and transferred as agricultural.

These discrepancies will surely bring legal complications. If the ground is worked systematically, the miner ought to spend $5000 or $6000 in one place, instead of digging a lot of little holes on small tracts. But no one wants to do this on ground that may belong to the railroad and may belong to the Government. The title would be too indefinite. There is no mineral on the surface, but down under the lava there is auriferous gravel which yields largely when worked in a systematic manner. The Government officials should at once take cognizance of these facts.

Saving Gold.

One of the problems of the future in all gold-mining regions is not only how to discover gold in paying amounts, but also, when found, how most effectively to save it. Much has been done toward the perfecting of gold-saving appliances, yet very much remains to be done before it can be said that this branch of the science of mining has been placed in a satisfactory condition. To do this will give an almost unlimited scope for scientific and practical investigation and experiment. This would involve a large outlay of time and money; but such outlay will prove a remunerative investment.

The mining community is dependent upon itself for any improvement in the processes of extraction. The result of work at the different mills and reduction works is all we have to go upon. What improvements are made, gradually, but slowly, find their way into practice. There is no standard work on processes of gold extraction which embraces all the experience of gold miners, though there is great need of one. Much can be done by our State Mining Bureau in bringing available data together, in which a beginning was made last year; and it is to be hoped that this season much more information on the same subject will be gathered.

Mineral Lands and Railroads.

The Mineral Land Convention has been summoned to reconvene at Helena, Montana, on Nov. 29th, as prompt work is necessary to frustrate the attempt of the Northern Pacific R. R. to take up mineral lands. The president of the convention in his call says: "The question of the mineral lands of Montana and the relations of the Northern Pacific Railroad Company thereto, having again been brought prominently to the attention of the people by the action of the railroad company in adversing certain mineral applications for patent, and by rulings of the Land Department, which appear to be adverse to the mineral claimants; together with the near probability of patents being issued to the railroad regardless of the rights of mine-owners, seem to render it necessary that the Mineral Land Convention again be called together for the purpose of devising new ways and means for meeting the serious crisis which now threatens."

This subject is a very important one for Montana, as well as other mining States and Territories. Unless prompt action is taken, vast tracts of mineral land will fall into the hands of the railroad companies.

THE Santa Barbara *Herald* says the gold beach mining at Lompoc is petering out.

A Tuyere Slagging-Valve.

(*Concluded from page 409.*)

istence the tuyere slagging-valve now in use at the Warwick furnace, and found to be valuable. The form was suggested by the chief engineer, who thought that a valve placed in the cap or the bottom of the belly-pipe, connected with the piston of a cylinder of a larger diameter than the valve and operated with a three-way cock placed in a pipe connecting the cylinder with the main blast-pipe, would afford a sure way of flushing through any belly-pipe without stopping the engine at all.

The accompanying drawings explain the construction. Figs. 1, 2, 3 and 4 represent the ordinary three-inch valve. In these figures, *C* is the leg-pipe; *D*, the elbow; *E*, the belly-pipe; *F*, the circular casting, keyed to the elbow by keys *T*. This casting carries the valve-seat, held in position by key *Q*, and is of the same diameter, external and internal, as the elbow *D*. *G* is the swinging-cap of the elbow, held in position by keys *S*. *H* is the valve-cylinder, with *K* opening for connecting-pipe running to the circular blast-pipe and a small opening *L*, at bottom, for the escape to the atmosphere of any air leaking past the piston. *M* is the usual eye-hole, arranged with a stop-cock to permit the easy cleaning of the glass. *N* is the guide for the rack-extension *O* of the piston-rod; *U*, the sector with extended arm, carrying the valve *V*, and fitted to work easily with rack *O*. In practice, it was found that when the valve *V* was thrown open by pressure of air in the belly-pipe (the pressure in valve-cylinder being cut off), owing to its own weight and that of piston and piston-rod, *V* would partially close again, not enough to interfere with the flow of slag through the opening, but just enough for the slag to strike it and in time cut it.

In order to hold the open valve in the position shown in Fig. 4, a ¾-inch pipe-connection, *S*, was made from the top of the circular casting, *F*, to the lower part of the valve-cylinder, *H*. The opening in the cylinder is immediately opposite the piston when the valve is closed. When the valve, *V*, is opened and the piston of the cylinder raises, air passes through the pipe, *J*, to the lower side of the piston and connects to them the valve, *V*, wide-open, and holds it in the position shown. In the pipe, *J*, is placed a stopcock, *R*, to regulate the amount of air to be admitted to the lower side of the piston. A brass plug, *X*, is screwed into the top of the tee to facilitate cleaning the pipe in case it should become filled with plumbago or gas dust.

The tuyere slagging-valve is easily applied to any of the usual forms of belly-pipes. To keep the valve closed, the furnace being in operation, the plug of the 1½-inch three-way cock is so turned that the opening to the atmosphere is closed and the passage from the main blast-pipe to branches and cylinders is opened. The ¾-inch cocks are turned the same way. The pressure of blast in the belly-pipe is the same as in the valve cylinder. The area of the piston being larger than the area of the valve in the belly-pipe, the latter is kept tightly closed, never leaking. If it is desired to open a valve, the plug of a ¾-inch three-way cock is turned, cutting off the supply of air from the blast-pipe and opening its passage to the atmosphere. The pressure of blast in the belly-pipe acting on the valve, forces it open, driving up the piston of the valve-chamber, upon which there is now no pressure. The air filling the cylinders, escapes to the atmosphere through the side opening of the cock.

Slag driven into the belly-pipes can be quickly discharged through one or more of the slagging-valves without loss of time. When the crucible is badly chilled, the iron and cinder notches are closed, and the slag melted by each tuyere is prevented from distributing itself over the area of the crucible and confined to the immediate vicinity of the tuyere melting it, this slag can be discharged through the tuyere slagging-valves with no risk to the men and without stopping the engine for a moment, thus avoiding all loss of time and all the dangers attending the further cooling off of crucible and blast. The management of a furnace is thus, to some extent, simplified, and one of the most serious annoyances attending the operation of an anthracite furnace is removed, viz.: the difficulty of keeping the tuyeres open. We shall, in the next number of the PRESS, describe the operation of larger valves of the same type.

The Drift-Mining Interests.

The fact that mining auriferous gravel by the hydraulic method has practically ceased in this State, owing to legal complications, has evidently created an impression that gravel mining generally has stopped. This is by no means the case, for the ancient river channels of California have scarcely been touched, and drift mining is a growing and successful industry. Some of the old hydraulic mines are being worked by "drifting," and more of them will be in course of time.

The Stewart mining bill, which will be considered by Congress shortly, not only ignores the drift-mining industry of California, but does it a positive injury by certain of its provisions. In another column is given a statement signed by prominent men interested in this branch of mining, in which the dangers that threaten drift mining are pointed out. Their views are indorsed by others who have seen the letter referred to after it was put in type.

The Forest Hill Divide, to which these gentlemen directly refer, has yielded something more than $20,000,000 in gold, and this from the more accessible points only; the greater part is still undeveloped.

There are a great number of similar volcanic-capped ridges, marking the courses of ancient gold-bearing channels in Placer, Nevada, Sierra, Plumas, Butte and other counties in this State. A few of these only have been developed, and it is apparent that the drift-mining industry is not only an important one at present, but is destined to become still more so as new regions are opened by capital.

If the Stewart bill, as it now reads, should become a law, prospecting for new drift mines would virtually cease, and most of those now unpatented would have to be abandoned.

To avoid misunderstanding, we think the bill should define the maximum limit in the number of acres, or the number of 20-acre locations which may be included in a single "claim." As the bill now reads, many miners will be at a loss to know whether a "claim" under the proposed law will be limited to 20 acres, 80 acres or 160 acres.

There is also an apparent oversight in the bill which permits the assessment work for five adjoining claims to be done at one point and then limits a single application for patent to 80 acres.

If it is shown that a drift-mining property on one of these volcanic-capped channels must contain 500 to 1000 acres in order to justify development—and experience shows this—it is plain that provision should be made for the working of that number of acres as one property; *i. e.*, for doing the assessment work at one point (and the amount should not be unreasonable), and for obtaining patent under one application.

If the 80-acre limitation makes it necessary to do $500 worth of labor on each 80-acre tract before applying for a patent, the drift miner will either have to go ahead without a patent or waste thousands of dollars in useless work.

These facts should be carefully considered by the Committee on Mines of the U. S. Senate, to prevent confusion in the future and to afford relief for the drift miners. As at present drawn, the bill relates mainly to quartz mines, the drift mines having been apparently overlooked. If the bill passes without being remodeled, it will, without doubt, work dire disaster to the important industry of drift-gravel mining in this and adjoining States.

Mr. Hammond's Views.

EDITORS PRESS:—Respecting the communication sent to you from Forest Hill regarding the Stewart bill in its relation to drift mining, I most strongly indorse the views therein expressed. Yours truly,

JOHN HAYS HAMMOND.

NEWTON LLOYD, a prominent mining man, heavily interested in mines in Mexico, and well known throughout the Pacific Coast, died at Coneto, in the State of Durango, last week.

ISHPEMING, Michigan, boasts of a gold mine with quartz worth $50,000 a ton. If they find a couple of tons of this kind of rock they will be in luck.

A RICH gold strike has been made in Montgomery county, North Carolina.

The Stewart Bill and Drift Mines.

California Mining Interests Threatened.

EDITORS PRESS:—We, the undersigned, being interested in the development of drift gravel mining properties, desire to call attention, through your columns, to the injurious character of certain clauses in the Stewart mining bill now pending before Congress.

These clauses concern the required annual expenditure on placer claims, and the number of acres which may be included in a single application for patent.

The bill calls for the annual expenditure of $25 "for each 20 acres of placer claims."

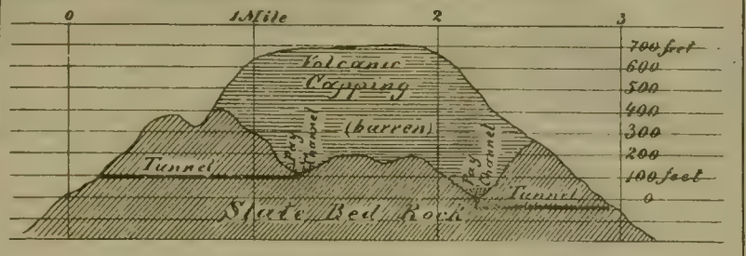
We assume that a "placer claim" may still contain as much as 160 acres, as formerly.

The annual assessment work upon one placer claim of 160 acres would then amount to $200, or double the amount now required.

A further provision permits the owner of several adjoining claims, not exceeding five, to hold the same by expending $5000 in labor upon one of the claims.

The owner of five adjoining claims, say of 800 acres, might then hold his property—either by expending $200 in labor upon each of the five claims, amounting to twice the present requirement, or by expending $5000 upon one of the claims, amounting to ten times the present requirement.

No distinction is made between shallow superficially exposed placer deposits and the covered deposits of the ancient channel systems.



It is possible for the prospector to make a location upon the exposed deposit with a certain degree of intelligence, even if confined to a small claim. He may test the quality of the gravel by means of shallow pits or open cuts.

But the location of the covered deposit is a very different matter. As a rule, the latter contains only a narrow winding course of pay gravel, which may be worked only by underground drifting, and cannot be exposed for prospecting without the outlay of a large amount of capital. The position and course of the pay channel is a matter of vague conjecture within limits too broad to be covered with certainty by a 160-acre claim.

As an example of the drift-mining gravel deposits, we herewith furnish a cross-section characteristic of the Forest Hill divide.

The narrow channels are filled with pay gravel to the depth of a few feet only, and are, as a rule, covered by a large deposit of barren volcanic material from one to three miles in width, and from 500 to 1000 feet in depth.

The surface of this extensive volcanic capping

CROSS-SECTION OF FOREST HILL DIVIDE.

offers no definite clue for the location of the hidden channel. The locator may satisfy himself that a pay channel exists somewhere under the volcanic capping, but he cannot determine the position within one-fourth of a mile or frequently within one-half of a mile or more.

Even if the precise location were known, the channel could not be worked profitably through shafts sunk from the surface, owing to the large flow of water in the channel course and to the comparatively small pay of the gravel per ton.

These channels can only be worked profitably through long bedrock tunnels placed low enough to drain the ground.

Such tunnels have to be driven through hard rock, seldom less than 2000 feet, and often as much as 5000 feet, before tapping the pay channel, and involve an expense of from $25,000 to $100,000.

To justify such an expense, it is necessary that the individual or company running such tunnel should own at least one or two miles length of pay tunnel. Owing to the uncertainty of the position or course of the channel, this usually involves the holding of from 500 to 1000 acres of ground, or more.

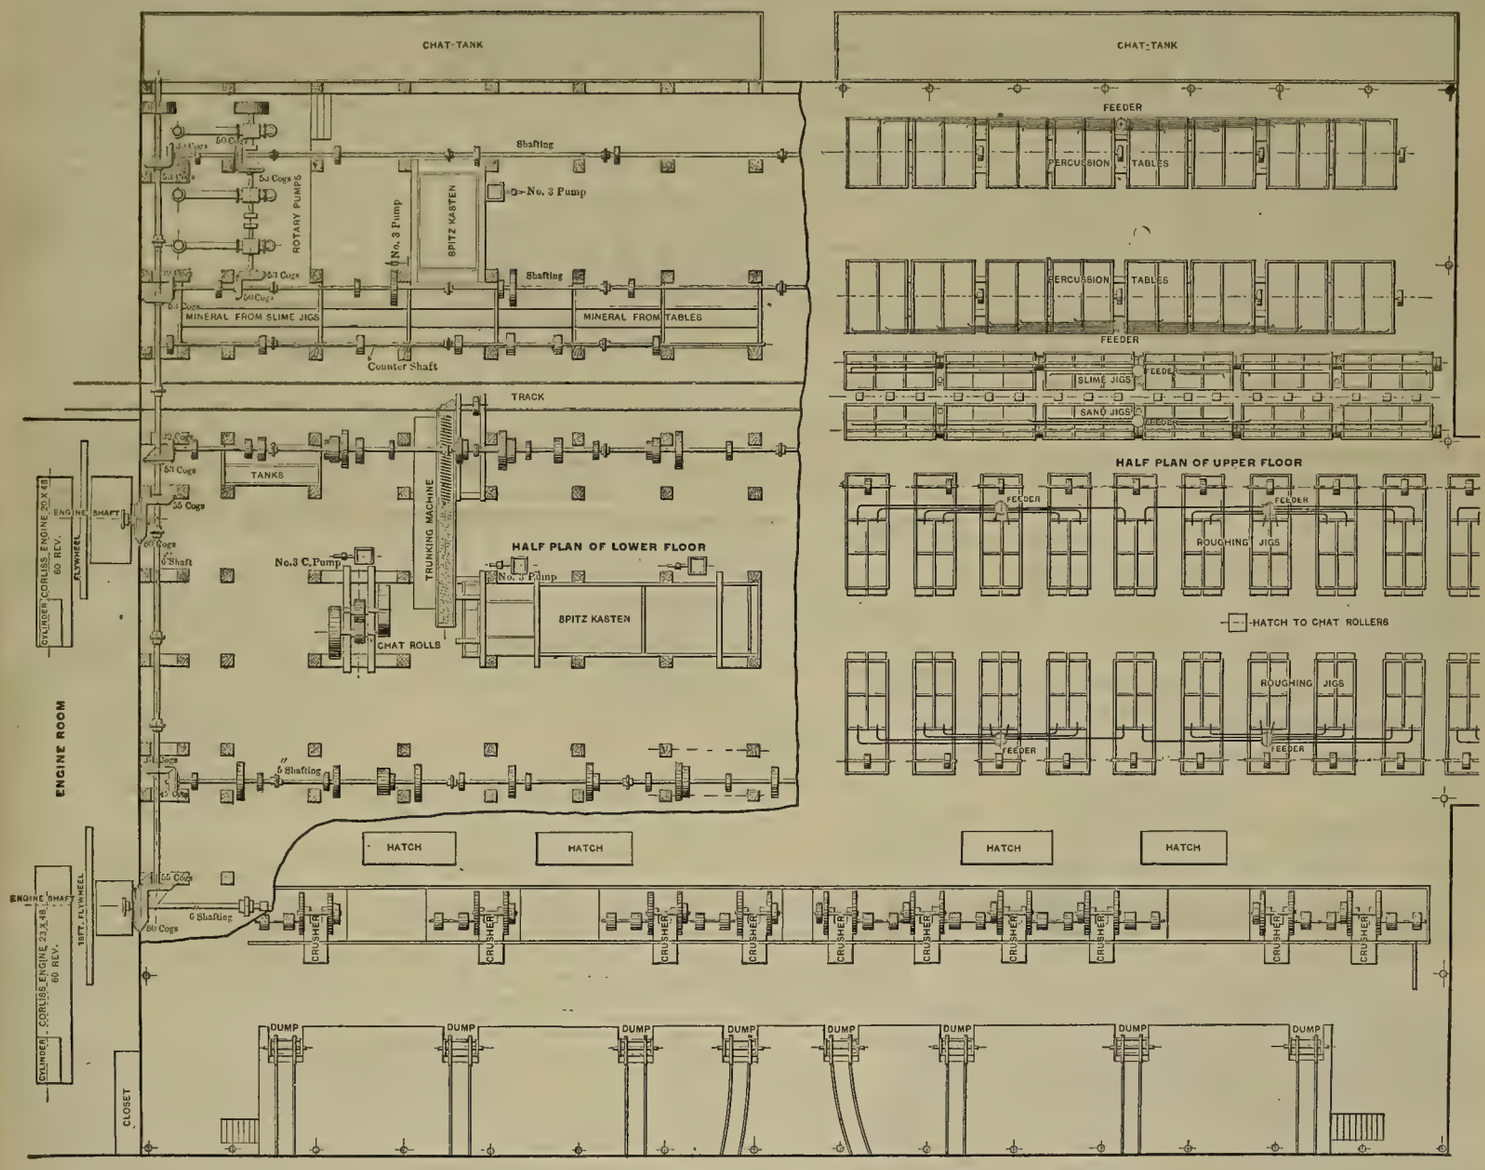
Assessment work done upon the surface of such properties is, as a rule, absolutely valueless. The above cross-section shows how fruitless would be the sinking of a shallow pit upon each 160 acre lot of the barren volcanic capping.

The provisions of the Stewart bill would cause the useless waste of a large amount of labor on the Forest Hill Divide and numerous similar divides in this State.

If the annual work is to be made a matter of valuable development, the provisions of the bill leave no choice to the owner of one of these properties—his assessment work will amount to ten times that at present required.

It is not our purpose to object to the rate of $25 for each 20 acres—*i. e.*, the doubling of the present rate—but we consider such increase sufficient, and think that provision should be made for doing all of the work at such rate at any point within the boundaries of the property.

A further provision of the bill limits the extent of ground which may be included in a single application for patent to 80 acres. We do not understand the purpose of this limitation, especially in its application to drift-mining properties, such as above described.



As already stated, the character and position of the gravel deposit to be worked by drifting, makes it necessary to include 500 or 1000 acres in one property. We do not see why the owner should be subjected to the useless expense of making a separate application for each 80 acres. Such a requirement would entail subdivisional surveys and a large amount of purposeless clerical work, and would greatly encumber the records.

The St. Joseph Ore-Dressing Works.

In the PRESS of last week was given a sectional view of the new ore-dressing works of the St. Joseph Lead Co., and herewith is presented a general plan of the mill, showing the arrangement. The construction of the building was described last week. The method of treatment may be outlined as follows: The ore is crushed by jaw-crushers and rolls, and screened dry through a 6 mm. screen. The sands passing through the screen are thoroughly mixed with water and elevated by centrifugal pumps to distributors and divided among the Parsons jigs, without any previous sizing or classification. The tails ("chats") after passing over the two sieves of these jigs receive no further treat-

GENERAL PLAN OF THE MILL OF THE ST. JOSEPH ORE-DRESSING WORKS.

ment, and are conveyed by launders to the "chat-tanks." Coarse galena and raggings are skimmed by hand from the jigs at intervals, leaving always a sufficient bed to insure good hutchwork. The hutchwork which comes through the sieves of the Parsons jigs pass through a series of spitzkasten. The heavy galena, mixed with some sand and slime, settles in the first box of the series from which it is fed to a trunking-machine. The pure galena from this machine falls into railroad cars and goes to the smelting-works. The tails from the trunking-machine, together with the sands settling in the second box of the spitzkasten, are elevated by centrifugal pumps and divided between the Hartz three-sieved jig. The tails of the Hartz jigs receive no further treatment, going directly to the chat-tanks. Galena and

pyrites are skimmed from the sieves of these jigs. A bed of galena is, however, maintained on all three sieves so as to insure a rich hutch-work. The hutchwork of these finishing-jigs is nearly pure galena, and goes to galena-boxes on the lower floor, which are emptied from time to time, and the galena loaded on cars to go to the smelting-works.

The fine slimes settling in the third and fourth boxes of the spitzkasten are united and raised by centrifugal pumps to the distributors feeding the first row of Parsons Rittinger tables. The middlings from these tables are treated on the second row of tables. The tails from all the tables flow into the chat-tanks, and the heads run into galena-boxes on the lower floor from which they are loaded into cars.

The raggings, containing from 12 to 20 per cent of lead, which are skimmed from the Parsons jigs, are recrushed by fine rolls and elevated without screening to a line of Hartz three-sieved jigs. These raggings contain considerable pyrites.

The main disadvantage attending the arrangement of the mill in two floors, as described, is the necessity for elevating the material to be treated several times. This is accomplished at Bonne Terre by the use of centrifugal pumps by which the sands are elevated *with the feed-water* required for the proper working of the various jigs and tables. It should not be overlooked, however, that the bulk of the material is elevated but once. After passing over the roughing-jigs, 600 tons of waste sand go at once to the chat-tanks. Of the remaining 200 tons, 74 tons are mineral and raggings, and 20 tons escape with the overflow of the spitzkasten, leaving only 106 tons to be elevated again. The average lift of the 800 tons raised by the centrifugal pumps, including that which has to be elevated a second time, is less than thirty feet. If a mill of several stories like an anthracite breaker, or one arranged in steps or terraces like the Lake Superior mills, had been built at Bonne Terre, it would have been necessary to deliver the ore at a level at least forty feet higher than at present, involving a much more expensive building, and increased cost of hoisting, forty feet instead of thirty, for the whole 800 tons, merely to save the elevating of 100 tons a second time.

Again, if the mill had been built in several stories, both the wash-water and feed-water for the different machines would have to be raised about 20 feet higher than at present, and as 29 tons of water are required to treat one ton of ore, this additional lift would be a serious matter.

In round numbers the saving by the present arrangement amounts to about 520,000 foot-pounds per day, or over 20-horse power.

Rocky Mountain Ore-Producers.

The Rocky Mountain Ore-Producers met at Salt Lake City last week. Utah, Nevada, Idaho, Wyoming, Montana and Western Colorado were represented. Strong resolutions were adopted in opposition to Secretary Windom's ruling on Mexican ores, based on a long report reciting the action of the Treasury Department, in inviting a hearing on the question, the long delay in making the ruling and the final holding against home ore-producers in opposition to the law and contrary to the traditions of the department.

The convention finished its labors by the adoption of an address demanding the free coinage of silver, the repeal of the Bland law, and the issue of silver certificates on deposits of silver bullion. A resolution was also adopted calling for the union of the mining States and Territories in a protective union for mutual benefit.

The following delegates were chosen to attend the St. Louis convention: R. C. Chamber, N. Treweek, J. J. Daly, R. Mackintosh, A. G. Morrell, L. E. Holden, R. C. Goodwin, A. Hanauer, D. C. McLaughlin, W. S. McCormick, T. R. Jones, O. J. Salisbury, J. R. Walker, C. W. Bennett, R. McBride, W. S. Smith, W. F. James, O. K. Hollister, H. W. Lawrence and F. W. Billings.

THE ELECTRIC MOTOR.—The Virginia *Chronicle* says: The surface electric-motor plant at the Nevada mill was inspected yesterday by Messrs. W. S. Hobart and Alvinza Hayward. The motors have been in constant operation for about three weeks, and if run continually for 30 days the contract with the Brush Co. will be fulfilled, and the plant accepted by the Chollar Co., if it is in first-class order at the expiration of the 30 days. Mr. Conner, the electrician in charge, is confident that he can run the mill for months without stopping for repairs to the electric plant. Messrs. Hayward and Hobart are reported to be satisfied with its work.

THE GOLD HILL MINES.—It has been decided to drain the Gold Hill mines down to the 2700-foot level, at which depth high-grade ore is alleged to have been developed at the time of the abandonment of the workings of Comstock lode below the Sutro tunnel level. There are also said to be extensive low-grade ore reserves on the 1700-foot level of the Crown Point and Belcher now flooded. The drainage is to be accomplished by donkey pumps in the Belcher and Crown Point, and by a powerful Cornish pump at the Alta shaft.

IT is hoped to complete the Owens River canal in Inyo county within the next 90 days. The entire length is over 38 miles, and it will reclaim 30,000 acres.

Inyo Marble.

It has been truthfully said, "There is only one California." There is no other part of the known world that has within her own borders such endless variety and boundless resources in soil, mine and climate in mountain and valley. Within her limits are all that the highest civilization demands or humanity craves. Within herself are all the elements of Empire, dependent on no other land for anything needed for luxury or comfort. Variety of climate to suit the most exacting within one day's ride. Wines and fruit that would almost put to blush the ancient land "of milk and honey."

Among the sources of her boundless wealth is last, though not least, her inexhaustible marble deposits. Italy has for over 2000 years been the studio of the world in fine arts. Hundreds of her people have become rich, and her name has become a household word the world over through her immense marble deposits. With all her world-wide reputation, she is now called to meet a competitor worthy of her steel.

California comes forward and claims her long and worthily worn laurels, by presenting a marble that will stand the most severe tests and compare with any marble known, for equality of texture, strength, crystallization, hardness and durability. The most noted is the Inyo marble in the Inyo range of mountains. It is a mountain of marble, with no soil to protect it from storm or sunshine of winter and summer for the centuries past, but there is not the least sign of decay. It contains white, black, blue, blue and white, mottled blue, striped white and purple, veined purple and yellow, yellow, moss agate, etc. The large mass is white; the other forms in different strata.

The top strata, or as it is termed by the quarryman, the slide, is considerably broken, probably caused by being undermined by the lake or river, which has undoubtedly some time in the past ages washed the base of the mountain. In proof of this, in sinking near the present foot of the mountain for water, six feet from the surface and for 25 feet down, volcanic ash or pumicestone was found, in which were imbedded mussels or fresh-water clams of the size now found in our markets. After penetrating this slide, a bed of marble is uncovered that appears never to have been moved from its original bed or formation.

This marble is a dolomite or magnesian limestone, composed of carbonate of lime and carbonate of magnesia in nearly equal parts. It has a clean, clear crystallization which is not excelled, if equaled, by any marble known on the market.

On this coast, where everything is hurry, hurry, and where the amount of labor required to put the material in shape for use is more of a consideration than durability, where the largest display for the least money governs in the selection of material to be used, the Inyo marble is met by the objection: "It is too hard." In our older cities, as New York, Boston, Philadelphia, where they are building not for the present but the future, its hardness is its great recommendation. One thing, however, is that it can be wrought and finished finer for less money than granite.

It is susceptible of highest polish and is capable of the finest carving. There is no kind of ornamentation for cemetery or building that cannot be executed in this marble; nor is there, it is claimed, any stone that will retain its polish longer than this, not even excepting Scotch granite.

With these points of superiority, it does not require a very far-seeing eye to see in it the large field for the use of capital and the accumulation of wealth.

The company have recently purchased a water power near Verdi, on the Truckee river, put in a dam and have now running through their raceway a body of water four feet deep and ten feet wide, with a fall of 25 feet at the location for the mill. This power they propose to utilize by erecting a mill for sawing, turning, polishing and finishing marble for all purposes for which marble is used, such as monumental and cemetery work, building, hearths, tile, steps, slabs, etc. With this power they will be able to furnish marble as cheaply as it is now possible to do in Italy, and will thus save to ourselves the thousands now sent out annually to other lands for this material.

MINERAL LAND CONVENTION.—Lee Mantle, president of the Mineral Land Convention, and all concerned will meet at Helena on the 29th inst. The call reads: "The question of the mineral lands of Montana and the relations of the Northern Pacific Railroad Company thereto having again been brought prominently to the attention of the people by the action of the railroad company in advertising certain mineral applications for patent, and by certain rulings of the Land Department which appear to be adverse to the mineral claimants, together with the improbability of patents being issued to the railroad regardless of the rights of mine-owners, seem to render it necessary that the Mineral Land Convention again be called together for the purpose of devising new ways and means for meeting the serious crisis which now threatens over two million acres of the richest mineral land, including the famous Oro Fino district in Montana, involved in the contemplated steal of the railroad company."

WOOL MANUFACTURES.

Comparison Between American and English Woolen Goods.

The preference of the American public for fine woolen fabrics of foreign manufacture, according to good authority, is not altogether based upon fancy or some whimsical notion; but it has a substantial basis in the actual superiority of the goods, not, perhaps, in their durability, but rather in their greater excellence of fabrication, especially in that portion of their manufacture pertaining to their finishing.

Mr. A. B. Capron, good authority upon this subject, says: It is a common, almost a standard, boast with us that we are not excelled in our woolen goods. This is a mistake unworthy the intelligence of our manufacturers. We do many things well, and even in a superior manner, but to take our stand upon a mere boast is not to our credit. The English manufacturer excels us greatly in the process of finishing, as is shown in the appearance of his finished goods. However humiliating to our pride, this fact must be conceded, and better candidly than to affect an assertive boastfulness.

We are in a position to remedy the defect. Aside from the general appearance of the face of English woolen goods, the "feel" and "handle" of their fabrics in this staple is far superior to those of our home manufacture. There is less of "sponginess" where a soft "feel" is required, and less of "harshness," or the "wiry feel" in goods, the requisites of which are firmness in heavy weight.

We in the United States have English designers and managers, some of them well and even thoroughly educated, graduates of their home textile schools; and it is to be presumed they are granted every facility—have their own way in every manipulation of the fiber from the bottom to the top of the mill, even to the selection of the wool, and yet they fail to produce the finished effects noticeable in their home goods and which strongly mark the difference between the fabrics of the two countries.

As colors enter largely into the face appearance of fabrics and have much to do with the general finished effect, the American is not so far behind. There are those who believe that the equal of English colors cannot be found in America. This is a mistake of the Englishman which may be offset against the American boast of equality in finishing. As applied to woolens, American colors are not excelled.

That which most detracts from American coloring in textiles is the use or blending of them. If a primary is not followed or contrasted with a legitimate secondary, the one will deaden the effect of the other. So of the tertiaries and their subordinate divisions on blends. It is a well-known fact among the craft that inharmonious blendings will neutralize the most brilliant colors, which inexpert critics charge to the cant phrase, "You can't equal the English colors." These are only a few of the elements which enter into the appearance of the finished fabric, but they are of supreme importance.

While in the one factor we may safely lay claim to equality, in the other we must acknowledge our deficiency and make our best efforts to discover a remedy.

Why and How Wool Varies.

It is frequently remarked, says an exchange, that all kinds and characteristics of wool can be grown in this country; that the fleeces of Australia, Buenos Ayres, Cape Colony and elsewhere can be produced here with all the peculiarities that distinguish them equally as well as in the countries of their origin. The disposition is to give no credit to the climate and vegetation of those countries that is not equally applicable to this. True, there are sections in the United States where fineness of fiber can be grown, but it has not yet been demonstrated that it can be done and still possess the suppleness and softness that characterize the fine wools of Australia. There may be exceptional instances where this has been done, but nothing has seemed to favor it on a large scale. The fine-fleeced sheep is not hardy enough to stand the winters of our northern Territories, and the soil and vegetation of the more southern sections, west of the Mississippi, are wholly unfavorable, while east of the Mississippi land is too valuable for sheep ranges.

Prof. W. H. Brewer, in writing on this subject, says: There is a great deal of difference in the climate for producing wool, whatever is said to the contrary. This is demonstrated beyond the shadow of a doubt. Some of the New England mills pay a slightly higher price for wools that come from the region that embraces Southern Ohio, Western Pennsylvania and a portion of Western Virginia, than any part of the United States. There is a texture to it, a slightly different feel which manufacturers understand. There is a change in the wool if sheep are transported from those regions to other portions of the United States which are a little drier, whether it be directly due to the influence of the climate or indirectly due to the breed. One of the manufacturers of New England said he had been in the habit of buying wool of a certain farmer in Southern Ohio. As the farmer's family grew up and swarmed, one of the sons went into Kansas and carried with him a portion of the flock of the old farm. The manufacturer bought wool of both father and son, and gave me a sample not merely from the same flock, but from the same individual sheep, taken two or three years apart, one when the sheep was an inhabitant of Ohio and one when it was an inhabitant of a pretty dry portion of Kansas. They were colored in the same dye, the same mordant was used, the same vat, and yet there was a big difference in the wools.

A gentleman of large experience in Virginia told me precisely the same kind of history. He himself had attempted the growing of sheep with the purpose of getting wool just as good in one region as in another and failed. There is a considerable difference in the quality of wool as produced in different climates that is due to the climate itself, directly or indirectly, and the food that is produced in that climate. It may be brasher, there may be a certain harshness about it, and it may not manufacture quite so well. Now, while sheep are long continued to be bred in the poorer of these climates, they deteriorate, unless the blood is kept good by an infusion from the better regions. And that is what will give some regions perpetually an advantage in certain kinds of stock-growing over others; it will always be to their profit to produce animals to go somewhere else, just exactly the same as farmers living in one region may grow grain to be used in another.

First Sheep in the United States.

Draper's *Record* gives the following interesting facts in regard to the first introduction of sheep into the United States, and the establishment of the first woolen-mill: The first sheep introduced into the United States were taken to Jamestown, Virginia, in 1609. Great efforts were made to encourage the woolen industry, and some years later a law was passed which compelled every family to spin three pounds of wool, cotton or flax per week during 30 weeks of the year. About the same time the first weaver settled in the country and received a grant of 30 acres of valuable land. In 1662 Virginia prohibited the exportation of wool and offered five pounds of tobacco as a premium for every yard of woolen tissue produced in the colony. The breed of the sheep at the time in America was, however, inferior, and it was not until the commencement of the present century that the Spanish Government consented to sell a flock of fine merino sheep at an exorbitant price for exportation to America. It is stated that even in 1810 there were only about 5000 sheep of good breed in the country, but from them sprang the large flocks which are now found in the United States.

The first cloth-mill worthy of the name was erected in 1788 by several of the inhabitants of Hartford, Conn., and its annual production amounted to 5000 yards. It is stated that the proprietors of this establishment presented Washington with a suit made of their cloth in 1791. Other works soon arose, and in 1810 there were five mills producing fine woolen tissues, and 19 which manufactured coarser descriptions, their aggregate production being 200,000 yards, and a considerable quantity was also produced on hand looms.

The war in 1812 gave a great impulse to the American woolen trade, but when peace was concluded British tissues were imported in enormous quantities and completely crushed the industries of the States. Congress then found it necessary to protect the American manufacturers, and imposed in 1816 an import duty of 25 per cent ad valorem on woolen tissues, and in 1824 it applied a duty of 15 per cent on raw wool costing less than 10 cents per pound, and of 20 per cent on wool costing more than 30 cents per pound.

WHAT CAN BE DONE WITH A POUND OF WOOL OR COTTON.—*Harper's Bazar* says: It has been fairly tested that a pound of wool can furnish in fine yarn 84,000 yards, lacking but 80 yards to complete forty-eight miles. This, at the time—more than 100 years ago—was regarded as a triumph of skill, and it was said by a score of mistresses in the art of spinning that the worthy dame of East Dercham, in Norfolk, could not be beat. This was considered so great a curiosity that the Royal Society of England did not hesitate to make honorable record of it. Since then, however, another lady "has spun a pound of combed wool into a thread of 168,000 yards; and more than this was her success in producing a thread 203,000 yards long from the same weight of cotton. Her ball unrolled would measure 115 miles. If this ball of cotton thread had been woven it would have made 20 yards of muslin one yard in width."

SHEEP HUSBANDRY IN IRELAND is growing in popular estimation, if the increase in the number of sheep for 1889 over that for 1888 of nearly 4½ per cent is any criterion. The number of sheep in Ireland is now estimated at 3,789,629, of which 40 per cent are under one year old. The relative standing of the provinces, according to the number of sheep, is as follows: Leinster, Connaught, Munster and Ulster. The county having the largest number of sheep is Galway, next to which stands the county of Cork.

NEVADA WOOL.—The *Nevada State Journal* is authority for the statement that manufacturers using Nevada wools complain of the tar which they find on the ends of the staple. It gives them a great deal of trouble, and is more difficult to handle than burrs. Unless the

practice of tarring fleece is discontinued, Nevada will lose its high reputation among manufacturers. If the wools of Nevada once get the reputation of being troublesome on account of tar on the ends of the staple, it will take a long time to overcome it, and manufacturers will pass the wool by.

WOOL-MANUFACTURING FAILURES.—The record stands 16 failures of woolen-manufacturing concerns in 1889 prior to Aug. 29th, as compared with 35 in a like portion of 1888. But comparison of aggregate liabilities shows an increase of far more than 32 per cent, the proportion of increase in number. The liabilities of failing woolen-manufacturing institutions this year amount to $6,920,000, as compared with $2,180,000 last year, and the total assets to $5,173,000, against $1,355,000 in eight months of 1888.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.

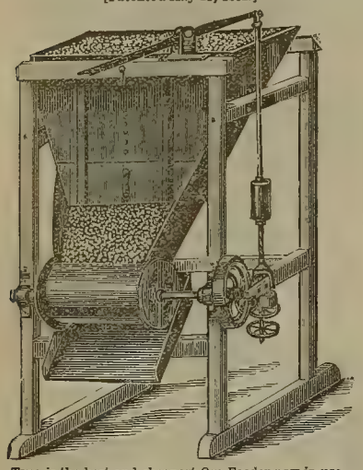
FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS
And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.
OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.
GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco.
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

THIS is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battern as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

AMERICAN MINING AND STOCK CODE
"KELLOGRAPH."

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES

Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, $5. Forwarded postpaid on receipt of price by
DEWEY & CO.,
220 MARKET STREET, SAN FRANCISCO.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap), do us the favor to write again.

Congress.

The Fifty-first Congress assembles next Monday under very favorable circumstances. The country is prosperous, the people content, and there is apparently no important question that is likely to divide the members on party lines. It is pleasing to note that all over the country there seems to be a decay of the violence of party strife, that strict party ties are growing weaker, and that the recent State elections have not, in the main, been characterized by those gusts of ugly temper and bickering that has so often turned conventions into bear gardens, and halls of legislation into an arena of political gladiators. The two great political parties are so nearly balanced in power, especially in the House, that no one can afford to put on arrogant airs. In view of this political situation we may reasonably expect that this Congress will be marked as particularly a business Congress.

The first business on the docket after the organization of the House will be the contested election cases, and as there are 18 of these cases, covering about 20,000 pages of printed testimony, all of which must be read, studied and debated, there is certainly no prospect of any important legislation till after the holiday season. With but one exception, all these cases come from the South, and the most interesting one is that of John A. Buchanan, elected from the Ninth Virginia district, who is charged with having secured his election by promising to protect the moonshine whisky people of the mountains in their illicit business.

The steamship subsidy question promises to claim immediate attention. The Pan-American Congress now in session, and the unusual number of memorials coming up from the various Boards of Trade throughout the country, invests this question with a gravity and importance that demands some kind of legislative deliverance. If we can trust the hints and prophecies that come from Washington and other political centers, the dominant party will offer in the House, on the subject of tariff and taxation, the Senate bill rejected by the last Congress, which makes some important reductions in the internal revenue taxes. It is believed that the duty will be taken from sugar, tobacco and alcohol, so far as used in the arts, mechanics and for medicinal purposes, while the imports on woolen goods, finer cottons and hardware, will be increased. The members from the tobacco-growing States are all in favor of removing the tax from that product, and believe that it will be done. Any tariff that passes the House will undoubtedly become a law, as the majority of the Senate are tariff men. Still, tariff legislation is not likely to create any sharply defined party issues, as high tariff and low tariff men are now found on both sides of the House.

The supporters of the bill for the free coinage of silver are preparing to fight hard for it, and are very sanguine of success. The National Silver Convention now in session in the city of St. Louis, composed of delegates largely from the silver-producing States and Territories, have already foreshadowed their action in passing a caucus resolution demanding that Congress pass an Act fixing a day, not later than Jan. 1, 1891, when the Mints of the United States shall be thrown open to free coinage of silver dollars, possessing the present standard of weight and fineness, and pending that time the Secretary of the Treasury be instructed to purchase and coin $4,000.000 per month under existing laws. The National Grange, recently in session at Sacramento, passed a resolution in favor of free coinage of silver, declaring that the depreciation in the market value of that metal had caused a corresponding decline in the leading farm products. Such influential indorsement is certain to cause Congress to give the matter serious consideration.

Another measure in which the great West is specially interested is the irrigation of arid lands. It is known that several bills have been formulated and will be introduced providing for the building of reservoirs and canals with Government money, or to grant tracts for irrigation to private parties on certain conditions. There is no use, however, in disguising the fact that there is a very formidable number of the present Congress who are known to be opposed to the use of Government money for any such purpose until Major Powell and the Geological Survey have finished the examination and mapping of the dry belts of the country. They say it is hardly possible to decide what to do and estimate the cost until the survey is completed.

The necessity of a new bankrupt law will be pressed upon the attention of Congress by a committee appointed for this special purpose by the National Convention that recently assembled at Minneapolis, Minn. While there is a very strong sentiment in favor of this sort of legislation, it would be hazardous to venture a prediction. It is believed that the international copyright bill will be passed, though there is a strong opposition to it. The bill proposing to put the control of Congressional elections into the hands of the Federal Government will meet with stubborn opposition, and its fate is by no means sure. As to pensions, the policy seems to be more liberal than ever before. Pensions for disabled soldiers has ever been one of the humane benefactions of the Government, but in its effusive charity it is now proposed to pension every one who has seen service in the army, whether well or disabled, rich or poor.

The recent investigation of the secrets of the Endowment House at Salt Lake City will no doubt call renewed attention to the treasonable attitude of polygamous Mormonism. It is in evidence that treason has been deliberately preached, and the National flag dragged in the dirt. This malignant cancer still festers and spreads openly and unblushingly in Idaho, Montana, Wyoming, Arizona and New Mexico, in spite of courts and prior legislation, and the moral consciousness of the nation demands a stern repression of the evil.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING NOV. 19, 1889.

415,497.—PUMP—F. Cavallero, San Jose, Cal.

415,411.—CONCRETE-MIXING WAGON — Geo. F. Gray, S. F.

415,454.—CONCENTRATOR—James Gray, Camptonville, Cal.

415,551.—CABLE CURVE—S. D. Northcutt, Los Angeles, Cal.

415,301.—WASHING-MACHINE—D. H. Sherwood, Salem, Ogn.

415,302.—STEAM BOILER — John P. Simmons, Los Angeles, Cal.

415,303.—STEAM BOILER — John P. Simmons, Los Angeles, Cal.

415,353.—DIVIDED CAR AXLE—O. Vanorman, Los Angeles, Cal.

415,486. — ANIMAL TRAP — J. F. Warnick, Eugene, Ogn.

415,479 —COLORED FIRE — J. G. Stuttz, San Diego, Cal.

17,198.—TRADE MARK—Creasinger & Co., Los Angeles, Cal.

17,201.—TRADE MARK—J. P. M. Perham, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONCRETE MIXING AND DELIVERING WAGON. Geo. F. Gray, S. F. No. 415,411. Dated Nov. 19, 1889. This invention consists in a novel wagon, the object of which is to enable the concrete to be mixed at the place where the laying of it is proceeding, and immediately delivered and spread upon said work.

PUMP.—Francesco Cavallaro, San Jose, assignor of one-half to Frank Stock and A. S. Mackenzie of same place. No. 415,497. Dated Nov. 19, 1889. This invention relates to an improved construction for a force-pump for spraying trees, but which may be used equally well in any place where a force-pump may be needed. It consists in the novel construction of the pump cylinder and plunger.

ORE CONCENTRATOR.—James Gray, Camptonville, Yuba Co. No. 415,454. Dated Nov. 19, 1889. This is one of that class of concentrators in which an endless belt is extended over drums at different levels, so as to travel slowly on an inclined plane and receive the material which is to be concentrated and separated. By the peculiar construction the upper end of the table will have the most vibration, the vibration decreasing until at a point about a pivot there is comparatively little or no motion. Then from that point to the lower end of the belt the motion again increases, and in an opposite direction from the motion of the upper part of the belt. The opposite movements of the belt surface will break up the bars or deposits which have a tendency to form if a single side motion is given to the concentrator, these bars forming in a peculiar way across the surface of the traveling belt and interfering with the proper separation of the sulphurets or heavier valuable material from the sand.

The National Silver Convention.

The National Silver Convention convened in St. Louis on last Tuesday. The following States and Territories sent delegates: Arkansas, Arizona, Alabama, Colorado, California, Florida, Idaho, Indiana, Illinois, Kansas, Kentucky, Montana, Missouri, Nevada, North Carolina, Nebraska, New Mexico, New York, Ohio, Oregon, Pennsylvania, Tennessee, Texas, Utah, Virginia and Wyoming.

The Committee on Permanent Organization reported the following permanent officers: Chairman, A. J. Warner of Ohio; vice-chairman, J. M. McMichael, Colorado; secretary, Albert Singer, Missouri; assistant secretaries, F. L. Dana, Colorado; T. J. Palmer, Kansas; J. A. Greer, Pennsylvania.

Chairman Warner, upon being introduced to the convention by Senator Stewart, said that no subject interested the world more than the silver question. Since Germany, in 1872, followed by other European powers and partly by the United States, by demonetization limited silver as money, the question had been a vital issue, and in discussion the bimetallists had won the victory. The attempt to change the money standard from gold and silver to gold alone was worse than a mistake. It was almost a crime. The demonetization of silver had made the gold standard different than before that Act. The demonetization of silver was, in fact, a great crime, and its revocation was now the important question of the world. People had suffered more from bad monetary legislation than from any other cause. The first duty was the stability of finances. What was asked was the restoration of the money standard which existed for ages, and that silver be placed on equality with gold at the ratio which has existed. It was the duty of the country to restore what should never have been disturbed, and this convention had assembled here to decide upon the best methods to be pursued in reaching the desired end.

The Committee on Resolutions is considered a very strong one and is as follows: Arkansas, B. D. Williams; Arizona, John C. Loss; Alabama, A. Irwin; Colorado, T. B. Buchanan; California, Hon. F. M. Pixley; Idaho, William Hindman; Indiana, Peter P. Kennedy; Illinois, Hon. G. E. Waite; Kansas, A. H. McLennan; Kentucky, Henry Watterson; Montana, W. G. Galligher; Missouri, R. P. Bland; Nebraska, William Wallace; New Mexico, J. A. Manzanaris; New York, Thomas Jordan; Nevada, Francis G. Newlands; Pennsylvania, W. J. Chayney; Texas, Charles Longuemare; Utah, C. C. Goodwin; District of Columbia, I. C. Michaels; Michigan, Hon. Ben Colvin; Wyoming, W. M. Grant; Tennessee, A. J. Keller; Virginia, John W. Porter.

A resolution was passed providing for the appointment of a National Executive Committee, to consist of one member from each State, the committee to visit Washington during the session of Congress.

Press telegrams report that the convention is a great success; even the unit standard people admit this. They express surprise at the representation from other than mineral-producing States, and at the character of the men who have come to participate in the deliberations of the convention.

It is understood that the delegates are divided on the Mexican lead question, but it is thought that a majority will favor the ignoring of that question entirely and confining the convention to the silver question. There are men who are supposed to represent President Harrison, who say that the message to Congress next Monday or Tuesday will recommend the coinage of $4,000,000 per month. The Administration, it is said, will go thus far to keep on the right side of the silver States.

Fire at the Anaconda.

On Saturday last a fire was discovered on the 500-foot level of the St Lawrence mine, one of the principal mines of the Anaconda company, Montana. Fortunately there were few men in the mine or in the Anaconda, which mine adjoins and is connected with the St. Lawrence on every level, the fire having broken out during the interval between the night and day shifts. All of these reached the surface in safety.

The draft created by the fire caused the air to suck down through the St. Lawrence shaft, through the levels to the Anaconda, and carried the smoke up the Anaconda shaft. Thus the workings of the St. Lawrence were cleared of smoke, while all of the connecting levels and shafts were filled and the fire doubtless spread into the Anaconda timbers. A solid column of dense smoke issued from the mouth of the shaft.

It was known that quantities of powder were stored in some of the lower levels, the igniting of which meant certain destruction to the great underground workings. At this juncture four men came forward and volunteered to go down and try and get out the powder, and they were at once lowered into the shaft. These were Henry Page, Jerry Sullivan, Pat Murphy and Tim Keleher, and they are entombed and undoubtedly dead, as a party of six soon followed the four unfortunate men into the depths to rescue them, but were forced to abandon their perilous undertaking and return to the surface. The great mine remains hermetically sealed. There is no doubt that fire is still raging among the timbers below. After all the drifts and levels connecting the Anaconda with the St. Lawrence had been thoroughly bulkheaded, the mouth of the Anaconda shaft was treated likewise.

THE White Pine *News*, although making favorable mention of matters at Robinson District, does not record any such excitement, or cause for one, as has been lately published in other papers further away from the mines.

PHELPS, DODGE & Co. of New York have purchased the Senator gold mine, near Prescott, Arizona. The price is supposed to be about $40,000.

LAST week the ore shipments from the Comstock mines to the mills were 5407 tons, yielding bullion valued at about $119,000.

THE statue to the late A. J. Stevens, master mechanic of the Southern Pacific Co., was unveiled at Sacramento on Thursday.

The Academy of Sciences Building.

What is destined to be one of the grandest and most substantial structures in San Francisco is now in course of construction. We refer to the new building of the California Academy of Sciences on Market street, now being built under the provisions of the Lick bequest. Through the courtesy of Capt. Jas. W. Duncan, superintendent of construction, a representative of the MINING AND SCIENTIFIC PRESS was recently permitted to examine the work so far as it had progressed. Though the frontage of the building is elaborate, massive and beautiful, and will be an ornament to the city's great thoroughfare, the observer can, from a mere outside view, form not the slightest conception of the dimensions, scope, strength and beauty of the entire building as it will be when complete. It is being constructed of solid and massive masonry, and no expense is being spared in putting in the very best materials and employing the best procurable talent in architecture and labor in building. To attempt a description of the building in its present stage would occupy more space than we have at our command in this issue, but suffice it to say that from a general observation of the structure as it stands to-day, the merest novice in architecture will realize that the building when complete will not only be unique, but a grand type of architectural and building skill, and that it must have been master minds and master hands that designed and executed the work.

The architects are Messrs. Percy and Hamilton, two of the most talented and competent men in their profession in this city. A deal of praise is also due to the Board of Directors of the Academy, consisting of Col. C. F. Crocker, president; Mr. S. W. Holladay, vice-president; Hon. Geo. C. Perkins and Messrs. Daniel E. Hayes, John Taylor, Irving M. Scott and E. J. Molera, for the close attention they have paid to details, their care and judgment in letting the various contracts, and their determination to have everything in the shape of material and labor of the very best that could be procured.

One feature of the building with which the writer was forcibly impressed is the floors. These, instead of resting on beams, are constructed of concrete, held in place by twisted iron rods of various sizes, timber being entirely dispensed with. These rods hold the floors by tensile strength, and such is the tensility exerted, that in tests made as the work progresses, the floors have resisted an actual pressure of 500 pounds to the square foot without the slightest sign of straining or giving. The advantages of this method of construction are that, not only are the floors the very acme of strength in building, but the floors and ceilings are unquestionably and positively fire-proof, which is saying a great deal when it is considered that so many so-called fire-proof buildings prove anything but fire-proof when they meet the test of fire.

The cement, which forms the most important ingredient of the concrete, is the celebrated Dyckerhoff Portland cement, the very best article procurable anywhere. It is imported from Amoenburg, Germany, where there are immense works devoted to its manufacture. It is compounded on strictly scientific principles, and is a triumph in chemistry in its line; it is notorious that the chemists of Germany are the greatest and most scientific in the world. Superintendent Duncan, who has had wide experience in the construction of buildings and various other structures in which concrete or cement is used, gives it as his opinion that the Dyckerdoff is, on account of its complete uniformity and thorough reliability, not only the most desirable, but the cheapest cement that comes to this market. In this view he is indorsed by George Goodman, the well-known contractor and operator in artificial stone and concrete, who laid the foundations of the building in concrete made with this cement, by Messrs. Ransome & Cushing, the contractors for the concrete work, and by Mr. John McCarty, contractor for the brick work. Messrs. Percy & Hamilton concur in this view, and are more than satisfied with the cement as shown in the work, and many of the leading architects of the city unite in pronouncing it a superior article.

In selecting materials for a work of such importance as the Academy building, it is not cheapness that is sought, but superiority, and builders concede that this German cement fills the bill in this regard. This being the case, it is to be hoped that the Dyckerhoff cement will come into general use in this city in all work where cement or concrete is necessary. The time may come when we may make Portland cement in this State, but until it does we must bring it from abroad; and as the money *must* go out of the country, it makes but little difference whether it goes to Germany or to England, except that if Germany produces a superior article, which this is said to be, we want it in preference; and, besides, Germans are among our best and most enterprising citizens and assimilate to our institutions more readily than the people of other nations. Of course there is no sentiment in business, but all things being equal, one would be apt to give the preference to the people most in accord with his country, and especially would this be the case in regard to an acknowledged superior article. To Mr. Chas. Duisenberg, the well-known commission merchant and ex-German Consul in this city, belongs the credit of introducing this valuable building material, and it is gratifying to him and his principals that the merits of the compound have met such excellent recognition in this city.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 27, 1889.

Trade is reported to be fairly active for the season of the year. The generally expressed opinion is that the recent storms have laid the foundation for a very prosperous year. The local money market is reported easy, with all legitimate requirements readily met at bank. The import of over $1,100,000 in sovereigns from Australia for exchange purposes and continued free remittances from the interior, and also neighboring States and Territories, all tend to make an easy-growing money market, and ought, in the natural course of events, to stimulate speculation. The low prices ruling for cereals and hops are a bad feature, but this is largely offset by good prices for other farm products and increasing activity in the mining districts due to a large supply of water. The British steamer Oceanic, hence Nov. 21st, for China, etc., carried the following shipments of treasure :

TO HONGKONG.

Chinese, Mexican dollars	$157,447 00
Chinese gold coin	21,224 00
Chinese gold-dust	40 00
Anglo-Californian Bank, Mexican dollars	160,000 00
Hongkong & Shanghai Bank, Mexican dollars	400,000 00
Total	$738,711 00

TO JAPAN.

Hongkong & Shanghai Bank (bullion)	277,000 00

TO CALCUTTA.

Anglo-Californian Bank (bullion)	117,000 00
Grand total	$1,132,711 00

MEXICAN DOLLARS—The market has ruled strong throughout the week at from 77½ to 77¾ cts., with, toward the close, 77¾ to 78 cts. obtainable. The market is fairly actives.

SILVER—The market made another advance during the past week, reaching in London 44⅜d, the highest figure for three years past. *Money*, a leading speculative-financial paper of London, England, confirms the position of the PRESS by stating that the enlarged demand for silver coin is due to increased prosperity, all labor finding employment at higher wages, and wage-earners preferring silver coin to gold owing to their small expenditures. This desire of the laboring classes has undoubtedly stimulated the bullion purchases of the Exchequer, who also finds in it a basis for the paying out of silver coin in other directions, so as to keep gold locked up as much as possible. He also foresees that England's increased wants for raw material, together with the larger requirements from Brazil and the Argentine Republic, will cause gold to be more largely exported in the near future, and without a substitute, to a reasonable extent, a monetary panic would be invited. Evidently Germany and France also entertain the same views. The agitation of the silver question in this country, and growing feeling in favor of bimetallism, has precipitated the issue and brought it more prominently and favorably to the front in the European countries. In our market at the close it is quotable strong at 97⅛@97¾ cts. per ounce fine.

London'cablesec reived to-day, Wednesday, quote silver at 44 3-16. Our market is quotable at 97⅜ to 97½ cents, with sellers reported asking more.

BORAX—Receipts the present week aggregate 200 ctls., and exports by sea 90 lbs. to Victoria and 19,950 lbs. to New York. The market is reported strong at full quotations and under an active shipping movement.

On yesterday (Tuesday) there was shipped via Victoria 19,651 pounds of borax to Chicago.

QUICKSILVER—Receipts the past week aggregate 139 flasks. There is a continued good home demand at steady prices.

The exports of quicksilver by sea the past week aggregate 453 flasks to Guaymas.

ANTIMONY—The market is reported very strong in sympathy with the East, where the market is reported quite bare.

LIME—Receipts the past week were quite light, aggregating only 2439 bbls. The demand is more of an offish character than noted for some time.

LEAD—The market is reported steady. The Lead Trust at the East is reported to be stronger than ever. It is generally claimed that Congress will take action on the Mexican ore question.

TIN—Exports the past week aggregate 17,400 lbs. tinplate to Guaymas. The market is very dull for spot, while consignments to arrive are provided for. The general feeling is that when the demand sets in, higher prices will rule. Foreign advices report a shade easier feeling.

COPPER—The market shows continued strength. Late foreign advices report the markets very active under large buying—larger than at any time since the collapse of the French Syndicate. As stocks whose prices are based on that of copper are higher, their tending up gives the impression that a concert of action is under way to manipulate for still better prices, provided the output of the mines is not increased so large as to interfere with it.

IRON—Still the markets abroad and at the East are advancing, and this, too, in the face of a large output. English advices report additional orders for iron vessels and heavy orders for all kinds of iron. The impression is that the market is being cornered. The English ironstone furnaces that have been idle for years are to go into blast soon. At the East, supplies are well sold into next year. In our market, values are very strong, with the demand confined as much as possible. It looks as if higher prices will obtain after the turn of the year.

The following are the latest comparative quotations f. o. b. at Glasgow:

F. o. b. Glasgow.	Nov. 20, '89.	Nov. 13, '89.
No. 1 Coltness	77s	77s 6
" Langloan	77s	77s 6
" Summerlee	77s	77s 6
" Gartsherrie	77s 6d	77s 6
At Ardrossa.		
No. 1 Eglinton	65s 6d	65s 6
" Glengarnock	77s	76s
" Dalmellington	68s	66s

COAL—Imports the past week aggregate as follows: From Newcastle, N. S. W., 5028 tons; Nanaimo, 1374; Sydney, 5385; Seattle, 2494; Coos Bay, 750; Departure Bay, 3400; Comox, 4000; total, 22,431 tons. Free imports of coast and continued mild weather cause household coals to be easier, although no reduction in quotations is reported. Owing to the large addition to our population, the consumption shows a decided increase in all kinds of coal, so that importers and agents are not disposed to press sales for fear that the weather may set in colder and under stronger buying stocks be depleted. Australian for shipment, after the turn of the year, is reported very strong, with some naming $8 to $8.25, according to grade.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Nov. 27, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	44	95¾	$13 00	$3 80	$21 35
Friday	44⅛	96	13 00	3 80	21 40
Saturday	44⅛	96¼	13 00	3 80	21 45
Monday	44⅛	96⅜	13 25	3 82½	21 60
Tuesday	44⅜	96⅜	13 25	3 82½	21 35
Wednesday	44⅜	96⅜	13 25	3 82½	21 30

NEW YORK, Nov. 26.—Borax continues to rule firm under a good demand. Quicksilver is steady. Tin shows an easier feeling, yet the undertone appears to be firm. Iron is in continued active demand, with prices well maintained. Copper still meets with a strong consumption and speculative demand.

Mining Share Market.

The mining share market the past week has again proven the correctness of inside points of lower prices. The points now out are for higher range of values, but whether on a showing of ore in one or more of the Comstock mines, on a short interest or on a bull movement maintained by twenty-dollar pieces, remains to be seen. There is no doubt but the better-informed operators have no confidence in the stability of the market and look for still lower prices in the near future. This opinion, no doubt, is based on well-grounded fears of assessments to be levied by several of the companies and more extensive deadwork. It is claimed that Con Virginia will pay a 50-cent dividend in next month, and with proper management Hale & Norcross might be able to declare a dividend in the near future, but whether the Savage Co. will remains to be seen. The president of the company has been buying property, or at least, so shows the official records of real estate transactions. By the way, the same gentleman informed the writer that he does not know what the milling charges are on the ore milled for the mines, of which he is president; as did A. K. P. Harmon express ignorance of the milling charges on the ore being milled by the Chollar Mining Co., of which company he is president. With such profound ignorance on the part of the presidents, how can stockholders expect to have their rights looked after? The mill and transportation charges on Con Virginia ore are $7 a ton and that on Challenge $5 for milling and $1 for transportation—a reduction on the latter of $1.25 a ton since July 1st of this year. It is claimed that the latter reduction by the Union Mill & Mining Co. is uniform. There is a feeling in certain well-informed quarters that the milling charges should be regulated according to the grade of ore, low-grade ore costing more to crush than does high-grade. Outside stocks, in sympathy with the Comstocks, have been dull and heavy, with a shading in values. It looks as if the manipulators of the Quijotoas, Tuscaroras and Bodies are waiting for a move in the Comstocks so as to advance their stocks. The Tuscarora mines have stopped shipping bullion by telegraph, while the Bodies have none to ship, either by telegraph, mail or express.

The manipulators of the Comstock share markets have succeeded most admirably in keeping reliable news of the work in the mines from the public, so all that can now be had is what they deign to give through official sources, which are like bones with very little meat. The better-informed and most experienced operators look with confidence upon the situation, and expect in the near future confirmed reports of an ore development in some of the more promising mines. As each group of mines has its friends, it is difficult for an outsider to form a correct idea when the ore strike will be made; but experience has taught the writer that it invariably comes in the mine whose stock is the best concentrated. There is no question but work of the most important character is being vigorously pushed in each group of mines. The ore output from the bullion-producing mines is being increased, while other mines will at an early day be added to the list. From the outside mines the news is of interest from the Quijotoas and Tuscaroras, but from the Bodies the old stale official reports of driving ahead come to hand. The controllers of these peculiarly managed mines should change the character of the official reports if they wish the public to pay assessments.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

PACIFIC COAST IMPROVEMENT CO., Nov. 25. Object, to manufacture, buy and sell sewer-pipe. Capital stock, $100,000. Directors: I. K. Luttrell, J. J. Loriness, H. Hoyt, E. P. Fish, A. J. Meany, A. A. Hoyt and J. M. Day.

SAN LEANDRO GAS AND ELECTRIC LIGHT CO., Nov. 25. Capital stock, $100,000. Directors: William J. Landers, R. C. Hawes, James A. Goodwin, F. B. Reynolds and S. A. Brooks.

PACIFIC OXYGEN AND SANITARY ASSOCIATION, Nov. 26th. Object, to manufacture chemicals, drugs and apparatus. Capital stock, $10,000. Directors, C. C. Vanderbeck, G. T. Mason, D. B. Green, F. H. Merzback, and Eugene W. Levy.

An Arkansas Wagon-Brake.

"E," writing to the Stockton *Independent* from Hot Springs, describes an Arkansas invention that he has noticed, as follows:

It is a new style wagon-brake. It does not require a skilled mechanic to manufacture it and there is no patent applied for. To make one, cut down a sapling five or six inches thick, cut it of the right length for a brake-bar; swing it under the wagon-bed close to the hind wheels, an old rope or strip of rawhide can be used for the purpose; now bore an auger hole in the starboard end of the brake-bar, between the wagon bed and wheel; this hole must slant backward at an angle of 45°; use a small sapling four or five feet long for a handle, whittled to fit the slanting auger hole; then attach a small rusty chain to the center of the hind axle and make the other end fast to the center of the brake-bar. The driver then ties a baling-rope to the upper end of the handle and takes the other end in his hand. When he wants to put on the brake he pulls the rope, and as the upper end of the handle goes forward the brake-bar rolls and shortens the chain attached to the axle; this movement brings the brake-bar in contact with the hind wheels. It works well. The entire cost of this brake, labor included, is 35 cents.

The Democratic party of Arkansas do not claim that the high tariff affects the price of this brake in the least.

Wonderful Tree Growths.

EDITORS PRESS:—Forestry Bulletin, No. 6, sent out by Forester Lyon, is a very valuable and useful document for tree-planters. It shows the relation of the growth of trees to the soil on which they are planted. Hitherto, climate or soil-humidity has been about all that has been considered in tree-planting in California. It will be seen by this bulletin that the constituents of the soil are an exceedingly important factor in tree growth. Some trees do fairly well on any of the soils tried, but others show marked affinities for some soils and do nothing or actually die on others, with the general conditions in both cases similar. The Forestry Experimental Stations under the conduct of so intelligent an observer as Forester Lyon will do more than anything that has ever been done to encourage tree-planting. By the system now commenced at Santa Monica, and soon, let us hope, to be extended to the other stations, a tree-planter can obtain exact information as to the best trees for any climate in the State.

Since Bulletin 6 was issued I have had some measurements of the trees reported on made, and also measurements of one or two others. The measurements of the Forestry Station trees were made on Oct. 14th, or nine months from the planting of the little seedlings.

	Hight, ft.
1 Eucalyptus polyanthema (Var.)	19½
1 " " "	16
2 " " "	16
2 " " "	15
1 " viminalis "	19

These trees are all on the side of a hill in the Santa Monica canyon, and have had no cultivation or care; per contra, there is a living stream ten to twenty feet below them, and a considerable distance to one side, which may have helped them. The record, however, is extraordinary under any circumstances. The tallest tree has grown two and seventeen-hundredths feet per month during the time observed. The E. globulus or blue gum on the same hillside has done nothing to compare to these growths.

We must surmise that there is something especially favorable in the canyon conditions to the growth of the Polyanthema and Viminalis. A number of other varieties in this location have exceeded in growth the blue gum, but not to so phenomenal an extent. Among these is that very attractive eucalyptus of which we are not yet certain of the name. We had it at first as the E. gomphocephala (Tooart gum), then Australian seed from Baron Von Muller sent us as E. Cornuta (Yate) came up looking exactly like the former tree, and lately we have had some seed sent as E. diversicolor (Karri), which appears similar. All of these trees are splendid and useful, so it does not matter much which it turns out to be. The Karri is one of the giants of the world of the forest, and attains a hight of 400 feet. The Yate and Tooart are both large and valuable timber trees. There is this observation to be made, however, in regard to these trees, and that is that should they turn out to be E. gomphocephala, it would not be wise to plant them largely far from the coast until more experiments have been tried. This tree has not been found in Australia anywhere except on the western coast seashore, and may not be suited to inland conditions.

These trees, whatever they are, hold a pleasant green color not common to the Eucalypti, and are umbrageous. It may be interesting and useful to compare the growth of some trees on a high, dry bluff some 200 feet above the sea, also growing without care with those in the canyon.

	Hight.
1 E. Viminalis (mauna gum) planted July 10, 1888	20 ft.
1 E. Viminalis (mauna gum) planted July 10, 1888	19 ft.
1 E. polyanthema (Red box) planted Dec. 15, 1888	12 ft. 10 in.
2 E. polyanthema (Red box) planted Dec. 15, 1888	11 ft, 8 in.

The conditions at Santa Monica are too good to be depended on by the general tree-planter. But it is, on the other hand, probably the finest nursery or propagating station in the world, and it seems no exaggeration to expect that this station is capable of being made the finest and most complete arboretum in the world.

Already it has been found that trees and plants which will not thrive, nor even live in some cases no farther off than Los Angeles, do splendidly here. Prof. C. S. Sargent, the eminent botanist of the East, editor of *Garden and Forest*, and chief of the celebrated Arnold Arboretum, writes me with prophecies of the great results the Santa Monica station should achieve. The tree-planting season is approaching, and the indications are for a larger planting than we have ever had.

ABBOT KINNEY.

Santa Monica, Nov. 16 1889.

THE office of the United States Geological Survey in this city will be abandoned at an early date and its business transferred to Washington. Major Powell, who had charge of the local office, will resume his survey of arid lands.

FRANK PIXLEY has started a new industry at the town named for him in Tulare county. He has imported some diamond-back terrapin from Washington, which he intends to breed in a swamp on his property.

Assessment Notices.

Booth Gold Mining Company. Location of principal place of business, San Francisco, California. Location of Works, Auburn, Placer Co., Cal.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 23d day of November, 1889, an Assessment, No. 4, of Two(2) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room No. 28, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of January, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. R. SPINNEY, Secretary.

Office, No. 310 Pine Street, Room No. 28, San Francisco, California.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company, Location and principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE.—There are delinquent upon the following described Stock, on account of Assessment (No. 15), levied on the 16th day of October, 1889, the several amounts set opposite the names of the respective Shareholders, as follows:

ATTENTION, MILLWRIGHTS!

A BOOK YOU ALL WANT.

Leffel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.

A STANDARD WORK.

This practical work of 288 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Pains have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.

Price 50 cents, post-paid. For sale by DEWEY & CO. 220 Market St., San Francisco, Cal.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

PRACTICAL

Books on Mining

AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warnford Lock. 788 pages, with 8 plates and 271 engravings in the text. 4to, cloth, $15.00, express prepaid.

IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Ross. This work embodies the information, collected during four and a half years, of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrages, flood protection, methods of regulation, locks, etc., have been treated in detail. 367 pages, large 8vo, with 26 plates and numerous engravings in the text. Price $15.00, express prepaid.

MEXICAN MINES.—Dahlgren's Historic Mines of Mexico, *only a few copies left;* price $25 00. Handbook to the Historic Mines of Mexico, price $1.00.

E. & F. N. SPON, Publishers,

12 Cortlandt St., New York.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Books on Assaying.

BY C. H. AARON.

PART I.—**Gold and Silver Ores.—Price $1.**

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc. Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Xanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F.

"WITTER'S SPRINGS." 16 miles from Lakeport, 20 miles east of Ukiah. Comfortable Hotel. Quiet Cabins. Lovely Scenery. Low Charges. Its waters are a sure cure for Dropsy, Scrofulous and Skin Diseases, Rheumatism, etc. Address H. L. DENIO, Upper Lake.

A New and Splendid Technical Treatise.

The Manufacture of

VINEGAR AND ACETATES,

CIDER, AND FRUIT-WINES;

Preservation of Fruits and Vegetables.

JUST READY.

A Practical Treatise on the Manufacture of Vinegar and Acetates, Cider and Fruit-Wines; Preservation of Fruits and Vegetables by Canning and Evaporation; Preparation of Fruit Butters, Jellies, Marmalades, Catchups, Pickles, Mustards, etc. Edited from various sources by Wm. T. Brannt, one of the editors of "The Techno-Chemical Receipt Book." Illustrated by 79 engravings. In one volume, 8vo, 479 pages.

Price $5.00, by mail, free of postage, to any address in the World.

CONTENTS.—PART I. The Manufacture of Vinegar. CHAPTER I. Introduction. II. Theory of the Formation of Vinegar. III. The Vinegar Ferment and its Conditions of Life. IV. Products of Acetous Fermentation. V. Methods of Fabrication of Vinegar. VI. Quick Process of Fabrication of Vinegar. VII. Arrangement of a Vinegar Factory. VIII. Artificial Ventilation of the Vinegar Generators. IX. Automatic Vinegar Apparatus. X. Operations in a Vinegar Factory. XI. Preparation of the Alcoholic Liquid. XII. Execution of the Work in a Vinegar Factory. XIII. Disturbing Influences in the Fabrication of Vinegar. XIV. Method of the Fabrication of Vinegar in Apparatus of Special Construction. XV. Further Treatment of Freshly Prepared Vinegar. XVI. Preparation of Vinegar from Various Materials. XVII. Preparation of Vinegar Specialties. XVIII. Fabrication of Wine Vinegar. XIX. Chemical Examination of the Raw Materials and Control of the Operation in a Vinegar Factory. XX. Examination of Vinegar as to the Presence of Foreign Acids and of Metals, as well as to its Derivation. XXI. Manufacture of Wood Vinegar. XXII. Preparation of Pure Concentrated Acetic Acid. XXIII. Acetates and their Manufacture.

PART II. Manufacture of Ciders, Fruit-Wines, etc. CHAPTER XXIV. Introduction. XXV. Fruits and their Composition. XXVI. Practice of the Preparation of Cider and Fruit-Wines; XXVII. Cider from Apples and Pears. XXVIII. Fruit-Wines; *a*, from Small Fruits; *b*, from Stone Fruits.

PART III. Canning and Evaporating of Fruit, Manufacture of Catchups, Fruit Butters, Marmalades, Jellies, Pickles, and Mustards. CHAPTER XXIX. Preservation of Fruit. XXX. Evaporation of Fruit. XXXI. Preparation of Pickles and Mustards. Appendix of XVI Tables. Index.

☞ *An illustrated circular, 6 pages, 4to, giving the full Table of Contents of this volume, will be sent free of postage to any one in any part of the world who will apply by letter.*

☞ *Our new and Revised Descriptive Catalogue of Practical and Scientific Books, 36 pages, 8vo. A list of Books on Distillation and Rectification of Liquors, Brewing and Fermentation, Wines, Sugar, Starch, etc., as well as a circular showing the full Table of Contents of "The Techno-Chemical Receipt Book," sent free of postage to any one in any part of the world who will furnish his address.*

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

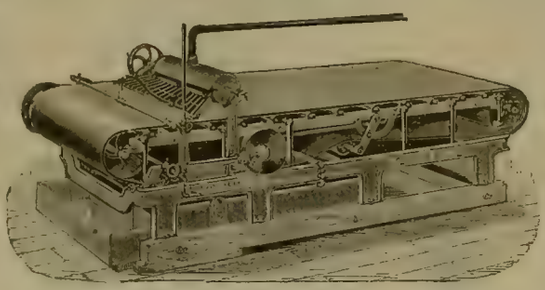
Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.



"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

BUILDERS OF

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.
We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

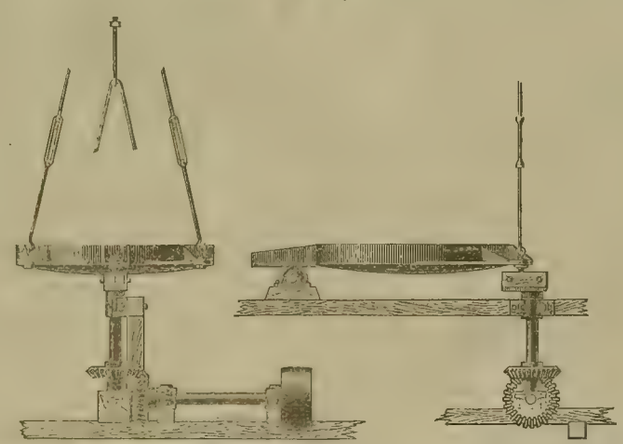
Blast-Furnace Lines.

Last summer we gave in articles in the PRESS the lines of various blast-furnaces, from a paper read before the American Institute of Mining Engineers by Edward Wash Jr. of St. Louis. He considers the main requirements of a blast-furnace to be: First, that it should be a good generator of carbonic oxide gas; secondly, that the gas thus produced should be used as effectively as possible on the materials to be treated. In his former paper he attempted to show that "by placing the bosh or widest diameter of the furnace entirely and safely within the zone of complete fusion," "a constant supply of fuel before the tuyeres would be secured." Under this condition (with the aid of a reliable blowing-engine) the furnace becomes, within the fusion-zone, an excellent gas-producer, thereby, as it would seem, entirely meeting the first requirement.

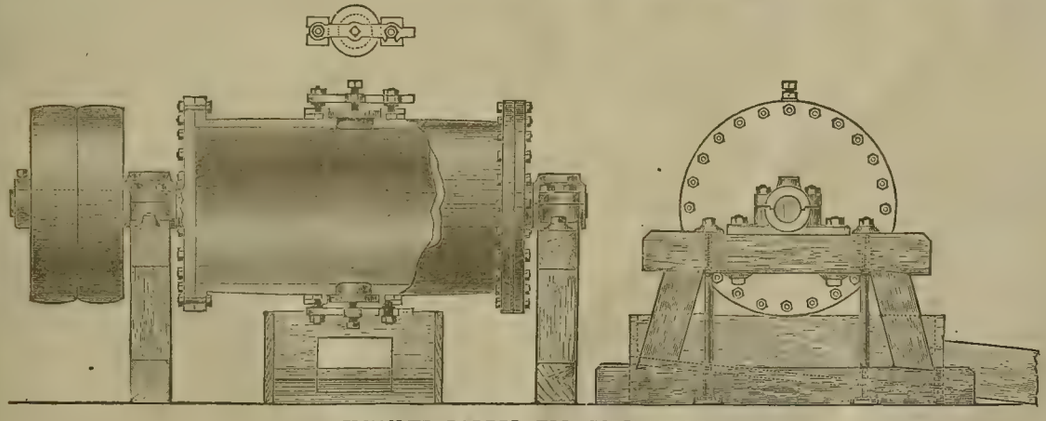


The statement of his original paper, "Hence we may conclude that the more narrow, within practical limits, the furnace shaft is constructed, the more thorough and the more energetic the actions of reduction and carbon impregnation will be," etc., was deliberately made. He has failed to observe anything since to make him alter the practical conclusion there reached.

To show that the views are correct, he now submits outlines of a few furnaces with comparative data of their work. The Union, No. 2 (Fig. 6), and the Triebach, No. 3 (Fig. 8)—which require less coke and charcoal respectively per ton than any furnaces that have come under observation—do not owe their low fuel consumption to large cubical capacity, to the employment of high temperature of blast, or to the great length of time the materials are allowed to remain in the furnaces.

No. 1 of the furnaces shown in the cuts is the Newport of Newport, England. It has a capacity of 30,000 cubic feet, a daily product of 70 tons, and uses 2308 pounds of fuel per ton of metal. No. 2, the Edgar Thompson "F," Pittsburg, has 18,000 feet cubic capacity, a daily product of 270 tons; fuel per ton of metal, 1863 pounds. No. 3 is the North Chicago; cubic capacity, 15,000; daily product, 175 4 tons; fuel per ton of metal, 2116 pounds. No. 4 is the North Lonsdale, Lancashire, England; cubic capacity 14,000 feet; daily product, 107 1 tons; fuel per ton of metal, 2130 pounds. No. 5 is the Union of Chicago; cubic capacity, 8824 feet; daily product, 142 tons; fuel per ton of metal, 1943. No. 6 is the Union No. 2, Chicago; cubic capacity, 6676 feet; daily product, 114.3 tons; fuel per ton of metal, 1697 pounds. All of the above are coke furnaces. Of the charcoal furnaces, No. 7 is the Midland, Crawford Co., Mo.; cubic capacity, 2000 feet; daily product, 48 tons; fuel per ton of metal, 1870 pounds. No. 8 is the Triebach of Triebach, Austria; cubic capacity, 1872 feet; daily product, 24 tons; fuel per ton of metal, 1365 pounds. No. 9 is the Ferdinand furnace of Hieflau, Austria; cubic capacity, 1235 feet; daily product, 24 tons; fuel per ton of metal, 1653 pounds. No. 10 is the Wrbna of Eisenerz, Austria; cubic capacity, 1000 feet; daily product, 20 tons; fuel per ton of metal, 1585 pounds.

LINES OF TEN BLAST FURNACES IN THIS COUNTRY AND ABROAD.



BATEA FOR CLEANING UP.

Clean-Up Barrel and Batea.

Illustrations on this page show the clean-up barrel and batea used in gold-mills. In cleaning up the mortars and boxes at the ends of sluices after a run, much valuable amalgam is found mixed with quartz, iron and other foreign matter. These cleanings, upon being placed in the clean-up barrel with additional quicksilver and cast-iron balls, are thoroughly ground and worked, the amalgam being taken up by the quicksilver and separated from the waste matter. The clean-up barrel, as illustrated, is of cast iron, having two openings, giving access to the inside. The journals are cast on the heads, one being extended so as to carry fast and loose pulleys for driving.

The batea is a cast-iron pan, supported at one end on a roller and suspended by rods at the other. An oscillating motion is imparted by means of crank on vertical shaft. In fact, it is a miner's pan on a large scale, and with it the waste matter can be quickly separated from large samples of ore. In mills it is used for saving amalgam often found mixed with quartz, etc., in cleaning up. In this respect it resembles the clean-up barrel, but is capable of closer work. Machines of the types illustrated are made in this city by the Fulton Iron Works.

CLEAN-UP BARREL FOR GOLD MILLS.

INCREASED FACILITIES.—The Judson Iron Works, on the bay shore, which employ 100 men, have decided to greatly enlarge their plant and increase their facilities for manufacturing their products. The works are already very extensive, covering several acres, and the importance to Oakland of the enterprise is considerable. A large addition of men will be made to the working force.

ON the 22d inst. there will be a total eclipse of the sun at 11:13 o'clock in the forenoon. It will not be visible in this country but will be in Mexico, the Caribbean Sea and the west coast of Africa, where vessels have been sent by several governments to take observations.

SOME miners working the Pot Hole claim, 12 miles from Yuma, have succeeded in pumping out the water and getting to bedrock. The gravel now yields from $2 to $5 to the pan.

The Silver Convention.

The Resolutions Adopted at St. Louis.

A great number of resolutions were introduced at the Silver Convention in St. Louis, all of which were reported to the proper committee. Among them the following, offered by Jacks of California, was received with cheers, and was referred under the rule:

WHEREAS, Wall street and Eastern bondholders are now actually at work striving to elect a Speaker for the approaching Congress whose record is entirely opposed to silver interests, whereas the representatives in Congress should be the servants of the people.

Whereas, This great convention shows a public opinion in the Western and Southern States and Territories in favor of more coinage of silver; therefore,

Resolved, That the Western and Southern Representatives in Congress be requested to support some friend of silver for the Speakership of the present House of Representatives, and that their failure to do so will be a betrayal of the people, warranting their political death.

Congressman R. P. Bland of Missouri addressed the convention. In the course of his speech he said: "The free coinage of silver will settle the silver question and greatly relieve the poor. The only question with metallists in our country is whether we should at once repeal our demonetization laws or wait for the convenience of the other powers, including Great Britain. It is a significant fact that you will scarcely find a man in public life to-day who will assume the responsibility of contending for a single gold standard. I am in favor of paddling our own canoe in this as well as all other subjects. If we have enacted bad laws, let us repeal them. Especially should we repeal a law that has been so universally condemned as the demonetization Act of 1873. No matter whether the interested few who engineered this legislation meant well or not, it was practically a fraud upon Congress and the American people."

Senator Stewart's Remarks.

Thomas Jordan of the N. Y. *Mining Record* read a paper on "The Silver Question," and papers were also read by Judge Morris of Richmond and Congressman Symes of Colorado. The latter was followed by Senator Stewart of Nevada. The Senator's address was an off-hand talk and seemed to suit the delegates better than the printed papers to which they had previously listened.

In the course of his remarks, Senator Stewart said: "Many nations have tried lead, iron and copper, but finally all civilized and semi-civilized nations have decided on silver. The use of silver is prehistoric. First we heard of the use of silver as money, while gold was first used as an ornament, and later as money. For 3000 years or more there have been metals out of which money could be manufactured. Now, I say, as long as a dollar can be manufactured out of a given quantity of silver or gold, it makes no difference to the owner what bullion he has. With either he can get a dollar, and with that dollar buy the same amount of labor or property. There is nothing like a scarcity of money. Poverty, inability to pay debts, inability to support a family, will make men cowards. The creation of the great middle classes of England was brought about by the discovery of gold in Mexico and South America. The fall in silver in Europe was the cause of the people having some money and becoming independent. The farmers of our country to-day, in consequence of the machinations of the money kings and gold mono-metallists, are losing the independence of character for which they have been noted. Their mortgages are making them cowards.'

"I will not stop to explain how this silver demonetization fraud was committed. There was no discussion in the Senate—not a word, not a suggestion in the Senate that the dollar was to be omitted. There is nothing in the record of the Senate to show how that dollar got out. The report of the Conference Committee doesn't show it, but we find the fact to be that silver was omitted, and I call upon the people to explain how it occurred.

"There are twenty-five thousand millions of the national debt we know of, and it is estimated that there is at least three times as much other debt, county, municipal, corporation, etc., making a hundred thousand millions in all. Two hundred millions of gold and silver was being manufactured a month. The people had a right to rely on that. Now this scheme has cut off one-half of that supply, and the debtor is bound by that contract."

Senator Stewart closed by urging that there be a plain demand upon Congress to remonetize silver. No dallying, no compromise, but a straight demand. "Meet the creditor," he said, "face to face, for if you must yield him your property, you might as well do it now as in the future."

Senator Jones.

A letter was read from Senator Jones of Nevada, in which he said: "I look upon the movement for the remonetization of silver as one of the most beneficent that can engage the attention of men. In the spirit of hope and aspiration which its success presages, I see a great force for the better and broader growth of our republic upon a basis of prosperity and intelligence at once natural and progressive. With a sufficient volume of money to meet the demands of its increasing population, our country will place itself in the vanguard of the nations for all time to come. No close observer of public sentiment in the United States can for a moment entertain a doubt that the great majority of the people are in favor of the full remonetization of silver. All that it is necessary for them to do in order to give effect to their desire is to make their voices heard by their Representatives in Congress."

The Resolution.

The following resolution, introduced by Mr. Newlands of Nevada, was referred to the Executive Committee, with full power, by a unanimous vote, and will form the basis for Congressional action before the Fifty-first Congress:

WHEREAS, It has been frequently stated, and the statement is apparently authentic, that the Act of Congress of 1873, entitled "An Act revising and amending the laws relative to the mints, assay offices and coinage of the United States," from which the silver dollar as one of the acknowledged coins of the Republic, existing in all previous laws, and for which free and unlimited coinage was provided in such laws, was eliminated and stricken out, and was considered by both houses of Congress without the real purpose of the bill being disclosed or discussed; and that, on the contrary, the debates of Congress show that the bill was discussed and considered upon the assumption that the Act contained and included the silver dollar as one of the existing coins of the United States, as evidenced by the debates of Congress, and by the subsequent declarations of distinguished men who participated in said act of legislation; whereas, it further appears that the said Act was signed by President Grant without the knowledge upon his part that the silver dollar had been stricken out as one of the coins entitled to coinage, which fact is evidenced by a letter written by him eight months after the signing of said bill to his friend Mr. Cowdrey, in which he said: "The panic has brought greenbacks about to a par with silver. I wonder that silver is not already coming into the market to supply the deficiency in the circulating medium. When it does come, and I predict that it will soon, we will have made a rapid stride toward specie payments. I confess to a desire to see a limited hoarding of the money. It insures a firm foundation in time of need, but I want to see the hoarding of something that has a standard value the world over. Silver has this. Our mines are now producing almost unlimited amounts of silver, and it is becoming a question, What shall we do with it? I suggest to put it in circulation now, keep it there until it is fixed, and then we will find other markets;" and, whereas, the effect of such legislation was, without calling the attention of Congress or the people thereto, to prevent the free coinage of silver and thereby to demonetize it as a legal tender for debts, thereby increasing the purchasing-power of gold, increasing the obligation of all debtors, and diminishing the value of all products and property other than money; and, whereas, such legislation, if the facts are correctly stated, constitutes the first instance in the history of legislation in this country in which the real purpose of the Act, fraught with so much injury to the best interests of the people, was withheld from deliberation and discussion; and the first instance which indirect and clandestine legislation affecting the great and important interests have been brought to the attention of the American people; now, therefore,

Resolved, That the Executive Committee be requested to inquire into the facts connected with the adoption and the signing of the said Act, and to make the same known to the people of the United States in such a manner as may be deemed advisable.

Mr. Newlands' Statement.

A motion was made by Francis G. Newlands in connection with this extraordinary statement and important proposition. Mr. Newlands said:

"It is not generally known that no special Act demonetizing silver or preventing its coinage was ever passed. From the early days of the Republic the silver dollar has been one of the standard coins mentioned in all the coinage Acts with other coins as entitled to free coinage and as a legal tender for debts. The Act of 1873 was entitled 'An Act to revise the mint laws and the laws relating to coinage.' The bill was discussed, it appears, in both the House and the Senate, without any reference whatever being made to the fact which was discovered after the Act was passed that the silver dollar was omitted as one of the coins of the country. On the contrary, the assumption throughout the debate was that the silver dollar was in the bill, and the Senate went so far as to pass an amendment providing for the inscription upon the silver dollar, which, when the Act was passed, proved to have no existence.

"The President signed the bill without knowing that the silver dollar was omitted. Eight months afterward he addressed a letter to a friend in which he speaks of silver as an acknowledged coin of the country, and refers to the great service that it would perform owing to the increased profits of the Comstock mines in the resumption of specie payments.

"All the men who participated in the consideration of the Act of 1873, with the one exception, when they have spoken at all on the subject, have publicly repudiated any knowledge that in it silver was demonetized or its coinage stopped. It is for the purpose of gathering all the information on this subject contained in the debates of Congress, the communication of President Grant and the subsequent declaration of prominent members of both houses that this committee was called upon to act, for if the people are convinced that the demonetization of silver was accomplished without debate and without the attention of Congress or the country being called to the fact, or was accomplished by stealth and clandestine legislation, the agitation in favor of restoring the silver dollar to its old place as money will be strengthened. After that is done, and not till then, should the monometallists present their arguments and let the matter go before the people for their verdict."

Mr. Newlands further intimated that the convention was a great success and its action would have an undoubted effect upon the farmers and industrial organizations and producing classes generally of the Mississippi and Ohio valleys, as well as the planters of the South. The great contraction of the currency caused, first, by the retirement of the greenbacks, and then by the demonetization of silver, had been felt through the country, save in some favored locality, in the fall of values; for it is axiomatic that if the volume of money is diminished in a country the values of all other property, and of labor, must also diminish; that the effect of the contraction of the currency is to increase the value of money and of all evidences of debt in the hands of the creditor class; to increase the obligations of the debtor class and to diminish the value of their products and their labor, with which they expect to pay their debts.

A General Committee.

Mr. Fitch amended his resolution so that instead of the convention selecting one delegate from each State and Territory and ten members at large, a general committee of one delegate from each State and Territory should be selected, and this general committee to select a committee of nine whose duty it shall be to call the next silver convention and generally keep alive the interest in the free-coinage movement.

This was agreed to and a Commissioner was named under it with James McCudden of California, W. J. Cheyner of Arizona, Charles F. Muesingbrod of Montana, Thomas Fitch of Nevada, Baldwin of New Mexico, W. F. James of Utah, and M. A. Grant of Wyoming among the Commissioners. Subsequently General M. Warner of Ohio was chosen Chairman.

Mr. Fitch's Speech.

A call was made for a speech by Mr. Fitch of Nevada, and he delivered the most notable one of the session.

"For 20 years we have had abundant prosperity, but at the end of it we find wealth centered in few hands. What has the laborer to show for 20 years of toil? He can boast that the aggregate wealth of the nation is largely increased, of factories established, cities erected, rivers bridged, transcontinental highways reaching from ocean to ocean. He can call the roll of millionaires and thousands will respond, where before the war there were less than 500. He can wipe sweat from his weary face and reflect that among the 8000 millionaires may be enumerated the names of 20 American citizens who have gathered $1,500,000,000 from the toil and tears of 60,000,000 people. He can walk weary and shelterless in the shadow of the palace he has built, but may not enter.

"I seek not to assail the rights of capitalists or arouse against them the prejudices of poverty or unthrift, but for 20 years capital has tampered with the people's money and gathered to itself illicit gains by increasing the burden of industry. The fight for the restoration of silver is a fight of the debtors against the creditors, laborer against capitalist, poor against rich.

"It is idle for monometallists to tell us prices have been reduced because of the increased production in India. This may be the approximate cause, but I say the cause will be found in the silver demonetization alone. England has become to-day the greatest silver consumer in the world, and yet in all her vast empire she produces less than seven per cent of the world's supply, and Germany, the co-conspirator in the work of demonetization, produces less than 3 per cent. England is the bunko-steerer of the world, and Uncle Sam is the gentleman from the rural districts. How much longer will our miners, planters and farmers consent that Senators and Representatives at Washington shall continue to legislate in the interest of Wall street? Is it not time for the American eagle to rise and shake the Liverpool salt from its tail? It may be the sudden remonetization of silver would produce some temporary disturbances in Wall street, but the eastern and western boundaries of this nation are not found between Pearl street and Broadway. We are here to represent the cottages and cabins of this country, and the interest should be protected though the bulls of Wall-street bucket-shops bellow with rage."

After the convention adjourned *sine die* a banquet was given to the delegates, at which many speeches were made.

The Lead Men in Convention.

Lead men who were barred out of the convention under the call held a meeting at the Southern hotel. California, Colorado, Montana, Utah, Idaho, New Mexico and Nevada were represented. James H. Blood of Colorado presided and W. G. Gallagher of Montana was secretary. The following preamble and resolution were unanimously adopted:

WHEREAS, The productions of ore and gold, silver, lead and copper constitutes the leading industries of the States and Territories of the Rocky mountain region and of the Pacific Coast; and, whereas, the results of such production are most important to the whole country; and whereas, in the interest of mine owners, miners, transporters, smelters, material-men and our mining interests generally, it is desirable that a thorough organization of all interest should be had on the principle that "in union there is strength;" therefore,

Resolved, That this convention earnestly recommends that in each of the mining States and Territories an association of all interested in said industries be formed, and that the associations so formed, by delegates duly authorized, form and organize a central association, all to the end that proper and full statistics may be collected for ready use, that ways and means be provided for the use of coming interest, and that our influence in favor of protection to our said industries may be consolidated and made potential.

It was agreed that these organizations should be pushed and a steady fight for lead be made, and an organization which Mr. Blood means to call to life in the near future.

El Dorado Quartz and Gravel Mines.

Had it not been for the settling up of California by agriculturists after the rich placer mines had begun to decline, it would not now be possible to work the remaining low-grade placer and quartz mines at a profit.

The rapid increase in population and agricultural productions stimulated the building of railroads, manufactories and other industries, which gave us cheaper transportation, thus lessening the cost of most of the necessaries of life to a great degree.

All will agree that on the Georgetown divide are immense bodies of auriferous gravel and low-grade quartz which are only waiting for capital and practical management to make them yield millions of gold both to the advantage of the operators and men employed, as well as to the community and county.

In the very fact of increased population, cheaper necessaries of life, and improved machinery and methods, is our abiding confidence that a revival of our mining industry is close at hand.

Already we see the headlights approaching slowly but surely up the divide. As mine after mine is made a success, undeveloped prospects will be opened up, and among them, no doubt, will be found valuable mines.

Visit the Taylor, the Kelley, Lone Jack, Big Sandy and other mines recently taken hold of by practical mine operators, and you will return imbued with renewed energy and confidence. You will see plainly that we have some equally promising prospects for milling propositions all along the line as far up as Volcanoville. These promising claims have been abiding their time for thorough development, just as many of the claims higher up are now doing.

Go visit the deep gravel mines on the Forest Hill divide and witness the grand results. Behold the millions of gold which is being taken from the deep and long-hidden deposits through tunneling and drifting, and the new tunnels being driven to tap gravel that promises even a greater output. Return to the promising deep gravel-beds of your own Volcanoville and vicinity, and more fully comprehend the possibilities in store for you. Like the prospectors on the other side of the river have done, you must also labor under many disadvantages and bide your time. But you have not much longer to wait.—*Georgetown Gazette.*

COMSTOCK MINES.—The Virginia City *Chronicle* gives the total value of the Comstock lode, according to Tuesday's quotations, at $5,945,000. The highest valuation was in January, 1875, when it was rated at nearly $500,000,000, and the lowest in July, 1884, when its valuation was placed at $2,900,000. At the time of the highest valuation there were only four bullion producing mines on the lode—the Con. Virginia, California, Crown Point and Belcher—while at present there are eleven; but the combined bullion product of these is less than one-fourth of that of the four mines mentioned above in 1875. At that date those were the only mines that possessed any actual value, that of the others being merely speculative. Union Consolidated, Mexican and other locations that had scarcely been disturbed by a pick, were quoted at $90, $95 and $120 a share.

THE CRYSTALLIZATION OF IRON. — Mr. Thomas Morris, F. G. S., of the Pearson & Knowles Company's works, Warrington, recently read a paper before the Liverpool Engineering Society on "Some Causes of the Crystallization of Iron." Mr. Morris, whose long experience in iron manufacture entitles his opinions to be received with respect, contends that the well-known brittleness frequently developed in iron is the result of excess of oxygen during the puddling process; overheating in the mill and axle forge furnaces; compression, as in the case of the inside of links of chains, hammering, cold rolled, etc., and not of vibration, which is, by many engineers and others, put down as the cause of crystallization. Mr. Morris' views were vigorously combated, and the discussion, though exceedingly technical, was varied and interesting.

THE WESTINGHOUSE ELECTRIC COMPANY has now an amount of orders on hand which represent a sum far above $1,000,000. They are occupied in constructing the machinery for 32 electric-light plants with a capacity of incandescent lights aggregating 31,150. In addition to that they have to make the machinery for the Allegheny City light plant, and they are also engaged in getting ready the machinery for the 50,000-light plant in London, England, as well as constructing machines which are to be used in the new electric shops now in progress of erection in London, England.

THE Mariposa *News* says: The sun does not rise on Mirror lake, Yosemite valley, until 11:30 o'clock in the morning.

Astronomical Photography.

(Concluded from last issue)

Part II: Stellar Photography.

Under this caption I will speak chiefly of what has been done by the astronomers' camera in the way of securing photographic images of the *stars;* of the wonderful *clusters* of suns, that seem like distant universes; and of the beautiful *nebulæ* which are scattered so richly over certain portions of the heavens.

This has only recently reached a truly successful stage; stellar photography may be considered an achievement of the last ten years, although experimentally it dates back to 1845, when William Cranch Bond (one of the first great American astronomers), at Harvard College Observatory, assisted by a photographer of Boston, named Whipple, took daguerreotypes of "Vega" and "Castor." The latter is a close double star, and even that early photograph showed "an elongation plainly due to the components." The work was very slowly advanced. Mr. Rutherfurd, with improved plates and using his 11½-inch photographic telescope, took photographs of stars down to the 9th magnitude (three "magnitudes" fainter than can be discerned by the unaided eye). In describing his success, the New York astronomer wrote:

"The power to obtain images of the 9th-magnitude stars with so moderate an aperture promises to develop and increase the application of photography to the mapping of the sidereal heavens, and in some manner to realize the hopes which have been so long deferred and disappointed.

"It would not be difficult to arrange a camera-box, capable of exposing a surface sufficient to obtain a map of two degrees square, and with instruments of large aperture we may hope to reach much smaller stars than I have yet taken. There is also every probability that the chemistry of photography will be very much improved, and more sensitive methods devised."

The astro-photographers have frequently recalled these words, and with reason. Mr. Common, in quoting them, remarked that in the light of recent events they seemed almost prophetic.

Stars and Nebulæ.

De La Rue, Huggins and Vogel in the Old World, Bond, Rutherfurd and Draper on this side the Atlantic, by a gradual process of experimental work, succeeded in obtaining photographic images of stars and nebulæ, and even of the spectra of these bodies. Their success increased as the plates improved; and to-day their worthy successors—for many of these honored names have passed into history—can exhibit photographs of the nebulæ which show every detail visible to the eye and bring out beautiful characteristics which the eye alone might never have discovered. In one of the Halls at the Lick Observatory the visitor notices on the wall, near the entrance to the Great Dome, an enlarged photograph several feet in diameter, which in answer to his question, the astronomer who is acting as guide will explain to be a picture of the "Great Nebula in Orion." I have seen many a foot pause on the steps leading to the large telescope, while the observer wondered at the curious photograph; and to those who understand its full meaning, the picture is marvelous indeed. It was obtained by Mr. Common of the Royal Astronomical Society, after a careful exposure of over an hour with his large reflector.

I dare say almost any one of my hearers is familiar with the beautiful constellation "Orion." It is not visible in the evening sky now, but will be before many months. Let me suggest to you, on some clear night (when no moon interferes) to hunt out the place of this nebula. You will easily recognize the "Belt"—depending from which in the legitimate manner are three fainter stars forming the "sword." Of these three stars, the southernmost is fairly bright, and the top one (nearest the "Belt") is rather difficult to see. The middle one appears as a blurred and ill-defined star of about the 5th magnitude. It is lettered *θ* [theta] on the maps and when viewed with the telescope is seen to be a multiple star (there are dozens of stars visible in a good glass) situated in a vast cloud, or "nebula" of self-luminous matter, which must be of such inconceivable extent that the entire diameter of our solar system—fifty-three hundred of million miles—would be a mere indistinguishable point in comparison.

A view of this beautiful nebula in a large telescope is something never to be forgotten; looked at as a picture only, it transcends any other like object in the sky. When we try to think of what it really signifies, the imagination is simply dismayed. Its appearance has been studied for centuries, but all attempts to detect any decided change in the structure of the nebula by comparison of drawings and descriptions have proved illusive. Years of ocular investigation, however, are excelled in fidelity by a single modern photograph, and while none of us may ever hear of the mystery being penetrated, a comparison of Mr. Common's photograph with one taken 40 or 50 years hence will definitely determine whether any changes are taking place, and perhaps reveal the true nature and signification of these most interesting bodies.

Another Remarkable Nebula.

And one which is visible this time of year, may be seen with the naked eye in the constellation "Andromeda," close to the star lettered *υ* [nu]. This has been most successfully photographed by Mr. Isaac Roberts, also of the Royal Astronomical Society, within the past year. With the photographic lens bought for the eclipse expedition, Mr. Barnard of the Lick Observatory has made a magnificent picture of this nebula. He has kindly allowed me a positive to show you this evening on the screen. You have doubtless heard that

Star Maps

Are now to be made by photography. This work was suggested by Rutherfurd in the "prophecy" which I have already quoted; it was first shown to be feasible by Professor David Gill, Her Majesty's Astronomer at the Cape of Good Hope, when he exhibited to the admiring members of the Royal Astronomical Society his photograph of the great Southern comet of 1882, which he obtained by an ordinary portrait lens with long exposure. This was not by any means the first comet photograph which had ever been made. After many previous experiments by others, Mr. Common had finally obtained a negative of "Comet b, 1881," a beautiful comet, still fresh in the memories of many of you, no doubt. And it was not so much the success of Mr. Gill's magnificent comet picture which awakened the astronomical workers to the importance of photographic methods, but the number and sharpness of the *star impressions* recorded on the plate. Throughout the tail, showing through that appendage apparently undimmed and scattered all over the plate with extraordinary distinctness, were hundreds of stars, from the brightest in that particular field of view down to the lesser magnitudes, entirely invisible to the naked eye. To many experienced photographers in the astronomical line, this picture came "as a revelation," as one of the foremost among them remarked. The importance of Dr. Gill's achievement was immediately perceived; it produced a revolution in at least one branch of observatory work, and on this hinges a curious bit of history.

That assiduous observer, Chacornac, many years ago, while Astronomer at the National Observatory at Paris, started in to make a complete set of

"Ecliptic Charts"

For use in discovering minor planets, etc. The Ecliptic, it need hardly be explained, is that path around the heavens in which the sun, moon and planets appear to describe their motions; and even the little planets or asteroids, with the most eccentric orbits, are bound to cross that line at some time during their revolutions. A minute chart of this region was then a great desideratum. A proof of its value is found in the list of discoveries made by Chacornac while executing the work. For a score of years the French Astronomer labored at his self-imposed task, and at his death early in the last decade, had finished but 36 out of the 72 Zodiacal charts projected. The brothers Henry (Paul and Prosper), of the same observatory, two most admirable men and devoted workers, attempted to finish Chacornac's undertaking. They succeeded in completing 10 of the remaining 36, but at this point reached that portion of the Ecliptic occupied by the Sun in mid-winter — in the Constellation "Sagittarius," where the Zodiac crosses the *Milky Way*.

I have a lantern slide (made by Mr. Barnard with the Willard Photographic lens) representing a region of the sky near this point.* When you have seen this you will appreciate the manifest hopelessness of the task undertaken by the Henry brothers. Thousands upon thousands of stars came into view with every sweep of the telescope; to enumerate these, even approximately, would have been an enormous task; to plot the position of each one accurately on the chart was a simple impossibility.

(Look into the sky some clear night—the heavens seem literally spangled with stars and the idea of counting them seems preposterous. Yet there are hardly more than 2000 visible at any one time to the naked eye, numerous as they seem. In the whole sphere there are less than 7000 naked-eye stars. With the slightest optical assistance the number is enormously increased. A spy-glass shows over 100,000. A common street telescope brings out half a million, and, as Prof. Young of Princeton says: "The number visible in the great Lick Telescope of three feet diameter is probably nearly 100,000,000." Again, you must remember that the stars are not at all uniformly distributed throughout the sky—in some places the field of the telescope is nearly barren of stars; in others, around the great circle of the *Milky Way*, the number visible is almost unlimited.) In this emergency

The Henry Brothers

Heard of Dr. Gill's photograph showing the multitude of stars, and in it discovered the solution of the difficulty. They would turn their telescope into a camera, and let the stars map themselves!

I cannot commence to tell you of the grand work the Henrys have accomplished. They use a twin telescope, consisting of a 13-inch photographic and a 9-inch usual glass, mounted as a single equatorial.

I will show you a view of this unique instrument (kindly prepared for me by Professor Burnham), and will speak more in description when we have it on the screen. You will remember that in the beginning of this lecture I spoke of the Paris Congress, which met in 1887, and of the work it proposed (among other things) to accomplish. The telescopes to be used by the different observatories co-operating are of this type. The ten or eleven thousand photographic charts estimated as necessary to cover the entire sky will probably be completed in five or six years. The star-chart congress will assemble again, the coming month, at Paris; and it will be supplemented by a general meeting of astronomical photographers, for the discussion and co-ordination of work in this grand field. The whole subject is so comparatively new that we may confidently expect even greater advances in the future. As it is, since the plan of operations (with a 13-inch telescope of 15-feet focal length) was adopted by the congress, a new scheme, involving a complete set of charts by a single telescope (a photographic doublet of 24 inches aperture) has been set on foot by Professor Pickering, the director of the Harvard College Observatory, the funds being provided by a wealthy New York lady, Miss Bruce.

This Projected Camera

Having a focal length of only 11 feet, will give plates each covering an area in the sky equal to five degrees square. With such a camera on a high mountain in the southern part of California, favored by our clear, transparent skies, Prof. Pickering expects to complete the entire series of charts, alone, in two or three seasons.

The very mention of the Harvard College Observatory brings with it a host of suggestions, most of which I must ignore in this address, for I fear I have already taxed your patience with too lengthy a presentation of a subject which really requires a volume by itself. I will only refer to a branch of the photographic work of which the Harvard astronomers have made a specialty—spectrum photography. A prism in front of the telescope is used to disperse the light of the stars in view before passing through the object-glass—each star shown then gives a spectral image instead of a point. Any of this audience who may have attended Professor Keeler's lecture on the "spectroscope" last year, will appreciate the special advantages of this study. The spectrum of every star in a cluster like the Pleiades may be photographed on a single plate and individual peculiarities studied. A distant unknown planet would possibly be recognized by the difference in its spectrum, since a star shines by its own light, and each planet in our system simply reflects the light of the sun. Any major planet in our system still unknown, would doubtless be of exceeding faintness—probably smaller than the 10th magnitude—its motion among the stars would be remarkably slow and difficult to detect; and if such a planet really exists, it may, in the course of years, be discovered by means of photography.

If I could place before you for comparison one of the very best optically constructed charts of the solar spectrum (say Kirchoff's), and also a copy of Professor Rowland's

Great Photographic Map,

A single glance would show you the wonderful superiority of the latter. Where dozens of "lines" are given on the chart, hundreds may be seen in the photograph, which extends very nearly as far in the *red* end of the spectrum, and far beyond it in the "*ultra-violet*"—that curious extension of the visual spectrum which would now be unknown to us but for these same photographic methods. And every "line" shown gives us a clue to the constitution of our sun, and adds an item of evidence to that long chain which will one day reveal the ultimate chemical conditions of matter.

In conclusion, I must explain one allusion which I have made, namely, the power of the photographic plate to exhibit stars which are invisible to the eye when using the same telescopic assistance. This seeming paradox is the result of the continually increasing "sensitiveness" of the gelatine plate as compared with the rapidly wearied human eye. The eye of the observer will not acknowledge the impression of a distant star, the rays of light from which are so exceedingly faint as not to produce any effect on the optic nerve in less than 1-10th of a second; the effect of these rays on the eye is not "cumulative." But when the photographic plate is exposed to the same rays for a number of hours, the effect of them is (as it were) "piled up;" images of the *bright* stars become larger and larger as the exposure is continued, and at the same time the number of the "*invisible*" stars collected on the plate is continually increased.

The little cluster now visible in the east of an evening, and known as the "Pleiades," is perfectly familiar to every casual observer of the heavens; a person of ordinary sight has no trouble in distinguishing six or seven in the group—a good eye can detect 11 or 12.

The French astronomer Wolf spent three years in making an accurate map of this cluster, as seen in the large Paris telescope, and at the end of that time had recorded 671 stars. A photograph taken in one night by the famous Henry brothers added over 800 stars to this number. And this is in a region of the sky which is not at all "rich" with stars. In a portion of the *Milky Way*, represented in one of the pictures I shall exhibit to-night, and containing about 8000 stars, only 14 are visible to the naked eye. So much for the *magnitude* of these photographic operations; as for the *accuracy*, it need only be remarked that a recent discussion by Dr. W. L. Elkin of Yale College has shown that careful measurements from a good photographic plate are even more reliable than those made with the best micrometers used with the telescope.

There is one drawback which should be mentioned—photographic maps are not a good guide to the real brightness of the stars. Any lady in my audience knows that she would not go to a photographer's in a red dress unless she wished to appear in the picture as if attired in a most somber manner. Nor would she decorate her little girl with a blue sash over a light dress, for there would then be no contrast shown in the negative. In other words, the photographic plates now used are insensible to those colors in the red and orange portions of the spectrum, but are especially acted upon by the blue and violet rays. For this reason a brilliant first magnitude *red* star, such as "Aldebaran" in Taurus, or "Antares," in the Scorpion, would appear no larger on the photograph than a good *bluish-white* star of the third or fourth magnitude. This matter of photographic magnitudes is now the subject of considerable investigation; it is an important one, but these differences do not appreciably lessen the value of the photographic plate as a star map.

And, finally, you must not imagine that these rapid and accurate photographic charts will do away with the usefulness of that great standard authority for star positions—that most important instrument of the old astronomy — the Meridian Circle. This detailed mapping of the heavens must proceed on exactly the same lines as those laid out for the minute survey of this great continent; just as the different elaborate State surveys, which give the mutual relation of every little landmark in each territory, depend, for their co-ordination into one complete map, upon the latitudes and longitudes of several important "stations" determined by our National Coast and Geodetic Survey, so will each photographic star map obtained by the new methods demand many well-determined reference points for its accurate reduction, and all these points must be obtained by observations with the Meridian instruments. The "Old" and the "New" Astronomy, as one of our greatest scientists has called them, are not rivals, but are mutually dependent, and Photography has become at once the Disciple of the one and the Apostle of the other.

*The original plate (5x10) from which this slide was made was exposed to the sky for 3h. 15m. During every second of this time the eye of the observer kept the camera exactly pointed. The plate shows over 15,000 stars.

NOTE.—Blackboard explanations were introduced by the speaker at several points of the lecture, and at its close a number of lantern slides made at the Lick Observatory, were, through the courtesy of Professor Holden, Director, exhibited by means of Professor Thoburn's lantern, kindly loaned by him, and manipulated by Mr. Swickard, a student at the University of the Pacific.

The Mining Industry.

Henry B. Clifford says, in the New York *Tribune:* Despite its load of fraudulent claims and wildcat schemes, the mining industry has paid more money in dividends, compared with other industries started in the last 30 years, than any business known. Compare the profits in mining with the profits on the total liabilities of the 156,000 miles of railroad with the aggregate liabilities of nearly $10,000,000,000. Then you will see what pays the most. Under the wing of mining there exists some of the safest and most profitable of all business. Take, for instance, the 12 great smelting companies, the mineral pawnbrokers. The smelting companies that do a strictly custom business show absolutely and unquestionably the largest profits of any industry in America. I know of instances where capital invested in smelting companies has been turned five times a year and each time the margin of profit has been over 20 per cent of the entire amount handled. They take no risk; simply buy the raw gold and silver in the ore at a reduced price, extract their cost of treatment and pay the miner the residue. It is a business where the principal is absolutely safe. All of these things should show the people the value of mining. Of late it has come about that if a mining man presents an enterprise to conservative capital he is looked upon with suspicion and no assistance is rendered him. The investor fails to realize that the very sinews of commerce come from the mines, and they are the root of half the successful industries of this country. In 1888, notwithstanding the fact that capital gave very little assistance to the mining industry, there was a steady, healthy increase of prosperity. Of the $87,000,000 produced from the mines in 1888, the amount was divided so that all avenues of industry profited. Over 10 per cent went to railroad corporations, 37 per cent to mine-owners, fully 15 per cent to smelting works, while the residue, 38 per cent, was circulated among the laboring elements. It is a great mistake to invest in mining property that has no basis of valuation other than a prospective hole, large paper capitalization, a few assays, a glittering prospectus and the word of some man that the ground can readily be developed into a bonanza.

A MINING SUIT.—A dispatch from Denver, Colorado, says: The famous Durant-Bonnybel case, which has been on trial in the United States District Courts for the past 16 days, came to an end at 10 o'clock to-night, giving to Bonnybel a verdict for the second time. The case is famous among mining men throughout the country, for the reason that millions of money depended upon the verdict. Reports from Aspen are to the effect that the city is wild over the verdict, and in Denver the wine is flowing like water at all the hotels.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NEW LONDON MILL.—*Dispatch*, Nov. 30: The building of the New London mill keeps up a ripple of excitement in the minds of many who are hopefully expecting to hear of some rich cleanings up when they get to running. This will be a benefit to all the surrounding country. Work on the above-mentioned mill is progressing rapidly while the good weather lasts, and Mr. Rees has got the mine in good shape to deliver 100 tons of rock per day, or as much more as may be wanted. There is a rumor that the Cosmopolitan mill will be ready to start up in another week, but it will probably take them a little longer to get ready. If this mill makes as good a showing as I think the New London will, it will only be a question of a very short time when all the intermediate country between Plymouth and Dry Creek will be worked.

PLYMOUTH CONSOLIDATED. — Amador *Ledger*, Nov. 30: Matters are moving along at the same slow pace at this once prosperous mine. Mr. Van Norden, the president of the company, was in Plymouth a few days back. Intimations were then made that the mine was to be worked in something like its old-time vigor, but whether under the present or a new company was not then known. Three or four extra men were employed, and a report circulated that a dozen more would be put to work. This, however, has not been realized. The explanation of the protracted idleness is laughed at in Plymouth. We notice it has since been published in the New York papers that the lower levels, said to have been so badly damaged by fire and water, are in condition to be worked again. We certainly think that continued inactivity calls for an official investigation in behalf of stockholders outside of the board of directors. The management has been and still is the subject of severe criticism by the small holders of stock, and it is due to all concerned to determine from disinterested sources whether there are adequate grounds for the dissatisfaction.

NEW LONDON.—The entire mill is expected to be under cover this week, so that the workmen will be able to push the work to completion hereafter regardless of the weather.

COSMOPOLITAN.—This mill is expected to be in running order in two weeks, and will be started as soon as finished. All who have inspected the underground workings speak in glowing terms of the large ore bodies exposed, and are sanguine of the property taking its rank among the dividend-paying mines.

NORTH GOVER.—Work was started on the North Gover on Tuesday last. It is proposed to sink the present shaft, which is 180 feet deep, to a depth of 500 feet before commencing to drift. The shaft is considerably caved, and the first work will be to repair it, and re-timber if necessary.

Calaveras.

COMMENCED OPERATIONS. — San Andreas *Prospect*, Nov. 30: The Benson Bros. started up their three-stamp mill at their gravel claim on Central hill this week. Albert Fletcher has been employed to attend the mill.

THE JACKSON CLAIM is being worked in earnest by the new company and we may soon expect to hear of some good returns from this mine.

Colusa.

BLACK DIAMONDS.—Colusa *Sun*, Nov. 30: D. P. Mulford, while out deer hunting a few days since, discovered in the vicinity of his ranch near Elk Creek a ten-inch vein of fine quality of bituminous coal. Mr. Mulford brought in a fine specimen. May this find turn out to be something more than a mere prospect.

El Dorado.

LONE JACK.—Georgetown *Gazette*, Nov. 30: H. Lawrence, Supt. of the Lone Jack mine, has bonded the Grover brothers' mine, an extension of the Slate Mountain mine, and also the California Jack mine south of Georgetown. The Lone Jack is operated by a S. F. company.

THE GOLDEN STATE quartz mine at Jones Hill has been leased from Barklage & Co. by Mrs. T. Z. Armstrong, Mat. Berschens and John Buchler, who began work last week.

Inyo.

PRESENT CONDITION OF PANAMINT.—Cor. Inyo *Index*, Nov. 30: The Surprise M. & M. Co., who are now operating here, own some 13 patented mines. The Hemlock, Stewart's Wonder, Hudson River and the others have all been opened sufficiently to demonstrate their permanency. Last winter three chloriders extracted from the Hemlock mine a quantity of ore. Ten tons of the first class, which was shipped and reduced, netted over $1500, and about 15 tons worked here produced over 3400 ounces of crude bullion. In consequence of the high cost of packing, milling, etc., nothing but the choicest ore was handled. In obtaining this ore large bodies of from 40 to 60-ounce silver quartz were left behind as valueless matter. The mineral belt wherein the mines lie is between three and four miles wide, running north and south, being easily traced 50 or 60 miles. At those points where the mineral crops out most prominently, and where the greatest natural advantages exist, mining camps have been established, such as Goler Canyon, Gold Hill, Panamint and Wild Rose, as bases for prospecting. A great porphyry dyke trends for miles toward the north and south. A ledge of galena and carbonate lead ores carrying gold and silver can easily be traced for miles. At a point about three miles south of Panamint it has been claimed by J. Curran and prospected to the depth of 130 feet. Three miles north on the same vein, about 1½ miles southeast of Panamint, the ledge has a tunnel run in the mountains following the croppings. At its mouth the croppings show about six inches of galena and carbonate lead ore; 50 or 60 feet in and at the face the vein shows two to three feet of high-grade ore, having a continuous body as far as opened. There has been considerable ore taken from the mine and shipped as back freight whenever opportunity has offered. Some 200 feet to the south a shaft has been sunk upon the croppings about 80 feet, and a few fine specimens of native gold were obtained while sinking the same. The vein here, like the Recluse owned by J. Curran has its ores free from the walls and carries plastic clay and porphyry ledge matter. The mine is called the Indus, after a rich locality in the East Indies, and has every appearance of honoring its name in the near future. The ore as taken from the ledge contains about 35 per cent lead, 40 ounces silver and $6 gold, being in black lime with two good walls easily traced, and having every appearance of a permanent vein. To the west of the lead belt lie the patented mines and mines owned and worked by private parties, which have in the past produced thousands of tons of ore and are as yet not much more than opened. The Blue Wing, Silver Rib and Magnet are owned by Russell & Mee. The last-named has contributed a large amount of silver ore. It is now being worked by Russell & Lemvigne, who are running a tunnel for deeper working. At the Oroville long tunnels have been run, deep shafts sunk, several fine bodies of ore exposed, and everything is in neat shape. The mine is owned by Mr. H. G. Chickering. The Sabine, a large, well-defined ledge owned by Chas. Anthony, shows considerable of a vein, averaging about 40 ounces per ton in silver. The Fremont and group, owned by James E. Wall, contain high-grade ores. Mr. Wall is about making arrangements to put them in working shape next spring. The Pontiac, with its large bodies of 40 to 50-ounce silver ore, now owned by J. Curran, lies idle, as the cost of packing, milling and other expenses leave no margin for profit. The Good Enough, Last Chance and others, owned by R. B. Flynn, make a good showing of high-grade ores. The Henry Clay group, owned by Peter Gallagher, have been sufficiently prospected to demonstrate their value. At the Jacob's Wonder long tunnels have been run, deep shafts sunk and a large amount of work performed, exposing a fine ledge. Mr. Daley's Antrim group, with drifts and shafts, have been prospected enough to show the value of the mines. There being so many fine-looking and valuable properties, only a portion of the most promising have been noticed. Every natural advantage exists for the economical working of the mines in this section. Fuel and timber are abundant and cheap. Water in sufficient quantity is convenient; but as an offset, high transportation, want of cheap milling facilities, lack of capital and other drawbacks exist, keeping the district in the background. At the present cost of transportation, silver ores containing 100 ounces return about $11 per ton after paying for team freight, railroad and reduction charges, leaving the miner only that amount for his labor and incidental expenses. The depreciation of silver has been another serious matter which the mines have had to contend with. At the present time reduction works capable of treating ores containing from 40 to 60 ounces of silver at such cost as to allow the mine-owner fair compensation for extraction, are badly needed.

Nevada.

COE MINE.—Grass Valley *Union*, Nov. 26: The Coe mine is now being worked on the tribute plan, and very good ore is being taken out at the 136-foot level east of the shaft. The bond on the mine expires on the 1st of January, when, if its conditions are not filled, the company will work the mine on its own account.

GOOD ORE AT THE PITTSBURG.—*Transcript*, Dec. 1: A foot ledge of fine-looking quality has been struck in the 900 level north of the Pittsburg mine. The station for the 1000-foot level is now being cut. Supt. Stokes is pushing the work ahead with activity.

THE HARTERY BONANZA.—Grass Valley *Union*, Nov. 27: The gold-bearing shoot of ore in the Hartery mine continues to grow in richness as the vein is exposed, and the specimens taken out in the last 48 hours are of greater value than any previously reported. This strike is on the second level below the drain tunnel, and as the ledge has been stripped the rich pay streak has become more clearly defined. The ledge is now five feet between walls, all of high-grade milling rock, while a 2-inch streak of it on the foot-wall is loaded with gold so heavy, indeed, that it appears to be more gold than quartz, the gold being coarse and of high quality. How far it will extend it is not possible to state, but up to this time there are no signs of its giving out, and it is found going down below the floor of the level. This ore is too rich to be worked by the ordinary mill process, and is being saved to be manipulated with greater care. From present appearances the shoot is likely to be extensive and rich even if its specimen character is not maintained, as the ore is showing well in galena, an evidence of reliability in the ore shoots of this district. With this find the prospects of the Hartery are very encouraging. The strike is the richest that has been made in the district in a long time.

Placer.

RED POINT.—Placer *Republican*, Nov. 27: The last four months at the Red Point mine have been occupied on the new branch tunnel which is now completed. It is 1100 feet long. The first upraise was made 811 feet from the main tunnel, and breasting was begun on the 12th inst. The work is directed up stream from the point where operations were stopped when the branch tunnel was begun, and the gravel ought to be good, as it was very rich when breasting was temporarily suspended four months ago. It is expected to yield something over $3 a carload at least. Preparations are being made to take out 200 carloads a day, which will employ about 70 miners.

IOWA HILL AND VICINITY.—Cor. *Argus*, Nov. 30: The outlook for our divide is encouraging. The recent heavy rains have given confidence to miners and ditch-men, who are making preparations to open up new claims and push old tunnels and shafts to completion. The Hogsback Co., whose ground is located above Indian Springs, have commenced work on a new and lower tunnel, and will push work on it all winter. A shaft sunk from their present tunnel struck gravel which gave a good prospect in gold—sufficient to warrant the company in driving a lower tunnel to strike the rich pay gravel in the old river channel now known to run through their ground and adjoining claims. The well-known richness of the gravel in the Red Point, or French company's mines, and others on the upper divide, is attracting the attention of other syndicates of capitalists to this section of Placer county. I learn from reliable sources that the agents of another French corporation are on their way to California, if not already here, whose reputed intention is to secure all they can of the valuable mining land on the Iowa Hill and Forest Hill divides. Ross E. Browne, the mining engineer, has been at work around this town surveying, taking the levels of the rim rock and the workings of our drift mines. A few more energetic men like Hoffmann, Hobson and Ralston, with foreign or Eastern capital to expend in developing our mines, would be welcome here. If the same good judgment is used, their reward would be as rich as that of the above well-known gentlemen. Although we have many acres of good hydraulic ground in this section, no mining by that process will be done here this season. The owners of hydraulic ground will not go to the great expense of fitting up claims while fears of injunctions haunt them. The Horman mine at Wisconsin Hill started up its mill last week, and are crushing the usual amount of pay gravel. About 20 men are employed at the mine. The owners have bought the water ditch at Wisconsin Hill from "China Tom," and intend running their mill by water-power. David McGetchen was in town last week from the Drummond quartz mine at Cottage Home, and reports the mill running steadily on good ore. About 25 men are at work, and expect to be employed all winter. The bedrock tunnel at the Morning Star gravel mine is being pushed ahead, consequently not enough gravel is being taken out to keep the mill running all the time. Rich results are expected as soon as the bedrock tunnel is completed.

Plumas.

INDIAN VALLEY MILL STARTED.—Greenville *Bulletin*, Nov. 26: On Monday, the Indian Valley mill started. The shaft has been pumped out, and sinking is to begin. Besides this, the mine has been opened up largely by the Union tunnel being driven into the mountain. Mr. Prentiss, the superintendent, has worked very energetically and deserves success. There is every indication of a good water season, a large supply already being in the Round Valley reservoir.

NEAR PRATTVILLE.—Cor. Lassen *Advocate*, Nov. 27: I am now on the North Fork of the Feather river, about six miles from Prattville, and am looking at some claims that look fine, and I think that this camp offers great inducements for capital. I find that there is here an ancient channel, that is rich in placer gold. The above channel you can follow for miles. There are three miles of it on the west side of the river, unbroken, which has been prospected with very satisfactory results. It follows across the river on the east side a distance unknown. I also find that the above channel is the main inlet to the whole country, and is covered with lava 450 feet deep. Plenty of ground can be had at reasonable figures, with clear title, and I look for a great camp here when capital becomes interested in the mines.

Shasta.

CRŒSUS.—Shasta County *Democrat*, Nov. 27: George Bassett came down Sunday from the Crœsus mine. He says the mining outlook in that camp is most propitious. The old Snyder mine is turning out to be a veritable bonanza, after all its ups and downs. Mr. Barron, the superintendent, has exposed 70 feet of a rich pay chute. This was found by crosscutting south from the main tunnel. The strike turns out to be a parallel vein with the one on which all the previous development work had been done.

FLAT CREEK.—About ten days ago Lem Walters and Ike Parker struck a four-foot ledge on the Flat creek side of the ridge south of Bull's Bar. The rock prospects $30 to the ton. This discovery is said to be the richest yet made in the Flat creek district.

Siskiyou.

THE SUNDAY MORNING MINE.—Cor. Yreka *Union*, Nov. 30: For the past 18 years rich pieces of float quartz have been picked up at various times by different parties on the north slope of Tanner's peak, with efforts made to discover the ledge from which it came, without success until after the arrival here of two prospectors, Messrs. Probasco and Stent, who after hearing the stories told by the old-timers concerning the float rock, proceeded at once to the locality with Harry Welker, who had previously found specimens. They began work in earnest to unearth the hidden treasure, which required but a few days' work with pick and shovel to expose to view the treasure vault from which came the precious float in the form of a well-defined fissure vein, showing a width of from one to three feet, between walls of porphyry and slate and speckled with the yellow stuff. The ledge has been crosscut at several places along on the surface, showing a continuous vein of quartz. A tunnel is being run into the mountain-side on the vein, and a winze is being sunk.

Tuolumne.

POCKET MINE.—*Union Democrat*, Nov. 30: It is stated on good authority that the pocket mine of Gale & Wickham, near Tuttletown, in this county, is showing splendidly. It is turning out coarse, massive gold in large quantity. The result in the past few days goes into the tens of thousands. The old Tuolumne pocket mines are "in Bonanza" sure. Its regular vein mines are also telling well under energetic, intelligent and economical management.

DRY TO WET.—Sonora *Independent*, Nov. 30: It is generally understood that the Golden Gate mill is to be changed from a dry crushing to a wet crushing mill, with concentrators, etc., and electric lighting machinery is now being put in to be used for lighting the mill, hoisting works and the stations of the shaft.

THE BLACK OAK MINE shut down last Monday, the men refusing to work any longer without money, as all hands are over two months without having received their pay, except in due-bills, of which the men have now plenty, as they are not in demand.

NOTES.—The Alameda mine is said to be in Bonanza, and the prospects there are very flattering. Frank McCann and some of his friends are to commence active operations on the Little Belle mine in a few days. The Mandrich Bros. have come upon a fine prospect in their old claim at Brown's Flat, and expect soon to take out a nice pocket. Hank Gale and James Wickham are still working to empty their rich pocket at Jackass Hill. They are taking out gold by the pound. Tuolumne's hills are full of it.

NEVADA.

Washoe District.

UTAH.—Virginia *Chronicle*, Nov. 30: On the 600 level the southeast drift is advanced 380 feet from the shaft station. Formation porphyry and clay.

OCCIDENTAL CON.—During the week extracted and milled 240 tons of ore showing an average assay value of $17 per ton. Repairs to the ore chutes caused a curtailment in the ore output below the usual average. The mill will be running to its full crushing capacity tomorrow.

NORTH OCCIDENTAL.—Extracting ore from the 300 and 400 levels.

HENDRICKS.—The steam hoist plant is now in first-class condition and repairs to the shaft collar in progress. When completed, explorations on various levels will begin.

SIERRA NEVADA.—On the 520 level at a point in the south drift from the east drift, 275 feet from the main east drift, a drift is advanced 100 feet, the face in porphyry and clay.

UNION CON.—On the 1465 level in the north lateral drift 50 feet south of the north line of the mine, west crosscut No. 3 is advanced 83 feet, and is in porphyry carrying strips of clay.

MEXICAN.—On the 1465 level from the north drift from west crosscut No. 1, 50 feet in from the lateral drift face, a west crosscut is advanced 159 feet, continuing in porphyry, clay and quartz.

OPHIR.—On the 1300 level from the end of the east crosscut from the shaft station a south drift is advanced 62 feet. Formation porphyry and quartz.

CON. CALIFORNIA & VIRGINIA. — From the stopes on the 1300, 1435, 1500, 1600, and 1650 levels continue to extract ore sufficient to supply the Morgan and Eureka mills. During the week 1154 tons and 230 pounds of ore were shipped to the Morgan mill, 1758 tons and 350 pounds to the Eureka mill. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $26.25.

SAVAGE.—Shipped 480 tons of ore, battery sample assays showing the usual average value.

GOULD & CURRY.—On the 400 level in the main south drift, 80 feet west of south crosscut No. 1, west crosscut No. 2 is advanced 30 feet. Formation quartz showing some value.

BEST AND BELCHER.—On the 625 level, the raise is carried up 50 feet. At the above hight a small station has been cut out and west crosscut No. 1 advanced 10 feet. Formation clay and porphyry with streaks of quartz.

HALE AND NORCROSS.—Shipped to the Nevada mill during the week 1015 tons of ore, showing an average value of above $30 per ton by pulp assays.

CHOLLAR.—Crushed 400 tons of ore during the week. The 500 level northwest drift continues in low-grade quartz.

POTOSI.—The 800 level drift is still stripping low-grade quartz.

NORTH GOULD AND CURRY AND EAST BEST AND BELCHER.—The west drift from the northwest drift is cutting occasional bunches of quartz.

IMPERIAL.—The joint Confidence-Challenge 500 level east crosscut from the north drift continues in clay. The joint west crosscut continues in quartz and porphyry. The joint 800 level north drift is still in clay.

YELLOW JACKET.—Daily ore shipments have been increased to 80 tons, battery samples showing an average assay value of $21.50 per ton.

ALPHA.—Started drifting from the 600 level shaft station. The 500 level west crosscut is in quartz and clay.

EXCHEQUER.—The 382 level east crosscut has entered vein matter and the 500 level north line west crosscut continues in quartz.

OVERMAN.—Shipped 327 tons of ore to the Vivian mill during the week.

NEW YORK CON.—The raise above the 800 level west crosscut is showing fair-grade quartz.

CROWN POINT.—Shipped to the Mexican mill 549 tons of ore, showing a value of $17.95 per ton by pulp assays.

BELCHER.—Nos. 2 and 3 east crosscuts on the 1200 level continue in low-grade quartz. The 1000 level south drift is still showing quartz. The 850 level south drift is in porphyry.

SEG. BELCHER.—The 1200 west crosscut 20 feet north of the line is in 84 feet, and continues in porphyry and clay.

ALTA.—Crushed 339 tons of ore showing an average pulp assay value of $29.75 per ton.

JUSTICE.—Crushed 229 tons of ore showing an assay value of about $20 per ton from pulp samples.

Eureka District.

BY RAILROAD.—*Sentinel*, Nov. 30: During November the following products from this district were transported over the Eureka & Palisade R. R.: Seven hundred and eighty tons of ore for Salt Lake; 270,000 pounds of Richmond crude bullion, 340,000 pounds Richmond market lead, and 105,000 pounds of Eureka Con. market lead.

Osceola District.

A DITCH.—Virginia *Chronicle*, Nov. 29: A force of about 400 men is employed in excavating a ditch to bring the water of Lehman creek into Osceola district, White Pine county, for the purpose of working the placer mines there by the hydraulic process.

Pioche District.

FURNACE.—*Record*, Nov. 23: Since starting a week ago yesterday the furnace has run steadily and without a hitch so far as its operation is concerned. Up to yesterday 500 bars had been run out, making two carloads, one of which was shipped. Under the supervision of Mr. August Werner there is no question about the base ore of the camp being successfully reduced. The whole reduction works are near completion.

BLACK LEDGE WINZE.—The water in this winze is now down a depth of 135 feet. Yesterday an auxiliary pump was put in at the 13th station to relieve the smaller one farther down the shaft. The new pump will raise to the 12th all the water pumped from below and that which may drain from the ledge above. This will materially assist the work below and progress will now be easier and more rapid.

Tuscarora District.

BELLE ISLE. — *Times-Review*, Nov. 29: West crosscut, 350-foot level, extended seven feet, showing faces of ore.

NAVAJO.—The west stope on the 150-foot level continues to look well. Mill is running on custom ore.

NEVADA QUEEN.—South intermediate drift from 150-foot level of Commonwealth has been extended 18 feet, and is showing some good ore.

COMMONWEALTH. — 100-foot level: No. 2 east crosscut, near the face of north drift, has been extended 20 feet; face is all in vein. No. 1 east crosscut has advanced 20 feet; total, 132 feet. North

drift to connect with No. 2 east crosscut, advanced 23 feet, will break through today. This will give good ventilation to all the openings north of the shaft. No. 1 west crosscut extended 15 feet; the ore in the face is improved in quality.

GRAND ISLE.—North crosscut on the 500 foot level has been extended 10 feet through a hard but favorable formation.

NORTH BELLE ISLE. — The sump has been sunk 15 feet below the 600-foot level station.

NORTH COMMONWEALTH. — East crosscut, 225-foot level, extended 10 feet. South drift from same crosscut extended 15 feet. At a point 105 feet south of the joint crosscut have started to crosscut the vein, which looks well.

DEL MONTE.—Crosscut No. 2, 100-foot level, extended 14 feet, total length 110 feet. The face continues to show high-grade ore.

ARIZONA.

CONCENTRATING PLANTS.—*Arizona Miner* Nov. 27: Concentrating plants are the great need of our mining camps. The Congress mill is being run on full time day and night now, turning out seven tons of rich concentrates per day. The Tiger is looming up once more as a silver-producer, and promises to return to its old-time position in the ranks of dividend-paying properties of this county. C. K. W. McNary continues to work on his cinnabar ledge in Copper basin, and is securing good ore from it. Messrs. Jos. Mayer, Geo. McCann and Henry Stoddard have struck very rich ore in the north extension of the Boggs mine, while doing their assessment work on that property. The Ryland M. Co. has advanced wages from $3 to $3.50 per day, without any solicitation from miners. The latter figure is the prevailing price at present in this section of Arizona. Richard DeKuhn yesterday bought a pack train of 20 animals for the Mockingbird mine. The papers in connection with the sale of the Senator mine were signed and the money paid yesterday, closing the transaction and transferring the title to that property to Phelps, Dodge & Co. of New York.

CUPEL.—Mohave *Miner*, Nov. 30: The recent strike in the Cupel mine, Stockton Hill, in the crosscut winze on the 200-foot level proves to be a permanent find. There is seven inches of high-grade ore. The winze is being sunk on the extreme end of the ore body, consequently nothing can be ascertained as to the size until sinking and drifting has advanced.

OLD DOMINION COPPER CO.—*Silver Bell*, Nov. 27: We had the pleasure of inspecting the mine and smelting works on Tuesday last, and noted many improvements made since our last visit in June, and although upward of 8000 tons of ore have been extracted in the interval, no diminution in the supply in sight in the several levels is apparent. In the main stopes of the sixth level the face of the ore body is about 50 feet in width with five sets of vertical timbers, from which may be gained an idea of the immense size of the vein. Other portions of the mine show ore in quantity, and it is all rich in copper. The improvements made during the past summer are all in the direction of increased convenience and facility in handling the ore. As stated last week, the force of employes at mine and smelter has been considerably increased, and operations will likely be continued on the present liberal scale while the activity and strength in the copper market continues.

RICHMOND BASIN.—Richmond Basin mines continue to reward industrious miners. Joseph Brewster is especially fortunate in having struck the ledge in his mine—the Southern Star—close to the line of the Harrison & Morton and a continuation of the ore body in that claim which has yielded handsomely in silver. The ore in the Southern Star is of the same character, assaying from $600 to $1000 per ton. The Harrison & Morton is still producing excellent ore. The claim is now owned by Thos. Moyle, Harry and Tom Letcher having sold their interest to him. Harry Letcher brought in 2600 pounds of high-grade ore from the H. & M. mine, on Tuesday, for shipment to Socorro, N. M. Joe Henry and Wm. Gill are getting good ore from the Helen claim. Lou Scanland is taking out some native silver from the Last Chance. Richmond Basin is one of the best silver camps in Gila county, and in view of the continued advance in silver, the outlook for the Basin is bright.

BRITISH COLUMBIA.

A $350 NUGGET.—Kamloops *Sentinel*, Nov. 23: Mr. W. F. Anderson of Cariboo passed through Vancouver the other day on his way to Victoria. He had in his possession a 14-ounce nugget, a perfect beauty, worth $250, taken out of the Anderson & Smith claim on Snowshoe creek. He reports that several have been secured this season varying from 8 ounces up to 24 and 30 ounces. Miners are looking forward to a lively period next season, and all regard the prospect as excellent.

GOLD. — E. Goodwin is in town to day from French creek, in the Big Bend country. He has with him a quantity of gold to the value of $400 taken out of the claim in which he is interested there. He claims to have struck it rich, and reports good prospects for that country in the near future.

DAKOTA.

SYNDICATE SMELTERY. — Deadwood *Pioneer*, Nov. 27: The mill of syndicate smeltery is nearly complete in all particulars. Frank Shaw, who has charge of machinery and work of setting it up, expects to finish his part by to-morrow night. The plant will be in condition to start up Saturday or at latest Sunday. It is not anticipated fires will be built, however, until after Mr. Miller's return from Helena, expected next week. The first or test run, it is currently reported, will be on Golden Reward ore, to be obtained from dump near reduction works. How much of this will be put through could not be ascertained, probably from two to three hundred tons. It is less than 30 days since excavations for foundation of plant were commenced. The short time required to complete it speaks well for the energy of those managing the work.

MORE PYRITES.—Dave Short was down from Bald mountain yesterday, and exhibited specimens of pyrites carrying gold and silver. The vein from which they were obtained is large, and is found in a location at the foot of Bald mountain. The discovery is not entirely new, but little attention was paid it until the knowledge became general here that pyrites is just what is wanted for flux in treating the refractory gold and silver ores of Bald mountain and Ruby basin.

COLORADO.

SAN JUAN.—*Denver Republican*, Nov. 29: The future of mining in that section of the silvery San Juan known as the Red mountain country presents to him who is conversant with its past and present record as a producer and the magnitude and richness of its veins, the most brilliant possibilities. The unexcelled prosperity of the Yankee Girl, Gusten and Robinson, and the continuation of their rich ore chutes, as shown by deep mining, will strengthen the wavering tendencies of smaller companies and cause them to push ahead to almost certain success, while by the completion of the Silverton & Red Mountain railroad to Ironton the great contact mines of Brown mountain will be enabled to employ large forces of men and ship thousands of tons of ore at a fair profit where it would have been impossible 18 months ago, by the primitive burro train and ore wagon methods, to have shipped any but the highest grades of this ore, amounting to a very small per cent of the great bulk mined.

CARBONATE.—Late arrivals from Carbonate report more than usual activity in mines thereat. Spanish R., Seabury, Iron Hill, and a number of lesser lights are working forces. The number of men employed is greater than at any time before in 18 months. As the year draws to a close and it becomes necessary to do annual assessment work, the number will increase largely. Spanish R. is shipping ore to Kansas City, Seabury is taking out ore, but holding it until local smelteries are in operation. Iron Hill is about getting ready for another run of its smeltery.

IDAHO

AN IMPORTANT STRIKE. — Wood River *Times*, Nov. 27: An important strike of ore is reported in the Red Elephant group of mines, near Bullion. This excellent property is evidently showing more value right along, and when thoroughly opened will prove very remunerative.

LOWER CALIFORNIA.

A NEW STRIKE.—Alamo *Nugget*, Nov 27: Last week Joe Guyette, a French prospector, found some rich float on the west side of the creek, three miles below the oaks off the Santa Catalina road. Some of it was brought to town and mortared at the rate of five dollars to the pound. Many of the leading prospectors in camp have been taking a lively interest in the new discovery, since it looks at present writing as though a valuable outlying province is to be added to Alamo. On Friday last, Tom Owens visited the locality and thought the discovery of sufficient importance to return Monday. Up to to-day he has not come back from his second trip. Sierra, Trumbaugh and a dozen others left Monday and Tuesday. They are slow about returning and among prospectors this is a good symptom. The new find is on the west side of the creek above La Poza, some distance up the mountain at that point and very nearly due south of Alamo. In a direct line it is probably not more than six or eight miles from here. It is highly probable that a valuable belt of seams, if nothing more, has been discovered.

MONTANA.

COPPER BOUNDARIES.—Butte *Inter-Mountain*, Nov. 26: So far in this mining camp, copper is confined to a small radius of territory compared to the vast mineral-bearing portion of the country. In fact there is no portion of the country but what is mineral bearing of some character, and all parts of it contain silver. The copper portion is that portion bounded as follows north, and including a portion of the Grey Rock: South by Park street, east by Silver Bow creek, and west by Missoula Gulch. In this portion of the country is being exclusively conducted the copper-mining industry of this camp. South of Park street on the leads running in that portion, no doubt is held that if sufficient depth were acquired, the developments would terminate in as rich copper producers as that portion now being worked by the large copper companies. The question as to whether the copper ore bodies extend farther in an easterly course will be solved by the new shafts at present being sunk for that purpose on the flat east of the Silver Bow mill, and appearances thus far are favorable. When sufficient work will have been performed there is no doubt a good showing will be made. All surrounding this copper portion of country is completely stratified with veins bearing silver. On the south, the main difficulty has been the vast amount of water to be handled. As to the ore being in existence farther south there is no question, as the richest character of ore thus far uncovered has been in those parts. On the north of the district mentioned are situated all the big silver mines with very few exceptions, the Moulton, Alice, Lexington, Magna Charta, Moose, Amy and Silver Smith; on the west, the Burlington, Nettie, Blue Bird, Champion, Moody and Sankey; and on the east, the Park Canyon district, it is now claimed almost to a certainty that the copper belt of country extends, as is witnessed by the very recent developments in the Homestake. Some have surmised during the past that as the mines continued in depth those now silver bearing would ultimately terminate in copper, although occasionally in the big silver mines of the camp an occasional bunch of copper ore is encountered. The absolute truth has yet to be proved as to whether such be the case or not.

TO PROSPECT WITH DRILLS.—Butte *Miner*, Nov. 25: Although considerable talk has been indulged in lately by some of the larger mining companies in Butte relative to the sinking of shafts on the flat between the Silver Bow mill and the range of mountains east, no definite steps with that end in view have as yet been taken. The talk of sinking the shafts has now almost died out, but another idea has taken hold of some enterprising capitalists which will in all probability result in determining the continuity of the copper veins of this side without going to the enormous expense of sinking shafts at various points. The new arrangement is the employment of the diamond drill at various places on the flat, and the general impression is that it will determine in a short time what is underlying the flat. The parties who have proposed this means of prospecting the flat are not connected with any of the larger mining companies hereabout, and it is not yet known where their "divvy" will come in if something is struck. They are Eastern men, and claim that they can easily prospect to a depth of 1000 feet with a diamond drill. In case arrangements are made for doing the work, drilling will commence early next spring.

THE MCDERMOTT. — Deer Lodge *New Northwest*, Nov. 29: The McDermott, in First Chance district, is showing up better with every foot of development. Six men are at work drifting on the lead and they are taking out some very good milling ore.

THE MILDRED.—A number of mining men from Anaconda visited Oro Fino last Friday to look at the Mildred—among them John Earll, who, it is understood, will have charge of its development. The claim adjoins the Phœnix on the east, and in the discovery shaft, which is down 80 feet, makes a splendid showing.

THE KEYSTONE.—The recent strike in the Keystone is turning out better than at first supposed. President Sparkman took a number of specimens to Butte for assay last week and the returns ranged from 36 to 141 ounces.

THE CHAMPION.—Supt. Mills informs us that nearly three feet of splendid high-grade ore has come in on the face of the west 350-foot level. It is the finest considerable body of ore ever struck in the mine.

THE AMERICAN RUBY.—The east drift on the vein in the American Ruby is in a distance of about 25 feet, and the 20-inch streak of high-grade ore encountered on the south wall in the crosscut still holds its own. Mining men regard the American Ruby as a phenomenal strike.

SOUTHERN CROSS.—The Southern Cross company has taken an eight months' lease of the new Salton-Cameron 10-stamp mill at Georgetown, and last week the stamps commenced dropping on ore from the Southern Cross mine.

NEW MEXICO.

ORE VEINS CONSOLIDATED.—*Southwest Sentinel*, Nov. 26: The veins on Bell & Stephens' Pacific and Skillicorn & Snyder's Pacific mines at Pinos Altos have come together at a depth of about 220 feet, where there is an ore body six or seven feet in width which averages over $15 a ton. These veins are some distance apart on the surface, but the difference in pitch is such that they have merged into one vein. Only $1775 worth of bullion was shipped through Wells, Fargo & Co.'s express office from this point last week.

GEORGETOWN.—Georgetown is holding its own as the principal bullion-producing camp of the Territory. All the mines are being profitably worked. Bragaw & Schlosser's leasehold on the McNulty, Naiad Queen and Commercial mines, covering an area of about 500x700 feet, is producing good ore and lots of it. Most of the ground is sub-leased to miners and nearly every man of the 50 there at work receives three-fourths of the profits of his own labor, which is generally more than miner's ordinary wages. A carload of ore recently shipped to the Socorro smelter produced $2498, being an average of $202.50 per ton. The Mimbres Con. M. Co. is driving tunnels and crosscuts into the Scottish. Their deepest workings are about 2000 feet from the incline shaft station on the Commercial. Deemer & Acosta have a lease on a block of ground on the first level of McGregor & Grampian's mines, and are taking out considerable ore that will run over $400 a ton. Fifteen men are at work in the Reynolds' Satisfaction mine, nearly all of them being leasers. They are taking out good ore and making more than wages. Deemer & Schlosser have a lease upon a large portion of the McGregor mine, most of which has been sub-leased to others. Much ore is being taken out. The miners at Georgetown have finally got rid of the Mexican adobe smelter. Joe Schlosser gave Colorado, the smelting man, a good lease on condition that the smelter would be closed down.

DEVELOPMENT WORK.—Silver City *Enterprise*, Nov. 29: The revival of the copper market will soon set things to humming in this section. With a proper freight rate hundreds of cars could be loaded here daily with a high-grade zinc ore, which under the present tariff cannot be handled at all. George Goodwin was in from the Yankee Girl this week, having shipped about 75 tons of ore from the dump, which is now being put through the Bremen mill. Seven carloads of iron were shipped out of the city on Tuesday. The average daily shipment of iron is about three cars. Experiments have been made with this iron recently, and it is claimed that it is specially adapted to the manufacture of heavy guns. John M. Wright has gone to Carlisle, taking J. T. Reed along to run some lines on the Jim Crow, in which he has lately secured an interest. While there, Mr. Wright will let a contract to sink a main shaft and otherwise develop the property. The Pacific will pay off in a few days, and will probably resume operations in a short time. A new plant may not be erected at present, but the old one will be changed somewhat. More plates will be put in and different concentrators added. J. W. Fleming has purchased from John Wilson Howard an undivided one-third interest in the Maud S, one of the Silver creek bonanzas in which Capt. M. Cooney is interested. The property is one of strong merit.

CLIFTON.—*Western Liberal*, Nov. 29: The San Francisco mine, a copper property owned by Carrasco & Salcedo, has been sold to the A. C. Co. This mine produced in about one year and ten months over $30,000 by manual labor, no machinery of any kind ever having been used.

OREGON.

SMELTING AT MINERAL CITY.—*Bedrock Democrat*, Nov. 26: The Porphyrite smelter at Mineral City started up Nov. 3d, and with the exception of a short stoppage rendered necessary by repairs to the apparatus, has run continuously since with great success. The extraction of silver and gold is most complete. This is the first matting furnace ever introduced in the Pacific Northwest, and, as far as results go, proves equal at least to the ordinary lead-smelting process, and in its adaptability to the conditions of mining in the Northwest is infinitely superior to any lead-smelting plant, however extensive. The works have a capacity of 30 tons per day, and can be easily and quickly enlarged to twice that amount. It is highly probable that such an increase in the capacity will soon be made, for the quantity of ore now in sight in the Porphyrite Co.'s mines is thought will warrant such enlargement. The company buys all ores thus far offered, paying cash therefor, and charging the lowest rates. Mineral is now the only mining camp in the Northwest which has a cash market for its ores at home. The smallest as well as the largest lots can be sold for cash at the smelter, whose working charges are not above those of Leadville or any other mining camp. Besides, the company makes no charges for sampling.

CORNUCOPIA.—Another rich strike is reported in the lower tunnel of the Red Jacket mine at Cornucopia. A ledge eight feet in width of solid ore averaging $60 to the ton is said to be the proportions of the strike.

SPARTA.—The mining outlook of the Sparta region never looked brighter than now. It is highly probable that several wealthy mining companies will be operating there extensively before many months.

GRAVEL AND QUARTZ. — Jacksonville *Times*, Nov. 29: Some mining is being done in the bed of Jackson creek, near town. Considerable prospecting is going on in Jackson and Josephine counties. Ennis and Cameron have everything in full blast at their Galice creek mine. Considerable prospecting and locating is again being done on Briggs creek, Josephine county. Piping has been going on at Henry Ankeny's mine in Sterlingville precinct for the past few weeks. A continuation of the rainstorm, which has been raging for the past few weeks, will start operations in all the mines. A 60-foot tunnel in the Ridgway & Ewing mine on Grave creek gives indications of good returns in the near future. E. Band, who is now in the employ of the Sterling Mining Co., informs us that piping commenced at their mines last week. Kiessling Bros. of Williams creek are down 75 feet on their main shaft, and show some splendid specimens of high-grade ore taken therefrom. Green Bros. are making good headway on their shaft on Galice creek, and their ledge improves in both quality and quantity as they go down. J. T. Layton has everything in readiness for a big run at his mine on Farris gulch. This is one of the most uniformly paying mines in the county. The Josephine county mines are attracting much attention from capitalists in all parts of the coast. Since the rains seem to have begun in earnest the mining population feel encouraged. A wet winter would put many thousands of dollars in circulation, for the miners were never better prepared to do good work. John B. Irwin has discovered one of the richest free-gold properties ever found in the State, in Union county. The quantity is large, and the best judges say it is a free milling composition of at least $100 to the ton in gold. Good prospects are reported from the vicinity of the Holman ledge, in Jackson creek district. Work is still progressing there, a fine vein of ore having been struck by the tunnel run by J. H. Huffer and others. Crow & Thorndike are now sole proprietors of the promising quartz ledge discovered near Galice creek district some time since, having purchased the interest of their partners. They are working the ore in an arastra. Samuel Sterling, an old and well-known miner in southern Oregon, has struck rich placer mines on the headwaters of Coquille. He reports having also found a very rich quartz ledge in the same vicinity. The new discoveries lately made by Mr. Sterling are near the old "Johnson Diggings," located near the adjoining corners of Coos, Curry, Douglas, and Josephine counties. The rich pay gravel which is now being worked out in the Wadleigh mine on Illinois river, is directly underneath the rich diggings worked over by Wimer and others in early days, a substratum of pipe clay intervening between the two gravel beds. At the time of the cave-in recently, the Wadleigh mine had already paid a handsome dividend over and above the expense of running 30 men, not to speak of hoisting machinery lately purchased, costing nearly $4000. A person going into the drift with a candle can see the specks of yellow metal in the gravel on either side. The cave was caused by water percolating through the bed of pipe clay that now forms the bed of the river. The water can be turned out above, and the mine will soon be in operation again. The discovery of the lower deposit of gravel was a fortunate circumstance for the proprietors, especially as the claim is on school land, to which they hold title, and the sub-deposit seems to be of unlimited extent.

UTAH.

REVIEW.—Salt Lake *Tribune*, Nov. 27: The receipts in this city for the week ending the 27th, inclusive, were to the value of $143,155.12, of which $73,579.32 was in ore and $69,575.80 was in bullion. For the previous week the receipts were to the value of $64,800.37 in bullion and $75,368.17 in ore—a total of $140,168.54. The product of the Ontario for the week was in ore sales, $7520.49; bullion, 21,059.06 ounces, an approximate total of $28,579.55. The Daly output for the week was from ore sales, $4773.86. Sulphides collected for part of August, September and October, $153,258.86. The Horn Silver mine continues its moderate output, and ships the ore to Colorado. There must be a considerable surplus, perhaps $250,000, in the treasury or out on call loans in New York, and the company ought to pay a dividend. Bullion receipts in this city during the week were to the value of $38,610.48; fine bars, $8535. The Hanauer smelter produced during the week bullion valued at $11,960; the Germania, $10,463.86. Ore receipts in this city for the week were to the value of $20,116.22 by Wells, Fargo & Co.; $37,850 by McCornick & Co., and $15,613.10 by T. R. Jones & Co.

WASHINGTON.

A NEW COAL SHAFT.—Ellensburgh *Capital*, Nov. 28: Work is about to begin on a new shaft at Rosyln. It will probably have three compartments and be provided with the strongest and best machinery. The company has drilled down 580 feet, and at that depth found the coal. The shaft will be sunk that depth at once, and then the work of taking out will commence. This will necessitate the employment of a large force of extra men and Roslyn should boom as soon as it is completed. No. 3 is now working 300 men, and a lot of coal is being taken out there. The lower mines are also doing well. It is reported that a fine vein of coal has been found about a mile above No. 3. If this turns out well, Rosyln will have to look out or a big town will spring up around No. 3.

MECHANICAL PROGRESS.

Who Invented the T Rail?

When railroads first came into use the "rail" was simply a flat bar of iron laid upon a string-piece of timber. The ends of these rails were constantly working loose, and unless carefully guarded and watched, they would soon turn up and go over the wheel instead of allowing the wheel to pass over the rail. The result would be that the rail would pass up through the car and often out through the roof to the danger of the life and limbs of passengers. This trouble was soon obviated by the introduction of the T rail. The first rails of this pattern were rolled in England, and it has long been claimed to be an English invention, and was long known in England as the "Vignoles" rail, after an English engineer who claimed to be the inventor.

A late number of *Engineering News* of New York, however, contains a facsimile reproduction of a drawing, and an accompanying letter written by the late well-known engineer, Robert L. Stevens of New York, written some five years prior to the date at which Vignoles claims to have invented his T rail. Mr. Stevens was in Europe at the time after locomotives and other railroad supplies for the then Camden & South Amboy railroad, of which he was chief engineer. The address is not given, but the letter accompanying the drawings reads as follows:

GENTLEMEN:—At what rate will you contract to deliver at Liverpool, say from 500 to 600 tons of railway, of the best quality iron rolled to the above pattern in 12 or 16 feet lengths, to lap as shown in the drawing, with one hole at each end, and the projections on the lower flange at every two feet? Cash on delivery. How soon could you make the first delivery, and at what rate per month until the whole is complete? Should the terms suit and the work give satisfaction, a more extended order is likely to follow, as this is but about one-sixth part of the quantity required. Please to address your answer (as soon as convenient) to the care of Francis B. Ogden, Consul of the United States at Liverpool. I am your obedient servant,

ROBERT L. STEVENS,
President and Engineer of the Camden & South Amboy Railroad and Transportation Co.
Liverpool (month invisible), 1830.

The shape of the rail, as shown in the drawing, is almost precisely like the rails now in use, with the exception that the base is narrower. The *Engineer* says: "The width of head and form of top and corner is almost precisely what practice has approved of. In so far as we have deviated by making the head deeper we have deviated injuriously, and are coming back to his general form. The same remark applies to the thickness of the web, which we now know to be little if any too thick in proportion for proper rolling, the modern fad for thin webs having resulted disastrously. The hight of the rail is almost exactly the same as the average width of the base, as the latest practice demands, which average was adopted for the rails shortly after rolled, in response to this inquiry, although we are unable to state what was its precise width. The spacing and size of ties (which had not then even a name, but were called simply 'supports') also corresponds exactly to what modern practice has approved and perpetuated. The one thing which looks awkward about the rail section is its very flat base, although we are by no means clear that this was really ill-advised, or would be now. The shape of the head is a very good compromise between the extreme pear shape and the modern form of square head which has come in with the fish-plate.

"It is an interesting fact that the rails rolled under this first order literally 'wore like iron.' They were iron; such as could hardly be had at any price 30 years later. For aught we know, there may be some of them still in use on sidings; there were some a few years ago, and if any still exist they ought to be preserved.

"It is not often that it has been given to man to effect by a single drawing such widespread and long-continuing effects as resulted from the one we here reproduce full size."

These rails were rolled in England, brought over to this country and laid down on the Camden & Amboy road, and were the first rails of the kind ever laid down on any road, either in this country or Europe.

The Value of Silicon in Iron.

Mr. Hadfield of England, in a paper read at the late meeting of the Steel Institute of Paris, said that silicon is a "dog" which has been given a bad name. To its influence upon iron and steel injurious effects have been attributed such as it does not really exert. Any quantity exceeding 10 per cent, or up to 20 per cent at most, has been considered to be highly injurious. This blame may seem to be well deserved in the case of alloys of carbon, silicon and iron. Such alloys, as regards ductility, are untrustworthy and have very little value. The blame, however, has been wrongly put upon silicon. It is now proved that silicon alloyed with iron, provided that carbon is absent or is present only in small quantities, gives good tests as to toughness and malleability. While, therefore, it is quite true that alloys of carbon, silicon and iron are brittle and even dangerous, the presence of silicon is not the only cause of the vil. It is rather the combination of silicon with carbon and iron. However, there is, says Mr. Hadfield, some feasibility in Mr. Hawe's suggestion that possibly silicon may enter into different combinations in steel, some promoting and some impairing, the qualities of ductility and malleability. Mr. Hadfield described some specimens of forged steel, containing up to two per cent of silicon, which present a remarkable ductility and toughness. Silicon alone does not produce a steel that will harden by water quenching, in this respect resembling manganese steel.

Silicon's Effects Upon Iron.

Apparently silicon, up to 1½ or 1¾ per cent, added to iron, although increasing the limit of elasticity and raising the tensile strength, does not impair ductility. But beyond this proportion the further increase of tensile strength noticed is only obtained at the sacrifice of a serious portion of the metal's ductility. There is no sharp line of demarcation, but after about 1½ to 2 per cent are exceeded, further slight increases cause great changes in the characteristics of the material. In this respect the action of silicon rather resembles that of carbon, in contradistinction to that of manganese. Of this latter metalloid larger amounts are required to effect similar changes. The tests clearly prove that silicon does not confer the same property as carbon does upon iron, that is, of rendering it liable to harden when dipped hot into a cooling medium.

Silicon Steel.

Mr. Hadfield's experiments have demonstrated that silicon itself does not cause iron to become red short. This conclusion is plainly deducible from the fact that the whole of the samples were subjected to high heats and even to a welding temperature without falling to pieces. In this respect their behavior was not unlike that of mild steel. Its fluidity when being poured is less than that of ordinary steel. The form of fracture of the lower percentages rather resembles that of ordinary mild cast steel, but when about 2½ per cent is exceeded the crystallization becomes larger and more marked and the material is rendered very brittle. Further additions of silicon transform it into a material approaching the appearance of silicon pig iron and non-malleable. High percentages of silicon in the cast or unforged material cause a considerable increase in shrinkage or contraction.

Practical Results.

Mr. Hadfield does not claim that there is any field for the employment of such an alloy or high silicon steel as that with which he has experimented. He disclaims any other purpose for his paper than the treatment of a subject of purely scientific interest, and the chronicling of the actual effect of the metalloid silicon on iron. And he concludes with the dictum that silicon cannot take the place of carbon in iron; which assurance he supports by the statement that carbon has the two advantages of being more readily applied and of producing a material better suited to the requirements of steel-users.

Leather Ropes.

W. H. Booth writes to the *American Machinist:* During a recent tour in Yorkshire through the woolen district, I had an opportunity of seeing a fairly large installation of square ropes of leather, which were giving great satisfaction.

These ropes were built of leather strips 1¼ inches wide up to a square cross-section, every strip breaking joint. They had been running several years and had about ceased to stretch, having been shortened four or five times by seven or eight inches at a time, a total length of one yard being in all removed.

I made special inquiry into the method of splicing, and found it to be by common wood screws, simply screwed into the material. The large driving drum was 21½ feet in diameter, and the rate of revolution was 46 per minute, the speed of the ropes being only 3100 feet per minute. Formerly the speed of revolution was 60, but it had been reduced for some reason, and, though the weight turned was now much less than formerly, the ropes at the slower speed showed more signs of distress than before the reduction.

There were 16 ropes in all, and some of the ropes lay twisted in the grooves, and there seemed little or no difference whether a rope lay as intended or became twisted and riding on its corners.

The grooves in which the ropes lay did not seem to be turned square to fit the ropes, which, when not revolving round their own axis, lay with one flat side against one or other of the inclined sides of the turned grooves.

Considering the great strength of leather, such ropes seem to offer one of the best means of transmitting power between fast-running pulleys.

It seems probable also that a square rope will absorb much less power than a round compressible rope of fibrous material, which are usually made to run between the sloping sides of V grooves, and must waste much power in internal friction and differential velocity friction. In breadth of pulley-face occupied, the square rope has the advantage over double belting to the extent of fully 50 per cent, even in ropes only 1¼" square, the advantage increasing as the side of the square increases. Leather belts, too, which can be pieced by so simple a means as wood screws, are easier to splice and shorten than are ropes in which the neatest splice is either thicker or weaker than the body of the rope.

SCIENTIFIC PROGRESS.

Curious Phenomena.

Curious and unexpected phenomena, oftentimes of a dangerous character, are constantly occurring in connection with the various phases of human industries, many of which require much study in regard to their cause. A circumstance of this character recently occurred at the Frankfort shops of the West Shore railroad. A cast-iron piston 18 inches in diameter, having been worn out, was removed from an engine and thrown into the scrap-pile. Some time afterward it was taken from the pile with other scrap, and being too large to use in the cupola, was carried to the breaker. On being struck it broke in two parts and immediately began to act in a remarkable manner. The iron turned to a red heat and from that to a sparkling white, while from the hollow parts a flame arose to the hight of three or four feet, throwing out sparks as though it were filled with damp gunpowder.

The man who broke the piston became frightened and threw a pail of water on it, which deadened the flame somewhat, but it continued to glow and throw out sparks for some time, to the amazement of the 20 or more men who stood looking on.

J. R. Slack, the chief draftsman of the West Shore, has referred the case to various scientific men, but has received few satisfactory replies.

One opinion is that cylinder oil worked into the hollow part of the piston around the plugs which filled the core-holes, and under the high temperature and pressure to which it was subjected, united with some of the core sand remaining in the piston, formed a highly combustible compound, which ignited spontaneously on exposure to the air.

Another theory is that the loose core sand, being thrown backward and forward by the motion of the piston, wore off a considerable amount of iron in an exceedingly finely divided condition, which ignited on exposure.

It is well known that a great many substances, iron among others, may be so finely divided that, when thrown into the air, they will take fire spontaneously, but it does not seem possible there could have been enough atomized iron in this case to cause the excessive amount of heat shown.

Whatever the cause may have been, the facts are as stated, and it is the only case of the kind on record.

The *Safety Valve*, from which the above is copied, considers the cause of the explosion as still a mystery.

A case somewhat similar was alluded to in these columns, some time since, in which an old piston casting, which had been thrown into the scrap-heap, had suddenly burst with a loud report, but without any reported display of incandescent activity.

Explosion in a Culm Bank.

An occurrence equally sudden and unexpected with the above recently occurred in a culm bank at a colliery near Scranton, Pa. This was certainly one of the most phenomenal occurrences ever recorded in the history of coal mining, and especially in the history of anthracite mining where gases are less often met with than in mines of soft coal. We condense from *Fire and Water:* Two men were standing at the bank, where the refuse was 150 feet deep and in the act of dumping two carloads of rock. Just as one was about to be dumped, the men were almost paralyzed with astonishment at a strange spectacle which met their eyes from the culm surface below them.

For the space of 20 feet square a thousand tongues of fire were issuing from the dirt. Then the coal began to crackle, and huge streams of black smoke to soar heavenward. One of the men shouted, "My God, what's the matter?" His companion, who had a dumper, pulled out the pin and turned the dumper around on a pivot, and as the rocks struck the dirt it was noticed that the edge of the bank near the rails began to slide. When another load of rock was sent down the bank the dirt, which was rushing from the edge, stopped, and as the rocks struck the center of the flames a terrific upheaval of rock and dirt took place, but not with the slightest sound of an explosion. As if hurled from a battery of Krupp guns, a thousand balls of redhot rock went high in the air, while a river of fire ran down the bank like lightning. Then the scene became obscured by volume after volume of smoke and dirt, and a sulphurous odor arose that almost smothered the men in the bank. The smoke hid the surroundings for a mile around. The smoke followed the course of the wind up a ravine, then through a valley to Coal Run, a mile away, where a number of inhabitants had their washing hanging in their yards. The clothes were made as black as night.

When the middle of the bank first gushed forth flames, a woman was observed picking coal at the bottom, in a direct line of the course the flaming stream of fire took. It was a Mrs. Boney, and with her a four-year-old son. When she heard the man shout she rushed down the road about 50 feet, and threw her son into her door-yard. As the upheaval took place she stood safely on the road, but did not know how her son had fared. The smoke gradually cleared away, and a terrifying sight met her gaze. The fiery stream ran off the bank and had entered her yard, and for a space of 30 feet seethed and waved to and fro in a compact body three feet deep. Every moment the terrified woman expected the house to be flooded with fire and the people inside perish. Then another unprecedented incident occurred. The crater in the center of the bank received a rush of rock and dirt from the top, and the shock was sufficient to carry a volume of dirt 25 feet wide and 4 feet deep down the bank and into the yard.

When Mrs. Boney entered her home she found that her son had worked his way into the house, where Mr. Boney's mother, aged 75 years, and a number of small children were found huddled together in the kitchen almost smothered with smoke and dirt. About the premises many fruit trees were consumed. A dog in the track of the fire was cremated.

For the past 12 years dirt has been dumped upon the heap, and about five years ago, while some people were picking coal off the banks, they built a fire at the base to warm themselves. The flame ignited the coal, and the bank became a fire, burning from the bottom up, until in the early part of this summer flames appeared on the top of the pile. Four months ago jigs were put in the breaker to clean coal, and the dirt has been very wet ever since, a dumper being often half-filled with water when it was taken to the bank and dumped, the water finding its way to the fire, where it evaporated. A large hole was probably eaten in the bank where gas accumulated, and was kept in by the wet dirt, which finally became dry from the heat, thus admitting air and causing the explosion. The news of the culm bank explosion has spread through the entire coal regions of Pennsylvania, where many thousands of banks lie, and has caused great alarm, as in nearly every instance the banks are on fire.

NATURAL ELECTRICITY.—An extraordinary tale comes from Burmah. Mr. Ronald H. King, an electrician well known to the Burmese, while on a prospecting and shooting expedition in the Island of Labuan, is said to have discovered a mineral from which electricity can be obtained without apparatus of any kind whatever. The mineral is described as being in the form of a black stone, of excessive hardness and very great specific gravity, being nearly as heavy as platinum. A small block in the shape of an irregular cube, measuring 4.3 inches one way by 5.2 inches the other way, was brought away, and on bringing it to the testing-room a strong effect was noticed upon the galvonometer. At first it was thought that the mineral was an ordinary loadstone, but on tests being made it was found that the force was more akin to that of an electro-magnet, and that a strong current would flow when the mineral was connected in a circuit. Further tests revealed that a difference of potential of 47 volts could be detected at the extremities, the internal resistance of the mass being 20 ohms. The block appears to waste away very slightly, leaving a slight gray powder upon the surface when connected up for some time. The electrician now uses the block to light a couple of incandescent lamps in his laboratory.

A WOMAN'S DISCOVERY.—A woman is said to have removed one of the greatest annoyances of photography. If it were not for the time and trouble it takes to properly develop photos, amateur photography would be one of the most delightful occupations one could engage in. The cause of complaint will soon be removed, as by a recent discovery, and that by a woman, Mrs. N. Gray Bartlett of Chicago, the wife of a prominent analytic chemist, pictures can be developed without the old-time process of washing in a dark room for hours and staining the fingers. By her process there is nothing to be done but to expose for a few minutes the negative, with the sheet of paper clapped on it for a few minutes, to the light. The pictures produced by Mrs. Bartlett's process are said to have the appearance of fine etchings.

EXPERIMENTS WITH PETROLEUM VAPOR have shown that air mixed with 5 per cent of the vapor does not explode; when, however, the proportion rises to 6.25 per cent a slight explosion take place, while with 8.3 per cent the explosion becomes violent. The most violent explosion takes place, however, with from 11 to 12 per cent of vapor; beyond this limit the violence of the explosion decreases, and when the air contains 20 per cent of the vapor no explosion occurs.

IMPROVEMENT ON THE PHONOGRAPH.—In the present phonograph, a stylus for impressing the wax is attached to the center of the vibrating diaphragm. The new improvement of G. Bettini is to extend little rods from the stylus to several parts of the diaphragm. In this way greater exactness of tone and speech is obtained, so the inventor claims, and much superior results.

ELECTRICITY DIFFERENTIATED. — Some one asks what is the difference between electricity generated by chemical process and that generated by friction, magnets and otherwise? The answer given is that the difference consists in tension or potential; frictional electricity has very high tension compared with that generated by a battery.

TO DETECT CARBONIC OXIDE.—M. Racine has contrived an apparatus which indicates the presence of three-fourths per cent of carbonic oxide in the air. A mixture of CO and air will cause platinum-black to glow; this burns a thread; an electric contact is thereupon made, and a bell rings.

GOOD HEALTH.

BEWARE OF QUACKS!—Nearly every newspaper you may pick up contains the picture of the venerable looking old man, and below it the statement that he wishes to do you good by telling you how to regain lost health. In another place you may read in large letters, "Manly courage, how lost, how restored." In still another you may find the picture of two people, one beside the other, the one the picture of robust health, the other of general debility and long-time sickness. All those advertisements directed to victims of youthful indiscretion, in nine cases out of ten, are the veriest humbugs. Millions of dollars a year are thus drawn from the unsuspecting young men of the country. These vampires gather in their victims by thousands, and grow rich off the credulity of those who patronize them. Young men, if you have any disease of any kind, go to your home physician for advice and treatment, and never trust yourself in the hands of these advertising quacks. By this the *Standard* does not mean to denounce the use of a large number of standard patent medicines which are advertised in nearly all papers, but when you see advertised some peculiar specific for private disease, "advice sent by letter," etc., let that remedy alone. The quack who uses newspapers to place his specific before the people will not only take your money, but perhaps ruin your health. Go to a physician in whom you have confidence, and trust him.—*Humboldt Standard.*

STARVING A COLD.—The man who originated the oft-quoted maxim, "Stuff a cold and starve a fever," either did not understand what he was writing about or he has been widely misunderstood, to the great injury of multitudes who have acted on the absurd maxim. Presuming that the author of it was a physician, who knew something of the nature of a cold and the action of remedies, he must have spoken subjunctively, and not imperatively. And then it would read thus: "*If* you stuff a cold, the consequence will be that you will be thrown into a fever, as the *result* of the stuffing treatment of the cold, and *then* you will have to starve the fever." This is a true and sensible interpretation of this commonly received maxim, which has done as much harm as any of the thousand and one popular errors which prevail on medical subjects. * * * Without dwelling on the nature and causes of colds, or on what physicians call the pathology of these disorders, I will say that a low or even starvation diet for a few days, with the free drinking of warm, mildly stimulating teas, is better for a cold than any drug or combination of drugs. If with this a warm bath or hot foot-bath is taken, little more will be needed. Nine cases out of ten of colds can be broken up in this early stage by a hot foot or rather leg-bath, keeping the bath as hot as it can be borne until perspiration arises. After the bath, drink a half-pint of hot lemonade and go to bed.—*Woman's Work.*

PROTECTION OF THE EARS UNDER CANNON FIRING.—Dr. Samuel Sexton of this city says: "It is the experience of many officers that the vibrations of great intensity which are given off from some field-pieces and bursting shells, charged with high explosives, are more disagreeable than the heavier sounds of great guns. The metal itself vibrates under these circumstances similarly to a tuning-fork. A very disagreeable jar is imparted to the temporo-maxillary articulation when the individual is near a great gun being fired off. This is lessened, it is believed, by standing on the toes and leaning forward. Some simple precaution, to be employed by officers and men during artillery practice, would seem very much needed, since aural shock is not only painful and distressing, but orders cannot be well heard while the confusion lasts. There is probably no better protection than a firm wad of cotton wool well advanced into the external auditory canal. In suggesting this protection, it is believed that harm can seldom take place from pressure of air from within, since it is known that the violent introduction of air into the tympanum from the throat, by means of Politzer's method of inflation, seldom ruptures the drum head, though, if such a volume of air were suddenly driven into the external auditory canal, the drum-head would in nearly all cases be ruptured."—*Scientific American.*

REMEDY FOR HEADACHES.—When in certain painful affections the physician advises the use of cold applications, and if the effect from them is not pleasing, then that hot should be tried, the patient is likely to consider it rather an uncertain sort of treatment, of doubtful value either way. It is, indeed, rather a curious thing that heat and cold can often be used interchangeably with like effects. Extreme heat will destroy the skin, and extreme cold will do the same. Now, headache is sometimes relieved by hot applications, and yet in some instances it aggravates the trouble. In case of the latter, oftentimes the cold applications will effect a cure. As a general rule, a throbbing headache, with tenderness and soreness of the scalp, can best be relieved by hot applications; whereas, when the head feels full and "bursting," if cold be applied to the head, and heat to the neck and spine, the effect is most agreeable. Probably one of the best external applications which is most serviceable in the different forms of headache is menthol. A solution of that should be made in about the proportion of one drachm of menthol to ten of alcohol. It can be applied on a thin strip of cloth large enough to cover the forehead. That should be kept wet with the solution. It is very cooling, and the effect in many cases of headache is very agreeable from the first.

HOW AND WHEN TO DRINK WATER.—According to Dr. Leuf, when water is taken into the full or partly full stomach, it does not mingle with the food, as we are taught, but passes along quickly between the food and lesser curvative toward the pylorus, through which it passes into the intestines. The secretion of mucus by the lining membrane is constant, and during the night a considerable amount accumulates in the stomach; some of its liquid portion is absorbed, and that which remains is thick and tenacious. If food is taken into the stomach when in this condition it becomes coated with this mucus, and the secretion of the gastric juice and its action are delayed. These facts show the value of a goblet of water before breakfast. This washes out the tenacious mucus and stimulates the gastric glands to secretion. In old and feeble persons water should not be taken cold, but it may be with great advantage taken warm or hot. This removal of the accumulated mucus from the stomach is probably one of the reasons why taking soup at the beginning of a meal has been found so beneficial.

HOW LONG TO SLEEP.—Up to the fifteenth year most young people require ten hours, and till the twentieth year, nine hours. After that age every one finds out how much he or she requires, though, as a general rule, at least six to eight hours are necessary. Eight hours' sleep will prevent more nervous derangements in women than any medicine can cure. During growth there must be ample sleep if the brain is to develop to its full extent, and the more nervous, excitable or precocious a child is, the longer sleep should it get if its intellectual progress is not to come to a premature standstill, or its life be cut short at an early age.

THE FEELING OF NERVOUSNESS that comes over the bravest of men when at the top of a high structure, and impels them to leap down and destroy themselves, is now known as "acrophobia." The subject is attracting the attention of scientific men quite extensively, but there seems to be no very definite understanding of the cause of the disorder.

A NEW DISEASE, called photo-electric ophthalmia, is described as due to the continual action of the electric light on the eyes. The patient is wakened in the night by a severe pain around the eye, accompanied with excessive secretion of tears. An oculist of Cronstadt is said to have had 30 patients thus affected under his care in the last ten years.

USEFUL INFORMATION.

Producing Fire By Friction.

One of the first things which every child learns about fire is that certain savage races produce it by the rubbing of two sticks. Delightfully simple as the description of the process is, any one who has tried to perform the operation will certify that it is by no means an easy one, and very likely will afterward declare fervently upon oath that the thing cannot be done. Many travelers have tried under the most auspicious circumstances — in countries where the production of fire in this manner is in every-day use, with a grinning native to choose the weapons and give a practical exhibition of his own skill—and after many joint and muscle-aching experiments have given up the attempt in a state of mind bordering on temporary insanity.

"We ourselves," writes a traveler, "have been successful just often enough to understand the uncertainty of the operation. In the first place, judgment is required in choosing the sticks. The immense variety of tropic vegetation furnishes many sorts that answer the purpose, but many also that will not; and an expert sometimes may be long in finding two species suitable. One must be light and soft, the other heavy, of close texture, and both must be dry. Upon the heavy bit he cuts two grooves, in the form of a cross, fixes it tight—with his prehensile toes probably—sharpens the light bit, places it in the intersections of the cross, and twirls it steadily between his palms. Gradually tinder forms, in the shape of dust, which drops down the grooves in a tiny heap on either side. If the twirling be interrupted for a second, that represents so much waste of time, which must be recovered at enormous interest. If the heavy piece shifts, the tinder is displaced. One or other of these accidents account for the failure of the inexperienced, which is pretty certain to occur." As in all other operations of the kind, manual dexterity comes only after considerable practice. But the power of originating fire in this manner with facility is not an accomplishment possessed by every one, even in the countries where the practice exists. The inhabitants of the Tropics do not always depend wholly upon their two sticks; among many tribes they are nothing but a last resort. They have other methods of producing fire. A native carries in his "betel-box" perhaps a fragment of hard pottery and a morsel of dry fungus. Fixing a bit of the latter in the hollow of the former, and holding it down with the thumb—in such a way that it follows the edge—he smartly strikes his box, which is bamboo, of course, just as if he were handling flint and steel. The fungus-tinder is glowing in an instant.

A practice still more odd is used by some Oriental people. They carry a short stick of lead hollowed like a cup at one end, which they fill with tinder, and a small bamboo which closely fits it. Setting the stick upright in the left palm, they adjust the bamboo over it, strike smartly, withdraw it as quickly, and the tinder is alight.

The friction methods in use in different parts of the world are various. One of the simplest is with the stick and groove—a blunt-pointed stick being run along a groove of its own making in a piece of wood lying on the ground. In Tahiti Mr. Darwin saw a native produce fire in a few seconds, but only succeeded himself after much labor. This device is employed in New Zealand, the Sandwich islands, Tonga, Samoa, and the Radack islands. Instead of rubbing the movable stick backward and forward, other tribes make it rotate rapidly in a round hole in the stationary piece of wood, in the manner we referred to, thus making, as happily designated, a fire-drill. This device has been observed in Australia, Kamchatka, Sumatra, and the Carolines, among the Yeddahs of Ceylon, throughout a great part of South Africa, among the Esquimau and Indian tribes of North America, in the West Indies, in Central America, and as far south as the straits of Magellan. It was also employed by the ancient Mexicans, and Mr. Tylor gives a quaint picture of the operation from a Mexican MS., in which a man half kneeling on the ground is causing the stick to rotate between the palms of his hands.

This simple method of rotation seems to be very generally in use, but various devices have been resorted to for the purpose of diminishing the labor and hastening the result. The Gaucho of the pampas takes "an elastic stick about 18 inches long, presses one end to his breast and the other in the hole in a piece of wood, and then rapidly turns the curved part like a carpenter's center-bit." In other cases the rotation is effected by means of a cord or thong wound round the drill and pulled alternately by this end and that. In order to steady the drill the Esquimau and others put the upper end into a socket of ivory or bone, which they hold firmly in their mouth. A further advance was make by some North American Indians, who appear to have applied the principle of the bow-drill, and the still more ingenious pump-drill was used by the Iroquois Indians. For a full description of these instruments we must refer the reader to Mr. Tylor's valuable chapter in his "Researches."

These methods of producing fire are but rarely used in Europe, and only in connection with superstitious observances. We read in Wuttke that some time ago the authorities of a Mecklenberg village ordered a "wild fire" to be lighted against the murrain among the cattle. For two hours they strove vainly to obtain a spark, but the fault was not ascribed to the quality of the wood or to the dampness of the atmosphere, but to the stubbornness of an old lady, who, objecting to the superstition, would not put out her night light. Such a fire to be efficient, must burn alone. At last the strong-minded female was compelled to give in; fire was obtained, but of bad quality, for it did not stop the murrain.

A belief in the peculiar virtues of fire obtained by the friction of wood has at one time or another prevailed among all nations of Indo-European race, and not many years ago the obtaining of need (fire) was practiced in the Highlands of Scotland. One of its principal virtues has always been considered to be its efficiency against disease.—*The Fireman, London.*

LOTUS ROOTS PURIFY WATER.—*Indian Engineering* states that a large basket of the roots of the lotus has been received by the municipality of Bangalore from Tanjore, and is now being planted out in the beds of the tanks in the station. This aquatic plant is one of the best water purifiers known. It rapidly oxygenates the water, and, ridding it of its dead organic matter, brings it into a healthy condition. The presence of such like aquatic plants in reservoirs is said to diminish evaporation.

TO KEEP OFF MOSQUITOES.—Take a small quantity of a two per cent carbolic acid solution and sprinkle sheets, coverlets, pillow and bolster on both sides, the edges of bed curtains, and the wall next the bed. The face and neck may also be slightly wetted with the solution. Not a single gnat or mosquito, it is said, will come near.

FOR a cement for fastening wood to stone, melt together four pints of pitch and one pint of wax, and add four parts of pounded brick-dust or chalk. It must be warmed before using and applied thinly to the surfaces to be joined.

TO WRITE ON THE SKIN.—A Nuremburg manufacturer has invented pencils in blue, black and brown, for writing on the human skin. They are for use in anatomical and chemical demonstrations.

A COLD PLACE.—There is said to be a spot in Siberia about 30 miles square where the ground has not thawed out for the last hundred years, and where it is frozen to a depth of 60 feet.

ENGINEERING NOTES.

The Hydraulic Railway Impracticable.

A correspondent writing to the *Industries* gives the following reasons why the hydraulic railway, which has been attracting so much attention in Paris, is impracticable for ordinary railway work:

The question of first cost appears to me to be a more serious one in the case of the hydraulic railway than that of power. The rails could certainly not be made lighter, considering the bearing surface required, than ordinary rails for the same class of traffic; and it is a very moderate estimate to assume that the cost, weight for weight, would be doubled, owing to the fact of the rails being planed and jointed. Indeed, to supply the rails at double the present cost would only be possible on a large scale, and by the use of special appliances. To avoid excessive loss in the transmission of power through the water pipes, either the latter must be of a very large diameter or the pumping stations must be very close together. Either of these alternatives means a very heavy outlay. The installation, moreover, must be from the first designed to suit the maximum amount of traffic likely to occur, so that at first, and for an indefinite period, the plant would be much in excess of the requirements, and this would involve a great waste of capital. On an ordinary railway, increasing traffic can be met by proportionate additions to the rolling-stock and locomotives, receipts being more or less commensurate with capital expenditure. Probably the only way to mitigate the evil referred to on hydraulic railways would be to add to the number of pumping stations; but in almost all cases the evil would exist to a greater or less extent. A locomotive drawing a moderately heavy train is frequently called on to exert 500 h. p., often much more; and if it is assumed that on a hydraulic railway a train is of such a character that only 250 h. p. is required for its propulsion, that the available head of water is 1000 feet, and that the velocity of flow in the pipe is five feet per second, then the diameter of pipe necessary to transmit this power would be about 11 inches, on the assumption that the total efficiency is 60 per cent.

Under these conditions, only one train could be propelled at a time on each section of line between the pumping stations, and the loss of head in the pipes would be about 4.7 per cent per mile, or in two miles nearly ten per cent. If the efficiency of the turbine itself be taken at 70 per cent—an estimate which for a head of 1000 feet is too high—the extreme distance between two pumping stations must not exceed two miles. By using larger pipes, this distance could of course be increased; but then, with the assumed power, the amount of traffic possible would be reduced. With a given diameter of pipe and available head, the power which can be exerted over a certain length is strictly limited, if the efficiency is to be kept up to a definite standard. I have made the preceding calculations not on account of their absolute value, but merely to show approximately the conditions of the problem to be solved. The assumed head of 1000 feet is, I believe, greater than that which the promoters of the Girard-Barre scheme propose to adopt, and, as far as the diameter of pipes is concerned, more favorable. Where natural water-power is available in mountainous districts, the cost of the line would probably be quite as heavy as with pumping stations, since expensive reservoirs in elevated positions would be wanted for storage; and in addition to the pipes for transmission of power along the railway itself, mains would be necessary to bring the water from the reservoirs to the line. In special cases, for short lines with heavy traffic, the Girard-Barre system may be applicable; for ordinary railway work, and especially for long distances and light traffic, it is quite out of the question.

MORE WATER-WAYS NEEDED.—There is a great revival going on at home and abroad, regarding the value of canals and waterways as a means of transit for heavy commodities, such as coal and ore. The canal from the Allegheny to Lake Erie is a recent project, and likely to go through if one can judge from the efforts of the backers thereof. Governor Beaver says his idea is to make this canal a link in a grand chain of Interstate waterways from New York to New Orleans. This would be very feasible by widening the Erie Canal from Buffalo to Albany and putting in one or two additional dams in the Ohio. If this project is ever put through it will provide a route for navigation to the lakes and a pathway for King Coal to reach cheaply the market which is now most promising to him. If coal could be towed to the lake ports in the original packages as loaded in the Monongahela, it would certainly stimulate the trade of the whole of Western Pennsylvania, and even that of some parts of West Virginia. In the same line is the idea of slacking the Youghiogheny river, so that coke could be sent from the Connellsville district to many points via water, and then by taking short rail hauls, many of the places now reached "all rail" could be more easily attended to. The Youghiogheny has been slacked to West Newton, and could be slacked to Connellsville with comparatively greater ease.

THE FEDERATION OF LABOR claims 600,000 members. A strike fund of two cents a week is proposed.

Passing Events.

The heavy rains of the past week have reached all over the State, and in the higher mountains heavy snow-falls have been experienced. While occasioning some present inconvenience, the results will be beneficial, and the miners have all the water they want for some time to come.

The views advanced in his message by the President of the United States are regarded with disfavor by the silver miners; but these views, opposed as they are to those of the recent Silver Convention, bring the subject prominently before Congress and the people. Several bills were introduced the first day of the session, looking to the free coinage of silver, and doubtless favorable legislation will result.

The great fires at Lynn and Boston again bring forward the subject of fire-proof construction, and that at Minneapolis the subject of danger of high buildings. It seems impossible to construct a building which, in these great fires, is absolutely fire-proof. The big fires of Seattle, Spokane and Ellensburg on this coast were attributed to faulty construction of buildings and poor fire departments; but they had the best sort of structures in Boston, and the best fire department in the United States, with the same results.

The elevator process of gravel-mining is proving a great success at French Corral, Nevada county. The water and debris are raised perpendicularly a distance of 40 feet, and run off into settling reservoirs from which the water flows to the river in a comparatively clear state.

The President and Silver.

In his message to Congress, President Harrison touches on the silver question in such a way as to convey the impression that he either has no fixed views on the subject or else that he is trying to carry water on both shoulders so as not to give offense to either the monometallists or bimetallists belonging to his political party. He shows that of the total coinage ($343,638,001) from the monthly purchase of $2,000,000 worth of silver bullion, there was only remaining in the Treasury on Nov. 1st of this year the small sum of $6,219,577, which is neither in circulation nor against which certificates have not been issued.

With no fixed views, yet he has the following to say in favor of silver:

The evil anticipations which have accompanied the coinage and use of the silver dollar have not been realized. As a coin it has not had general use, and the public Treasury has been compelled to store it. But this is manifestly owing to the fact that its paper representative is more convenient. The general acceptance and use of silver certificates show that silver has not been otherwise discredited.

While admitting that the evil prognostications of the gold rings or monometallists have not been realized, yet he says:

I think it is clear that if we should make the coinage of silver at the present ratio free, we must expect that the difference in the bullion values of gold and silver dollars will be taken account of in commercial transactions, and I fear the same result would follow any considerable increase of the present rate of coinage.

Evidently the President is treading in the same path of the alarmists of 11 years ago who opposed the monthly purchasing and coining of silver to the extent of $2,000,000 as a minimum and $4,000,000 worth as a maximum. He unhesitatingly ignores the favorable results of the tests already made in the floating of nearly $350,000,000 in silver, and also the well-established fact that our currency is inadequate to meet our large and growing commercial wants. In attestation of the latter we cite the small amount of silver in the Treasury vaults that is not in use, as well as the following from the New York *Journal of Commerce* of Nov. 23d:

The Secretary of the Treasury has received a letter from the Merchants' Association of Boston, Mass., asking that the Secretary recommend to Congress the granting of a sufficient appropriation to secure an adequate supply of currency of convenient denominations at the Sub-Treasury in Boston. They do not ask an increase of the circulation, but desire small notes to be used in discharging their pay-rolls. There are several difficulties in the way of granting this request. First, the Treasury has only about eight millions of net silver dollars upon which small certificates could be issued. Second, whatever facilities may be granted at one sub-treasury must be granted to all. This would involve a large increase of the circulation. Third, to comply with this request would be a wide departure from the original plan of the independent treasury. These objections may be overruled by Congress, but until such additional legislation has been enacted the only way in which an adequate supply of small notes can be obtained is through the national banks at the Government rate for express charges.

And here is what the New York *Financial News* says:

Milton A. McRae, manager of the Cincinnati *Post* and St. Louis *Chronicle*, calls attention to the fact that Uncle Sam is backward in supplying the demand for the "penny." He says "there is a penny famine, and that although the Mint at Philadelphia is worked to its utmost capacity, the cry is, more." Here in Wall street we have been so pinched for dollars that we have not had time to think of pennies, but there is an urgent call for an increase of our currency. Our senators should remember we are a great growing country.

There are two other important facts that enter into the consideration of the subject. First, the gradual retirement of national bank-notes reduces the volume of currency, and they can, or at least should, only be replaced by silver certificates. This will take large sums of the latter. Second, the legal tenders issued in an emergency should now be made to give place to certificates based upon and redeemable in silver dollars, worth just 100 cents, receivable for taxes, duties and private debts. Knowing that upon demand the coin is forthcoming, no one will hesitate in accepting them at their face value. It is not a requisite that the silver bullion be coined immediately, for it could be placed in the Treasury vaults and coined at the discretion of the Treasury.

SENATORS STEWART and REAGAN have both introduced bills providing for the free coinage of silver.

Astronomical Society of the Pacific.

Another Medal Donated.

A meeting of the Astronomical Society of the Pacific was held at the hall of the California Academy of Sciences on Saturday last. In the unavoidable absence of the President, E. S. Holden, Vice-President Wm. M. Pierson occupied the chair.

Twenty-seven members were elected. Among the prominent names of the new members are to be found Miss Agnes Clerke, the author of "History of Astronomy," and Miss C. W. Bruce of New York City, to whom Harvard College Observatory is indebted for the funds for the Bruce Photographic Telescope. The total membership of the society now is 179.

A paper was read by Mr. A. D. Leuschner "On the Determination of the Relation Between the Exposure Time and the Consequent Blackening of the Photographic Film." This paper dealt with an investigation of a plate upon which a number of standard squares had been impressed by the Standard Lamp of the Lick Observatory. These squares had been given exposures of one second, two seconds, four seconds, eight seconds and 12⅝ seconds. These squares were then compared with each other and with a standard square by means of the wheel photometer of the Lick Observatory. Every precaution was taken to eliminate errors of observation in the comparisons.

An extended series of observations showed that the density was proportional to the time only between the exposures 2 seconds and 8 seconds, and with an approximation up to 64 seconds; beyond this the density was not proportional to the time. Mr. Leuschner also found that squares of the same exposure time on different parts of the same plate were not equal in density; due, doubtless, to the unequal distribution of the emulsion on the plate, and therefore the above results were derived from comparisons with the deduced mean of four squares in each case.

The principal paper of the evening was read by Mr. Barnard on some photographs of the Milky Way, the Andromeda Nebula, etc., that he had made with a large portrait lens of 6 inches aperture and .31 inches focus. This was strapped on the tube of the 6½-inch equatorial of the Lick Observatory, the clock-work of that instrument being controlled by hand with the slow motion rods at the eye-end. A star was kept bisected by the cross-wires in a high-power eye-piece on the 6½ inch itself. The additional weight of the camera made it necessary to constantly correct the clock throughout the exposures.

With this instrument a negative of the Pleiades was made on August 23d of this year, an exposure of 1h. 15m. being given. This showed the Merope Nebula conspicuously, the sharp prong of nebulosity from Electra, and some of the nebulosity about Maia and Alcyone. A negative of the Milky Way (17h. 57m. 18 9°) was made July 28th with an exposure of 2h. 35m., and another of the Milky Way (17h. 56m. 28°) on August 1st, with an exposure of 3h. 7m., and a negative of the Great Nebula of Andromeda on August 26th, with 4h. 18m. exposure.

The paper was illustrated by lantern slides from these plates. These were projected on a large screen by the oxy-hydrogen light. The nebulosities of the Pleiades were very conspicuous to the audience, and the beautiful cloud forms of the Milky Way, with the myriads of stars into which they were partially revolved, were exquisitely shown. (One of these slides is reproduced in this number of the PRESS.) The slide of the Great Nebula of Andromeda, when first projected on the screen had a mask over it with a small hole representing (to scale) the largest field of the great telescope on Mt. Hamilton; this was moved about over the slide showing successive fields of view over and around the Great Nebula. Only a small portion of the nebula could be seen at once; the mask was then suddenly removed and the entire nebula, suspended amid countless stars, flashed into view. The contrast between the limited space representing the field of the great telescope, and the sky as shown by the photographic lens, was startling in the extreme. This slide showed the great nebulous rings that were first proved to exist by Roberts. Mr. Barnard has estimated by carefully counting areas, that the original negative of the Andromeda Nebula—8x10 inches—contains 64,000 stars that can be distinctly counted. This entire plate had been reduced to a lantern slide, which brought out peculiarities of arrangement in the stars that were not suspected in the original negative. In all of these photographs the stars were perfectly round.

Mr. Leuschner also read a paper on the Orbit of Swift's New Comet, which he had completed from observations by Mr. Barnard at the Lick Observatory on Nov. 20th, 21st and 22d. He called attention to the small inclination and to the perihelion distance which were suggestive of periodicity.

After the papers had been read, Chairman Pierson announced another gift to the society of $2500, free of all conditions. This is the generous gift of Alexander Montgomery, Esq., who is a life member of the society. It has been suggested that this donation be used in establishing a permanent fund for a gold medal to be given annually for the best paper read before the society. If this is carried out, it will be the second medal of the society, Mr. Joseph A. Donahoe having established a perpetual fund for a medal for the discovery of comets after January 1, 1890.

Patio vs. Pan Amalgamation.

We recently had the pleasure of meeting a gentleman who has had an extended experience with Mexican mines and reduction works. In the course of conversation the question was asked: "How do the percentages of extraction by the patio process compare with those of pan amalgamation?" As this question has often been asked, and never, to our knowledge, definitely answered, the figures given by our informant will be of interest.

It seems that some little time ago the question of these percentages was raised between a Mexican, managing a patio, and the manager of a panmill. To settle the question, a sample lot of 50 tons was sent to the mill and an equal amount of the same character of ore worked on the patio. The *bullion* returns showed that on the patio there was saved 98 per cent of the silver and 30 per cent of the gold. In the mill 96 9-10 per cent of the silver and 90 6-10 per cent of the gold was saved.

On the patio 55.2 ounces of quicksilver were consumed per ton of ore worked, whereas in the mill the consumption was only 4 36 100 ounces. The amount of chemicals used was the same in both cases.

A general impression prevails that the Mexicans can work ore in the patio much closer than we can in the pans. In this instance the Mexicans themselves worked by the patio process, while an American attended to the pan amalgamation, so both parties were working "with their own tools," and trying to do their best. Aside from the other percentages, the difference in loss of quicksilver is quite remarkable, the American losing less than half a pound per ton of ore, while the Mexicans lost 3½ pounds.

Academy of Sciences.

At the meeting of the Academy of Sciences held on Monday evening, Dr. H. W. Harkness presided; a number of books were reported as having been added to the library by purchase and donation.

The following donations were made to the cabinet: One specimen Echinis remora (Linn.), found attached to a shark near the Sandwich islands, donated by Dr. E. S. Clark; one specimen of early stage of some Selachianoid fish, probably a ray, found in Sitka bay, Alaska, donated by Jerome B. Cox; a piece of vein matter forming a distinct cross, from a mine near San Andreas, Calaveras county, donated by Melville Attwood; collection of beetles, containing 1421 specimens of about 200 species, collected mostly in the vicinity of Oakland, the collection containing many interesting and rare specimens, donated by F. C. Torry; four skins of young auk and four sea birds' eggs (unidentified), from Alaska, donated by Mrs. W. J. Dodd.

The paper of the evening was read by the author, Vice-President H. H. Behr, entitled "The Economy of Nature as Exemplified by Vegetable and Animal Parasites."

IT seems rather unjust, after the Union Iron Works of this city have produced so fine and speedy a ship as the Charleston, that they must forfeit $33,384 penalty for lack of specified horse-power, and $3500 for delay in completion.

Relieving Tuyeres of Slag.

In the PRESS of last week cuts were shown of a three-inch tuyere slagging-valve, used at the Warwick furnace, as described by Mr. Edgar S. Cook of Patterson, Pa., before the American Institute of Mining Engineers. The cuts on this page show the large, or six inch, slagging-valve.

Flushing can be done through the tuyere slagging-valves with the same facility as through the cinder-notch. It occasionally happens, even in a furnace working well, that a pocket forms under or around a certain tuyere, so that when the engine is stopped, this tuyere is sure to fill with slag. When this condition is known to exist, it is only necessary to throw the blast off the furnace, open the valve of the tuyere, and put the blast on again blowing slag out and then stop the engine.

In addition to the uses mentioned in the PRESS last week, it is found that the tuyere slagging-valves supersede the "pricking" of the tuyeres, and answer the purpose far better. A pricking rod is now used only when a large, hard lump obstructs the nose of a tuyere, which rarely happens. In order to keep the valves in good working order, it was the custom to open them regularly once or twice per turn. In so doing, it was noticed that the tuyeres kept cleaner and brighter than heretofore. Besides, they never before made so much iron in the same time. A clean, bright tuyere will certainly melt more material per hour than one furred with dirt. The frequent opening of the slagging-valves removes the dirt deposited in the belly-pipes from the gas and the infusible dirt that collects around the nose of each tuyere.

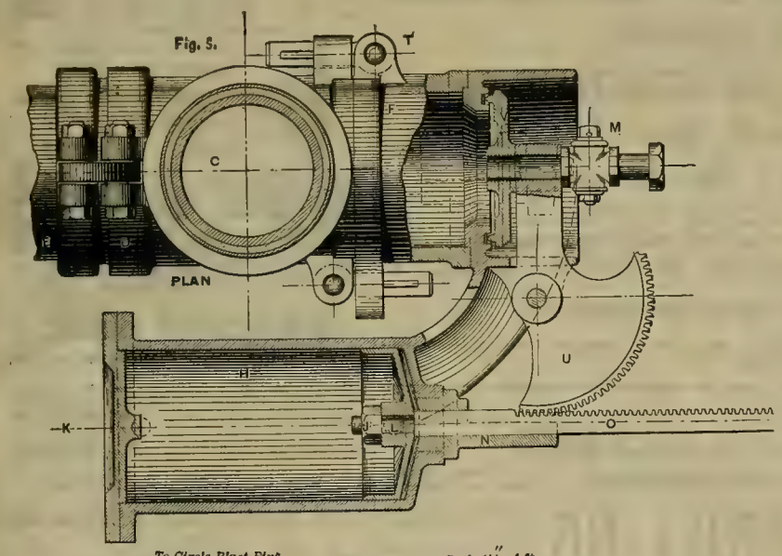
In the form of six-inch valves shown in Figs. 5, 6 and 7, it will be seen that the valve *V* replaces the ordinary swinging cap, and carries the eye-hole *M* and the pricker-hole *W*, the latter being closed by means of a full-way valve, instead of lever and ball. This valve is located on the front tuyere, directly over the iron notch, and is made to replace the ordinary cap, the eyesight and pricking-rod holes being in the valve. It can be easily opened to change nozzles. It is safer to operate a valve of this size independently of the others. Its cylinder is connected to the blast-pipe by a separate one-inch pipe.

It is considered that the six-inch valve would be of more value than the three-inch one, chiefly in extreme instances of the chilling of the crucible and a large accumulation of dry ore-dirt in the furnace. As now constructed, the three-inch tuyere slagging-valve can be placed in position in about five minutes, everything being got ready before the stoppage of the furnace after a cast. A circular casting, about 11 inches long, of the same internal and external diameter as the elbow-casting of the belly-pipe, is keyed to the elbow in place of the cap, the cap being transferred to the opposite end of the valve-casting. In other words, the ordinary elbow is lengthened by a separate casting 11 inches long. The air-cylinder is permanently attached to this circular casting, carrying the sector and the rack-extension of the piston-rod operating the valve, the valve itself being on the lower side of the casting. The seat of the valve is made detachable, so that it can be renewed should it become worn or cut by the action of the slag.

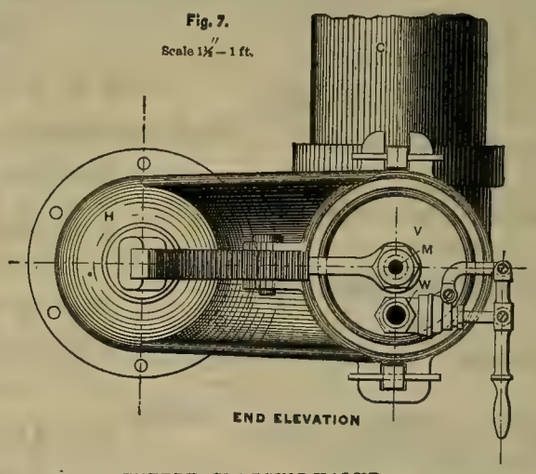
Recently they allowed considerable slag to accumulate in the furnace. By simply operating the three-way cock of the six-inch slagging-valve, they flushed through the belly-pipe and valve without any injury either to the pipe or valve. A very slight shell of chilled slag remained in the pipe. The valve was closed easily and tightly by reversing the cock.

On another occasion, shortly before the regular time for flushing, the engine suddenly stopped, in spite of the efforts of the engineer to keep it moving. A joint in the steam-pipe had

THE "SURE GRIP" TACKLE-BLOCK.

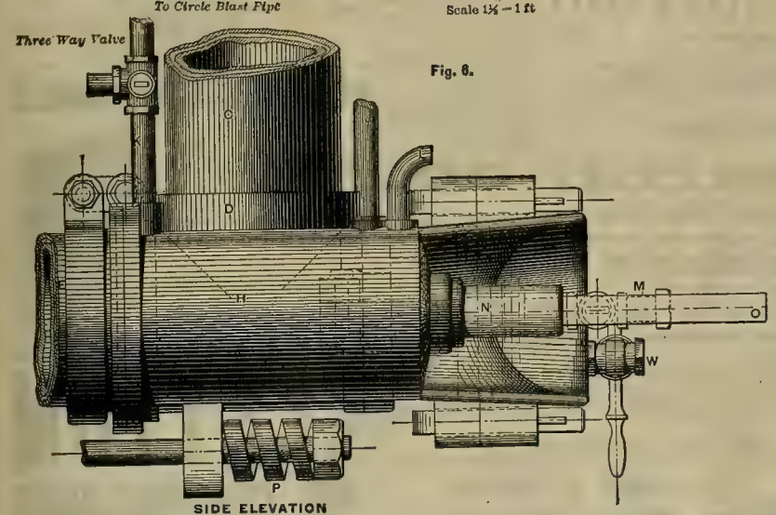


slag in the pipe, draining itself and also the adjoining pipe, the only one on which they had not placed a slagging-valve. The three-inch valves were opened as quickly as possible by the keeper, by means of a small bar, no air-pressure being in the pipes. From each, the slag flowed without difficulty. The delay in opening the three-inch valves caused a more or less heavy shell to form in the pipes, in contract with the six-inch valve, which opened of itself and left but a light shell in its belly-pipe. In half an hour's time all the pipes were perfectly cleaned and they started up again. But for the slagging-valves, the pipes would all have been completely filled with slag, which would have solidified before it would have been possible to remove it by means of the ordinary swinging caps, thus entailing a stoppage of four or five hours. Such a long stoppage, coming unexpectedly, might, under some conditions, cause much trouble and additional expense.



An Improved Tackle-Block.

A cut given herewith shows the Detroit "Sure Grip" steel tackle-block, which will hold the load at any point without backward slip, thus enabling a man to hoist with less than the usual exertion. It is not a chain tackle, an ordinary rope being used. There is a wedge-shaped brake in the upper portion of the block. The two center ropes running in contact with the wedge, always travel in the same direction at the same time. The brake thus has a double grip and is positive and automatic. Its efficiency increases in direct proportion to the increase of load; at the same time it is susceptible of being disengaged by very slight pressure, the cord and lever controlling it. This device is very desirable when it is of advantage to hold a load suspended for a time. The Parke & Lacy Co. are agents for this coast.



The "Milky Way."

In the present number we reproduce a portion of a negative taken at the Lick Observatory by Mr. E. E. Barnard on July 24th last. It shows a portion of the Milky Way in the constellation Sagittarius; right ascension 18h. 10m.; declination—20°. For this we are indebted to the courtesy of Mr. Chas. Burck.

TUYERE SLAGGING-VALVE.

SIX-INCH TUYERE SLAGGING-VALVE FOR FURNACES.

A PORTION OF THE MILKY WAY.

appears in this issue. The lantern slide (3¼x 4¼) contains less than a quarter the area of the original plate, and therefore covers about four square degrees in the sky. In this area the original plate shows about 4000 stars, none of which are brighter than the fourth magnitude. It is unnecessary to add that all the fainter stars have been unavoidably lost in the processes necessary to produce the cut, but the chart as rendered is interesting not only as showing the curious arrangement of the stars in space, but especially as exhibiting the general character of the maps obtained by means of photography. The least negligence of the observer (during the whole three hours of exposure) in watching the performance of the clockwork which was driving the equatorial to which the camera was attached would have ruined the sharpness of the picture, yet it can be seen that all the star images are perfectly round and distinct. During the whole time Mr. Barnard's eye was literally "glued to the telescope," and the slightest irregularity in the motion was immediately corrected by means of the slow-motion screws.

PRACTICAL

Books on Mining
AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warnford Lock. 733 pages, with 8 plates and 271 engravings in the text. 4to, cloth, $15.00, express prepaid.

IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Ross. This work embodies the information, collected during four and a half years, of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrages, flood protection, methods of regulation, locks, etc., have been treated in detail. 367 pages, large 8vo, with 26 plates and numerous engravings in the text. Price $15.00, express prepaid.

MEXICAN MINES.—Dahlgren's Historic Mines of Mexico, *only a few copies left;* price $25.00. Handbook to the Historic Mines of Mexico, price $1.00.

Descriptive Catalogue and Circulars of Books relating to Assaying, Mining, Electricity and Mechanical Engineering, sent free on application.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING NOV 29, 1889

416,028.—MATCH-MAKING MACHINE.—W. Bend, Portland, Or.

415,812.—WAVE-POWER.—A. W. Dow, S. F.

415,969.—CONCENTRATOR.—Geo. Gates, Drytown Cal.

416,000.—SAFETY DEVICE FOR ELEVATORS.—John Hatch, S. F.

416,112.—SAFETY DEVICE FOR ELEVATORS.—E. Lamoree, S. F.

416,004.—ADJUSTABLE WINDOW SASH.—Chas. Megow, S. F.

415,978.—CARBURETOR FOR GAS ENGINES.—D. S. Regan, S. F.

416,017.—DIE FOR MAKING ENGINE SPRING ENDS.—Geo. H. Smith, Sacramento, Cal.

415,800.—GANG PLOW.—H. Squire, Stockton, Cal.

416,021.—CONCENTRATOR.—C. H. Voll, S. F.

415,934.—SHIPPING-BOOK.—G. H. Wheeler, Tacoma, Wash.

17,218.—TRADEMARK.—Crocker & Co., S. F.

The following brief list by telegraph, for Dec. 3, will appear more complete on receipt of mail advices:

California—H. G. Blasdell, Oakland, ore-concentrator belt; F. Ellis, San Francisco, gas governor; J. W. Gentry, assignor of two-thirds interest to G. A. Loring and W. H. Terry, Oakland, cable grip; William Grath, San Francisco, stamp-canceling and post-marking machine; W. W. Hanscom, deceased, A. P. Hanscom, executrix, San Francisco, air-brake and relief-valve; Abel Henning, Oakland, assignor of one-half to A. M. Bolt, Alameda, and T. F. Lint, San Juan, oil-gas apparatus; H. P. Holland, San Francisco, ore concentrator; B. Holt, Stockton, feeding mechanism for harvester and thrasher; T. J. Hubbell, assignor of one-half interest to W. H. Wolf, Santa Clara, universal ladder; N. S. Keith, San Francisco, regulator for electric motors; W. N. Laufenberg, Stockton, grain-separator and cleaner; R. G. Longherry, San Francisco, address tag; J. D. Morgan, Ventura, agricultural machine; J. H. Scott and S. Nelson, San Francisco, collar-fastener; C. S. Webber, San Jose, stringing pianos; A. A. Wentworth, Merced, necktie fastener.

Oregon—J. B. Irvin, Sparta, ore concentrator.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DIE FOR MAKING ENGINE SPRING ENDS.—George H. Smith, Sacramento. No. 416,017. Dated Nov. 26, 1889. The invention relates to the making of the ends of locomotive springs so as to connect them with what are known as the "spring hangers." It consists in a means for forming suitable lugs upon the ends of the back or main leaf and in shaping and slotting these ends. The long or first leaf of the spring is called the "main" or "back leaf," and in order to connect two or more pairs of springs with equalizing levers, so as to distribute the strain through both springs, it is necessary to connect the spring with the equalizing levers by means of links, and in order to retain the links in place and prevent their slipping upon the spring, the ends of the main leaves of the springs are provided with lugs which engage the links and hold them in place. These ends are of three kinds, two of them having half-round or concave bearings, one being slotted and the other solid, and the third being what is known as a "flat bearing." This invention is designed to form these ends.

CONCENTRATOR.—George Gates, Drytown, Amador county. No. 415 999. Dated Nov. 26, 1889. This is one of that class of machines for concentrating ores in which the separation takes place upon a concentrating table to which is given a jarring movement. The table has its surface divided into a number of independent inclined parallel runs or channels, and having a jarring motion at right angles to the flow of material. The feeder is at right angles to the table, with passages of regularly increasing lengths, by which the material is directed into the runs or channels in the table. There are perforated water-pipes on the same side of said runs or channels for discharging water into them.

CARBURETOR FOR GAS ENGINES.—Daniel S. Regan, S. F., assignor to himself and Sanford S. Bennett of Alameda. No. 415,978. Dated Nov. 26, 1889. This improved carburetor is designed specially for use in connection with an explosive-vapor engine. The object of the invention is to provide a device for charging atmospheric air with the vapor of a light hydrocarbon liquid, and transmitting this vapor directly to the engine cylinder, within which it is ignited and exploded so as to propel the piston of the cylinder, said piston acting as a pump during alternate strokes, by which a sufficient quantity of air is drawn into the carburetor by the vacuum produced by the movement of the engine-piston to form a single charge for the engine, the carburetor ceasing to act immediately upon the stopping of the engine.

ORE CONCENTRATOR.—Chas. H. Voll, S. F. No. 416,021. Dated Nov. 26, 1889. The invention relates to one of that class of ore-concentrators in which an endless traveling table is employed, and it relates specially to that subclass in which the concentrating table consists of a blanket carried by an endless traveling bed. The patent covers a number of details, the main thing being the endless traveling bed for supporting and carrying the blanket, composed of rigid, separated or spaced slats, having enlarged heads or ends with inclined inner surfaces for inclining the sides of the blanket, said heads or ends being connected by pivoted links and having notches in their bases, sprocket-wheels engaging the notches to drive the bed.

SAFETY DEVICE FOR ELEVATORS.—John Hatch, S. F. No. 416,000. Dated Nov. 26, 1889. This safety device is designed to gradually stop the movement of the elevator car upon the breakage of the suspending cable. The inventor provides clamping-shoes which serve to guide the cage and prevent it from swinging from side to side in the guides, and which are connected with an automatic mechanism on the cage or car. In case the cable breaks, these clamping-shoes grasp the opposite edges of the guide-timbers in such a way that there is no tendency to separate or spread these guide-timbers. The heavy weight or pressure of the clamping-shoes on the guides will be such as to gradually check the motion of the cage and finally stop it.

ADJUSTABLE WINDOW SASH.—Chas. Megow, S. F., assignor of one-half to John L. Anderson. No. 416,004. Dated Nov. 26, 1889. This invention relates to that class of window-sashes which are pivoted at their sides, whereby they are adapted to be reversed to permit ready and easy access to them from the inside for the purpose of washing them; and the invention relates particularly to that class of these pivotally-adjustable sashes in which the inside and outside beads and the intervening parting strips are themselves pivoted, so as to adapt them to be thrown backwardly in the window-casing or frame, thereby freeing the sashes. The object is to provide a simple and easily operated window, the sashes of which can be readily reversed to permit them to be reached.

The Power of Niagara Falls.

To be Utilized by a California Invention.

The famous Niagara Falls, it is estimated, would, if fully utilized, afford all the way from ten to fifteen million horse-power—probably enough to run all the machinery in the New England States. The magnitude of the undertaking, as well as the fact that no water-wheel has ever been found adapted to such conditions, has heretofore discouraged any attempts to make use of this stupendous power. Turbine wheels, it is well known, cannot be operated under any such head as these falls afford, their usefulness being limited to heads ranging from 10 to 30 and 40 feet, and as there are many other streams from which this much fall can be obtained, that do not present such difficulties of application, the great wealth of energy Niagara affords has been allowed to run to waste.

The remarkable results obtained from the Pelton wheel on the Pacific Coast has attracted the attention of many of our most eminent engineers with reference to its application to the falls above referred to, and an examination of the extraordinary conditions under which many of them are being successfully operated clearly indicates their adaptation to such purpose. The means of utilization being thus determined, the problem presents no insurmountable difficulties.

A commission from the Canadian authorities, consisting of a member of Parliament and several noted engineers, recently visited the Pacific Coast to investigate the merits of this wheel with reference to its adoption in various enterprises projected in the Provinces, but more particularly for purpose of utilizing the water-power of Niagara Falls from the Canadian side. The result of the investigation was satisfactory in the highest degree, and will undoubtedly result in the first attempt to make this gigantic force available for manufacturing and commercial purposes. The members of the Commission were of the unanimous opinion that by means of Pelton wheels it is practicable to utilize to a very considerable extent the energy these falls afford, and that the project, stupendous as it is, involves no greater engineering difficulties than are encountered in many of the great enterprises now under construction in various parts of the world.

The hight of Niagara Falls is 164 feet. By piping water a distance of about three-quarters of a mile to a point below the rapids, a fall of 240 feet can be obtained. This entire fall it is proposed to utilize, placing the wheels above high-water mark along the bank of the river and locating various manufactories on accessible sites above, the power from the wheels to be carried up by a system of cable transmission. Anywhere from 100,000 to 500,000 horse-power can, it is estimated, be obtained in this way without any appreciable loss in the current which sweeps along with such irresistible force.

In addition to local manufactories, dynamos will be run to supply power and light to the adjacent towns and cities, as also to transmit electrical energy for power and light to the cities of Buffalo and Toronto, which are only about twenty miles distant.

The project, though one of great magnitude, is now believed with the means at hand to be perfectly practicable, and the utilization of these great falls, about which there has been more discussion than any other problem of modern times, seems about to be realized.

Mining Personals.

John Palmer, formerly superintendent of the Grover and Bunker Hill mines, Amador county, is now superintendent of a mine in Kern county called the Glen Olive. It is situated from 8000 to 9000 feet above sea level, and 18 miles from a postoffice. The ledge is am l—two feet wide—and the rock is worked by two arastras, crushing about three tons per day. The rock yields from $40 to $60 per ton. Everything freezes during the winter, so as to prevent the running of the arastras.

Mr. Woodbury returned to Sonora from the New Albany mine a few days ago, where he has been superintending the erection of two Woodbury concentrators. The mill is now steadily in operation.

E. W. Roberts of this city has been examining mining properties in Tuolumne county.

E. C. Van Blarcom, who is operating a mill on the Bosse system at Pachuca, Mexico, is back in San Francisco on an enforced vacation. Mr. Van Blarcom had the misfortune to have his hand injured while at work at the mill, and has had to have one finger amputated. He will be here a couple of weeks and then return to Mexico.

R. A. Penrose, Assistant State Geologist of the State of Arkansas, is engaged in inspecting the manganese ore deposit found on the headwaters of Mark West creek, not far from Santa Rosa.

Mr. J. J. Smith, the successful manager of the Golden Monarch Mining Company, with basis of operations at Clear Creek, Baker county, Oregon, and who is also manager of the Milwaukee Mining Company, with mines located in Shoshone county, Idaho, has gone to Milwaukee to lay before his company the importance of having more extensive milling machinery on the Golden Monarch mine. At present they are working five stamps with very satisfactory results, but with the addition of five or ten stamps more they would then be able to not only mill their own ore but do custom work, a very important item. Another object of Mr. Smith's visit East is to place with Eastern capitalists a tract of placer ground, consisting of 200 acres, situated in Granite mining district, Oregon, one of the richest placer gold diggings on the coast.

The Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

MINERS AND SALOONS.—A correspondent of the Redding *Free Press*, from Custer, Idaho, says: "Nearly all the mines about Custer are shutting down, and the men right in the beginning of winter are forced to leave and hunt new jobs. Many of them I have seen carrying their blankets out on their backs, and that, too, after they have worked, perhaps, six months at $2 50 a day net. They ought to have money, but they have not. The ten saloons of this little place of 200 inhabitants, and the numerous well-fed gamblers, tells the tale of the honest workingman's foolishness."

Ticket-Holder for Piece Goods.

Samuel Bauman of Santa Cruz has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a device for marking goods in dry-goods stores, such as are known as piece goods. He terms the device a ticket-holder, and it consists of a plate folded to fit the end of the board on which the goods are rolled, and having a slot in which the ticket or card may be slipped. The device is shown in a cut on this page.

What are known as piece goods are usually rolled upon boards, and being laid upon the shelf with the ends presented to the front, it is difficult to properly mark the goods so that their price, number, etc., may be seen at a glance. The plate devised by Mr. Bauman has its sides triangular in shape and folded so as to just slip over the end of the board on which the goods are to be rolled. The plate is secured to the board by spurs which engage with the wood. At the point where the plate is folded over the end of the board, slots are made, forming tongues which are raised from the surface of the end of the plate so as to admit the ticket or slip upon which the necessary figures and words are printed. The ticket slips into the space beneath the strips. Upon these slips are printed the matter that is necessary to identify the goods, giving number, price-mark, etc., and the slips are easily introduced and removed at will. When the goods lie upon the shelves these slips are permanently exposed, so that they can be easily read at a glance. The plate also prevents the end of the board from splitting.

Assessment Notices.

Booth Gold Mining Company. Location of principal place of business, San Francisco, California. Location of Works, Auburn, Placer Co., Cal.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 23d day of November, 1889, an Assessment, No. 4, of Two(2) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room No. 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of January, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. R. SPINNEY, Secretary,

Office, No. 310 Pine Street, Room No. 23, San Francisco, California.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company, Location and principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE.—There are delinquent upon the following described Stock, on account of Assessment (No. 15), levied on the 16th day of October, 1889, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.

PACIFIC IRON WORKS

1850. 1888.

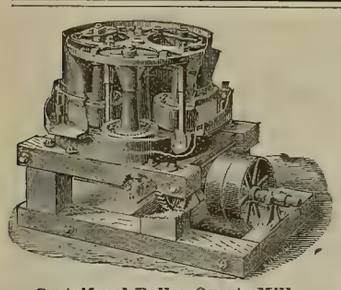
BUILDERS OF

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

THE RUSSELL PROCESS COMP'Y.

TALCOTT H. RUSSELL, Secretary,
NEW HAVEN CONN.

P. O. Box 496.

Smelter For Sale or Exchange.

One 50-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

AMALGAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers. Cornish Crushing and Finishing Rolls. Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❋ BOILERS HORIZONTAL, VERTICAL ... AND SECTIONAL. ...

IMPROVED STEAM STAMPS

Hoisting Engines, Safety Cages, Safety Hooks,

ORE CARS, WATER & ORE BUCKETS,

Air Compressors, Rock Drills, Etc.

GENERAL MILL AND MINING SUPPLIES, ETC.

Sectional Machinery FOR MULE-BACK TRANSPORTATION.

Pumping Engines and Cornish Pumping Machinery,

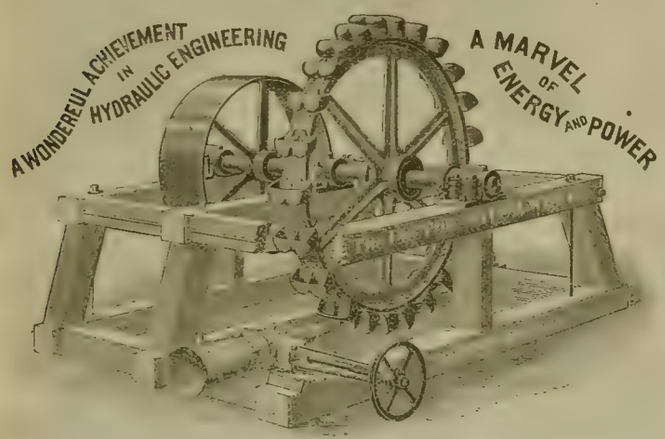
IMPROVED WATER JACKET

Blast Furnaces for Galena & Copper Ores,

SLAG CARS AND POTS,

Roots & Baker Pressure Blowers,

SUSPENDED TRAMWAYS.



General Offices and Works: FULTON AND UNION STS., CHICAGO, ILL.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.

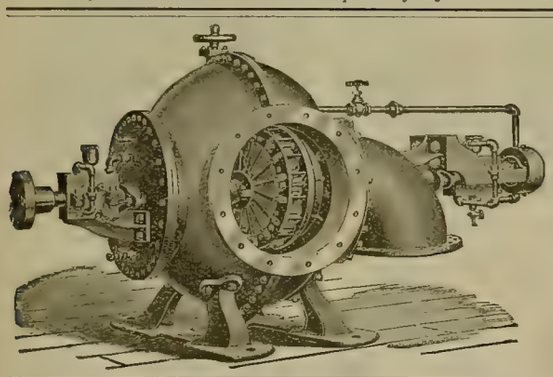
Adapted to heads running from 20 up to 2,000 feet.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS



Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

120 FIRST ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Morgan Crucible Co., London, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 5, 1889.

General trade for the season continues fair. As usual, as the year draws toward a close, more apathy is felt in all lines, owing to the desire of merchants to close up their yearly business. The money market is easy, with no particular call from any quarter for accommodations. The reserves in banks are not only large but increasing. Much of this no doubt is being drawn together for disbursement next month on interest and dividend accounts. Remittances from the interior are fair.

The steamer City Rio de Janeiro, hence Dec. 3d for China, took out the following treasury shipment:

Mexican Dollars	$369,928
Gold Coin	21,190
Gold Dust	2,808
Silver Bullion	448,500
Total	$842,426

The bank shipments were as follows: To Japan, by the Anglo-Californian Bank, silver bullion, $48,500; by the Hongkong & Shanghai Banking Corporation, silver bullion $400,000, Mexican dollars, $44,000. To Hongkong or Yokohama, by the Anglo-Californian Bank, Mexican dollars, $57,000. To Hongkong, by the Bank of California, Mexican dollars, $150,000; by Wells, Fargo & Co.'s Bank, gold-dust, $2000. The balance was shipped by Chinese.

MEXICAN DOLLARS—The demand the past week was fairly active for shipment to China; prices ranged from 77⅝@78c., closing at about 77½@77¾c.

SILVER—The market held steady at 97@97¼c. up to Monday, when 97½c. was bid and 97¾c. paid for immediate delivery; but yesterday the market was irregular at 96½@97c. The advance was in sympathy with higher prices abroad, owing to a freer demand. The decline was due to the President's ambiguous, unsatisfactory and straddling attitude toward silver. It is very generally conceded that the set-back is only temporary, for Congress will undoubtedly pass some kind of an Act that will give more protection to this leading industry. What it will be no one at present has any fixed opinion, but that relief will be afforded is admitted by all. The proposition of the Secretary of the Treasury to allow the free depositing of bullion at the mints and the issuance of certificates against it at the market value up to one dollar an ounce, fine, and making the certificates redeemable either in gold or silver coin, will unquestionably find advocates with a large class. This, or a similar kind of compromise, with proper safeguards, may be passed by Congress. If such is done, it is only a question of time when it will give way in turn to free coinage. When a full copy of the Secretary's report to Congress is received, a fuller and much clearer idea of his position can be obtained, and will admit of being criticised intelligently. English mail advices report that the exports of silver from that country promise to be fully £8,000,000 for the calendar year—a larger amount than since the phenomenal year of 1884.

London cables came through to-day (Thursday) quoting silver 925 fine at 43¾d; New York quotations came through at 94¾c, while our market is quoted at 95⅛@96c, with no business. Yesterday the Government bought at 96½c. Holders look for better prices again. The next steamer leaving for Japan and China is announced to sail on Dec. 14th, so that export buyers are not anxious at present.

QUICKSILVER—Receipts the past week aggregate 375 flasks. The market continues steady. The outlook is of the most flattering character for a large increase in the consumption.

ANTIMONY—The market has made another advance in sympathy with the East, where a scarcity is reported.

BORAX—Receipts the past week aggregate 375 ctls., and shipment by sea 19,684 pounds to New York and 650 pounds to Mexico. The market is reported steady at current quotations.

LIME—Receipts the past week aggregate 4659 barrels, and exports by sea 350 barrels to Honolulu. The consumption is not only light, but promises to decrease still more in the near future, owing to stormy weather.

LEAD—The market has a firmer tone, notwithstanding the President's remissness in not touching on the Mexican ore importations. There appears to be a feeling that favorable action will be taken by Congress looking to increased duties.

TIN—Imports the past week embrace 481 boxes plate from Rilvardo. The market is reported unchanged. Prompt shipments and consignments to arrive are very firm at the higher quotations. Spot is dull and barely steady. The European and Eastern markets are tending up.

COPPER—The market has made another advance. Our mail advices report that the upward movement is due to the manipulation of the French, who are largely interested in stocks that are affected by the price of copper. Our exchanges, while expressing satisfaction at the advance, nevertheless advise caution, fearing that the rise has been too rapid to warrant a belief in its stability, owing to consumption falling off and the output of the mines being increased.

IRON—Imports the past week were 400 tons pig iron from England and 150 tons from Irondale. Late English and Eastern advices report the markets steady at previous quotations. The high price to which all grades have been sent, together with a closer money market, naturally warrant conservatism; although all advices tend to show that the consumption the world over, for the next few months, will increase rather than decrease. The higher price abroad has not been confined to England, for Germany, Austria, and other countries report rapid advances. In our market, quotations are unchanged, with holders very firm in their views, and predicting better prices in the near future.

COKE—Imports the past week aggregate 2069 tons. The market is well supplied, but stocks being well held, prices are unchanged.

COAL—Imports the past week aggregate as follows: From Coos Bay, 1100 tons; Nanaimo, 2996; Newcastle, N. S. W., 14,480; Sydney, 2000; Seattle, 558; New York, 105; Philadelphia, 199; overland, 21; Departure Bay, 1200; total, 22,640 tons.

The yards are well stocked, and as the weather is still mild, the consumption is light for the season. While dealers are still confident, yet there are signs of an easier feeling for spot, but for Australian just shipped or to be shipped, full prices are asked. Owing to high charters outward from Australian ports, a lower range of values could not be expected. The market for spot and near-by receipts depends largely on the character of the weather from now on.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Dec. 5, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	..	..	$.....	$....	$.....
Friday	44 3-16	96	13 90	3 92½	21 30
Saturday	44 3-16	96	14 10	3 85	21 35
Monday	44⅜	96½	14 15	3 85	21 35
Tuesday	44⅜	96⅝	14 15	3 85	21 45
Wednesday	44½	95⅞	14 00	3 85	21 30

NEW YORK, Dec. 4.—Borax steady at last rates. Quicksilver, 68@70c for trade wants. Copper with little addition to current supplies continues to advance. Lake closes at $14 paid; Arizona, $12.75@13; casting, $12@12.25. Foreign markets strong and higher. Lead moves better at $3.80 bid and $3.85 asked.

Mining Share Market.

The market for Comstock shares on Friday, Saturday and Monday had quite a setback, averaging about ten per cent. The decline was engineered by the pool so as to uncover margins and also get in all the stock possible from frightened outside holders who have their holdings paid for. Indifferent to bad reports from the mines were set afloat, as were also reports of assessments to be levied on Crown Point, Ophir, Mexican, Confidence and Challenge. With the financial statements making a poor showing, outside dealers were confirmed in their opinion of assessments to be levied. These statements were, in some instances, made as bad as they could, for what purpose each reader must form his opinion. Now that prices are down, all reports are bad, whereas a short time ago, when stocks were selling at double to-day's prices, everything was gilt-edged. Many brokers have been closing up accounts and report few, if any, stocks on hand. In outside stocks the market has hung fire, with the Tuscaroras on the down-grade. Even Bob Keating's glowing reports of Commonwealth did not brace up prices.

The monthly financial statements of the mines, given elsewhere, show an indebtedness for Crown Point, when in reality the company, after the November bullion is received, will probably have fully $15,000 on hand. Savage will also have money on hand. The bullion production of the mine was, last month, over $30,000, with over $50,000 to come in on assessment. Hale and Norcross crushed 3900 tons of ore last month, averaging over $30 a ton battery assay. Chollar will also make a good showing. When all the returns are in from the mines, they will make a favorable showing and induce buying from a good class of purchasers, notwithstanding the fact of reports being out that when Col. Mackay left he stated there would be nothing until he returned. Louis Sloss is also reported to have said the same thing regarding himself and the market, which was finally capped by Capt. Voll, the spiritualistic mining-stock operator, who stated that there would be nothing until *he* returned.

From the mines there is nothing new to report from private sources. Attention is drawn to the pumping of the Gold Hill mines. As near as we can learn, the water will at first be pumped down below the 1700 or 1800 level, where it will be held and the levels from the 1700 up to the water-level be explored, and if the prospects justify, then more powerful pumping machinery will be put in and the mines drained to the lowest level. On the levels extending from the water-line down to the 1800-foot, the better-informed mining men claim that there is a body of good milling ore, particularly in Crown Point and Yellow Jacket.

Relative to the value of Crown Point and Yellow Jacket on or about the water level, we learn that Gov. Stevenson in the Kentuck trial held in December, 1888, testified that he (Stevenson) ran a drift from Crown Point through Kentuck (95 feet) and connected with Yellow Jacket on the 1300-foot level. A crosscut was made east from this drift 200 feet long, which penetrated 25 or 30 feet of white quartz, value $10 or $12 per ton, 90 per cent of which was gold. The Governor did not think this gold ore, which worked in his mill about $10 per ton, would pay. California mines make a profit out of gold ore worth $2.50 per ton.

The news from the Middle and North End mines is of an encouraging character, and promises are held out with further work of the most flattering character. Work in and around the Ward shaft is still attracting attention.

From the outside mines the news from the Quijotoas and Tuscaroras continues of the same heretofore rosy character; while from the Bodies, that astute mining man, Capt. John Kelley, reports work on all the levels, upraises, etc., being driven ahead. From the fact that the captain is down here a large portion of the time, the disappointed miners in that district must be doing some driving on their own account.

WORK on the large cantilever bridge over the Colorado river, nine miles below Needles, is being pushed forward with all possible dispatch. A dynamo has been put up so that men can work at night. The main span will be of steel and 660 feet long.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
M. D. SHRADER—Santa Clara Co.
W. W. THROBALDS—Los Angeles Co.
E. FISCHER—Central California.
GEO. WILSON—Sacramento Co.
E. H. SCHAEFFLE—Fresno Co
C. EDWARD ROBERTSON—Humboldt Co.
FRANK S. CHAPIN—Butte and Yuba Cos.
WM. H. HILLEARY—Oregon.
E. E. DEMING—Oregon.
W. B. FROST—San Luis Obispo Co.

THE ore deposit about to be worked in the Boston and Montana mine, through the means of a tunnel nearly completed, is estimated to contain 800,000 tons of ore, worth $23 200,000.

BUTTE, MONTANA,

The railroad, mining and commercial center of the new State, offers some of the best inducements for investments in

Real Estate, Mines & Mining Stock

of any locality in the Northwest. For particulars address The Evans-Terry-Claussen Brokerage Co., 41 E. Broadway, Butte, Montana.

FOR SALE CHEAP.

One new double circular Sawmill to carry 60 inch bottom saw, with wrought-iron hangers for top saw. Friction feed works, patent steel screw double-throw headblocks, with track iron, saw carriage and frame complete.

RISDON IRON & LOCOMOTIVE WORKS,
San Francisco, Cal.

AMERICAN MINING AND STOCK CODE
"KELLOGRAPH."
Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES

Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, $5. Forwarded post-paid on receipt of price by
DEWEY & CO.,
220 MARKET STREET, SAN FRANCISCO.

ATTENTION, MILLWRIGHTS!
A BOOK YOU ALL WANT.
Leffel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.
A STANDARD WORK.

This practical work of 288 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Pains have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.

Price 50 cents, post-paid. For sale by DEWEY & CO. 220 Market St., San Francisco, Cal.

"WITTER'S SPRINGS." 16 miles from Lakeport, 20 miles east of Ukiah. Comfortable Hotel. Quiet Cabins. Lovely Scenery. Low Charges. Its waters are a sure cure for Dropsy, Scrofulous and Skin Diseases, Rheumatism, etc. Address H. L. DENIO, Upper Lake.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap), do us the favor to write again.

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & CO., Publishers, 220 Market St., San Francisco.

The Pittsburgh Boiler Scale Resolvent.

☞This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

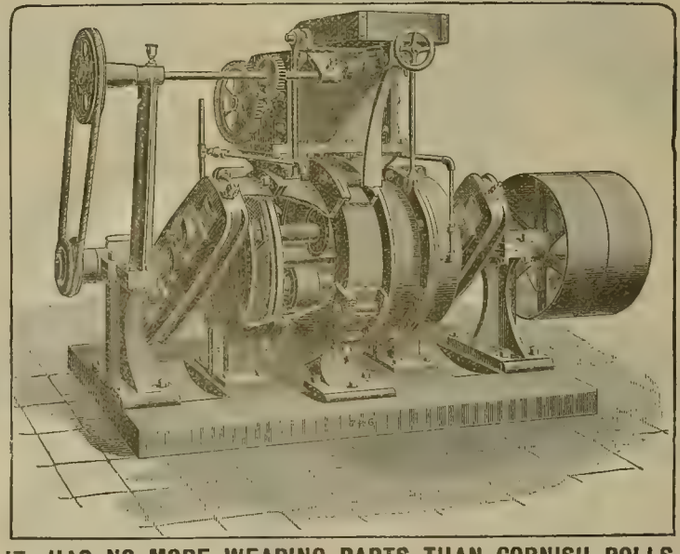
We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one **is the only good thing we have ever used.** Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as **sulphate of lime, carbonate of lime, mud, and everything that is bad.** Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern; Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }



FOR SALE ONLY BY

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.
GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

A New and Important Book on Steam Engineering.

Le Van's Great Work on

THE STEAM ENGINE

—AND—

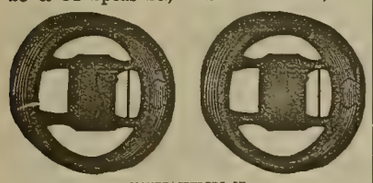
THE INDICATOR.

JUST READY.

THE STEAM ENGINE AND THE INDICATOR: Their Origin and Progressive Development, including the Most Recent Examples of Steam and Gas Motors, together with the Indicator, its Principles, its Utility, and its Application. By WILLIAM BARNET LE VAN. Illustrated by 205 engravings, chiefly of Indicator-Cards. 469 pp., 8vo.

Price $4.00, by mail, free of postage to any address in the world.

CONTENTS.—I. Introduction. II. Who Invented the Steam Engine? III. Heat and Work. IV. Expansion. V. The Indicator. VI. The Action of Steam in the Cylinder of an Engine. VII. Horse Power. VIII. Diagram showing the Action of Steam in Steam Engine Cylinder. IX. Correct Indicator Diagrams. X. Steam Expans on Curves or Pressure of Steam in Cylinder. XI. Comparative Indicator Diagrams. XII. Steam Jackets. XIII. Varieties of Steam Engines. XIV. Gas Engines. XV. Automatic Cut-Off *vs.* Positive Cut-Off. XVI. Miscellaneous. Appendix. Index.



☞ *An illustrated circular of 6 pages, quarto, giving the full table of contents, with specimens of the engravings of this valuable book, will be sent free of postage to any one in any part of the world who will send us his address.*

☞ *Our new revised Descriptive Catalogue of Practical and Scientific Books, 80 pages, 8vo, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, as well as a circular of "Van Cleve's English and American Mechanic," sent free and free of postage to any one in any part of the world who will furnish his address.*

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

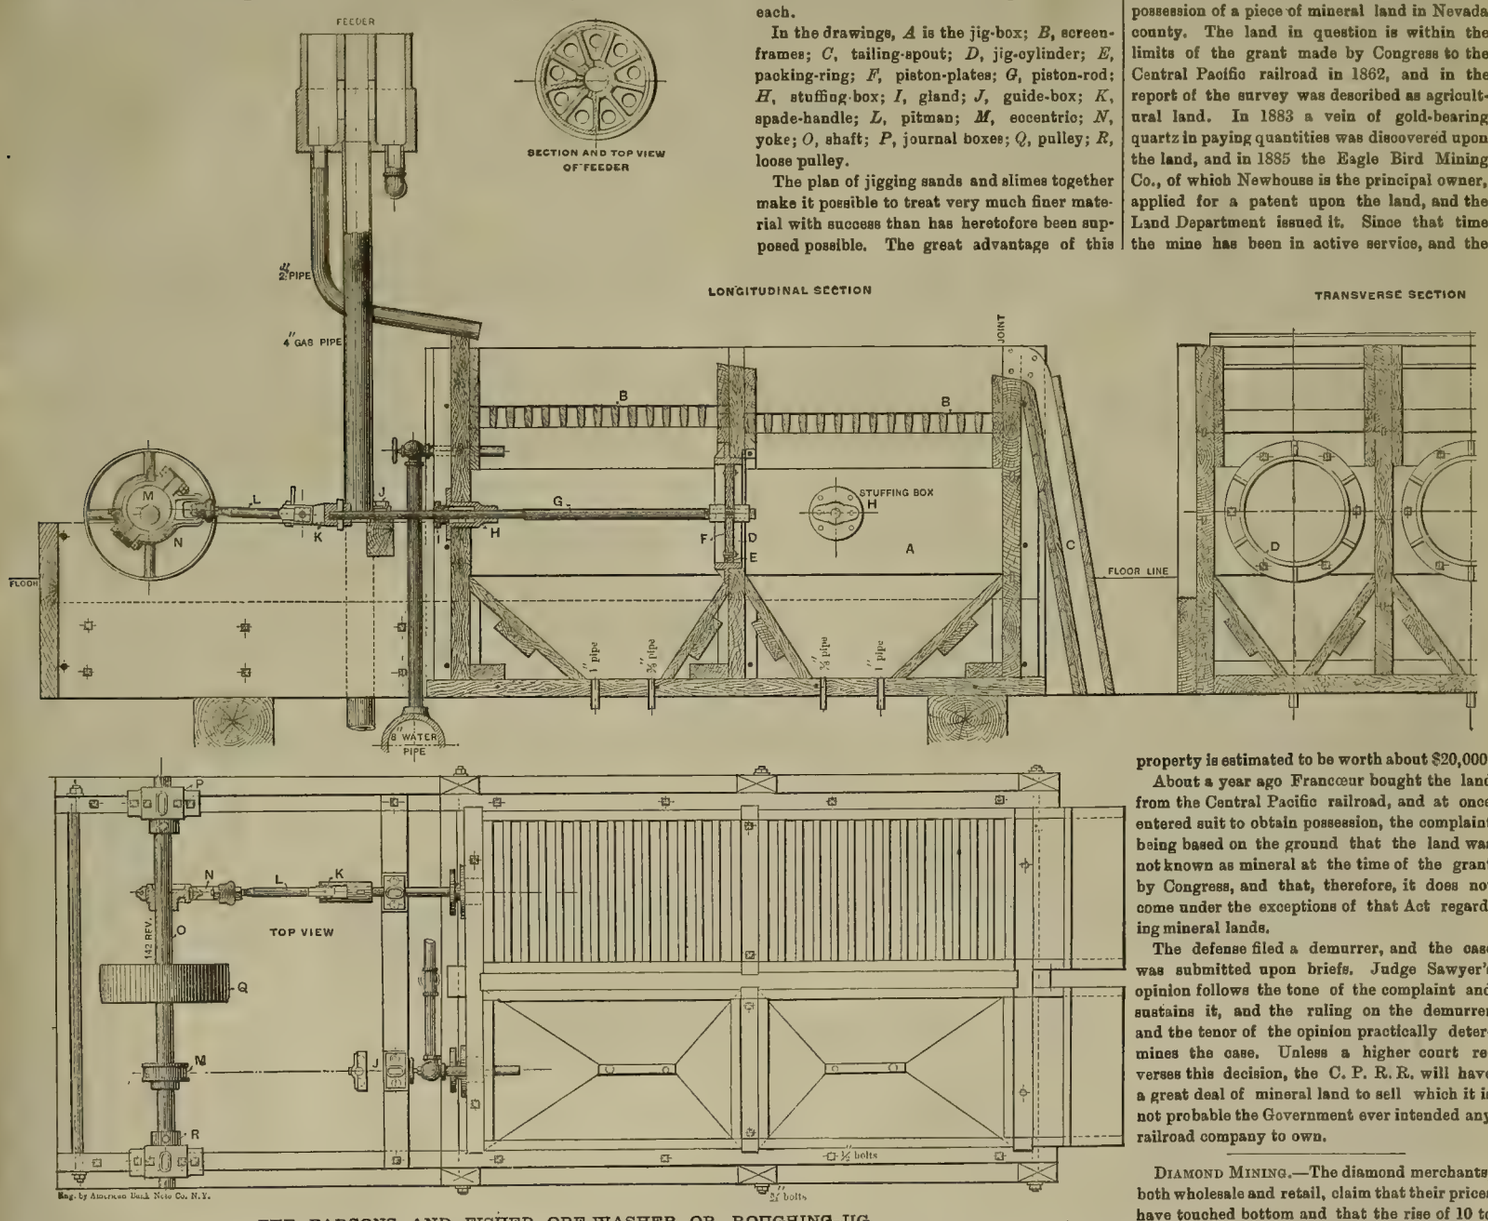
Ore-Jigging Machines.

On page 455 of this number of the PRESS are given drawings of the Parsons percussion tables, and on this page are drawings of the Parsons & Fisher ore-washer, which machines are used at the new ore-dressing works of the St. Joseph Lead Co. The preliminary jigging of the ore is done in the jig or washer shown herewith. It is a two-sieve under-piston jig, each sieve 24 inches by 39. The piston is vertical, 15½ inches in diameter, and moves in a short horizontal cylinder 4½ inches long in the partition between the two jig-boxes. The piston-rod is horizontal and enters through the stuffing-box. For convenience the jigs are made double, *i. e.*, four sieves, or two jigs, are united in one machine. One great advantage of this form of jig is the small floor space occupied by a large number of machines, the whole area of the jig-box being available for jigging.



The stroke of the piston is two inches, and the number of strokes per minute 150. The quantity of under-water required is about two cubic feet, or 16 gallons per minute. The consumption of feed-water is 16 to 18 gallons per minute, containing about 13 pounds of sand (dry weight). There are nine jigs, 4½ machines, for each set of crushing apparatus. Each jig treats, therefore, about nine tons per 24 hours, or less than one-third the capacity of a jig of equal area according to the data of Rittinger, so that the mill has ample jig capacity.

In the Lake Superior copper-mills the tendency, of late years, has been to increase largely the number of jigs, in the attempt to lessen the losses in the tailings. The St. Joe mill has, however, a larger jig capacity, in proportion to the rock crushed, than any of the Lake Superior mills. For the treatment of 800 tons of material per 24 hours there are 252 jig-sieves. The rough sands at the St. Joe mill are divided between 90 sieves, or 9 tons per 24 hours each.

In the drawings, *A* is the jig-box; *B*, screen-frames; *C*, tailing-spout; *D*, jig-cylinder; *E*, packing-ring; *F*, piston-plates; *G*, piston-rod; *H*, stuffing-box; *I*, gland; *J*, guide-box; *K*, spade-handle; *L*, pitman; *M*, eccentric; *N*, yoke; *O*, shaft; *P*, journal boxes; *Q*, pulley; *R*, loose pulley.

The plan of jigging sands and slimes together make it possible to treat very much finer material with success than has heretofore been supposed possible. The great advantage of this system of jigging is the large proportion of sands successfully treated and finally disposed of by the roughing-jigs alone. Out of 800 tons per day, only 136 tons require further treatment, viz., 30 tons raggings, crushed and treated on the three-sieve jigs, 66 tons fine sand, also treated on three-sieve jigs, and 40 tons of slimes treated on the side-bump tables.

The sole disadvantage lies in the difficulty of forcing all the very finest slimes to go through the jig-sieves.

THE PARSONS AND FISHER ORE-WASHER OR ROUGHING-JIG.

An Important Mineral Land Decision.

Judge Sawyer of the U. S. Circuit Court has overruled a demurrer, and rendered a decision in favor of the plaintiff in the important mining case of George H. Francœur against Oscar Newhouse. The action was brought to recover possession of a piece of mineral land in Nevada county. The land in question is within the limits of the grant made by Congress to the Central Pacific railroad in 1862, and in the report of the survey was described as agricultural land. In 1883 a vein of gold-bearing quartz in paying quantities was discovered upon the land, and in 1885 the Eagle Bird Mining Co., of which Newhouse is the principal owner, applied for a patent upon the land, and the Land Department issued it. Since that time the mine has been in active service, and the property is estimated to be worth about $20,000.

About a year ago Francœur bought the land from the Central Pacific railroad, and at once entered suit to obtain possession, the complaint being based on the ground that the land was not known as mineral at the time of the grant by Congress, and that, therefore, it does not come under the exceptions of that Act regarding mineral lands.

The defense filed a demurrer, and the case was submitted upon briefs. Judge Sawyer's opinion follows the tone of the complaint and sustains it, and the ruling on the demurrer and the tenor of the opinion practically determines the case. Unless a higher court reverses this decision, the C. P. R. R. will have a great deal of mineral land to sell which it is not probable the Government ever intended any railroad company to own.

DIAMOND MINING.—The diamond merchants, both wholesale and retail, claim that their prices have touched bottom and that the rise of 10 to 15 per cent in the retail trade within the last six months will be steadily supplemented. The reason given is that the De Beers Mining Co. of South Africa controls 29-30ths of the output, and is in a position to control the supply, and consequently the prices.

IRVING M. SCOTT says he expects shortly to have a Government contract to build a 7000-ton cruiser, and will increase his plant at the Union Iron Works and take on a much larger force of ship-builders and iron-workers.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

In Calaveras County.

A New Concentrator and an Ore-Roaster.

EDITORS PRESS:—At Angels everything is moving along smoothly and briskly. The mines are steadily improving and each month sees an additional mine put on the list of producers. All the mills are clattering away save where they have been shut down to sink, new mills are in course of erection, and Angels is destined to be the leading mining camp on the mother lode.

The Gold Cliff is being worked under bond by Mr. Hayward's agent, and will, without doubt, soon be added to the paying mines of Messrs. Hayward, Hobart & Lane. Mr. Dolling has "struck it rich," and all Angels rejoices with popular "Oho!" over his strike.

Tullock Concentrator.

Mr. Jas. Tullock, or "Uncle Jimmy" as he is favorably known, has perfected his concentrator and has had it most severely tested. Mr. Lane of Hayward, Hobart & Lane dumped the ore on to the table by the bucket and shovelfull in a vain effort to clog it. So satisfactory is it in its working that a number have been ordered by the largest operators of Angels, one superintendent declaring that from actual tests he knew he could with two of Tullock's concentrators do the work of eight vanning machines at one-twentieth of the first cost. The concentrator is simply the old-fashioned rocker with the ducking running on rollers which carry the screened sulphurets up over the front, while the tailings run off over the lower end. I found the concentrates almost pure metal, while the tailings were clean sand. The concentrator is simple, cheap and a success, and is destined to fill the long-felt want of a low-priced, successful concentrator.

A New Mill.

The Con. Calaveras Gold Mining Co. at Robinson's Ferry have in course of erection a Huntington mill. This is being erected about half-way along on their 9000 foot on the mother lode. The mill will be used to test the ore at this point on the vein. At the same time the tunnel from the south end will be continued on in. It has now been driven over 1100 feet. Numerous shafts will be put down on the 9000 feet of the vein, and the property most systematically prospected and developed before the necessary mills are erected. If all of our English mining operators were to conduct their mining operations on as conservative and systematic a basis as Mr. Theo. Allen of this company is doing, their would be but few failures.

A Pocket Mine.

Mr. Harvey Wood of Robinson's Ferry is still in bonanza on his pocket mine. He is working a small vein that crosses the different branches of the mother lode at their junction, his vein cutting them at right angles.

River Mining.

Mr. J. R. Moffitt of Chinese Camp has met with bad luck in his river-mining the past season. He had the river-bed pumped dry and the ground stripped ready for operations when a sudden rise in the river drove the men out. After this had subsided, the water was again pumped out and the miners had cleaned up but a few pans full of dirt, which in their language were "more gold than dirt," when that October storm came down upon them, sweeping away their dam and undoing in an hour all the work of the season. Mr. Moffitt lost over $9000, to say nothing of the gold that lay almost in sight. The coming season Mr. Moffitt will erect a permanent dam, and he has every reason to believe that he will then reap the harvest of gold that has eluded his grasp in each of the past three seasons.

Mr. Moffitt has not confined himself to his river mining, but has turned his experience gained in former years in smelting to the perfection of

The Moffitt Oxygen Ore-Roaster.

This invention, while not complete in every detail, has advanced far enough to command the attention of every owner of ore requiring roasting. The principle is that of a complete roast in granular form of all ores under a great air-pressure in a confined chamber burning oxygen. The machine is automatic in its operation, feeding and discharging continuously. While the method is a combination of mechanical and chemical skill, there is an entire absence of theoretical accompaniments. Mr. Moffitt will have his roaster in operation within another month, when the owners of refractory ores will be invited to send in their rock for trial, and at the same time inspect the operation of this compact and economical ore-roaster.

Across the Mother Lode,

In Tuolumne county, but little is doing, owing to an absence of water. At Quartz mountain the Haslep mine is kept free of water while offered for sale. The mill has been leased by the company's former superintendent, Mr. Bowman, who is milling the ore extracted from the Dutch mine. This is being developed under bond by Messrs. Brigham, Lane & Garrard. Their shaft is now down 135 feet, and shows that the two branches of the mother lode join at this point, forming a vein 60 feet in width, with an average milling value of $3 a ton.

Both the owners of the mine and the operators are very conservative in their statements, but there is no doubt about the Dutch mine being put upon a working basis, and soon added to the numerous profitable mines on the wonderful mother lode. E. H. SCHAEFFLE.

Mines of a Rainless Land.

Iquique and the Silver Mines and Saltpetre Deposits.

[Written for the PRESS by "DON JUAN."]

The coast between Callao in Peru and Coquimbo in Chili is the most monotonous on the whole American continent. The track between Arica and Copiapa, a distance of over 600 miles, is that in which the rainless zone is most pronounced. With the possible exception of Pisagua, there is no inhabited place where good drinking-water can be had. Nearly all the settlements, therefore, along this barren waste are either dependent on steamer transport for fresh water or obtain it by distillation of sea water. Here is a country indeed where there is no trace of vegetable life whatever. One is not even able to detect the smallest lichen by aiding the eye with the best of lenses. The whole surface appears as if water had never run over it. Every edge of the rock appears sharp, as if freshly broken. One would hardly believe, from the above description, that people could be found who would inhabit such a desert; but such is the case. The wants (or greed) of man have established many industrial towns along this coast, for the purpose of extracting the precious metals from the bowels of the earth and for working the very extensive deposits of alkaline nitrates. The most important place of these settlements is the port of Iquique, now in Chili, but before the last war part of the Republic of Peru. This city is not only the most important in the rainless zone, but ranks second only to Valparaiso on the whole west coast of South America.

Iquique is situated in the province of "Tarapaca" in the extreme northern part of Chili, in lat. 20, south; long. 71. It has a good harbor and safe anchorage. At least the outer harbor (as it is called) is large and safe, but the smaller or inner port is very dangerous. For this reason ships are always long delayed in this place discharging or taking in cargo. The inner harbor is so rough as to permit of traffic over it only about three days of each week; for as there is no wharf out to the deep water, the enormous amount of cargo handled at this port has to be transported by lighters and large boats. I saw several men drowned here on New Year's Day last in attempting to reach their ships in small boats on one of the rough days.

There are nearly always from 60 to 80 large ocean vessels in the port, English, German and French, but it is very rarely (I am sorry to say) that the stars and stripes are seen in this, or for that matter any other South American port. I know from personal experience that the people prefer American goods, and in particular, American tools and machinery, but they are rarely ever seen in the market.

Iquique has a population of about 20,000, 90 per cent of whom are natives of Chili, Peru and Bolivia; the remaining ten per cent are English, Germans and French, with a very few Americans thrown in (just enough to promote business and enterprise among the balance). Iquique has two large distilleries (for water), and also a line of small steamers running up the coast to Arica, bringing down fresh water from there. It has three smelters and a large railroad shop, with a line of railway up the coast to Pisagua and into the nitrate deposits. There are two first-class hotels in the city and a number of smaller ones. The town is nearly all built out of frame houses; very few adobes are seen. One of the best houses is occupied by Dr. J. M. Merriam, American Consul of the Port, who is a very courteous gentleman and looks to the interest of our citizens at that place with the greatest care and attention.

By far the most important industry of this Province is that of mining, purifying and shipping nitrate of soda. The Government charges an export duty on this product, and from this source alone they received in 1888 the enormous sum of $18,000,000.

Next to the nitrate business is that of mining for silver. Some of the famous silver mines of Tarapaca have been worked for over 200 years. In my next letter I will give your readers some information as to the extent of these mines and the method employed in working them.

CLOSED DOORS.—A recent dispatch from Albuquerque, N. M., says: The stockholders' meeting for the election of directors of the Lincoln Lucky Mining Company was held here. The old directors were unanimously re-elected, with the exception of Thomas Wright, who had sold his interest. The mine is the most valuable in New Mexico, and is capable of producing about 60 tons of ore a day, netting the company from 20 to 25 per cent on the purchase price of $150,000. In the face of all this it was resolved to close down the mine, thus throwing out of employment a large force of miners and teamsters.

Mineral Lands and Railroad Grants.

In the report of the Secretary of the Interior he has the following to say concerning mineral lands on railroad grants:

It is reported that the work of examining exparte mineral entries is in arrears about two and a half years, and in contested cases about two months. There have been suspended in the offices lists of railroad sections involving some 5,561,207 acres, upon the question whether the company shall be required to furnish mineral affidavits or not. The question presents itself in regard to mineral lands lying within the grants of railroads running through the mineral belts, and which would otherwise than because of their mineral character be included within the railroad grants. The Act of Congress absolutely and unqualifiedly reserves all mineral lands from the railroad grants made to the most extended and important railroads of our country, and this reservation affects the claim of such roads as the Northern Pacific to a great part of its land subsidy.

It also affects to a very considerable degree the Central Pacific and Southern Pacific roads with some others, and how to determine what are mineral lands at this time when the roads are claiming their grants is indeed a difficult and most important matter. Originally it was left to the company to make affidavit in the form adopted by my predecessors and by them deemed sufficient for a long while, but by which it was not made necessary for the officer taking the oath to swear to his actual knowledge that the land was not mineral. Many of the selections made by the railroads under their grants were supported by such affidavit, but upon the same coming before the Commissioner of the General Land Office he demanded that further affidavits should be made, the same as required from settlers on homestead claims, whereby actual knowledge of the fact that the same was not mineral land was required to be sworn to. This the railroad companies have failed to do, insisting that their claims, made under the regulations at the time existing, are valid and should be allowed.

This question is not yet determined, but it is deemed a matter to which your attention should be invited for the purpose of having, if necessary, some further legislation upon the subject. On one hand, it is to be noted that additional affidavits have been required since the selections were claimed; on the other stands the absolute reservation of the law and the right of the people to enjoy these mineral lands, if such indeed they be, among the selections made by the railroads. If legislation is not made on this subject the Department will have to decide by such light as may be obtained as to the real nature of the lands, whether mineral or not, however difficult the inquiry may be and whatever the responsibility assumed.

It is deemed advisable, however, that a law should be passed by Congress enabling the Land Department to thoroughly investigate the character of lands, supposed to be mineral, and within the reservation of the law, before the railroad is entitled to any cession whatever. It would require a considerable appropriation for the purpose of making an investigation and survey, and connected with this, authority should be given to the Secretary of the Interior to refuse to certify lands to the railroads until there be clear proof that the same are not mineral. The question is a most important one. It is far-reaching in its results, and may affect the welfare and independence of many of our citizens.

It would not be unreasonable to direct that the patents issued should themselves contain a reservation of any land therein described if it proved upon further development to be actually mineral land. The mineral lands should be preserved for our people, and there is no claim on the part of the railroads to obtain these sources of vast wealth not intended for them that should be humored to the least degree beyond the law. This I say in no spirit of hostility to the railroad companies, but from a thorough conviction that the best interests of the Republic would be served by dividing this vast mineral wealth among individuals rather than by allowing it by any means to fall into the possession and control of large corporations. It is not intended to be granted to them, and they should not be allowed to obtain it by default. Sufficient means of proving exactly what the character of the land is, should be provided.

There are in this division also some 2129 suspended entries. It is desirable that a re-examination of these cases should be had, as it is believed it would lead to the granting of patents in many cases. It is intended that additional proof shall be called for and the entries either canceled for failure of the claimants to meet such requirements, or, if the proofs authorize it, patents issued.

THE PAMLICO MINE SUIT.—At Hawthorne, Nev., the case of the Pamlico Mining Co. vs. Garrison & Key, which has excited great interest in mining circles, has been decided. The special issues decided by the jury are to the effect that the Pamlico Mining Co. has a valid claim, and that in their claim two ledges exist, known as the east and west ledges, having their tops within the claim, and that they do not cross the side line of the claim on their course, but on their extent downward into the earth they pass through the northeast side line of the claim and beneath the adjoining lands, including the Lakeview, the property of defendants; also that the defendants have asserted an adverse claim to some portion of the east vein to find the northeast side line of the Pamlico. The judge stated from the bench that the findings of the jury warranted a judgment and decree for the plaintiffs quieting its title to the Pamlico mine and the veins on their extent downward and for costs for suit. A force of men will be put to work in the Pamlico and active operations will begin at once.

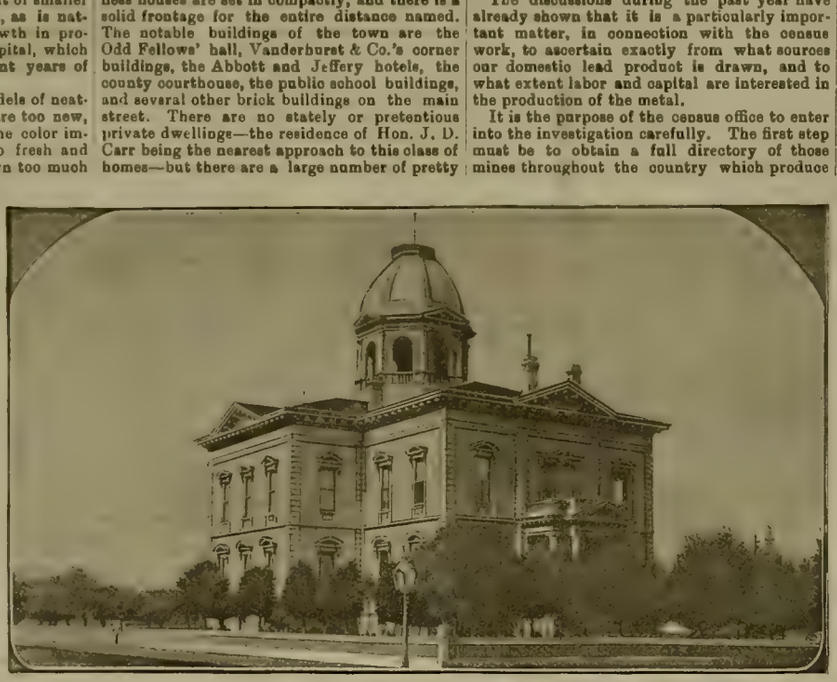
Using Oil with Ores.

The *Alta California* says: Experiments are now being made in Denver with a new appliance for the concentration of dry silicious ores. So far the experiments have proved a success, the tailings from the concentrator—if so it may be called—only running one ounce in silver from a crude ore that ran over 10 ounces of silver per ton. The first unimportant means of testing the new system having proved the correctness of the theory, other larger and more capable means have been employed. The whole system of concentration appears to be based on the well-known affinity of the lighter forms of sulphuret and chloride of silver for oils. Petroleum is the oil now being used by the parties having these experiments in charge, and appears from its density to possess the requisite adhesiveness to effect the result desired. The ore is first crushed to such a degree of fineness as to enable it to pass through a 40-mesh screen, and, while dry, is thoroughly mixed with the oil, after which it is placed in a circular tank, or receiver, through the center of which runs a rotating hollow tube, to the bottom of which tube is attached, on two opposite sides, a couple of fans, the lower edges of which are unevenly cut in order to send—in the revolution—the lighter particles of ore and oil mixture to the outer side of the drum, or cylinder. This rotating hollow tube is perforated at or near the bottom, and, when the receiver is thoroughly charged, acidulated. (Sulphuric acid is used.) Steam is introduced through the tube and is forced to the bottom of the mixture, while the arastra-like fans, attached to the bottom of the tube, keep the whole mixture in motion, and the action of the revolving tube, the fans, and the injected acidulated steam causes the lighter portions of the mineral-charged oil to float to a point just above the center of the receiver, where there are suspended two semi-circular doors, which, when the oil has passed above them, laden with its precious freight, are raised, and the superfluous water allowed to drain through slight perforations in the bottom of these semi-circular doors, after which the mineral-laden oil is carefully removed to settling barrels, revolving with jets of steam injected continuously from the lower ends. These settling barrels being placed at an angle permit the mineral-laden oil to pass through openings in the ends, which are connected with shallow settling tubes or tanks from which the concentrated ore is shipped directly to the smelters, who will hardly be likely to refuse so pleasant an addition to their heating powers.

THE PACIFIC ROLLING MILLS have brought suit in the Superior Court against the Mission Transfer Co. to recover $159,872 78 for alleged breach of contract. An agreement was stated by which the Transfer Co. undertook to furnish the Pacific Co. with crude petroleum having a specific gravity of 32° to 35° Beaume scale as an experiment for heating iron, the cost not to exceed $1.70 per gross ton and the Pacific Co. to retain an option of contracting for 32° grade petroleum during three years, at $1.25 per barrel. Afterward, as the plaintiff alleges in the complaint, the Pacific Co. made preparations for carrying out the contract at a cost of $9,872 78, but when a call was made upon the Transfer Co. the latter refused to furnish the petroleum. The Transfer Co. filed a demurrer to the complaint, but Judge Hunt overruled it. While admitting that the contract is difficult of construction, the Court expresses the opinion that the complaint states a cause of action which entitles the plaintiff to some relief and leaves the controversy to be settled by the usual mode.

CALIFORNIA CON. QUICKSILVER CO.—This company with a capital stock of £450,000 has been "launched" in London. The New Idria mines form part of the property, and have produced over 140,000 flasks of quicksilver, mostly from shallow workings, and it is to the prosecution of the said workings in depth that the company looks to pay dividends. There are also "many thousands of tons of low-grade ore, both underground and on the dump, which will be available for treatment." A good deal of work has been done upon these mines, and the Picacho group has also been partially developed at an expenditure of about £18,000, with results which, in the opinion of experts, point to favorable issues in the future. A further source of revenue lies in the Chrome Iron ore property, 2220 acres in extent, which contains "valuable deposits." The vendor is to receive for the three properties, with all their machinery and appurtenances, on the spot and in New York, £380,000, of which £150,000 will be discharged in fully paid-up shares.

THE Alta Mining Co. has just received $25,000 for the sale of ore concentrates at Salt Lake.



California Towns.

Salinas City, Monterey County.

There has been notable improvement in California towns during the last decade. This is true not alone of the metropolis and of the group of our large interior cities, but of smaller towns and villages as well. Indeed, as is natural, the towns reflect well the growth in production, and in the acquisition of capital, which has happily characterized the recent years of California's life.

Many of our small towns are models of neatness. The traveler will say they are too new, the bricks and mortar too near the color imparted by the kilns, the paint too fresh and staring and the fragrance of the town too much like that of the sawmill. It is true that they are deficient in rows of ancient trees, which give grace to the street and comfort to the pedestrian; it is true that they lack hoary and picturesque ruins—moss-grown and ivy-wreathed walls of brick and stone and all that sort of thing—for the old clapboarded "brought-around-the-horn-in-'49" houses do not, unfortunately, make picturesque ruins. It is true that the bright new street-car sometimes floats along in a trackless sea of mud, and that the electric lights sometimes shed their rays over the homes of the ground-squirrel, but these are only signs of new ones and prophesies of the future, when the builder shall come within sight of the enterprising boomer.

But talk as the tourist may of our towns and villages as compared with the time-honored hamlets of the effete East, there is very much in many of them to enjoy and admire, and they are a credit to the young State in which they are rising. We could name a host of such towns, which are as full of thrift, energy, and the spirit of development as the most appreciative mind could desire. Our engravings on this page give scenes in one of the best of our smaller towns, Salinas City in Monterey county. The county court-house is as tasteful as the most exacting murderer could choose to be tried in, and the bird's-eye view of the town with its neat streets and hundreds of homes embowered in shade trees, as cozy and neat a residence place as the most virtuous could cast his lot in. Monterey county is full of historic interest and of new life. Its charm as a seaside resort is world-wide, and the productions of its large valleys and rich hillsides are hardly less widely known.

COURT-HOUSE, SALINAS CITY, CAL.

The remarkable fertility of that portion of Monterey county which is comprised in so much of the Salinas valley as is tributary to Salinas City, is almost too well known to need recapitulation. Travelers through this section, over the Southern Pacific railroad, always have their attention attracted by the remarkably fertile appearance of the soil—an appearance which is abundantly borne out by experience in its cultivation. As is well known, it is in this valley that the sugar-beet is now being cultivated on a large scale, and though it is a new business for most if not all the farmers, still the results of the past season's operations have been most promising and encouraging. There is scarcely a crop that is produced anywhere in California but here finds a congenial soil and climate. Not the least of the advantages enjoyed by the farmer of this section is the nearness to market, but two or three hours being required to land products of any kind in San Francisco. This alone makes this section a favorable one for the production of small fruits, poultry, etc., which must be hurried to market as quickly as possible.

Salinas is the county seat of Monterey county, situated about midway of the valley, and ten miles from the Bay of Monterey. It is the commercial center of Monterey county, and has as bright prospects as any town of similar size in California. It has a population of about 3000. Most of the business of the city is transacted on Main street, which can boast of several handsome and substantial buildings, which, with the smaller structures, line the street for a distance of four blocks. The business houses are set in compactly, and there is a solid frontage for the entire distance named. The notable buildings of the town are the Odd Fellows' hall, Vanderhurst & Co.'s corner buildings, the Abbott and Jeffery hotels, the county courthouse, the public school buildings, and several other brick buildings on the main street. There are no stately or pretentious private dwellings—the residence of Hon. J. D. Carr being the nearest approach to this class of homes—but there are a large number of pretty cottages, surrounded by green lawns, embowered with flowers and shaded by evergreens and natural trees, thus giving to the place a home-like and comfortable appearance which is highly pleasing. The city is provided with schools unexcelled by any in the State. There are eight church organizations, while societies of a fraternal and social character are numerous. The people are liberal, enterprising and cultivated, which is shown by the city being wide-awake and progressive. The town is supplied with water-works and lighted by gas and electricity. There is a good pavement upon Main street, and bituminous or artificial stone sidewalks are the rule for most of the distance through the business part of town. There are two first-class weekly newspapers and one lively daily.

The city has two parks, one of which is somewhat improved; the other is not. With the exception of the Salinas flouring-mill, a planing-mill and a machine-shop, there are no manufactories in Salinas. The flouring-mills have a capacity of 500 bbls. per day (24 hours' run), and are fitted up with the latest improved roller process machines. There is an immense grain warehouse near the mills, 1100 feet in length, which we noticed was well stored with wheat. A beet-sugar factory is contemplated at Salinas, being an enterprise of Claus Spreckels, in addition to the one built by him at Watsonville.

SENSIBLE MINERS.—A miner named Granville was killed at Virginia City recently, and the funeral cortege was unusually large and was headed by a large delegation of workmen and miners on foot. All of the employes of the Gould & Curry and Best & Belcher mines were included in the latter, and they will donate to deceased's widow $8 each—what would have been the cost of carriages had they not attended the obsequies on foot.

BIRDS-EYE VIEW OF SALINAS CITY FROM THE DOME OF THE COURT-HOUSE.

Reports of Lead Product Wanted.

Special Census Agent C. Kirchhoff, Jr., of New York has written to Mr. Mackintosh of the Pioneer Sampling Works, Salt Lake, the following letter:

The discussions during the past year have already shown that it is a particularly important matter, in connection with the census work, to ascertain exactly from what sources our domestic lead product is drawn, and to what extent labor and capital are interested in the production of the metal.

It is the purpose of the census office to enter into the investigation carefully. The first step must be to obtain a full directory of those mines throughout the country which produce ore containing lead in sufficient quantity to warrant payment for it by samplers and smelters. I would beg you to further this worthy object by sending me at your earliest convenience a list of the mines, with the name and address of the manager, from which you have bought ore during the current year.

This is all very well, as far as it goes, but the trouble is it does not go far enough. The census agent should prepare a circular for mailing to every mine in this inter-mountain region, if not to all the mines in the country, asking these questions: Give the number of mines producing lead ore in your district. Percentage of lead in the ore. Wages paid in each mine. Cost of extracting the ore. Freight on ore to the smelters from the mines. Cost of sampling. Cost of smelting. Freight on bullion from the smelters to the New York market. In short, give in detail the cost of each step of production, and add the freights in mining machinery and supplies and amount shipped annually into the mountain regions, showing also how the railroads would be affected were shipments of supplies in, and ore and bullion out, to be curtailed. Then let the mine superintendents impress firmly on this census agent's mind that without suitable protection for the western miner as against Mexican peon labor, American mining interests will go by the board, dragging down the western railroads and the general prosperity of the West with them.

A NEW METHOD of weather prediction has been discovered by Ch. Montigny, a French physicist. He has observed that the scintillations of stars increase before many storms, indicating disturbance of the upper atmosphere hours before the meteorological instruments show any change. The fiercer the storm, the more is the strength of the scintillations increased.

Mines and Labor.

The following is the official statement of sums disbursed to employes of Comstock mining companies for services during the month of November: Alta mine and mill, $7160; Andes, $225; Alpha, $1679; Baltimore, $2975; Belcher, $6349; Best and Belcher, $1941; Benton Con., $550; Bullion, $125; Challenge, $800; Confidence, $2400; Caledonia, $1125; Chollar, $8104; Con. Cal. and Virginia, $43,817; California Mill, $854; Combination Shaft, $395; Carson River Mills, $18,500; Crown Point, $9763; East Best and Belcher, $240; Electric Light Company, $2725; Exchequer, $1679; East Sierra Nevada, $950; Gould & Curry, $3312; Hale and Norcross, $12,930; Hendricks, $1500; Imperial, $3000; Justice Mine and Mill, $6750; Jumbo district, $1950; Kentuck, $675; Mexican, $2296; North Occidental, $767; Con. New York, $1222; North Gould and Curry, $275; Occidental, $5766; Occidental Mill, $2761; Osbiston Shaft, $240; Overman, $3275; Ophir, $2003; Potosi, $3951; Savage, $7888; Scorpion, $250; Seg. Belcher, $1400; Sierra Nevada, $3242; Silver Hill, $2306; St. Louis, $125; Six-mile Canyon Mill and Mines, $2875; Union Con., $2311; Union Shaft, $240; Utah Con., $3184; Yellow Jacket, $10,500; Water Company, $13,500; Ward Shaft, $1149; total, $214,001.

The above is merely the sum disbursed in wages and does not include other operating expenses.

A SAGACIOUS HORSE.—The Guerneville *Herald* says: The Sonoma Lumber Company has at its mill a most sagacious horse. He has been used in the sawdust cart for twelve years to haul away the sawdust from the mill. He has become so well acquainted with his work that he goes from one hopper to another, throughout the most intricate passageways, without a driver, and he never strikes a post, and begins and quits work by the whistle, the same as the men.

AN OPENING FOR PROSPECTORS. — Within two years we are to have a railroad through Southern Nevada to California, from Salt Lake City. This road will open up an immense and hitherto inaccesible mining region. It will be a fine field for prospectors, and as the Carson & Colorado road will connect with the road mentioned above, the mineral belts will be reached very easily. Thus the mines of Southern Nevada will add much to the business of the Carson & Colorado.

NEW RAILS DIRECT FROM THE OLD.—It is stated that Jacob Reese of Pittsburg has interested a number of Louisville capitalists in his method of reducing old steel rails of heavy sections to light sections fit for relaying. The experimental steps are being taken at the works of the New Albany Rail Mill Company, at New Albany, Ind., and subsequent operations will depend entirely upon the results shown there.

MINING SUIT.—The Waterloo Mining Company of Milwaukee, Wis., has filed a suit in the United States Circuit Court at Los Angeles against John S. Doe, the San Francisco capitalist, asking damages in the sum of $200,000. In the petition the company set up that they own a ledge in the Calico Mining District in San Bernardino county, from which defendant has been taking mineral since Feb. 11, 1889.

A VALUABLE and interesting specimen of crystallized gold has been received at the museum of the State Mining Bureau from Lovelock, Butte county. The forms of the gold crystals are clearly and beautifully cut, and the specimen is additionally interesting because of its great scarcity in the locality in which it was found.

AT the annual meeting of the stockholders of the Baltimore M. Co., the following officers were elected: John H. Dickinson, president; Phil Selner, vice president, and W. J. Hamilton, H. S. Wynne and A. K. Grim, directors. A. K. Grim was re-elected secretary and E. Strother, superintendent.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

STOPPED.—Amador *Ledger*, Dec. 9: The mill at the McKenzie Bros.' mine near Irish Town has been forced to suspend, owing to the supply of wood failing and the inability to get more hauled on account of the condition of the roads. It was expected that the mill would be able to resume operations the latter part of this week.

THE Reed and Askey mill has also been shut down temporarily, on account of the soft state of the road, rendering hauling rock from the mine to the mill impracticable.

THE Italian quartz claim in the black hills near the Seaton, owned principally by the Ginocchio Bros. of Jackson, has leased the Seaton mill of 20 stamps. The mill is now being put in order for crushing operations. Some excellent rock has been lately taken out of this claim, and it gives every promise of turning out a fine paying property.

THE CASCO MINE.—*Dispatch*, Dec. 7: The old Casco or Hardenburg mine at Middle Bar, which has lain idle so many years, is to be brought into activity again and worked on a large scale by a company of San Francisco and Eastern capitalists. In fact, we may say that work has already been commenced, as some of the machinery is already on the ground, and the necessary buildings will be put up as soon as the lumber can be delivered and the weather will permit. The work will be under the management of James Evans, a miner of many years' experience.

MITCHELL.—We understand that arrangements are being made to open up and thoroughly develop the Mitchell mine at Middle Bar, and that work will be commenced forthwith. There are also several other mines in that vicinity, including the Sargent and Amador Queen mines, upon which it is said that work will be resumed in the near future.

El Dorado.

CHILI RAVINE.—Georgetown *Gazette*, Dec. 5: Work at the Chili ravine mine is being vigorously prosecuted. The mill is running regularly and is paying handsome dividends. Recent developments in this mine are decidedly promising.

ZANTGRAFT.—Placerville *Observer*, Dec. 7: The present rain will probably start the mill at the Zantgraft mine. This mine, which is situated near the Alabaster Cave in El Dorado county, is one of the best paying quartz mines in the State. The rock has paid steadily and will for years. The pay chute is over 1600 feet in length, the longest in the State. Rock is now being taken from the 350-foot level. The ledge at this depth is three feet in thickness.

DEVELOPMENTS continue to progress at the Gentle Annie mine at Poverty point. One crosscut just completed shows 38 feet of ore, not of high grade but uniform in character, all containing gold in paying quality. Other openings are being made along the vein, none of which has as yet been extended far enough to determine the width of the ledge. Developments already made show a continuous ore body for a distance of 1200 feet along the line. Taking into account the length and width of this ore body, and its depth from the top to the level of the proposed millsite, it would contain at a low estimate over 100,000 tons of pay material, which a mining man of known experience proposes to deliver at the proposed millsite by contract, at an expense not to exceed 35 cents per ton. The facilities for water-power and other advantages for cheap working, justifies the belief that it can be reduced at a rate but little in excess of the cost of mining.

KELSEY.—Dave Croft was over from Kelsey one day last week, and reports general prosperity on that side. Preparations are being made for active operations at the Lone Jack mine. The Big Sandy mill is running regularly. Work at the Taylor mine is progressing.

A PURCHASE.—Placerville *Observer*, Dec. 10: Luke Morgan and Jas. Kenney have purchased Jonas Bitters' gravel claim at Mt. Gregory. A fine wire cable for use in the Pacific shaft was received by the company last week. Work in the shaft was temporarily suspended pending its arrival. Work has been resumed. Work at the Chili Ravine mine is being vigorously prosecuted. The mill is running regularly and is paying handsome dividends. Recent developments in this mine are decidedly promising. Three new Huntington mills have been ordered for the Kelley mine at Kelsey. Mr. Pearson and his company mean business, and as soon as their electric plant is in position active operations will begin.

Inyo.

NOW SHE BLOWS!—Inyo *Index*, Dec. 4: The whistle at the Cerro Gordo hoisting works tooted last Saturday for the first time in ten years, the reverberating echo being regarded as a joyous note, promising a return of the good old times with a revival of the mining industry. Work began on the shaft Monday morning. It will be cleaned out and retimbered, when the Union mine will again come to the front as a leading bullion-producer.

TO HAUL ORE.—Inyo *Independent*, Dec. 6: A team of eight horses and 12 mules left Independence to-day for Cerro Gordo. They are all fine animals and will be put upon the road between Keeler and Cerro Gordo hauling ore down to Keeler and supplies up to the mines.

BONDED.—Arch Farrington has bonded two mines in the Beveridge district of Manuel Montana for $5000.

BORAX.—There is much activity in making borax in Saline valley. The capacity of the works will be largely increased soon and more than double the amount of teams will be employed in hauling the borax from the works to Alvord. Already this interest makes a good deal of business for the town of Big Pine.

Fresno.

HILDRETH.—Cor. *Expositor*, Dec. 4: Since the "Abbey" tooted her whistle for the last time, some two months ago, the bottom has well-nigh fallen out of the town of Hildreth, the boys have scattered far and wide, some to distant Mexico, some to arid Arizona, while a goodly number are still hunting the goddess, fortune, among the rough and rugged mountains of our own dear State. Yet there are beyond doubt some rich deposits here awaiting merely the influx of capital to put things in proper shape, but it seems that at present the eyes of capital are not turned this way. Mr. Jesse Morrow, a distinguished fellow-citizen of yours, hopes for big things from his mine; every morning, through the still, clear air, may be heard the music, sweet to the miner's ear, of his stamps crushing out the long-sought precious gold. Judging by the prospects, Mr. Morrow has a valuable property. Another venture has been set on foot by three enterprising spirits, Messrs. Mussel, Fitzsimmons & Zoller. These gentlemen have formed a syndicate for the working and development of that known as the "Zoller Mine." This is a well-defined four-foot ledge of quartz which averaged by actual test in the McNally mill, $15 per ton, and as all three men are miners of long experience and know what they are about, there is no doubt they will look with satisfaction on the result of their work when "cleanup" day comes. Rumors reach us that negotiations are almost completed for the sale of the Hanover mine, at present owned by H. S. Williams of Madera, to a French syndicate. Over at the Zebra, where, owing to a temporary derangement of the machinery, work was suspended for a few days, the boys have resumed business, and things are going along smoothly.

Mariposa.

THE CHAMPION.—*News*, Dec. 1: Work is progressing rapidly on the levels and good milling ore is being taken out. Free gold can be seen almost every day, and the ore is rich in sulphurets. A shed has just been built around the hoisting works. The frame of a building to inclose the engine and boiler is being put together. The arastra to be run by steam is not yet a success. The motion is too rapid. Several pounds of ore were shipped to Chicago this week to be assayed. The outlook for the Champion is very good.

RICH ORE.—Mr. C. F. Peregoy sent sulphurets from his mine at Whitlocks to the city recently to be assayed, and the returns came up this week. They show over $1000 a ton in sulphurets. These average about one per cent, that is, in a hundred lbs. of ore there is one lb. of sulphurets. There is also considerable free gold. The vein is large. The shaft is down about 50 feet. "I consider Whitlocks one of the best mining camps in the State," said a well-posted miner, Monday. "All it wants is capital to develop it."

Monterey.

LOS BURROS.—Salinas *Index*, Dec. 7: As L. Gilson, president of the Cruikshank Min. Co., passed through here on his way to S. F. last week, he interviewed Chairman Samuels on the question of a road to the mines, and was informed by the chairman of the board that there would be no trouble on that score after they had demonstrated the existence of permanent and paying mines. Mr. Gilson stated his absolute confidence in the unmistakable demonstration of that fact before spring, and Mr. Samuels said that was as soon as the construction of a mountain road could be undertaken. It is probable that the road will be built next summer. The new mill started up on the 29th ult., and worked like a charm. It is known as the Huntington pattern. Its crushing capacity is from 12 to 15 tons of ore per 24 hours. Mr. Gilson intimated that, if the Steamship Co. could land the machinery, his company would immediately erect another mill of the same capacity. The success of the Los Burros district is assured.

Mono.

THE BODIE CON.—Bodie *Miner*, Dec. 9: During the past week the upraise from south drift, 900-foot level, was advanced 17 feet. Upraise No. 2 from south drift, 1000 level, was driven 27 feet. East crosscut from shaft, same level, was extended 29 feet. There were employed 11 miners, 1 foreman, and jointly with Mono, 4 engineers, 2 firemen, 2 carmen, 1 blacksmith, 1 laborer, 1 watchman.

MONO.—During the past week west crosscut No. 2 from south drift, 1000-foot level, was advanced 16 feet. East crosscut from south drift was driven 28 feet.

Napa.

QUICKSILVER SHIPMENTS.—*Calistogian*, Dec. 4: During November last there were shipped from Calistoga, flasks of quicksilver, produced at the mines, as follows: Napa Consolidated, 395; Bradford, 125; Gt. Western, 80; Sulphur Bank, 164; total flasks, 764. The Napa Con. still produces wonderfully well, and the Bradford mine continues to yield satisfactorily. The past two months' shipments from the Gt. Western have been fair in comparison with the monthly product of last summer. The Napa Con. Co. will declare another dividend of ten cents per share at the close of the present month, making four for the year, or a total of $40,000 to stockholders during 1889.

Nevada.

PITTSBURG.—Grass Valley *Union*, Dec. 5: Since the Pittsburg mine was started up under the superintendency of Charles Stocks a considerable amount of work has been done in sinking the main incline, running drifts, and extracting of quartz by tributers. On the No. 9 level north where a good quality of ore had previously been found, further exploitations have been made which give encouragement that a valuable pay-shoot will be found in that direction. To demonstrate this, No. 10 level is now being opened and drifts have been started both north and south. The north drift is expected to strike the pay-shoot in a distance of 200 feet, where an extensive body of ore and a ledge of good size is expected to be found owing to appearances on the level above. The late crushings of the ore from the mine have been very encouraging, as the average of company and tribute rock has given a yield of $13 per ton, and the sulphurets have brought $72 per ton. The work in the mine at present is more in the nature of prospecting, but it is the intention when more new ground is opened to increase the working force of the mine with a view to keep the 10-stamp mill constantly going.

HARTERY MINE. — Grass Valley *Union*, Dec. 2: Some of the rich specimen quartz recently taken out of the Hartery mine yielded 40 per cent of gold when it was crushed. This quartz was taken from the second level south below the drain tunnel, or about 340 feet from the surface on the incline. It is from a regular pay shoot that is going down, as is shown in sinking about 10 feet below the level of the tunnel. The incline shaft is sunk 200 feet below this level, but the drifts are not opened. The shaft is now being pumped out with a view to starting a new level, which is expected to enter the pay shoot in about 100 feet. A number of tributers are now at work in the mine who are taking out good ore. The tribute force will not be increased at present. Sixty loads of quartz are now ready for crushing at the Larrimer mill, which has been rented by the company and which will be started up in a few days, when the flume which conveys water-power to the mill is rebuilt. The unfavorable weather has retarded the work. The openings in the mine will soon furnish sufficient quartz to keep the 10 stamps of the mill constantly going, unless continuous rains shall interfere with the hauling of quartz from the mine to the mill. The Hartery is showing up in the most encouraging way, and there is a strong probability of its becoming one of the most noted mines of the district. It is situated right in the center of the rich mineral belt on the west side of Wolf creek, from which millions of gold have been extracted.

THE RAINS AND THE MILLS. — If the rains continue much longer some of the quartz mines with light machinery will have trouble in keeping the water "in fork." The mines that have water-power have no cause to fear hindrance in that respect. Deep snowfalls and hard freezing weather can only knock them out.

IDAHO.—The Idaho mill is about ready to start up. The concentrators are in position, and have been put on trial for the past day or two.

THE MACHINERY STARTS.—*Transcript*, Dec. 3: The new machinery on the Federal Loan quartz claim started Monday for the first time, and it works smoothly. It will not take long to get the water out of the old shaft, which is 160 feet deep. The shaft is to be enlarged to the dimensions of five by eight feet, and will be sunk to a total depth of 300 feet before any drifting is done. The sinking and enlarging of the shaft will be completed this winter. The Federal Loan has produced very rich ore in the past, and it has every promise of becoming a paying property under the good management of Superintendent Vincent.

THE SAN JOSE MINE.—Nevada *Transcript*, Dec. 7: The hoisting and pumping machinery bought from the Centennial M. Co. will be running on the San Jose mine within about ten days. It would have been completed ere this, but the big storm blew down some trees across the road and the hauling of the rig was interrupted till the obstructions could be removed. When the machinery starts it will take about five days to pump out the water, and then the main drift will be pushed ahead speedily, while at the same time the breasting out of gravel will begin. The drift is in 400 feet from the shaft, and the channel is supposed to be about 1000 feet wide. At a point 80 feet from the shaft the rim-rock and light wash gravel carrying fine gold were encountered. This formation continues for a distance of 120 feet, and then the simon-pure blue gravel, which makes the water used in washing it look like indigo, is encountered and extends the remaining 200 feet of the drift with bedrock still pitching. The blue gravel carries coarse gold, and many nuggets worth from one to three dollars have been found by panning. Every pound of gravel shows gold. Any tenderfoot can take a panful from any point and get at least 20 colors. One pan yielded $11 worth of the royal metal. Old gravel miners say they have never seen anything that promises bigger than the San Jose mine.

SPECIMENS FROM THE COE MINE.—Grass Valley *Union*, Dec. 11: The tributers working on the 136-foot level of the Coe mine, besides getting ore that has milled $28 per load, have taken out some fine specimens that are too rich to run through the batteries. These specimens came from the ledge both east and west of the shaft, and go to prove the existence of a fine shoot of ore. This ore and specimens were taken out by Wm. Williams, James Buckett and partner, who have a tribute contract that extends to the first of January, at which time the bond of the mine, which is held by Denver parties, will expire.

SHIPMENT OF CONCENTRATIONS. — Sulphuret concentrations from the quartz mines of Grass Valley to the amount of 240 tons will be shipped this month by the Narrow Gauge railroad to the new refining works recently opened at Kenneth, Shasta county, on the line of the Oregon railroad.

Placer.

A NUGGET.—Placer *Republican*, Dec. 8: Russell Dunavent, brother of Mrs. J. M. Fulweiler, found a gold nugget near Mr. Fulweiler's barn on Thanksgiving morning. It is an unusually handsome specimen and weighs three ounces and four and one-half pennyweights. It is worth about $19 an ounce. Mr. Dunavent found the nugget while he was preparing the ground to plant fruit trees, and it was only two or three inches beneath the surface. It will surmount a pile of oranges at the citrus fair.

Plumas.

RICH BAR MINE.—Plumas *National*, Dec. 1: Alex. Buvinghausen, who owns this claim, has been doing some very efficient work upon it during the past summer. He commenced work at the mouth of Kellogg ravine and ran a cut, which is now completed, seven feet deep and five feet wide, through the bedrock, to the bank, a distance of 230 feet. In running this cut enough gold was taken from the crosscut crevices to pay the expenses of the work. He now purposes driving a tunnel from the head of the cut 300 feet into the bank, which will tap the channel seven feet lower than it has ever been tapped before. The prospects for this claim are immense.

San Diego.

HELVETIA. — Julian *Sentinel*, Dec. 3: The machinery is now being put in place and housed in, so the storms of winter won't interfere with the development of the mine. The work, which has been going slow for the lack of machinery, will now be pushed as rapidly as possible, and ere long we hope to hear the music of the stamps running on Helvetia ore.

STANLEY.—Tommy Roland is pushing work on the Stanley mine, at Banner. The shaft is now down 35 feet, with fine prospects for a good mine. It is the intention to sink 100 feet.

Siskiyou.

QUARTZ.—Yreka *Journal*, Dec. 7: Spencer & Co. of Humbug have two teams hauling quartz from their mine to the McCook mill at the forks, which will be started up this week, to be run by a steam engine secured from Scott valley. Dodge & Co. have moved their well-boring machine back to Ashland from Henley, to replace it with heavier apparatus in boring for the blue lead, as soon as the roads are in better condition for hauling. The river miners on the Klamath are still taking out considerable gold-dust, the river and weather being favorable for good working in sinking down on the old channel. The Humbug creek quartz miners are making great preparations for big work next summer, and a mining boom may certainly be anticipated, as all the ledges tested prospect exceedingly rich. Martin Andrews' claim at Hamburg on the Klamath was filled again by the last storm, which closes out work on his part for the season. He took out considerable money, realizing some $5000 in one week, but lost heavily by the great cloud-burst of August, which prevented him from getting more than even on the outcome.

Santa Cruz.

IN THE COAST RANGE.—Santa Cruz *Sentinel*, Dec. 7: The ledge on P. T. Stribling's gold mine near the Ben Lomond road was again struck the other day, and the quartz averaged $20 to the ton. Work on the mine has been suspended for the present and will be resumed in two weeks. Specimens of sulphurets of iron sent to San Francisco assay $175 to the ton.

Sierra.

GOLD.—*Mt. Messenger*, Dec. 7: The yield of the Young America for November was $23,000; Sierra Buttes, $9000; Cleveland, $1800.

BUNKER HILL.—Work has been temporarily suspended on the Bunker Hill for want of air in the breasts, but will shortly be resumed.

TUNNEL.—Hard rock has been encountered in the tunnel being run below Holland Flat by George W. Cox.

THE EXCELSIOR M. Co., at St. Louis, is raising a shaft for gravel known to be overhead.

CHIPPS. — Work is being pushed on the Chipps mine, above Sierra City, by Mr. Lock. The only thing lacking is a lot of pipe, some of which is on the way from below.

Tuolumne.

BOSS PROCESS.—*Union Democrat*, Dec. 7: The Boss continuous process of amalgamation, erected on the Golden Gate mine, is now in operation after many delays and difficulties overcome. The result will soon be known of its application to gold sulphuret ores. It has heretofore been used on silver ores on the Comstock, etc. A large steam boiler and Root blower passed through town to the Hyde mine a few days ago. The latter is to be used to ventilate the mine. Mr. Maxwell and his son arrived on Tuesday last and proceeded to the mine, where operations are being vigorously prosecuted.

NEVADA.

Washoe District.

YELLOW JACKET.—Virginia *Enterprise*, Dec. 7: Daily ore shipments have been increased to 80 tons. Battery samples show an average assay value of $21.50 per ton.

ALPHA.—The usual prospecting operations are in progress on the 500 and 600 levels.

EXCHEQUER.—The 382 level east crosscut has entered vein matter, and the 500 level north line west crosscut continues in quartz.

OVERMAN.—Mine looking well and shipping the usual amount of ore.

NEW YORK CON.—The raise above 800 level west crosscut is still showing fair-grade quartz.

CALEDONIA.—The southwest drift still in porphyry and clay.

ALTA.—Are crushing about 340 tons of ore per week, worth $29.75 per ton. During the week have sent below $22,011 in gold coin, being the net proceeds of ore concentrations for November.

CON. IMPERIAL.—North drift on the 300 level up 30 feet, with top in porphyry. Some low-grade quartz is found on the 500 level.

CHALLENGE CON.—The joint Confidence-Challenge west crosscut from the 300 level north drift is out 48 feet, 7 feet having been added during the week; face shows porphyry and quartz.

GOULD AND CURRY.—Prospecting on the 200 and 400 levels is continued in favorable ground.

BEST AND BELCHER.—Most of the prospecting is on the 625 level. West crosscut No. 1 on said level is showing a promising formation of clay, quartz and porphyry.

JUSTICE.—Mill running to its full capacity on ore that assays $20 a ton.

HALE AND NORCROSS.—On the 300 level No. 1 east crosscut is in 145 feet, with the face in porphyry and clay. The north upraise from the 1300 level is advanced 30 feet. The top shows quartz giving low assays. The south upraise from the same level is advanced 50 feet. The face shows stringers of fair-grade ore. During the week have hoisted 958 cars of ore, shipped to the Nevada mill 840 tons, and milled 840 tons. Total number of tons milled last month, 3900; average battery assay, $30.10.

SAVAGE.—During the past week have hoisted 500 cars of ore and shipped to the Rock Point mill 437½ tons; average battery assay, $28. Have not received final cleanup from the mill for last month's crushing. We are extracting ore from the 400, 500 and 750 levels. Have men employed on repairs and prospecting the several levels.

CROWN POINT.—The north drift on the 400 level, ninth floor west, is in clay and porphyry. The pay ore has been cut out in that direction. Nothing new to report of the stopes elsewhere. Shipped to the mill during the past week 960 tons and 1410 pounds of ore, the average battery assay of which was $17.75 per ton.

BELCHER.—Low-grade quartz is showing on both the 1000 and 1200 levels. On the 850 level the south drift is in clay and porphyry. It begins to show a little water.

SEG. BELCHER.—The usual prospecting operations are in progress on the 1200 level.

UNION CON.—The west crosscut from the north lateral drift on the 1465 level is in porphyry that contains some clay "slips."

MEXICAN.—The west crosscut from the north drift from west crosscut No. 1, on the 1465 level, continues in a vein material composed of quartz, clay and porphyry.

OPHIR.—On the 1300 level from the end of the east crosscut from the shaft station, a south drift is advanced 93 feet. Formation, porphyry and quartz.

CON. CALIFORNIA AND VIRGINIA.—From the stopes on the 1300, 1435, 1500, 1600 and 1650 levels continue to extract ore sufficient to supply the Morgan and Eureka mills. The ore breasts on the 1650 level continue to look well, and are yielding the usual quality of milling ore. The average battery

samples will probably be about the same this week as last, *i. e.* $26.

UTAH.—The southeast drift on the 600 level continues in vein material composed principally of porphyry and clay.

OCCIDENTAL CON.—Sufficient ore is being extracted to keep the mill fully employed. The average of the pulp assays remains about $17 a ton.

NORTH OCCIDENTAL.—The 300 and 400 levels continue to look well and are yielding the usual amount of ore.

SIERRA NEVADA.—On the south drift from the main east drift a drift is out about 140 feet. It is being advanced in a favorable formation of porphyry and clay.

POTOSI.—There is still a good deal of ore showing in the drift on the 800 level as it advances, but it is not of high grade.

EAST SIERRA NEVADA.—The south drift on the 520 level is making the usual good progress.

CHOLLAR.—The ore-producing sections continue to look and yield well. The amount of ore crushed weekly at the Nevada mill is about 400 tons. On the 500 level and in some other parts of the mine the work of prospecting is still continued.

Blind Mountain District

SILVER ORE.—Pioche *Record*, Dec. 1: Wednesday Jimmy Clark was in from Blind Mountain district, where he has been working for a long time past. He recently shipped nearly a carload of ore which assayed up in the hundreds in silver.

Ely District.

PLACER MINES.—White Pine *News*, Dec. 1: There has been considerable excitement in placer locating during the past week. The whole of Robinson canyon, the town of Ely, and down as far as McQuitty's have been taken up. In all the prospects made, coarse gold in paying quantities has been found. It now looks as if Ely's placer-fields would, at no distant date, show up as promising as those of her sister camp Osceola.

THE JOANNA BONANZA.—White Pine *News*, Dec. 1: We took a drive up the canyon a few days ago to take another look at the Joanna mine. We found three men quarrying out the hillside on a breast 100 feet or more, and keeping two teams steadily at work hauling to the mill. The only waste on this breast of ore is about a foot of sagebrush and loose gravel that is stripped from the slanting surface of the hill. The grade of the ore has raised from $30 to $40 a ton. Mr. D. C. McQuitty, an old California miner, who accompanied us, was greatly astonished at the immense mass of ore in sight and said that in all his experience in California he never saw anything like it. It is a mountain of high-grade gold-bearing rock which promises to contain millions of the most precious metal. Every one who sees it is astonished at its great mass and high grade. Already numerous offers are coming in from mining men looking to a purchase of the property, but Mr. Watson, knowing he has a good thing, is not at all anxious to part with it. We are reliably informed that a bond for 30 days and $100,000 with a forfeit of $10,000 has been refused by Mr Watson. We are not in a position to say what exact value Mr. Watson places upon the property, but it is probable that not less than half a million dollars would induce him to sell, and the company that gets hold of it at that figure we should consider lucky. The Joanna is a great property, and, whether sold or worked by its present owner, is almost certain to last for many years and pour out a constant supply of the most valuable metal known to commerce. That there are other equally as good mines in this district all indications seem to warrant, when explored and opened up.

Eureka District.

ORE SHIPMENTS.—Eureka *Sentinel*, Dec. 7: During the week the following named companies made shipments of ore to Salt Lake City, viz.: Diamond mine, 63 tons; Bullwhacker, 58 tons; Jackson, 44 tons; Matthewson Bros., 24 tons.

Freyburg District.

ASSESSMENT WORK.—Belmont *Courier*, Dec. 7: George Ernst and Michael Colligan are doing assessment work on Mr. Ernst's mine in Freyburg district.

Harrison District.

GOLD.—Lyon County *Times*, Dec. 3: Harrison District is in Mason valley, about two miles northwest of the town of Greenfield, and gold was discovered in the district a little over a year ago by Pat Gallagher. Soon after the first discovery was made the surrounding hills were rapidly staked out into claims, and a number of locators did quite a little work on their claims. Three well-defined ledges were discovered. On the first ledge is the Harrison claim, owned by Pat Gallagher, and south on ledge No. 2 is the Cyclone claim, owned by Watkins, Mullen and McGowan, while still south of this claim, on ledge No. 3, is the Sunday claim, owned by Barton, Cooper and Emmerson. The Harrison and Sunday claims have had the most work done on them, and for the past month the owners of the latter have been at work on their ground. Pat Gallagher started work on the Harrison on the 2d of this month and will continue the work during the winter. Two inclines have been sunk on the Harrison to a depth of 35 feet, and in one, drifts have been run each way on the ledge to a distance of about 30 feet. The ledge is about four feet wide and the gold is free. Assays show the ore to go from $15 to $28 per ton, and the gold is worth about $18 an ounce. Mr. Gallagher will have a sample lot of the ore from the Harrison worked at some mill on the Carson river as soon as he can have it taken out.

Jefferson District.

SILVER.—Belmont *Courier*, Dec. 7: Thomas Warburton brought in a very rich specimen of silver ore from Jefferson on Tuesday last. It was extracted from one of the ledges in the Harrison mine, and assays $1 to the pound. The Harrison Bros. had 1000 pounds of this class of ore in sacks when Mr. Warburton left Jefferson for Belmont.

Silver Park District.

RICH ORE.—Pioche *Record*, Dec. 1: J. B. Gilbert and John Wagener have shipped a carload of rich ore from the Hassampie mine, in which they recently made a strike while chloriding. At last accounts the ore has widened to two feet.

Tuscarora District.

PROSPECTING.—*Times-Review*, Dec. 3: There is a great deal of prospecting going on in this district. Many of the miners who are unable to obtain work at day's wages are sensibly putting in their time upon locations of their own, and the probabilities are that a number of paying properties will be developed before the opening of spring.

DIANA.—*Times-Review*, Dec. 7: Have started work in east crosscut No. 2, 300-foot level from the North Belle Isle.

BELLE ISLE.—South drift from west crosscut, 250-foot level, extended 10 feet. The face continues in vein.

NAVAJO.—Work in the mine has been continued to the stopes above the 150-foot level, which shows some high-grade ore.

GRAND PRIZE.—North crosscut on the 500-foot level extended 13 feet without change. A winze has been started on the south 400-foot level drift and sunk eight feet; bottom showing two feet of concentrating ore.

DEL MONTE.—East crosscut No. 1 from north drift, 225-foot level, extended 10 feet. Joint crosscut, same level, extended 12 feet. East crosscut No. 2, 100-foot level, extended 20 feet; the face is still in the vein.

NORTH COMMONWEALTH. — Joint crosscut, 225-foot level, extended 12 feet; the face shows well. The crosscut west from the end of the south drift, same level, has been extended 16 feet in the vein. A crosscut has been started east from the same point.

NORTH BELLE ISLE.—North drift, 600-foot level, is in 38 feet from the shaft. The rock is hard with seams of spar giving low assays. The crosscut from the 300-foot station has been extended 23 feet; face looking favorable.

NEVADA QUEEN.—South intermediate drift from Commonwealth 150-foot level has been extended 11 feet. From this drift a crosscut has been run into the hanging-wall a distance of 18 feet. The ore is too low grade to pay and the miners have been put to work in crosscut 120 feet east.

COMMONWEALTH.—100-foot level: No. 1 east crosscut extended 19 feet and has improved in quality, showing some high-grade ore. No. 2 east crosscut advanced 18 feet; face in the vein giving low assays. No. 1 west crosscut has been run 21 feet. A drift has been started from upraise in north drift; average assay from ore extracted, $261 per ton. 150-foot level: East crosscut from No. 11 drift extended 17 feet; total, 45 feet. North drift from No. 14 upraise extended 14 feet and continues to develop good ore. North drift, 50 feet east of No. 14, advanced 10 feet, following ore; average, $88 per ton.

ARIZONA.

QUARTZ MOUNTAIN.—Arizona *Journal-Miner*, Dec. 4: An abundance of water in the Hassayampa will enable the Quartz mountain mill to start up on full time. As they have also an abundance of good ore out, this property will soon range itself in the list of bullion-producers. Twelve tons of the richest ore yet taken from the Catoctin mine were shipped this week.

BIG BUG.—A deed from the Big Bug Mining and Reduction Co. for 18 mines in Big Bug district has been filed for record in consideration of $250,000. By this transaction the former company virtually ceases to exist, and the company becomes known by the latter name, a company incorporated under the laws of the State of New York. The reason given for the change is stated to be that the former name of Big Bug had an entirely different and more significant meaning to New Yorkers than it had in Arizona. Over 21,000 pounds of ore were received at the sampling works Wednesday.

DAKOTA.

UNCLE SAM CLEANUP.—Deadwood *Pioneer* Dec. 5: Cleanup from the Uncle Sam for November's run has not yet been brought in for shipment East. A *Pioneer* reporter was told yesterday, however, by a gentleman in position to know whereof he spoke, that the bullion secured will be worth nearly if not quite $20,000. This amount would be even better than the public and perhaps stockholders had looked for. Until November 16th but 20 stamps were dropping; since then 10 more have been let loose. Therefore, $20,000 would indicate that the quality of ore has improved greatly, and also that operations for the future will be profitable enough to soon warrant payment of dividends.

BLUE BIRD.—While doing annual representation work day before yesterday, miners employed by the Blue Bird Co., Ruby Basin, struck a body of very good ore. Stockholders were somewhat excited about the matter yesterday, and look for great things in a very little while.

COLORADO.

REDUCED FORCE.—Aspen *Times*, Dec. 3: Following the temporary discharge of the main force employed on the Aspen mine, the Compromise Co. has also cut its force down to a mere handful. This action results entirely from the condition of the ore market. D. R. C. Brown, in talking about the matter, stated that, so far as the Aspen mine was concerned, there was no other reason whatever connected with the shut-down besides the condition of the market for the product. He fully expects that satisfactory contracts will be made during the month and that the mine will start up again with a full complement of men by Jan. 1st. A force of about 30 men is now employed. The Compromise has only been employing 60 hands since the product was cut down some two months ago. The conditions surrounding it are exactly like those that affect the Aspen.

STRIKE IN THE MONARCH.—It is difficult to secure definite information regarding the strike in the Monarch, but it is pretty well settled that one of the most important discoveries of the year has been made in that property. The ore was first found on that part of the territory which is claimed by the Cora L., and, in following it down into the undisputed ground, it has opened out wonderfully. The ore body is declared to be very large and of a superior grade.

THE J. C. JOHNSON.—Some very important developments are now being made in the J. C. Johnson. At a point 650 feet north of the main incline a second incline is being run following the chute of lead ore found in that part of the mine. The incline starts from the fourth level, the fifth being used as a sump. It has reached a point 150 feet under the fourth level, or 56 feet under the fifth, and the sixth level has been started. It is in this that the recent developments have been made, the most important feature being an 18-inch streak of high-grade lead ore. This runs 40 per cent lead and away up in silver, being the best mineral ever found in the mine. The importance of this discovery lies in the fact that it shows that the ore increases in grade as depth is gained. This has been shown at every other point along the Aspen belt, and the further demonstration in the Johnson is highly interesting.

ORE SHIPMENTS.—*Idaho Springs News*, Dec. 6: Ore shipments from this place for the month of October aggregate 2,849,000 pounds, while the shipments for November amounted to 2,704,550 pounds. The Mixsell mill has resumed operations after a suspension of a couple of weeks on account of the cold weather. The mill is making piles of concentrates. The Idaho Custom mill, under the management of J. C. Holmes, continues to do good work. Three batteries of stamps are kept pounding steadily on ore from the Grover Cleveland. During the month of November the Lamartine shipped 40 carloads containing from 12 to 15 tons of ore. The lessees, Hanchett, Burns, Williams and Armstrong, each pocketed about $10,000 after paying all expenses, as a result of the month's product.

IDAHO.

ORE SHIPMENTS FROM HAILEY.—Wood River *Times*, Nov. 15: During the year ending Sept. 1, there were 151 carloads of ore, weighing 4,271,175 pounds, shipped from Hailey. This is an average of about 28,286 pounds to the car.

THE BLACK CREEK MINES.—Boise *Statesman*, Dec. 1: Arthur Neal was in the city yesterday, at the Overland Hotel, and a reporter interviewed him for the purpose of obtaining reliable news from headquarters concerning the Black Creek mining region. Mr. Neal was in a communicative mood, and stated that there have already been 40 or so quartz locations made in that vicinity. The district lies in Elmore county two miles east of the Ada county line, and to get there one has to travel only a distance of 21 miles east from Boise City. Mr. Neal individually owns the Homestake and Mountaineer locations, and is co-owner with Mr. George House in the Rover, Humming Bird, Bertha, and Washington claims, the latter being an extension of the Homestake, which lode is 100 feet wide on the croppings, the ore from which runs on an average by assay of $50 per ton.

CŒUR D'ALENE DISTRICT.—Wardner *News*, Dec. 1: The placer interests on the North Side have a stanch friend in Syd Mills, who continues operations in a very systematic manner, proving incontestably the vast amount of gold contained in the claims purchased and operated by him. He keeps a force of 12 men under the superintendence of Ben Stahl, piping on the Robinson claim and on ground adjoining on Fancy gulch. He is also doing a large amount of assessment work, employing an equal number of men on Eagle creek, five miles above Eagle City.

LALANDE DISTRICT.—The concentrator of the Tiger mine which was closed down for some weeks for repairs and the introduction of new machinery, was started up again on Friday, the 22d, under the supervision of A. B. Campbell, who has been appointed receiver for the property.

A LEASE.—Ketchum *Keystone*, Dec. 7: Messrs. Philbrick, Harlan & Williams have secured a lease of the Nabob mine at Galena. Two teams—one six-horse and the other a two-horse team—left Ketchum last Wednesday with sleighs loaded with about 5000 pounds of supplies for the mine. The Nabob is considered a very good prospect. A lot of ore from the Tyrolese mine was brought to the Ketchum sampler this week which yielded 126 ounces silver, $30 gold and 45 per cent lead per ton. Ore shipments continue well as compared with this month of previous years, and several leasers of good properties in this vicinity are arranging now to continue shipping ore all winter.

LOWER CALIFORNIA.

ALAMO GOLD.—*Nugget*, Dec. 5: The purchases of gold-dust for November as reported by Smith & Edwards, Aldrete & Romero, Carillo, Venn and others indicate that the placer yield for the month was from $250 to $500 more than for October. About $5500 is a fair estimate. Doc. Breckon and Jack Barnes have struck another lot of rich ore in the 26-foot drift of the Asbestos. Sierra's cinnabar prospect on Mt. Alamo is scooped in by the 10,000 meter grant of the tunnel company. The heavy rains we are now receiving ought to increase the placer yield for December in Alamo district to $10,000. The dry washers are taking a rest these moist days. The water-loving prospectors are engaged in looking over the mountains and mesas. Several blasts this week in the A. H. Butler indicate that Mr. Hughes and the boys are getting ready for another run at the little five-stamp mill.

MONTANA.

TO RESUME.—Butte *Miner*, Dec. 4: Since the advance in the price of copper several properties which have in the past produced a vast amount of copper, but which had to close down when the metal became cheap, are now getting ready to resume operations. The principal one of these is the Ramsdall-Parrot. This mine now has a 400-foot shaft, from which crosscuts and levels have been run. The lead is the same one as that on which the Parrot is located, and the product will in future add greatly to the copper and silver output of the camp.

SUSPENDED. — *Inter-Mountain*, Dec. 4: The Elm Orlu has suspended operations for the past two weeks, having lost the lead at the bottom and the upper workings having been entirely worked out. In the past this mine has produced some very fine and exceedingly rich ore. The company are at present running a drift from the 300-foot level of the Black Rock that is considerably lower than the Elm Orlu, that will have to be run at least 600 feet to determine if the Elm Orlu is really on the vein as originally supposed, and if such be the case and an ore body is cut, it will be entirely worked through the Black Rock shaft.

THE ANACONDA SMELTER. — *Inter-Mountain*, Dec. 6: The Union Pacific has been rushing coal into Anaconda at a lively rate for the past few days, and the prospect for a constant supply of fuel is such that the upper smelters of the company began work last evening and are now in full operation. The company has made a large increase in its coal order, and intends to provide at great expense storage capacity for the extra coal received, so that in the event of a snow blockade this winter, or a temporary stoppage of railroad operations for a short period, a shutdown of the smelters will not be necessary. The big new smoke-stack at the upper works is a success, and carries all the smoke over the hills to Lost creek and keeps it out of the town of Anaconda. At the mines of the Chambers syndicate the forces have been increased to such an extent that ore can readily be produced sufficient to keep the smelters in constant operation. At the Anaconda and St. Lawrence there is no change to report, though it is expected that the mine will be opened within 24 hours. There are no indications of fire in either shaft.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City *Enterprise*, Dec. 7: James Kerr and Paul Mitchell have secured a lease on the Timmer mine, Cow Springs district, and will soon be taking out plenty of ore. M. W. Bremen is improving the road leading from his mine into town. It will shorten the distance to the mine by a mile and a half, and will enable the teams now at work to deliver 150 tons per month more than over the old road. John A. Miller has a lease on the Telegraph mill and will haul ore there from the Nugget mine, Carlisle, for treatment. The Carlisle Co. has let out 15 miners in the past week. The Frue vanner recently ordered by the Humboldt Co. of Shakespeare has arrived, and is being put in position in the mill. Sil Gamblin has purchased a one-half interest in the Red mine, at Pinos Altos, from Mr. Robinson. A force of men is now at work in the mine. W. C. Tonkin informs the *Enterprise* that a force of men has been put to work on the Canyon Gold Co.'s property near Clifton. Work will be pushed and a mill erected soon. Work on the Grand Tower group at Gold Hill is progressing satisfactorily. A considerable body of carbonate ore has been discovered, which it is thought will average $200 in silver and over 20 per cent lead. A lease has been secured on the upper levels of the Golden Giant, at Pinos Altos, by J. W. Clark. The double-compartment shaft will be timbered from top to bottom, a distance of 280 feet, after which several contracts will be let to extend the various drifts and the sinking of the main shaft.

OREGON.

CORNUCOPIA.—Bedrock *Democrat*, Dec. 7: There is at present between three and four feet of snow at Cornucopia, and the indications point strongly to the heaviest fall this winter ever known in that locality. At Cracker City there is more snow now than there was all last winter. In the Greenhorn and Granite mining sections there is already an abundance of snow. The same can be said of the other mountain sections, and not only the miners but every person in Baker county is in consequence happy at the prosperous outlook for a great water supply the coming season.

GREENHORN MOUNTAIN.—*East Oregonian*, Dec. 7: B. L. Duncan arrived on Sunday from the Greenhorn mining section, via Baker City. Mr. Duncan reports three feet of snow in the Greenhorn mountains, and mining operations comparatively at a standstill on account of the winter having set in. Mr. Duncan reports this to be a wonderful mining country, there being so much rich ore in sight. He brought samples down from a number of mines in that section. He says J. H. Mitchell, owner of the Virginia mine, has met with great success of late, and is doing more work in his mine than any other one man in the mining district. He has already worked up 100 tons of ore from which he has realized handsomely; has another hundred tons on the dump, and from 500 to 1000 tons in sight. The Phœnix, owned by the Berry Bros., is turning out well. They have an arastra and work their own ore.

UTAH.

STRIKE IN THE WOODSIDE.—Park *Record*, Dec. 7: For some time past the Woodside company's workings have been of such a nature that people in local mining circles have been on the tip-toe of expectancy for some good news from this bonanza property. The news is ripe, for a very important strike has been made. During the last four months operations at the mine, under Supt. Chas. H. Gitsch, have not been confined solely to cleaning up and shipping the ore left by the leasers, but also to driving two crosscuts in the direction of where it was expected a north vein would be encountered. This vein was cut on Tuesday and a fine body of ore is exposed which has not yet been driven entirely through. The vein lately encountered is large and rich, and the ore is of about the same character as what made the leasers wealthy.

ACTIVITY AT THE ANCHOR.—Pursuant to the terms of the contract awarded to W. W. Dull, an Eastern oil man of 25 years' experience, the work of boring an eight-inch hole from the bottom of the Anchor shaft to the tunnel level will be commenced the coming week. The machinery and drill are now here and they are now being set up. There can now be no question about the success of this enterprise. As soon as the hole is down, the mine will drain itself, and then the shaft, at present 600 feet deep, will be sunk to the tunnel level, which is nearly 1200 feet from the surface. When the shaft connections are complete the numerous veins of ore in all this vast space will be opened up to great advantage. Since the work of getting the boring machine ready was started, work on the crosscuts has been stopped, and Thursday morning the men commenced drifting on the veins from the tunnel level. Teams also commenced delivering the second-class ore to the Union concentrator, and the concentrator started to treat it yesterday. The operations at the Anchor are in charge of Wm. M. Curtis, the efficient superintendent.

THE ONTARIO SHAFT.—The deepest workings of the Ontario are now at 1320 feet, or rather that is the depth of the No. 2 shaft. Drifting to cut the vein on the 1300-foot level is being pushed, and the work of sinking the shaft to the prospective tunnel level, 1560 feet deep, will be resumed ere long. The water is easily handled.

CAMP CROSSCUTS.—A shipment of bullion is being made up at the Marsac mill. The vein opened up by the leasers of the Creole No. 2 continues to get richer. Ore is being sacked for shipment. The Ontario bullion shipment for the week was 38 bars, containing 19,538.55 fine ounces of silver. Col. Ferry's shaft on the North Pole claim is down 50 feet, to bedrock, from whence drifting to cut the vein is in progress.

MECHANICAL PROGRESS.

American Screw Machines in England.

A late number of London *Iron* makes the following notice of a roller screw machine which has recently been introduced into the works of the American Screw Company at Providence, Rhode Island:

These machines—one for forming the blanks and the other for rolling the screw-threads—have been recently brought over to this country [England] and we have just been afforded the opportunity of witnessing their satisfactory working. The blanks are formed from a coil of wire of the necessary gauge. They leave the machine with the head, the slot, and the point fully developed, at the rate of from 50 to 60 per minute in regular working. From the blank-forming machine the blanks are taken to the threading machine, and are placed en masse in a revolving tray, from which they are fed automatically into the body of the machine. Here they come between a pair of fluted dies which are made to traverse past each other in a horizontal direction. The dies roll the blanks in succession between them, the thread being thus formed, the finished screws dropping from the dies at the rate of 54 per minute. Upon the occasion of our visit the working of this latter machine was made comparative with an ordinary screw-cutting machine. The ordinary machine was set to work on 1½-inch blanks of No. 9 gauge, the threads being cut in the usual way, and the screws being turned out at the rate of seven per minute. The American machine was then started on blanks of the same length and gauge, the finished screws being turned out at about the rate already stated. The finish was all that could be wished, while the rate of production as compared with the ordinary machine renders comment superfluous. But the rate of production is by no means the only advantage arising from the new system of manufacture, there being many points of improvement in the screws thus formed. The following claims are advanced for these gimlet-pointed rolled wood screws: (1) Superior point, centralizing the screw, and enabling it to enter the wood straight. (2) A deep, thin thread, having a greater hold and not distorting the fibers of the wood. (3) A small shank, which avoids splitting the wood, and requires but one boring for hard wood. (4) The use of a tough material, and the absence of a weak place in the screw.

Besides the screws we have been describing, we were also shown some new drive-screws. These screws have a very quick thread, which facilitates their advance into the wood, into which they can be driven clean home by a hammer, and extracted like ordinary screws. Hitherto the cost of manufacture of these screws has prevented their wide adoption. In order to secure a good hold of a screw, it is essential that the fibers of the wood should be as little broken up as possible by the entrance of the screw. In driving a screw of the ordinary type into wood with a hammer, the fibers are so broken up by the screw-threads that the holding capacity of the thread is greatly reduced, and even where threads of steep pitch are cut into wire, the waste of material and reduced strength counterbalance, to a great extent, the holding capacity due to the spirally formed threads. A nail or screw forces its way into the wood, and its holding power depends more directly upon the shape and condition of the walls of the cavity formed by its entrance than it does upon the tensile strength of the metal itself, which is generally more than sufficient to resist any direct strain brought upon it. The American company's drive-screw is capable of forming a cavity which, as to the strain upon it and its withdrawal, acts like a nut to a screw. The walls of this cavity are made up of the compressed fibers of the wood, instead of disintegrated fibers which result from driving ordinarily.

These screws are made by special machinery designed by the American Screw Company, and which forms the screw by swaging and rolling. This drive-screw can be forced into wood by the blow of a hammer, makes its own nut as it descends into the wood into which it is driven, and may be withdrawn from the wood by turning with a screw-driver in the ordinary way. This was demonstrated at our recent visit, the screw being seen to give a partial turn at each blow of the hammer. The cold-rolled screw machines are being introduced in this country by Mr. Wm. H. Reynolds, Bartholomew House, Bartholomew Lane, London.

THE LAW OF GRAVITY IN THE MANUFACTURING BUSINESS.—It is now recognized in New England that there is really such a law, and that it has a tremendous force and never fails to be executed. Mechanics and capitalists are equally concerned to know what is the scope and meaning of this law, and then to study carefully its relation practically to their business as craftsmen or as employers or masters. In New England it is rapidly beginning to be felt that the manufacture of cotton goods must eventually be carried on near the place of production, and hence a general rule is being formulated that in the near future raw materials must be manufactured near the place of production, if any money is to be made in the operation. Already an edge-tool company in Maine has begun the erection of a branch factory in the metal region of the South, and this is by no manner of means an isolated instance. Year by year the competition in business is becoming more and more serious, and common prudence seems to demand that a very thorough study of the situation should be made. If the cotton manufacture shall in the next twenty-five years center chiefly in the South, or the metal manufacture nearer the source of supply, and otherwise the factory approach the place where raw materials are produced or found, it by no means follows that the North may not have some equivalent to take the place of cotton, or New England some factories to work other productions than iron. The genius and skill of our inventors and artisans will rapidly find out the industries and manufactures for any given locality, and so the real balance will be properly kept, while the prime cost of production will be lessened. The warning has been plainly heard all along the line, and capitalists will study the situation more carefully than ever, and discriminate with greater closeness before selecting the particular direction in which to spend time and money.—*The World's Progress.*

New Foundry Practice.

We have been asked the question several times recently, "What are foundrymen now doing who have always insisted that they were obliged to have some Scotch pig-iron as part of their mixture?" The great advance in prices abroad of course prompts the question. Foundrymen who have been interviewed on the subject give various answers. Some, especially in the East, have still on hand or under contract a supply which covers their immediate requirements. What they will do when that is exhausted they leave for the future to determine. Others, and a far more numerous class, have cut loose from Scotch pig-iron entirely, using in its place Ohio softeners of practically the same characteristics, realizing the same results. They will probably not return to the use of Scotch pig-iron again unless radical changes, now most unlikely, should occur in the iron market here and abroad. But the great majority of our foundrymen have cut loose from all past practice and are making satisfactory mixtures with Southern soft grades or Northern high-silicon irons. We have recently been shown numerous specimens of difficult foundry work made by enterprising molders, in which not a pound of Scotch pig or any other special softener had been used. But a few years since such work would not have been attempted without a most carefully compounded mixture. Present foundry practice is in the direction of the intelligent use of pig-iron according to its own chemical constituents and without the blind adherence to tradition which involved a constant reliance on one particular kind of iron as part of the mixture.—*The Iron Age.*

A NEW STEEL PROCESS.—Some stir, says the Chicago *Journal of Commerce*, has been made in that city during the past week anent the promulgation of a process, invented by two gentlemen of Kentucky, which it is claimed will speedily change low-grade steel into tool metal possessing a high degree of superiority. The method embraces a bath containing glycerine and several hydrocarbonaceous substances dissolved in water. The low-grade steel is brought to a white heat, then plunged into a bath and permitted to remain until cool. The heated metal in the bath sets free certain hydrocarbon gases which are absorbed by the steel, and by the time the latter has cooled, chemical and physical changes have taken place in its composition and transformed it into a hardened, high-grade, impenetrable steel. This process is known as the Redeman-Tilford, and as such is already known among iron men. Great things are claimed for it, and these claims, it is alleged, are supported by careful tests.

BLACKSMITHING A LOST ART.—Blacksmithing may very properly be classed among the lost arts. The hammerers in iron of to-day do not possess a tithe of the skill of their seventeenth century brethren, and even of an earlier date. At the Birmingham museum and art gallery is a lobster executed in hammered iron, a piece of ancient Japanese work and supposed to be the specimen work of an armorer. All the articulations had the exact movements of its natural prototype, and were equally close and nicely fitted. At the Paris art gallery there is a gate made in the seventeenth century by a blacksmith, every part of which was hand-forged or hammered. It is made in the form of the limb of a tree full of leaves, and every leaf is as perfect as nature forms it. A close examination showed that no file or other finishing marks had been used in the perfection of these works of art. It may well be doubted if there is a hammersmith in the world who could duplicate these specimens to-day.—*Ex.*

A MAMMOTH GLASS ENTERPRISE.—Eastern and Pittsburg capitalists are about to inaugurate a great glass enterprise near Pittsburg, Pa. The invested capital will be $3,500,000. On a tract of 500 acres, embracing one and one-half miles of river front in the Monongahela Fourth Pool, there will be erected, among other factories, plate glass works 1500 feet long, and employing at the outside nearly 3000 men. The purchase price of the tract was $250,000, and deposits have been made.

YOU cannot dream yourself into a character. You must hammer and forge one for yourself.

SCIENTIFIC PROGRESS.

Japanese Art.

At the opening of the Annual Exhibition of the School of Design of this city, on the evening of the 4th instant, the Alvord gold medal for excellence in oil painting was awarded to Oroka Soyeda, a young Japanese student. Another Japanese, Mr. Takahoski, was awarded honorable mention for excellence of sketches in water-colors, both in figures and landscapes. After Mr. Soyeda had received his medal, a little girl from the audience ran up to him and presented him with a handsome bouquet, which he received with manifest delight. The second and only other gold medal was awarded to Miss Isabel Hunter for excellence in drawing.

The Way a Japanese Artist Works at Home.

The following sketch of the manner in which Japanese artists work in their own country will be read with interest in connection with the above. We copy from a late number of the *Magazine of Art:* The technique of Khiosi's work was most fascinating. I had come away from England with all sorts of theories concerning the technical part of an artist's work, and when I got to Japan I found there was absolutely nothing that was not known by that man. This fact is as remarkable as it is true. His method of work, too, interested me exceedingly. To begin with, the assistant brought his stretcher of silk—a lovely piece of silk stretched across a wooden frame—and placed it in front of him. Then, taking a long, burnt twig, he thought for a few minutes, looking all the while at his silk—thought out his picture, indeed, before he put a single touch on his canvas. How different is this from the man who so often, with us, puts on a lot of hasty touches in the hope that they will suggest the picture!

When this Japanese saw his picture completed in his mind, he began with the little burnt twig to trace a few sure lines. I never saw such facility in my life. A few swift strokes indicating the outline on the silk of two black crows, then he took up his brush and began at once with the Indian ink, with full powerful color, and in about seven minutes he had completed a picture, superbly drawn and full of character—a complete impression of two black crows, very nearly life-size, resting on the branch of a tree.

Khiosi never under any circumstances repeats himself; every picture he paints is different, while for his work he asks but a small price. Captain Brinkley told me of an incident which well illustrates the man's character. A member of one of the foreign legations had invited Khiosi to come around and sketch on the floor at an evening party to himself and a number of Europeans. Khiosi refused absolutely, although he was to be paid enormously well for his work, because he said he felt he would not have a sympathetic audience.

After he had done his crows, he painted a colored picture, beginning with Indian ink. First he tried all his colors, which were ready prepared in different little blue pots and placed all around him. These little shallow pots, or saucers, had each its own liquid, which the assistant had prepared to a certain extent beforehand. They contained flesh tint, drapery color, tones for hair, gold ornaments, and so forth. These colors had evidently been used before, as they were in their saucers, merely requiring dilution before immediate use. The saucers were arranged chiefly on his right, with a great vessel of water, of which he used a great deal. All his utensils were scrupulously clean. When he began there was no fishing for tones, as on the average palette. No accident! All was sure—a scientific certainty from the beginning to the end.

The Carboniferous Era.

Buried in the depths of the earth, distributed all over the globe, and in total quantity beyond the ability of the human mind to conceive, and almost beyond its power of computation, lie the skeletons of forests which covered the earth for, perhaps, millions of years, during that early period called by the geologists the carboniferous. During a long interval of time the globe was covered with a warm, moist, misty atmosphere, rich in carbonic acid, the food of the vegetable kingdom, and its soil was kept warm and productive by the conjunction of the heat of its internal fires with the caloric received from the sun and held encaged by this atmosphere, which is known to have the property of permitting easy transmission of the rays of the sun to the earth, while strongly resisting their return into space. Under such circumstances the growth of vegetation took place with a rapidity unknown even in the tropics of to-day; the earth became covered with forests; forests grew on the relics of early vegetation; millions of square miles of soil were composed of the trunks, the branches, the leaves of tropical plants, the stems of gigantic ferns, the masses of enormous moss; while the sea was clogged with marine vegetation, the growth of which was stimulated by a steady and uniform warmth extending from the equator to the poles.

Higher animal life could not exist amid this atmosphere of mixed air and carbonic gases; but the lower forms swarmed throughout the world. Thus heat, moisture, and carbon-supplying compounds conspired to provide a wonderfully gigantic and rankly-growing vegetation, and the progress of ages saw the rise and the fall of measureless quantities of woody material, which was finally spread over the earth, to form, by later consolidation, and by the elimination of volatile constituents, those apparently inexhaustible stores of fuel now an essential element of human life and civilization. The partial decomposition of the animal and vegetable juices and fiber produced the petroleums and the unimagined quantities of compressed gases, which are just coming into use for fuel and light in many parts of the country—a hitherto unsuspected reserve. This process of production and storage of fuels of such strange variety of condition and composition is now known to have been a system of reception and storage of a minute part of the energy, the work-power, that the sun and the subterraneous fires of the earth were lavishly and wastefully distributing in all directions into space. Every pound of the carbon thus stored away for the use of the human race in the millions of years succeeding the millions that should elapse before its appearance on the globe, is now known to hold in "potential" form, as the man of science puts it, 14,500 thermal units of heat.—*Prof. R. H. Thurston.*

WHY FLOWERS SLEEP.—It is to give busy insects a chance to fertilize them. That flowers sleep is evident to the most casual observer. The beautiful daisy opens at sunrise and closes at sunset, whence its name, "day's eye." The morning-glory opens its flower with the day. The "John-go-to-bed-at-noon" awakes at 4 o'clock in the morning, but closes his eyes in the middle of the day, and the dandelion is in full bloom only during the hours of strong light. This habit of some flowers is certainly very curious, and furnishes one of the many instances which prove the singular adaptability of everything in nature. The reason is found in the method by which this class of flowers is fertilized. It is obvious, says Sir John Lubbock, that flowers which are fertilized by night-flying insects would derive no advantage from being open by day; and, on the other hand, that those which are fertilized by bees would gain nothing by being open at night. Nay, it would be a disadvantage, because it would render them liable to be robbed of their honey and pollen by insects which are incapable of fertilizing them. It is possible, then, that the closing of flowers may have reference to the habits of insects, and it may be observed, also, in support of this that wind-fertilized flowers never sleep.—*Jewish Messenger.*

THE COLOR OF THE EIFFEL TOWER, says the *American Architect*, has been one of the puzzles of the Paris Exposition, no two persons agreeing as to what the real color is. Some people imagine that it has been plated with nickel or silver, while others call it red, and others, again, think it is of a beautiful bronze color. The fact is that it is painted in five shades of the same color, modulated with the skill that the French often show in cases of the kind. From the base of the first platform the color is a dark "Barbedienne" bronze, verging a little to red; thence to the second platform the color is the same, but lighter; and from this point to the top the color grows constantly lighter, by five successive gradations, the top being almost a golden yellow. Three coats of paint are spread over the entire surface, and over all is a coat of very hard, transparent varnish, which, by reflecting the sun, adds to the difficulty of defining the color.

DANGER FROM "FLASH POWDER."—The recent fatal explosion of so-called "flash" powder at the laboratory of a Philadelphia chemist is a startling reminder of the unknown perils encountered daily by the fireman. The detonation was caused by the action of water upon the powder which was being poured into it from a seven-pint jar, with the idea of rendering it harmless and getting it out of the way, and was so terrific that three men were killed at once and five others injured. How it came that the unfortunate chemists were ignorant of the peculiar qualities of the powder will never be known. This case certainly calls for legislation absolutely forbidding the storage or manufacture in our cities of a substance which can be set off with the destructive force of dynamite by a simple stream of water, perhaps from a hoseman's pipe.—*Ex.*

METALS IN THE SUN.—Platinum has never as yet exhibited its presence in the sun's atmosphere, but recent investigation upon the solar spectrum would seem to establish the fact that it exists in the sun as well as upon the earth, lines corresponding to that element having been observed in the spectrum. The same investigation confirmed the belief in the presence of such metals as bismuth, cadmium and silver, which have heretofore been considered doubtful.

FOSSIL ICE.—Large deposits of ice, believed by some to be relics of the glacial period in this country, have been discovered in Idaho. It is proposed to form companies to mine this ice for sale in Western cities, where ice is always dear and scarce.

COCOANUT BUTTER.—German chemists have discovered in the cocoanut a fatty substitute for butter, and it is being produced in large quantities at Manheim. One factory turns out 6000 pounds per day, worth 15 cents per pound.

GOOD HEALTH.

The Temperature of Our Food and Drinks.

Of all nations, the American is the most in the habit of taking his food and drink at a temperature as remote as possible from that of the body. Ice-water drinking is a national habit, and ice cream a national dish, predilection for which runs through all classes of society, and becomes a binding force in social, and we might add, scientific and religious gatherings. Americans should, therefore, take an interest in the experimental researches on the temperature of our food and drink made by certain foreign savants whose names are, as is usual, hyperplastic with consonants just in proportion to the rigidity of their science and the seriousness of their inquiries.

The temperature of our food and drinks was treated of by Von Spath and Kostjurin a year ago, and more recently by Uffelmann of Rodstock.

Prof. Uffelmann reviews the work of his predecessors, and draws his conclusions partly from this and partly from his own experiments. They bear first upon the temperature of ingesta in health, and the rules laid down are:

1. That, in general, a temperature of food and drink which approaches that of the blood is most healthful. For nurslings such temperature is essential.

2. For quenching the thirst, the best temperature is from 50° F. to 68° F. The favorite American temperature is, as is well known, 32° F., and an issue is raised at once between Prof. Uffelmann and the American nation.

3. The ingestion of very hot or very cold food or drink in health has a damaging effect, which is increased just in proportion to the rapidity with which the hot or cold substance is taken. Hence the gulping down of ice water or hot coffee, etc., means eventually, according to the light we are quoting, a mere ventral damnation. If a person takes a drink for the purpose of warming himself, as in cold weather, he can accomplish this by having the drink at a temperature of 116° to 120° F.

4. The use of very hot and cold substances, following or alternating, is injurious to the teeth. But the taking of cold water lessens the injurious action of extremely hot substances upon the stomach.

5. Ingestion of cold food and drinks lessens the bodily temperature, whether it be normal or febrile.

6. Cold fluids lessen the hyperirritability of the stomach.

Cold ingesta raise the tone of the stomach, increase peristalsis, and promote movement of the bowels. Cold food and drinks increase the tendency to cough, according to Uffelmann, by causing reflexly a congestion of the bronchial vessels. Hence, persons with bronchial disease ought not to indulge in cold drinks. It is, however, a common custom to give persons who suffer from pulmonary hemorrhages ice to swallow; and, according to the view stated, this would be an injurious practice.

Hot food and drinks stimulate the stomach more than cold. But after repeated use they lessen the tonus of the digestive tract, and cause congestion and dyspepsia. This condition has been observed after the so-called hot-water cure. Hot drinks tend to lessen bronchial irritation, and this is one cause, possibly, of the success in some cases of the hot-water treatment of consumption.—*Medical Record.*

REMEDY FOR LOW SPIRITS.—Take an ounce of the seeds of resolution, mixed well with the oil of good conscience, infuse into it a large spoonful of the salts of patience; distill very carefully a composing plant called "other people's woes," which you will find in every part of the garden of life, growing under the broad leaves of disguise; add a small quantity and it will greatly assist the salts of patience in their operation; gather a handful of the blossom of hope, then sweeten them properly with the balm of prudence; and if you can get any of the seeds of true friendship, you will then have the most valuable medicine that can be administered. But you must be careful to get some of the seeds of *true friendship*, as there is a seed very much like it called "self-interest," which will spoil the whole composition. Make the ingredients into pills and take one night and morning.—*Cor. Sac. Sunday Union.*

CIGARS INFESTED WITH TUBERCULOSIS.—A celebrated European specialist for diseases of the throat, nose and ear, asserts that tuberculosis is making alarming progress among cigar-smokers. He does not attribute this to the use of tobacco, but to the manner in which cigars are manufactured. Rolling the tobacco-leaf is a craft that requires neither strength nor intelligence, consequently in this branch of the operation it is usual to find male and female operators who are weak and diseased, and who, in consequence of their infirmities, are economical employes. Most of these suffer from scrofula or tuberculosis. They cough, and often give the finishing touches to a cigar with their lips.—*Epoch.*

BETTER THAN DRUGS.—The victim of the habit of "taking something" for every little derangement or ailment often becomes a confirmed invalid. This paragraph is written with the hope that those not yet in bondage to this habit may be prevented from forming it. Exercise, open air, sleep, diet, rest, food, not in excess or deficiency—let the ailing medicate themselves with these, and there will be no drugs in their bodies to poison them. A good sister approached one of our ministers and asked information as to a certain remedy that costs a dollar. Said he: "Now don't try that drug, but spend the dollar in oranges, and eat one or two for *the first dish at breakfast;* they will produce the effect you desire, and they won't poison you." She followed the advice, and was gratified with the results.

CANCER AND AGE IN ANIMALS.—An instructive monograph on tumors in the lower animals, by Dr. Plicque, appeared in the *Revue de Chirurgie.* Among the more interesting definite facts included in his paper are the subjects of melanosis and the relation of cancer to age. Melanosis, so malignant in man, is far nearer the innocent type of tumor in animals, especially in the horse. A melanotic nodule on a spot subject to irritation by harness sometimes disappears when the harness is adjusted so as to rub the new growth no longer. The phenomenon has even been observed after the growth has begun to ulcerate. Other tumors, especially sarcoma and carcinoma, are often more intensely malignant in animals, especially the horse, than in man. Animals protected by the resources of civilization, so as to live to an old age, rarely if ever met with in nature, are especially subject to cancer. Indeed, Dr. Plicque finds distinct evidence that age is far more predisposing to cancer in beasts than in man. Bouley, a French veterinary authority of experience, believes on the ground of long observation, that dogs are doomed to cancer if they live to old age and are not killed by some acute pulmonary or gastro-intestinal affection. The cat, often cherished and kept alive when old and miserable, is also very subject to cancer in age. Statistics show that cancer is far more frequent in the carnivora than in vegetable eaters. This statement, as Dr. Plicque is careful to explain, is liable to mislead the pathologist; indeed, it is a capital example of a statistical doctrine eminently calculated to deceive the thoughtless. For if we only note what animals are mentioned in this paragraph the truth will become apparent. Old cats and dogs, carnivorous animals, are kept alive through a somewhat misguided philanthropy, or rather zoophily. But an old horse is seldom favored in this doubtful way, and cattle are killed, or ought to be killed, when they are young and tender. The herbivora have little chance of living long enough to have cancer.—*Lancet.*

USEFUL INFORMATION.

Chinese Floating Gardens.

Dr. Macgowan, a gentleman well known to scientific circles in this city, and long a resident of China, has given a lengthy description in the *China Review* of the manner in which the well-known floating gardens of that country are formed. The article has been condensed as follows: "In the month of April, a bamboo raft 10 to 12 feet long, and about half as broad, is prepared. The poles are lashed together with interstices of an inch between each. Over this a layer of straw an inch thick is spread, and then a coating two inches thick of adhesive mud taken from the bottom of a canal or pond, which receives the seed. The raft is moored to the bank in still water, and requires no further attention. The straw soon gives way and the soil also, the roots drawing support from the water alone. In about 20 days the raft becomes covered with the creeper (*Ipomœa reptans*), and its stems and roots are gathered for cooking. In autumn its small, white petals and yellow stamens, nestling among the round leaves, present a very pretty appearance. In some places marshy land is profitably cultivated in this manner. Besides these floating vegetable gardens there are also floating rice-fields. Upon rafts constructed as above weeds and adherent mud were placed as a flooring, and when the rice shoots were ready for transplanting they were placed in the floating soil, which being adhesive and held in place by weed-roots, the plants were maintained in position throughout the season. The rice thus planted ripened in from 60 to 70, in place of 100 days. The rafts are cabled to the shore, floating on lakes, pools or sluggish streams. These floating fields serve to avert famines, whether by drouth or flood. When other fields were submerged and their crops rotten, these floated and flourished; and when a drouth prevailed they subsided with the falling water, and while the soil around was arid, advanced to maturity. Agricultural treatises contain plates representing rows of extensive rice-fields moored to sturdy trees on the banks of rivers or lakes which existed formerly in the lacustrine regions of the Lower Yangtsze and Yellow rivers."

A MACHINE FOR WRAPPING ORANGES.—The Remington Arms Company is manufacturing for Humphrey Williams of Yorkville, Oneida county, N. Y., a large number of machines for packing or wrapping oranges in papers for shipping. The machines are simple and comparatively inexpensive, but one will do the work of three persons at least. They will wrap nicely in papers 2500 oranges per hour. The machine is about three feet long by three feet high and 18 inches wide, not including the cylinder for feeding or the endless chain carrier, which is about seven feet long, and operates like a straw-carrier in a threshing-machine, and carries the fruit after the wrapping operation to bins or boxes. The machine is operated by a crank. The fruit passes from the cylinder down a slide, one at a time, into a wire cup, which opens and drops the orange on a square paper cut by the machine from a roller, then passes through an aperture which wraps the paper and trims it, then the fruit passes on to the carrier. The operation is both simple and rapid.

CAST IRON PIPE FOR NATURAL GAS.—An opinion has become quite prevalent that cast-iron pipe is not safe for collecting natural gas. Those who have imbibed that idea may be interested in the following which a Cincinnati manufacturer of cast-iron pipe writes to an exchange: "The Central Ohio Natural Gas and Fuel Company of Columbus, O., has just contracted with Northern pipe foundries for 25 miles of cast-iron pipe, to be used in the distribution of natural gas. This, in connection with the ever-increasing demand for pipe, even in the Pittsburg district, for the same purpose, is of sufficient interest to your readers, we think, to have you devote some space in your next number to calling attention to the use of cast-iron pipe as a conduit of natural gas. This year the Equitable Natural Gas Company have laid their entire system from their field reducing station to Pittsburg of 24-inch and 30-inch cast-iron pipe, and now have their plants in successful operation. The People's Natural Gas Company, the Monongahela Natural Gas Company, the Philadelphia Company, all of Pittsburg, are laying enormous quantities of natural gas cast-iron piping. The Indianapolis (Ind.) Natural Gas Company, as well as the natural-gas companies of Fort Wayne and Logansport, Ind., have much of their system laid with cast-iron pipe, and their extensions are being made with the same kind of pipe."

HOW TO STOP A RUNAWAY HORSE.—A policeman, who has distinguished himself in stopping runaway horses, gives in the Medical Classics the following points as to how to accomplish this difficult feat with the greatest success. When you see a runaway coming, do not try to check him by a rush from the opposite direction or the side, for you will be immediately knocked flat by the collision; but instead, prepare yourself for a short run with the horse. Measure with your eye the distance, start for the run while he is yet some distance off, perhaps ten feet in the case of fair to medium runaways. You may depend upon his keeping a straight line, for a really frightened horse is half blind, and would not veer for a steam engine. He will go straight ahead until he smashes into something. So do not get close to the line on which he is rushing, and as he passes you, grab the reins near the saddle. Gather the reins firmly, and then, leaning backward as you run, give them a powerful yank. You may be able to brace yourself somewhat as you give this jerk by half sliding on your feet. The strong jerk on the bit tells the horse that he again has a master, and prepares him for the final struggle. A step or two forward after the first yank, do it again. This is the finishing stroke. It never fails when given by a determined man. Keep a firm pull on the reins till you grasp the horse by the nostrils, and hold him so till he is pacified.

A NEW USE FOR THE FIRE-ESCAPE LADDER.—In the next war we are likely to see the aerial turntable ladder truck employed in a novel manner in siege or even field operations. The Germans have discovered that for purposes of observation the extension ladder fire-escape is superior to a balloon. The latter is, of course, peculiarly liable to destruction from an enemy's shot, while from the top of an aerial ladder a man can look over into a fortification or earthwork with the minimum of danger. The apparatus is, of course, also more handy in every way than a balloon. Apparatus of the kind have already been added to the equipment of the German army, and are being experimented with. Here is a new field opened to our enterprising inventors and makers of such machines.

LOCK-WIRE ROPE.—A style of wire rope, quite new in this country, although it has been used for a year or two in England and on the continent, called "lock-wire rope," bids fair to take the place of the greater portion of other make of wire rope now in use, particularly where great strain is required and as small a rope as possible is desired. The outer layers of wires of which the rope is made are irregular in section, and not round, as in ordinary wire rope. The inside or heart of the rope is formed of wires instead of hemp, and these wires are round.

DIRT REMAINS.—Somebody says: If the floor of a room is swept ever so clean with a hair broom, yet if it is then washed, the water in the pail reveals that much dirt was left; if wheat is ever so well cleaned with the dry process and then washed in a good wheat-washing machine, the water reveals the dirt still remaining.

WHY DO THEY?—A correspondent of an exchange writes: Apropos of left-handedness, I should like to see a satisfactory explanation of the fact that women always (with exceedingly rare exceptions) button from right to left, and men from left to right. Personally I have remarked only four cases of exception to the rule.

ELECTRICITY.

PROGRESS IN ELECTRIC LIGHTING.—The recent advance in electric lighting is most notable. The increase in the number of lights has been steady and rapid, and, although no radical improvements nor fundamental discoveries have been made, yet the efficiency of all of the lighting systems has been largely increased and the expense reduced. In arc lighting, there have been only changes in detail of the important systems, but the number of new stations being equipped, and that have started in the last year, greatly exceeds the showing made in 1887. Incandescent lighting has progressed still more rapidly. The Edison Company has erected central stations of large capacity—up to a maximum of 50,000 lamps—in New York, Philadelphia, Chicago and other cities, besides adding to the already long list of smaller stations. They have increased the efficiency of their incandescent lamps, and have perfected their dynamos. The returns of stations using this system have been for the year most satisfactory, and it is stated in some of the technical papers that no less than $10,000,000 has been subscribed abroad for the extension of the system. The number of electric motors that have been supplied from central stations has also largely increased. The Westinghouse Company has continued to distribute electricity by the alternating system, and has rivaled the increase of the older Edison Company.

GENERATION OF ELECTRICITY DIRECT FROM COAL.—Prof. John Perry, F. R. S., in a recent address in England said: "Now, I pointed out in 1881 that if coal or gas were burnt in a voltaic cell, as zinc is burnt, and an electromotor were used, we could utilize as mechanical energy not merely one-tenth but nearly nine-tenths of the energy of coal. I pointed out then that coal-gas could be burnt in this way, but there were two difficulties: First, the apparatus required was too large per horse-power developed. Second, the apparatus required was too expensive. The first of these difficulties has already been got over by a correspondent, who is in some sense my partner. We see our way to developing one useful horse-power per cubic foot of volume of apparatus. Unfortunately, the difficulty of expense still remains. But I am firmly convinced, and I have good reason for my belief, that all the difficulties will be got rid of, and that coal will actually be burnt in this way. Even to those of you who may not be troubled about the general question of economy, the mere possibility of an armor-clad being able to carry enough coal for a voyage at full speed around the world, must appear to be an important result."

SPEED OF ELECTRICITY.—There is, as Prof. Thompson remarks, no assignable "velocity of electricity," as this must vary with the current and the conductor. Wheatstone, in 1833, seemed to show a transportation velocity of 183,000 miles a second through copper wire; but in late experiments, signals were sent over ordinary telegraph wires on poles, and had a rate of only 14,000 to 16,000 miles. With wires near the earth, the velocity was 12,000 miles, but reached 24,000 on very high wires.

ELECTRICITY IN A COAL MINE.—The Erie colliery at Mayville, Penn., is lighted by electricity, and uses an electric motor for hauling purposes. It is claimed that this use of electricity effects a saving of $25 per day on the cost of power, and that with the further advantages derived from the electric light over the ordinary method of lighting, has enabled the company to increase its output from 1000 to 1500 tons per day.

PRESERVING MILK BY ELECTRICITY.—M. Maisonhaute, says the *Bulletin International de l'Electricite*, having noticed that the passage of a current of electricity through milk retarded the formation of cream, made a series of experiments to see whether milk could be kept fresh in this manner. The result of these experiments is a patent for the preservation of milk by means of either static or current electricity.

TELEPHONES IN AUSTRIA.—Telephonic communication has been established in Austria between Vienna and Prague, a distance of 220 miles. It is said that the curious fact has been noticed that those who listen at Prague hear more clearly than those who listen at Vienna. After much discussion as to the cause, some one has suggested that they speak plainer at Vienna.

TELEGRAPH RATES IN RUSSIA.—In Russia, the telegraphic system is under Government control. One of its rules requires that no female telegraphist shall marry any one not employed as a telegraphic operator, and it also requires that in case of sickness the wife shall be the substitute of the man, and perform double service.

AN ELECTRICAL DOG-CART.—An ordinary-looking four-wheeled dog-cart, without shafts and driven by electricity, recently appeared in Camden, New Jersey, doing ten miles an hour with ease. It has been built for the Sultan of Morocco.

Passing Events.

The heavy rainstorm has continued for many days, and as we write (Thursday), gives promise of still continuing. More or less damage has resulted from the incessant rainfall, mainly in washouts along the railroad lines. Some of the lands along the main rivers have been flooded, and there is anxiety where the levels are not of first-class construction. There will be no lack of water the coming mining season.

A very important decision to owners of mines within the Central Pacific Railroad grant has been rendered by the U. S. Circuit Court, in which the miners lose, on the ground that the land had been listed as agricultural and was not known as mineral when the grant by Congress was made. The subject is referred to elsewhere in the PRESS.

The message of the President and the election of a "gold-bug" as Speaker of the House, seems to have had a bad effect on the price of silver, which has stopped the advance it had previously been showing. However, the subject of silver will be very thoroughly discussed during the present session of Congress, and the interests of silver miners will not be neglected.

AN officer of the Canadian Pacific steamer Danube told a reporter of the *Astorian* that his entire crew were made seasick on a recent trip crossing the Columbia river bar.

Secretary Windom's Report on Silver.

In another column we give the text of Secretary Windom's views on the silver problem, a careful reading of which will convince the most obtuse that while he advances arguments from his standpoint that are of a convincing character of their correctness, not only in theory but also when put in practice, yet he would give the Treasury such monetary power as to virtually dictate the finances of the country. In this we make more special reference to his being granted "discretionary power to suspend temporarily the receipt of silver bullion for the payment in notes when necessary to protect the Government against combinations formed for the purpose of giving an arbitrary and fictitious price to silver." If this be granted, he is to be the sole judge, which clothes him with a financial dictatorship that no one man should possess.

The Secretary has unquestionably given to the subject that close study which its great importance demands, and has evidently brought to his aid the views and opinions of the ripest and most experienced financiers in the country. In doing this he must have consulted with those holding all grades of opinion on the silver problem, and from their expressed opinions deduced his own conclusions. If a bill is drawn up in accordance with the Secretary's suggestion, it will be hedged in such a manner as to insure both the Government and the holders of Treasury notes issued against deposited bullion against loss; it will give to the notes a monetary value which places them at par without fluctuating, for it would pledge the Government for their redemption on demand at their full expressed face value. In this connection we refer the reader to the Secretary's report, which is not only concise but made so plain as not to require elaborating.

The more closely the Secretary's position is studied, the more convinced must be the student that if his views, with probably two or three changes, and two or more other provisions, be drafted into a bill and become a law, the result will be, sooner than thought, the free coinage of silver, not only in this country but also by the nations composing the Latin Union, which will have a strong bearing in causing other countries to remonetize silver and adopt free coinage. One of the provisions we refer to is the retirement of both the national bank notes and legal tenders, by the payment of Treasury notes issued against silver purchased by the Treasury. These purchases would absorb the silver bullion product of this country for several years to come, and bring the metal up to the parity of gold. Holders of legal tenders would not hesitate a moment to relinquish them and accept in lieu therefor notes that are based on the metal currency of the country, and for whose redemption on demand the Government stands pledged.

Probably one of the most essential ideas conveyed in the Secretary's suggestions, and which the casual reader would overlook, is that if his views, as expressed in his report, are enacted into a law, England and other nations desiring silver bullion from this country must bid well up for it in the open market or else buy Treasury notes and draw out the bullion from the United States depository. This would virtually give to this country a whip handle in the world's silver market never before enjoyed by giving us the full control of values. The Act would also prevent this country from being flooded with foreign silver coin, which is a desirable end to be kept in sight.

The Secretary's report is so worded as to convey the idea that he, like many others, labors under the impression that the production of silver can be largely increased to the detriment of the country that remonetizes it. In the light of the past we think that it is about time that such absurd notions are dispelled. The world's product has steadily decreased until last year it reached only about $135,000,000, being below the world's requirements.

AMERICAN TIN.—It is stated that an English syndicate with $15,000,000 capital is about to develop the American tin mines. The first operations will be in the Black Hills, Dakota.

THOMAS CRACKLIN was killed in the North Star mine, Grass Valley, on the 9th inst. He was struck by a car on the 900-foot level and was knocked to the 1100-foot level.

The World's Increasing Gold Production.

Heavy deposits of snow on the higher mountain ranges insure a liberal supply of water in this State for both surface and deep mining. For several winters past the water supply has been steadily decreasing, in many districts either not affording enough for surface mining and water-power for mills, or else giving a supply not lasting longer than two or three months. Private advices received from several of these localities give the gratifying information that there is quite a sufficient supply to admit of working the idle mines. As they are producers of gold, it now looks as if for the fiscal year ending with June, 1890, California's output of gold will show an increase of fully 20 per cent over that for the like time in 1888–89. California is not alone on this coast in the promise of an increased gold yield, for from Nevada advices are coming to hand that make it certain that that State's gold output will show a very large gain, particularly from the Comstock mines and the White Pine district. It looks as if the mines on the Comstock will before the close of 1890 show all of from 75 to 90 per cent gold against very nearly that much of silver now.

With an increased production of gold in this State and also in Nevada, it confirms the view of many that the world's output of gold in next year will equal if not exceed that of silver. This is borne out by returns for the first six months of this year from the several gold-producing countries. Bearing on this, a late English exchange says that from January 1, 1889, to July 1st, the gold product of the Transvaal district, South Africa, was £750,000, as compared with £400,000 during the corresponding period of last year and £900,000 during the whole of 1888. During the 17 years from 1871 to 1887 the South African gold production averaged only £50,000; this year the Transvaal and remaining localities are estimated to turn out £1,750,000. In Australia, Queensland is gradually taking the lead. From 1851 to 1886 the yearly average was £542,000, the 1887 production reached £1,590,000, and during the first half of the present year it amounted to £1,400,000, the increase being chiefly due to the extraordinary yield of the Mount Morgan mine, which for some months past has been distributing a monthly dividend of £100,000 on a stock capital of £1,000,000. About 6000 tons of gold quartz pass through the stamps of the mine every month, the average extracted from a ton being 5¼ ounces. Several other Queensland mines are also doing well. The total yield of the colony is estimated at £3,000,000 for the current year against an average of £542,000 from 1851 to 1886, both included.

Favorable reports have recently been received from Peru and Bolivia, where, between the River Madre de Dios and the Peruvian frontier, rich gold-fields have been discovered. A railroad is to be built from the banks of the Madre de Dios to the Amazon river in Brazil. Gold production in British India has to deal with comparatively modest figures. During the fiscal year 1888–89 the entire yield was £400,000.

Shasta County Ore Milling.

Josiah Phillips, who had charge of the Dodge pulverizing-mills at the Hart & Fleming and Little Nellie mines, Shasta Co., is in the city again. He says the Dodge pulverizers and Triumph concentrators have been doing excellent work up there. At the Hart & Fleming, they had a five-stamp mill, but could make no money with it, and tried a Dodge pulverizer and Triumph concentrator. With these, the mine paid enough in the last six months for Hart & Fleming to buy for $40,000 the Bugbee or Little Nellie mine, where they have put up another No. 2 Dodge mill and two Triumph concentrators. The pulverizer has been crushing 12 tons of very hard rock every day—rock that many people did not think the machine could handle at all. The machinery used saves the sulphurets and fine slimes, which makes all the difference possible in the results accomplished.

The Walker Bros.' mine, near Redding, Mr. Phillips says, started up a few weeks ago. They have ten stamps of 1150 pounds each, and crush 30 tons of ore per day, employing 45 men in the mine and mill.

Prospectors and Geologists.

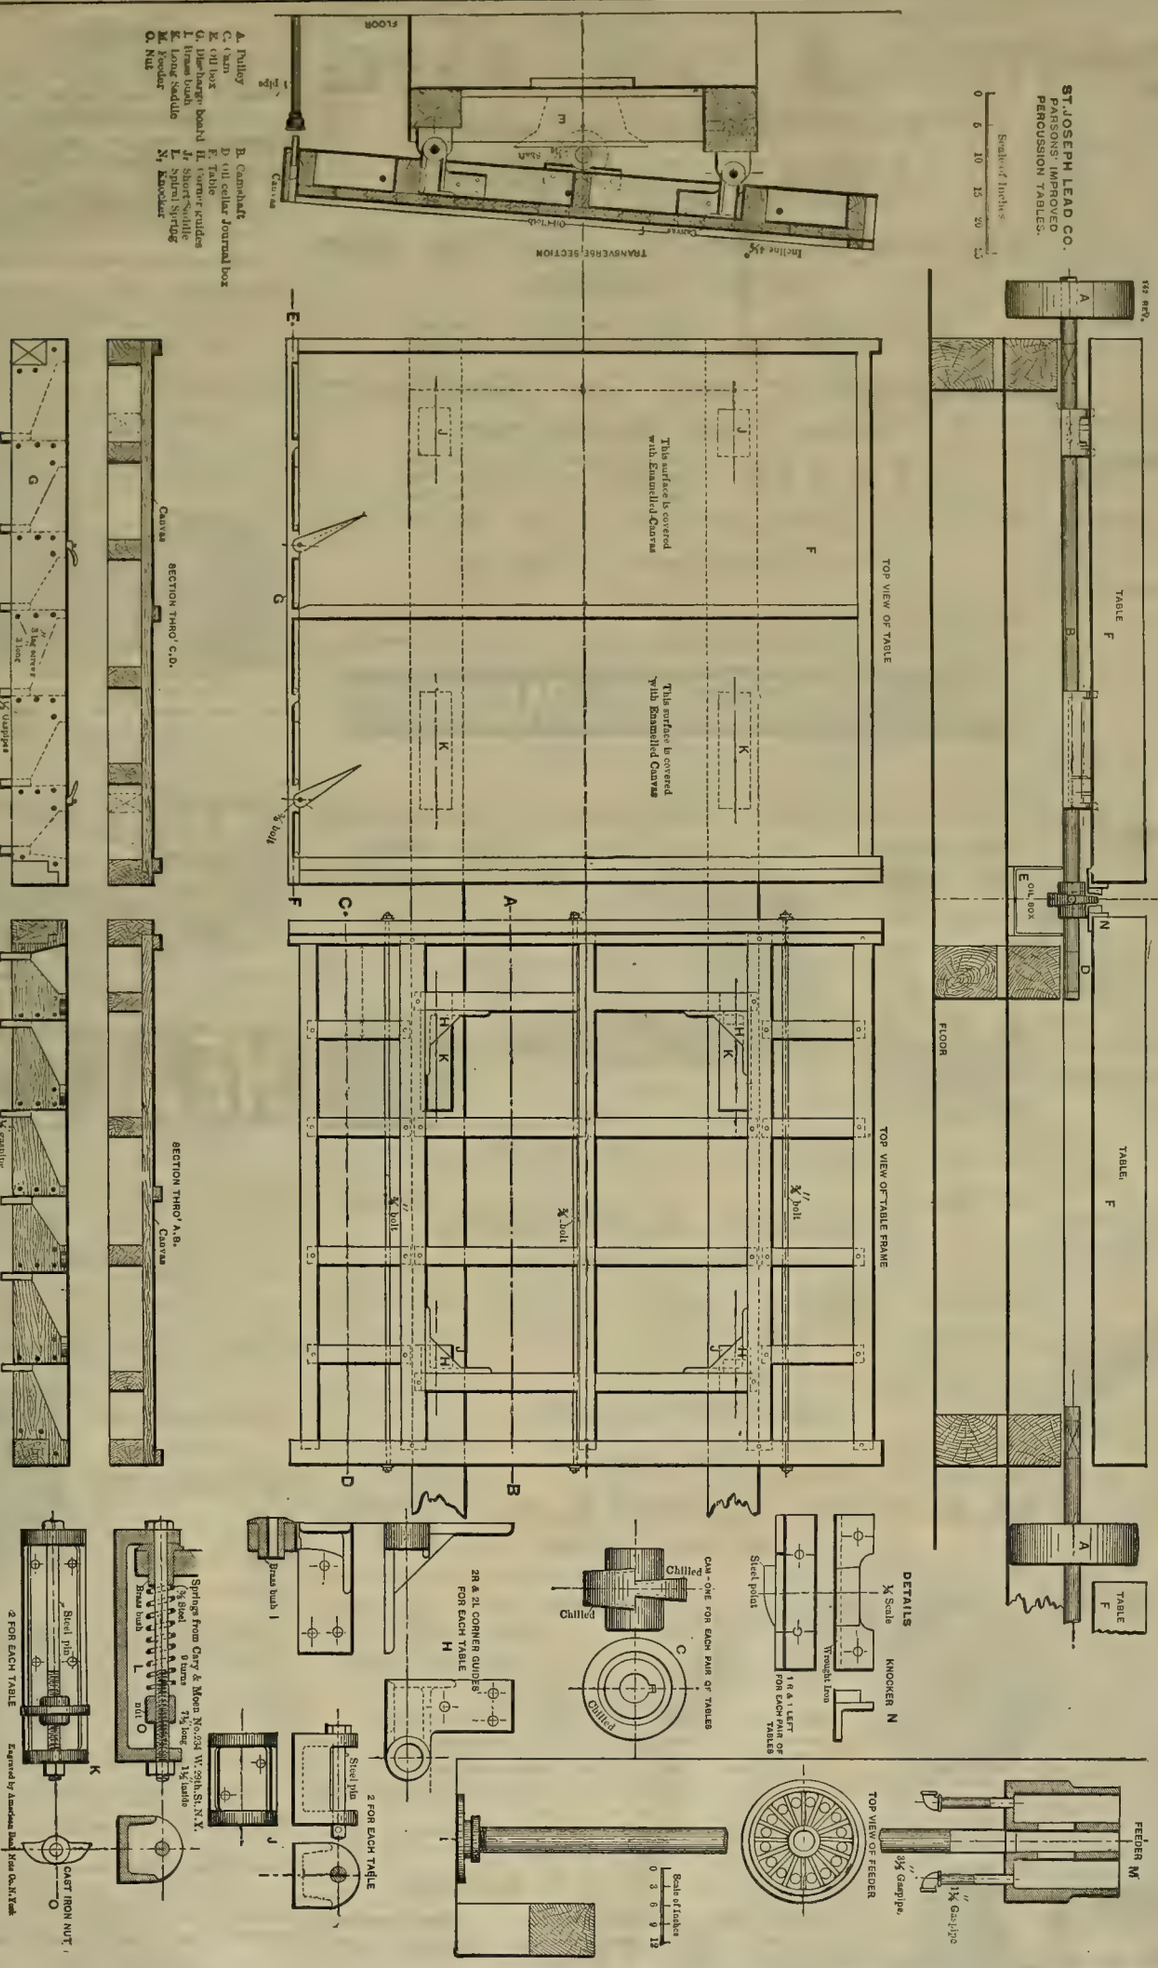
Prospecting for gold is done either in a region hitherto unproved, or in sections which contain auriferous areas for extensions are lost or abandoned leads. There are still tracts in this State which have never been carefully prospected, but where gold may possibly be found. The Los Burros district, in Monterey county, is in a range where no one supposed good mines could ever be discovered; yet some good mines are being worked there, and it is on the Coast Range. The relations between the geologist and the practical miner have never been very cordial in this country. There is a tendency on the part of the geologist to regard the miner as an empiric, while the miner is apt to regard the geologist either as possessing mysterious knowledge or one ignorant altogether of practical mining.

Geological science does not teach that gold is arbitrarily confined to any particular formations, or to rocks of any special group; but the experience of practical observations and the results of scientific investigation show that in various parts of the world the deposit of gold in matrix rocks has been most actively developed during certain geological periods, some very ancient, others comparatively recent, and that alluvial gold can only be looked for successfully in formations resulting from the denudation of such matrix rocks. Every old prospector can tell his tale to illustrate how uncertain and apparently erratic is the mode of occurrence of gold in both alluvial and quartz. The creek-bed prospected from side to side without result, while the rich lead lay concealed under adjacent hill-slopes; the holes bottomed without a color, while a few feet away ounces of gold to the pan rewarded subsequent workers; the promising quartz-gravel in well-defined lead worthless, while an adjacent ledge-wash or angular detritus near by paid well; the well-defined lead barren, while an insignificant vein near by, paid largely. All and many more instances are within the experience of most men who have worked in gold-fields.

This does not imply there is no law. It simply means that we have not yet mastered the law so far as to be able to indicate certainly where gold will or will not be found within an area having generally encouraging conditions. Every fragment of gold is in the place where found in consequence of the operation of certain fixed laws. The chemical laws we may know, but have not learned their application as regards the deposits of gold in matrix rocks. The mechanical laws are simple enough in themselves, but how their operation was influenced by past geological or physical conditions we can only conjecture.

Hence it can be easily understood that, though the geologist may be able on scientific reasoning to indicate generally the areas where gold may or may not be found, he may not be able, unless he has had practical experience, to direct the actual search as well as the practical prospector, who has been taught by numerous failures or successes to look for it in any conceivable position, regardless of any apparent law that may have been formulated from a limited experience.

THE North Beach & Mission R. R. Co. of this city will probably decide at its next meeting whether its cars, which are now drawn by horses, shall be moved by cable or electricity. Electricity is favored by the company and will be adopted as the motive power if it is found that it can be used successfully.



EDMUND BELL, a well-known mining man, was drowned near Sunny Hill, Shasta county, on Sunday. He was engaged in replacing a foot-bridge across the north fork of Cottonwood Creek and fell into the water.

RUDOLPH HERING, an Eastern sanitary engineer, is to be paid $1000 and expenses by Oakland for a report as to the condition and requirements of the municipal sewer system.

SINCE the late storm, placer mining near Hornitos, Mariposa county, is prosecuted with much success. The Merced *Express* says the miners expect to get $100,000.

THE new coast defense vessel now well under way at the docks of the Union Iron Works has been named the Monterey.

THE San Francisco Supervisors will soon appoint an inspector of elevators.

THE PARSONS-RITTINGER TABLES IN USE AT THE ST. JOSEPH ORE-DRESSING WORKS, BONNE TERRE, MISSOURI.

Parsons-Rittinger Table.

The Rittinger side-bump table, as modified by Mr. Parsons, is used at the ore-dressing works of the St. Joseph Lead Co. at Bonne Terre, Mo., and was described before the American Institute of Mining Engineers by H. S. Munroe, of the School of Mines, N. Y. The cut on this page shows the table in detail. The tables are built in pairs, and each table is made double as usual. They are small, each half the double table being about 3 feet by 7½ feet. Instead of being hung from rods, the table is supported on four cast-iron feet or "guides," which slide on horizontal steel rods. The latter rest in cast-iron "saddles," bolted to the heavy sill-timbers which run under the whole row of tables. Light spiral steel springs around two of these rods give motion to the table. The tables bump against each other, the blow being taken by a joist of hard wood lying loose between them (not shown in the drawing). The tables are forced apart, against the tension of the springs, by a spiral wedge-shaped cam; 150 bumps, ⅝ inch long, are given per minute.

The surface of the table is covered with the black enameled duck, sometimes used for desks. This covering is cheap and easily renewed, and furnishes a surface well adapted for the exceedingly fine material treated. The tables are inclined 4½°. There are 16 pairs of double tables in the mill, or 64 tables in all. Of these, 32 are head tables and 32 are used for treating middlings. They are not worked to their full capacity, the head tables treating but 1¼ tons each, or 2½ tons to the double tables per 24 hours. The material treated is exceedingly fine, 70 per cent being less than one-twentieth mm.

The following are typical assays of the stuff treated and the resulting tailings. The samples, as before, were subdivided by sifting: Size, ½ mm. to ¼ mm.; percentage of sand of given size, 9 0; percentage of lead in stuff treated, 2.50; percentage of lead in tailings, .82; size, 1-20 mm. to ⅛ mm.; percentage of sand of given size, 19 4; percentage of lead in stuff treated, 2.65; percentage of lead in tailings, .40; size, below 1-20 mm.; percentage of sand of given size, 71.6; percentage of lead in stuff treated, 15.52; percentage of lead in tailings, 2.74; average percentage of sand of given size, 100.0; average percentage of lead in stuff treated, 11.75; average percentage of lead in tailings, 2.45

The yield of ore treated year before last was 5.65 per cent. The loss on the tailings is about 2.13 per cent, or 27.4 per cent of the total amount of lead in the ore. The losses in the Lake Superior copper-mills range from 28 5 per cent to 31 per cent, treating material much more easily saved than this galena. At Bonne Terre, an unusually large part of the mineral exists in the ore in an exceedingly fine state of division. This necessitates very fine crushing, and consequently involves the production of a large amount of very fine stuff, much of which contains galena too fine to be saved. The cost of dressing is 36.4 cents per ton, which compares favorably with the very best Lake Superior practice.

Natural Gas Pipe.—It is estimated that there are 27,350 miles of pipe mains being used for the transmission of natural gas at the present time. In Pittsburg alone there are 500 miles, which supply 40 iron-working factories, 37 glass houses, 83 foundries and shops, 450 enterprises of various kinds, and 4268 private houses. The amount of gas consumed is represented by an annual consumption of about 7,000,000 tons of coal.

Lake Nyassa, Africa, is a gigantic trough of granite and gneiss, 300 miles in length, nowhere over 50 miles in breadth, and 1600 feet above the level of the sea, the mountains rising all around it, and sometimes almost sheer above it to a further hight of 1000, 2000 and 3000 feet.

PRACTICAL

Books on Mining
AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warnford Lock. 788 pages, with 8 plates and 271 engravings in the text. 4to, cloth, $15.00, express prepaid.

IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Ross. This work embodies the information, collected during four and a half years, of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrages, flood protection, methods of regulation, locks, etc., have been treated in detail. 367 pages, large 8vo, with 26 plates and numerous engravings in the text. Price $15.00, express prepaid.

MEXICAN MINES.—Dahlgren's Historic Mines of Mexico, *only a few copies left;* price $25.00. Handbook to the Historic Mines of Mexico, price $1.00.

17,241.—TRADE-MARK—J. P. Smith, S. F.

The following brief list by telegraph, for Dec. 11, will appear more complete on receipt of mail advices:

California—H. W. Bodeman, San Francisco, adjustable stove-grate; M. P. Boss, San Francisco, stamp battery; S. P. Burdick, Oakland, vehicle; H. A. Free, Vacaville, paper-fastener; George Harvey, Forrestville, draft-hook; Benjamin Holt, Stockton, grain-cleaner; W. P. Humphreys, San Francisco, three patents for dredging apparatus; Anthony McLean, San Francisco, carrying-pulley; J. H. McNutt, Alameda, water-heating attachment for gas-stoves; P. J. Moore, San Francisco, oil-can; Jacob Myers, Eureka, suspender buckle; Charles E. Naylor, San Francisco, means for operating device for show windows; E. L. Ransome, San Francisco, concrete mixing machine; W. T. Y. Schenck, San Francisco, hose reel; Charles Schultz, Merced, cable-grip and turn-tab e; Emil Schroeder, San Francisco, hair-clipping bench for fur dressers; J. H. Scott, San Francisco, c ffin-fastener; J. A. Howell, Wheatland, sickle bar for harvesters; H. E. Thomas, assignor of one-half to F. H. Hausman, San Francisco, surf-power machine.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GRAIN SEPARATOR AND CLEANER.—M. N. Laufenburg, Stockton, assignor to the Stockton Combined Harvester and Agricultural Works. No. 416 464. Dated Dec. 3, 1889. This is an apparatus for more perfectly separating and cleaning grain. The invention is intended to separate from the grain as much as possible of the straw and lighter chaff so as to reduce the work of the supplemental cleaner.

OIL-GAS APPARATUS.—Abel Henning, Oakland, assignor of one-half to Alfred M. Belt of Alameda and Thos. Flint of San Juan. No. 416 609. Dated Dec. 3, 1889. This is an improved apparatus for the manufacture of gas from naphtha or other similar hydrocarbon product. By the arrangement adopted the inventor has an automatic control over the supply of gas-making material so that the apparatus will be self-operative and self-regulating.

ADDRESS TAG.—Robert J. Loughery, S. F. No. 416,472. Dated Dec. 3, 1889. The object of this invention is to provide a convenient and effective device for use in putting up and shipping bundles of merchandise with a permanent tag on which to mark the address of the goods for shipment or other purposes. It consists of a combination binding board and tag, having rope permanently attached thereto, said ropes being passed around the bale or bundle so as to inclose the whole, and the board with them.

FEEDING MECHANISM FOR COMBINED HARVESTER AND THRASHER.—Benjamin Holt, Stockton. No. 416,618. Dated Dec. 3, 1889. This is an improvement in traveling harvesters in which the grain which is cut by the sickle is transported by a carrying-belt called the "draper" and discharged upon what is known as the self-feeder, from which it is delivered to the cylinder of the thrashing machine, passing thence to the cleaning apparatus. The present invention consists of a device for assisting in the delivery of the straw from the draper to the self-feeder and preventing the lodgment and clogging of the straw in its progress from the header to the thrasher. In the usual construction of headers and thrashers the grain is delivered from the upper end of the draper so as to fall approximately upon the self-feeder which delivers it to the cylinder; but a great deal of the straw and chaff fall down from the end of the belt and soon become piled up and clogged in this space. Mr. Holt's invention is designed to overcome this difficulty by providing a constantly-moving shaking-table intermediate between the draper and self-feeder.

SICKLE-GRINDER.—Henry Thibault, Stockton. No. 416,518. Dated Dec. 3, 1889. This is a grinding implement specially adapted for sickle-grinding. The blade to be ground is supported by flanges of a top-plate and presses down on the stone, which, by means of a treadle and intervening gears, is rotated. The pressure down upon the stone causes a spring to condense and bear upwardly so as to hold the stone constantly and with required pressure to its work. In grinding sickles it is of great importance that the pressure of the stone be nicely regulated. In this case this is effected permanently by a collar by which the inventor accurately regulates the tension of the spring.

ORE CONCENTRATOR BELT.—Henry C. Blasdell, Oakland. No. 416,663. Dated Dec. 3, 1889. This invention relates to that class of belts used in endless-belt concentrators, and it consists in the novel arrangement of the side flanges of the belt. The object is to provide a concentrator belt of this class with side flanges which are arranged in such a manner that in passing over the drums or rollers of the machine they will conform in the best manner to their change of direction and will also better confine the charge upon the surface of the belt.

Secretary Windom's Silver Policy.

Late mail advices from Washington give the following from Secretary Windom's report to Congress, and to which President Harrison referred in his annual message :

The Secretary enters into an able and learned dissertation on the silver question, and devotes many pages of his report to the same. Elaborate statistics are given and the subject is thoroughly discussed in all its details, closing with the following recommendation :

The Measure Recommended.

Issue Treasury notes against deposits of silver bullion at the market price of silver when deposited, payable on demand in such quantities of silver bullion as will equal in value at date of presentation, the number of dollars expressed on the face of the notes at the market price of silver, or in gold, at the option of the Government; or in silver dollars, at the option of the holder. Repeal the compulsory feature of the present Coinage Act.

The Secretary desires to call special attention to this proposition, believing that in the application of its principles will be found the safest, surest and most satisfactory solution of the silver question as it is now presented for the action of this country.

In explaining the proposed measure at this time it is intended to deal only with its general features, but, if desired, a bill embracing the details believed to be necessary to its satisfactory operation will be prepared and submitted for the consideration of Congress.

The proposition is briefly this: To open the mints of the United States to the free deposit of silver, the market value of the same (not to exceed $1 for 412.5 grains of standard silver) at the time of deposit, to be paid in Treasury notes; said notes to be redeemable in the quantity of silver which could be purchased by the number of dollars expressed on the face of the notes at the time presented for payment, or in gold, at the option of the Government, and to be receivable for customs, taxes and all public dues; and when so received they may be reissued; and such notes, when held by any national banking association, shall be counted as part of its lawful reserve.

The Secretary of the Treasury should have discretionary power to suspend, temporarily, the receipt of silver bullion for payment in notes, when necessary to protect the Government against combinations formed for the purpose of giving an arbitrary and fictitious price to silver.

If the price of silver should advance between the date of the issue of a note and its payment, the holder of the note would receive a less quantity of silver than he deposited, but the exact quantity which could be bought in the market with the number of gold dollars called for by his note, at the date of payment. If the price should decline, he would receive more silver than he deposited, but the quantity which could be purchased with the number of gold dollars called for by his note at the time presented for payment.

Three Good Results.

The advantages of retaining the option to redeem in gold are three-fold :

First—It would give additional credit to the notes.

Second—It would prevent the withdrawal and redeposit of silver for speculative purposes.

Third—It would afford a convenient method of making change when the weight of silver bars does not correspond with the amount of the notes.

So far as the issue of the notes is concerned, the plan is very simple. If a depositor brings a hundred ounces of silver to the mint, and the market price of silver at that date, as determined by the Secretary of the Treasury, is 95 cents an ounce, he would receive in payment Treasury notes calling for $95.

Various methods of redeeming the proposed notes have been considered, but the plan recommended seems preferable.

They might be redeemed wholly in silver bullion of the same weight as that deposited; that is to say, if an owner of silver had deposited a hundred ounces, he might receive back a hundred ounces.

The objection to this plan of redemption is that it would subject the notes to all the fluctuations which might occur in the price of silver, and, from lack of steadiness and certainty of value, they might not circulate freely as money.

Another plan which has been suggested is to redeem them in lawful money of the United States, dollar for dollar. This is practically a purchase of the bullion at its market price, the Government becoming the owner of it on the issue of the notes. This method has some features which commend it, but on the whole it does not seem logical or desirable that the notes should be redeemed in a currency which is certainly no better, if as good, as themselves. Moreover, it does not seem expedient to pile up in the vaults of the Government a large quantity of silver bullion, which cannot be made available for the redemption of the very notes which are based upon it.

True, the Government might coin the bullion into standard silver dollars and use the resulting coin for the redemption of the notes, which would be quite satisfactory when the silver dollar becomes equal in value to the gold dollar, but at present it would not appear to be either just or desirable to issue a note on a deposit of a hundred cents' worth of silver, and redeem it with a dollar containing only 72 cents' worth of silver.

Advantages of the Proposed Measure.

Among the obvious advantages of the measure proposed, the following may be briefly stated:

First—It would establish and maintain through the operations of trade a convenient and economical use of all the money-metal in the country.

Second—It would give us a paper currency not subject to undue or arbitrary inflation or contraction, nor to fluctuating values, but based, dollar for dollar, on bullion at its market price, and having behind it the pledge of the Government to maintain its value at par, it would be as good as gold, and would remain in circulation, as there could be no motive for demanding redemption for the purposes of ordinary business transactions.

Third—By the utilization of silver in this way a market would be provided for the surplus product. This would tend to the rapid enhancement of its value, until a point be reached where we can with safety open our mints to the free coinage of silver.

Fourth—The volume of absolutely sound and perfectly convenient currency thus introduced into the channels of trade would also relieve gold of a part of the work which it would otherwise be required to perform. Both of the causes last mentioned, it is confidently believed, would tend to reduce the difference in value between the two metals and to restore the equilibrium so much desired. It would furnish a perfectly sound currency to take the place of retired national bank notes, and thus prevent the contraction feared from that source.

Fifth—It would meet the wants of those who desire a larger volume of circulation by the introduction of a currency which being at all times the equivalent of gold, would freely circulate with it, and thus avoid the danger of contraction, which lurks in the policy of increased or free coinage of silver, by reason of the hoarding or exportation of gold.

Sixth—It should not encounter the opposition of those who deprecate inflation, for though the volume of currency may be somewhat increased, the notes would be limited to the surplus product of silver, and each dollar thus issued would be absolutely sound, and would represent an amount of bullion worth a dollar in gold.

Better for Silver-Producers.

Seventh—It would be far more advantageous to silver-producers than increased coinage under existing law, for in both cases bullion would be paid for at its market value, and under the plan proposed a much larger amount could be used with safety, and while increased coinage would arouse the fears and encounter the opposition of a very large and powerful class of people, it is believed that this measure would meet with their acquiescence.

Eighth—There would be no possibility of loss to the holders of these notes, because in addition to their full face value in bullion they would have behind them the pledged faith of the Government to redeem them in gold or its equivalent in silver bullion.

Ninth—The adoption of this policy and the repeal of the Compulsory Coinage Act would quiet public apprehension in regard to the overissue of standard silver dollars, and the present stock could therefore be safely maintained at par.

Tenth—This plan could be tried with perfect safety, and, it is believed, with advantage to all our interests. Should it prove a successful and satisfactory plan for utilizing silver as money, other nations might find it to their interest to adopt it without waiting for an international agreement, and should concerted action be deemed desirable, it could then be more readily secured.

By this method it is believed that the way would be paved for the opening of the mints of the world to the free coinage of silver and the restoration of the former equilibrium of the money metals.

The Celebrated H. H. H Liniment.

The **H. H. H. Liniment** is for the treatment of the Aches and Pains of Humanity, as well as for the ailments of the beasts of the fields. Testimonials from importers and breeders of blooded stock prove its wonderful curative properties. No man has ever used it for an ache or pain and been dissatisfied.

Assessment Notices.

Booth Gold Mining Company. Location of principal place of business, San Francisco, California. Location of Works, Auburn, Placer Co., Cal.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 23d day of November, 1889, an Assessment, No. 4, of Two(2) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room No. 28, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of January, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. R SPINNEY, Secretary,

Office, No. 310 Pine Street, Room No. 28, San Francisco, California.

DELINQUENT SALE NOTICE.

Gray Eagle Mining Company, Location and principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE.—There are delinquent upon the following described Stock, on account of Assessment (No 15), levied on the 16th day of October, 1889, the several amounts set opposite the names of the respective Shareholders, as follows:

C. A. LUCKHARDT, Manager. ESTABLISHED 1869

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for the most suitable Process for Working Ores.

Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,

(Formerly Huhn & Luckhardt,

Mining Engineers and Metallurgists.

J. KUSTEL. H. KUSTEL.

METALLURGICAL WORKS.

318 Pine St. (Basement,

Corner of Leidesdorff Street, · · SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my Process.

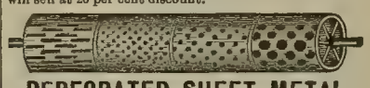
Assaying and Analysis of Ores, Minerals and Waters.

Mines Examined and Reported on.

Practical Instruction given in Treating Ores by improved processes.

G. KUSTEL & CO.,

Mining Engineers and Metallurgists.



GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut or burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

21 & 223 First St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 12, 1889.

General trade is very quiet—heavy rainfalls interfering with the distributive demand. Money is easy, considering that taxes are being paid and that general annual settlements will soon be in order. After the holidays the money market is expected to rule very easy.

MEXICAN DOLLARS—The market has been fairly active under buying for shipment by steamer leaving for China on Saturday of this week. From first hands quotations are given at 77½ cts.

SILVER—As indicated would be the case in last week's paper, the market has been gaining in strength. This is due to the position taken by Secretary Windom and also to the acknowledged fact that Congress will act in favor of silver. Another factor is the English mint being again in the market. There is no denying but the better informed begin to agree with the position of the PRESS that the world's gold production is increasing quite rapidly, while that of silver shows very little change, and consequently the white metal is likely to be the scarcer of the two. The failure of active explorations on the Comstock in uncovering a large silver bonanza, with the percentage of gold increasing in the bullion output, and work in the leading mines running toward the gold lode, are very important facts bearing on silver. If they find, which they undoubtedly will, a high-grade gold lode on the Comstock, and one or two outside districts develop large lodes of high-grade gold, the change of silver for the better will be quite marked. During the past week there has been quiet buying of silver in our market at advancing prices from 96 cts. up to 97 cts, yestesday (Wednesday).

QUICKSILVER—The market shows considerable strength. There is a growing confidence of more activity next year than witnessed for several years past. Receipts the past week aggregate 390 flasks.

BORAX—The market is quiet but firm at current quotations. Receipts the past week aggregate 372 ctls.

LIME—Receipts the past week aggregate 1754 bbls., and exports by sea 1230 bbls. to Honolulu and 250 bbls. to Kahului. The market is dull and easy.

LEAD—The market holds to steady prices. English and Eastern advices report the market fairly active, with an undertone denoting considerable strength. The Australian output is being closely watched.

COPPER—The exports by sea the past week aggregate as follows: To New York 20,200 lbs. copper cement. From the New York *Iron*, Dec. 5th, we obtain the following cable advices: Consumers purchase freely, and Birmingham firms and buyers for the Continent operated heavily. Smelters are reported to be comparatively bare of stock. It is believed that the adoption of the new smokeless powder by the German Government will lead to a large increase of consumption of copper in the manufacture of cartridge-cases. The report has circulation that the Cape Company and other London-owned mining concerns have sold their entire stock, and German representatives are said to have contracted for the greater part of the entire production for months ahead. If the German Government adhere to the new powder it is believed that the requirements of copper for cartridge manufacture will be equal to nearly the entire European production. Secret negotiations have, it is reported, been carried on by the French Government, and their agents are said to be endeavoring to secure any supplies that the Germans have not monopolized. The stock originally held by the late syndicate has been reduced 60,000 tons in eight months, and it is believed that a further considerable reduction of the holdings will be made without bad effect upon the market. The stock remaining unsold is held by four bankers.

CHROME ORE—Exports by sea the past week aggregate 194,390 lbs. to New York. The market and mines are without any particular change to note.

TIN—Imports the past week aggregate 40,223 boxes of plate from England. The exports aggregate 280 boxes of plate to Mazatlan. The local market shows a stronger tone for spot, due to high prices abroad, shipments to arrive contracted for and the near approach of the can-making season. European advices report a strong and fairly active market for both pig and plate.

IRON—Imports the past week aggregate as follows: From Hull, 100 tons; Liverpool, 135, and Newcastle (England), 300. The market is lifeless, yet holders are not disposed to make concessions so as to effect sales. The close of the year has an unfavorable bearing on the market.

COKE—Imports the past week aggregate as follows: From Antwerp, 300 tons, and 650 tons from Newcastle, Eng. The market is reported stronger, with higher prices to buy.

COAL—Imports the past week aggregate as follows: From Seattle, 6945 tons; Coos Bay, 750; Departure Bay, 4255; Nanaimo, 2184; Sydney, 4100; Swansea, 2379; Tacoma, 4600; New York, 100; total, 25,313 tons. The market is reported unchanged, although in some grades more activity is noted. The mild weather is against any decided consumptive demand for household coals. Steam coals are in fair inquiry, but consumers are for present requirements reported to be well stocked. Outward freights from Australia continue to rule strong at high figures, owing to crop prospects promising the largest outturn on record.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Dec. 12, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	43¾	94¾	$14 00	$3 85	$21 50
Friday	43¾	94¾	14 00	3 85	21 50
Saturday	43¾	95	14 00	3 85	21 25
Monday	44	95⅝	13 90	3 85	21 00
Tuesday	44	96⅜	14 00	3 85	21 00
Wednesday	44½	95⅝	13 90	3 85	21 15

NEW YORK, Dec. 12.—Spot business in copper light, but prices fairly supported. Lake Ingot, $14.50; wire bars, $14.75; Arizona, $13.50; casting, $13; futures, February, $14.30; March, $14.25; April, $14. Lead restricted to light wants of consumers $3.80@3.85 full for spot or near future. Quicksilver is fairly steady. Iron is very firm.

LONDON, Dec. 6.—The copper syndicate holds less than 130,000 tons of that metal taken from the Societe des Meteaux. It is the intention of the syndicate to maintain the price of copper at £50@55 ₱ ton. Should the price fall below £50 the syndicate will cease selling and even buy. It is believed the syndicate is competent to sustain its project.

Mining Personals.

At a special meeting of the Boards of Directors of the Navajo, Belle Isle, North Belle Isle and North Commonwealth and Del Monte mines of the Tuscarora district, W. C. Price, the superintendent, presented his resignation. As Superintendent Price stated his action was prompted from a necessity for rest and vacation from business, it was accepted. R. M. Catlin, formerly the assistant superintendent and civil engineer of the mines, will be appointed superintendent of the Belle Isle, North Belle Isle and the Navajo mines, and F. F. Coffin will be made the superintendent of the North Commonwealth and Del Monte mines. Superintendent Price, however, will retain his large interests in the several mines.

Prof. C. E. Anthony has returned from Lower California with the idea that as soon as a big smelter can be erected somewhere south there will be plenty of ore for it. He has been trying to get the Los Angeles people to subscribe, but has not been successful. The San Diego people would like to have the proposed smelter in their city.

Harry Wolcock, a miner well known in Grass Valley, who has been working some time at the Idaho mine, has had an offer to go to Honduras to engage with a mining company operating there, and will soon leave for that country. He has had mining experience in South America, and therefore is familiar with the work that is before him.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN THE MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Mining Share Market.

The mining share market the past week showed more activity in the Comstocks, with Chollar and Potosi the leaders in an up move and Con. Virginia in the North Ends and Crown Point in the Gold Hills leaders on the down grade. The movements both up and down give unmistakable signs that the pool is after stock—stocks they want and stocks they will have; of this fact the outside public may make up their minds. There is no doubt but they have gathered in large lines of stock from the disgruntled, disappointed outside holders who never see anything good in the market when prices are low; they only see big things when stocks are active, high, and every other person, except insiders, want them. In outside stocks trading was slow in the Quijotoas and Bodies, but fairly active in the Tuscaroras on bull points freely circulated on the outside.

A correspondent writing from Virginia City says that the ore taken out of Kentuck on the 1300-foot level went in bullion from $40 to $60 a ton. This is four times what Gov. Stevenson, the reported controller of the mines, stated when the Kentuck case was on trial.

There are points out for lower prices of the Comstock, when there will be a buy for something big. More assessments are to be levied so as to frighten holders and give the pool an opportunity to sink prices lower.

The November bullion output of Hale and Norcross was over $85,000; Savage, over $38,000; Crown Point, $33,938; and Chollar, nearly $22,000. This month's output of the two latter promises to be larger than was that in November.

From the mines the news is of an unimportant character so far as official reports go, but private advices are very favorable and point with unerring certainty to developments within the next few months. This information comes from miners who have facilities for being the best posted on the Comstock mines. The length of time before a development is made depends upon the character of the work and also insiders' wishes. The north drifts on the various levels of the Gold Hill mines are being pushed ahead, and air connections ought to be made soon, if not already, on one or two of them. In Con. Imperial, on the 300-foot level, another west crosscut has been started. A joint west crosscut on the 800-foot level has been started by Challenge and Confidence. On the 850-foot drift in Belcher a crosscut is to be started soon. An improvement is reported in both Chollar and Potosi, but of what nature we are not advised. Work in the North End mines will bear close watching. From the outside mines all advices are of a procrastinating character—the same old "chestnut" of the past few months.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Germania, Dec. 3, $2472; Hanauer, 3, $9500; Alice, 6, $18,688; Hanauer, 5, $4900; Savage (for Nov.), $88,932; Crown Point (for Nov.), $33,939; Hale & Norcross (for Nov.), $85 293; Hanauer, 6, $4500; Germania, 6, $2446; Occidental, 8, $5235; Con. California & Virginia, 7, $61,048; total for November, $234,422; Hanauer, 7, $2875; Eureka Con., 7, $14,800; Richmond Con., 7, $12,590. The ore and bullion receipts at Salt Lake City during the week ending Dec. 7th, were $302,604.40, as compared with $123,483.90 for the week previous.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

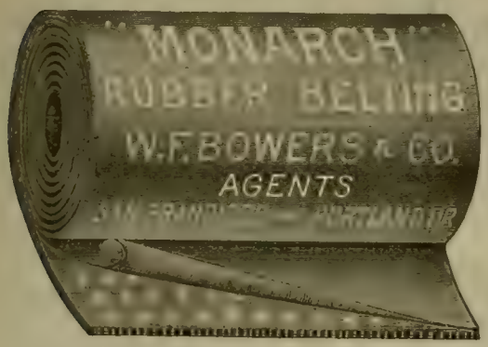
Complimentary Samples.



Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER

THE Evans School of Assaying has removed to rooms 46 and 47 Montgomery Block, No. 628 Montgomery street, now occupying the place where the U. S. Geological Survey officers had their laboratory. Mr. Evans is about to start a class in chemistry as applied to mining. The new rooms are very well adapted to the requirements of the school. The prospects are quite bright for the next season.

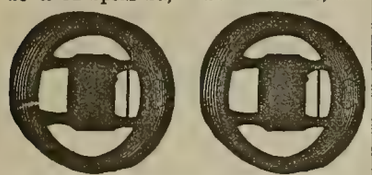
THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battern as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

IMPROVED BELT FRUE ORE CONCENTRATOR.

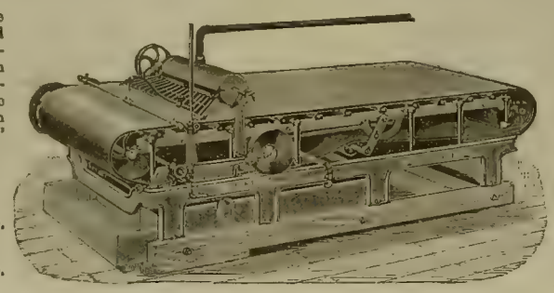
The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).



N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.
Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Emipre Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

We offer our customers the **BEST RESULTS OF 38 YEARS' EXPERIENCE** in this **SPECIAL LINE** of work, and are **PREPARED** to furnish the **MOST APPROVED** character of **MINING AND REDUCTION MACHINERY,** adapted to all grades of ores and **SUPERIOR** to that of any other make, at the **LOWEST POSSIBLE PRICES.**

We are also prepared to **CONSTRUCT** and **DELIVER** in **COMPLETE RUNNING ORDER,** in any locality, **MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC.,** of any **DESIRED CAPACITY.**

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

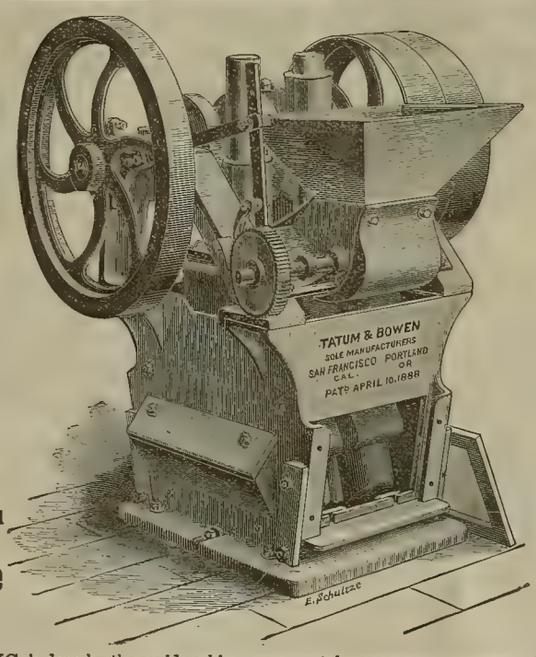
"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The **best form of Feeder ever devised,** and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.



WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

—THE—

PERFECTED DOUBLE Economic Quartz Mill.

Attached to each Mill is an effective

Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with our shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 9 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

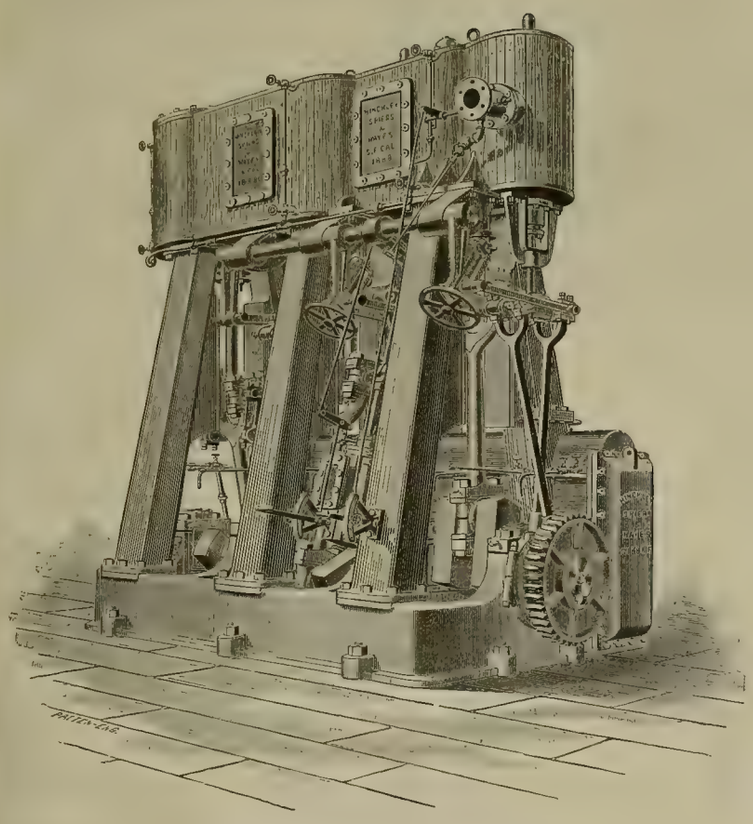
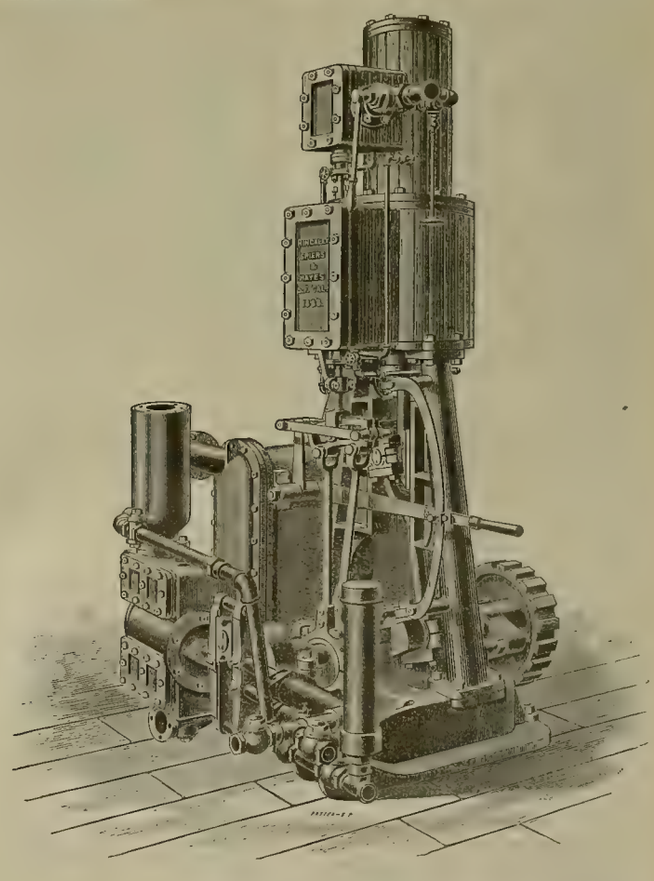
Engines for Steam Schooners.

Within the past few years the use of steam schooners for the coasting trade has largely increased, it being found that they are quite profitable and answer the purpose better than ordinary sailing craft. Although very many have been built, they are in demand at present and the demand cannot always be met. It is probable, therefore, that a number more will be built the coming season.



The Fulton Iron Works of this city has made a specialty of the machinery of these schooners and makes several types of engines particularly adapted to this class of vessel. Among these is the "compound tandem" engine illustrated on this page. For smaller vessels this is a very convenient engine, being light, compact and inexpensive. They work with equal efficiency to the ordinary compound, though in this type one cylinder is immediately over the other. The only objection made to this class of engines is that it may "stick" in the center. This objection, however, has no more weight than it has against any ordinary rough crank-engine, some of which are used in our large tugs, like the Monarch. An engineer of any experience can prevent any difficulty.



STEAM SCHOONER FOR THE COASTING TRADE.

Another engine made by these works for steam-coasters is the triple expansion of the type shown in the cut. They work with great economy, comparatively little fuel being used, which is a point to be gained in these vessels, which have little room for coal. In order to obtain economy in these engines the steam must enter the first cylinder with pressure of 140 to 160 pounds. The practical object of using the three cylinders instead of two or one is to obtain as great a uniformity of temperature in each cylinder as possible, in order to prevent condensation which occurs in long cylinders. There are many of this type of engines in use on this coast. The style of engine here illustrated has been placed in the steamers Ajax, Farralones, Noyo, Point Loma and National City.

An engraving is herewith given which illustrates the type of steam schooners in use on this coast. Most of them are employed in running to and from the lumber ports, and in carrying produce of different kinds. They make their trips regularly, and with sufficient speed for freight purposes.

TRIPLE-EXPANSION MARINE ENGINE.

COMPOUND TANDEM ENGINE.

NATURAL GAS.—A company has been organized at Salinas to bore for natural gas. The stock has all been sold and work will be commenced early next year. Natural gas has been discovered near Salinas several times during the past few years and at a depth of from 80 to 100 feet, but this company proposes to go deep, and if possible, get something permanent, as the flow from those already discovered was not of sufficient quantity to be utilized with any degree of satisfaction.

THE pottery at Lincoln keeps 165 men steadily at work. Their salary-roll amounts to $8000 a month.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Mariposa County.

Mines Off and On the Grant.

[From Our Own Correspondent.]

EDITORS PRESS:—Outside of the county the general impression is that all the mineral wealth of this county is on the Mariposa Grant. In consequence the county is seldom visited by experts in search of mining property of proven value. While the grant contains large areas of mineral-bearing ground, the county holds within its limits a vast mineral territory that when tested has proven equal in extent and richness to the mines on the grant. From Tuolumne Co. via Coulterville, until near Bear Valley, the mother lode stretches along mile after mile before it strikes the grant.

On this Belt

Are innumerable prospects only awaiting capital to prove them mines of value. Independent of the mother lode, but on what might be called the "mother lode belt," are a number of developed properties that will well repay a visit of inspection by mining capitalists.

Hornitos.

Within 16 miles of Hornitos is a group of mines that with a small outlay of capital in addition to that at present invested, would prove very valuable. The group includes the Moorehill, Rand & Wallace and Francis mines. The vein is in contact with slate for hanging and granite for foot-wall. The course of the vein is northwest and southeast and the pitch about 35 degrees. The lode crosses Mariposa creek, which furnishes water for batteries thoughout the entire season and sufficient flow for water-power during seven months of the year. The first mine is

The Moorehill,

Owned by Mr. J. W. Craighan of Hornitos. A shaft 110 feet in depth shows a vein of an average width of six feet, with two feet on the footwall of heavily mineralized ribbon-rock; 26 tons of rock from this shaft milled 31 ounces of gold. The average milling value of the vein is from $15 to $20 in free gold and 5 per cent of sulphurets worth $80 to $90 a ton.

The mine crosses Mariposa creek, and from its banks a tunnel 70 feet long has been driven on the vein. This can be continued throughout the entire length of the mine and backs be obtained of an average depth of 250 feet. Adjoining the Moorehill on the southwest is

The Rand & Wallace.

This location is developed by a tunnel 40 feet in length, which shows a vein 4½ feet in width of quartz carrying free gold and galena sulphurets. From this claim a large amount of gold in the shape of specimens has been extracted; none of the rock has been milled to test its value, and as assays prove nothing, I will not quote them, but state that the rock is similar to that of the Francis, which joins it on the northeast.

The Francis.

This mine is owned by F. Olcese of Hornitos. It is developed by tunnel No. 1 of 350 feet in length, with crosscut from the end of tunnel 80 feet long, which cuts the vein at a depth of 80 feet. Tunnel No. 2 is 250 feet long, being driven on the vein which shows an average width of seven feet, at 130 feet deep, running from $8 to $10 in free gold, and carrying 20 per cent of sulphurets that go from $75 to $90 a ton. A shaft has been put down on the vein 300 feet from the east end, which shows in its 80 feet of depth a vein averaging four feet, very evenly mineralized; the surface ores from this shaft milled $18 a ton. The tunnels on the mine can be continued from Mariposa creek on through the entire 3000 feet of the property.

A 10-stamp mill with two Frue concentrators is in operation on the mine. In looking at this ore I see that it carries the same antimonial silver ore that is characteristic of the mines of Ophir, Placer county. While none of the present owners will admit that there is silver ore in the vein, its presence is evident to the naked eye. Once the vein is worked below water level, this class of ore will, without doubt, come in as heavily as in the Hathaway of Ophir, and in consequence double the present value of the rock. These mines could be worked as one or separately. Wood and water free is to be had on the mine. All that is required is capital to develop, equip and work the mines in a practical way.

On the Enterprise,

Near Hornitos, the vein has been developed to a depth of 115 feet by shaft, on a two-foot vein, giving $9.75 in free gold, with sulphurets running as high as $2000 to the ton. At present the mill is running on custom rock from prospects in the immediate vicinity.

Eureka, or Quartz Mountain, Mine.

This is two miles south of Hornitos and is the property of Mr. M. L. Rodgers. The vein has a dip of 42 degrees, with slate walls. A main working shaft has been put down on the center of the 1500-foot of the mine to a depth of 200 feet. From the bottom of the shaft a drift has been run north 40 and south 60 feet. The vein in the north drift averages ten feet in width, while the south shows seven feet. The ore is free gold and sulphuret. All along the surface numerous shafts have been sunk in the earlier workings by Mexicans, the ores from which yielded by arastra as high as $80 to the ton. The ore extracted from the present shaft and drifts gave an average of $5 to the ton in free gold, and 4 per cent of sulphurets of $50 a ton value. Some 200 feet of backs can be obtained from the bottom of the present shaft.

There is on this mine a complete ten-stamp mill, hoist, air-compressor, Burleigh drills, pumps and all the necessary buildings, all in first-class order. The hoist is capable of sinking to a depth of 2000 feet. This property can be bought for less than the cost of the improvements at this time.

The Dorse mine joins on the west. On this a ten-foot shaft has been put down on a ten-foot vein of rock which milled $8 to the ton. Adjoining this is the Brooks, where a shaft 130 feet deep on a vein 6 to 12 feet wide shows $13 rock. The Carr mine joins this; the workings on it are only superficial. Here are four locations of 1500 feet each on a vein that is proven to exceed an average of eight feet in width, and worth $8 to the ton. Either of these mines can be worked separately or the whole under one consolidation. All this group requires is the necessary capital to either transmit power by electricity from the Merced river or a railway to the river from the mines. The entire belt or group can be secured at a nominal cost, and in the hands of capitalists, the property could be put on a working basis of $2 a ton, thus leaving $6 per ton profit. As at present situated, Mr. Rodgers does not feel able to equip it so as to bring the cost of working down to $2, and to work the mine with its present plant is only wasting the ore in unnecessary expense. Capitalists desiring a large property containing a large body of fair-grade gold ore will find this group worthy of inspection.

From Coulterville across to the Grant, numerous claims are being worked in a small way. The Cathay mine, which joins the Grant mine on the northwest, is now down 100 feet on good rock, though the owners content themselves for the present with the pockets encountered. The average of the vein matter is up to that on the mother lode, on which it is located.

The Champion

Mine is five miles from Mariposa. The property is under development by Chicago capitalists. Their shaft is now down 90 feet, and a drift has been run 150 feet on the two ledges of rock, running from $2 to $16 to the ton, with two to eight feet of vein matter. The owners are very sanguine, and have every reason to believe that the mine will, when developed and equipped, prove a dividend-payer.

Mariposa M. & M. Co.'s Mines.

This company's property embraces the entire Mariposa grant of 44,000 acres, and an unbroken stretch of 20 miles on the mother lode and its accompanying ledges. Naturally, all Mariposa county sits and waits for the development and operation of this immense property. Once it is put in full operation, this property alone will make Mariposa as lively as she is now dull; and with the successful working of these mines, other capital will flow in to develop the other mines of the county. It is not necessary for me to dwell upon the early history of this famous property. At the present time the company is confining its work to a point two miles north of Bear valley, and within half a mile of the old Pine Tree workings. Here, under the management of Mr. J. W. Cross, the superintendent, very large bodies of high grade, free-milling rock have been developed in the present system of tunnels and crosscuts. From the main working tunnel three crosscuts have been driven. In No. 1 the first vein struck is the Josephine, which here shows a width of 30 feet of rock, running from $15 to $20 to the ton. Continuing, the crosscut next encounters the west branch of the Josephine, which averages 16 feet in width of ore of similar value. Still farther on and the Pine Tree ledge is cut, showing 30 feet in width of rock running $6 to $8 to the ton. In crosscut No. 2 the same veins are encountered, but show that they are gradually going nearer to each other, while the size and character of the rock remain the same as in the No. 1 crosscut. As the tunnel continues on its course east, the ledges join and form one vein, 40 feet in width. All of the work at the present time is in development. Chinese miners are employed exclusively, and all the work conducted on a most conservative basis. On the Princeton, which is seven miles southeast of Bear valley, it is the intention of the superintendent, Mr. Cross, to put down a 1000-foot shaft the coming spring. Just what action the owners, Messrs. Hayward, Hobart, Mackey, and Jones Bros., will take is unknown. That the ores are in large bodies, and the grade unusually high for so large a vein, is now proven, and it is not to be supposed that with these facts proven the wealthy mining operators who own the property will long allow this great wealth to lie undisturbed, especially as Mr. Hayward is now credited with owning the controlling interest. Once this property is in full operation, Mariposa will awake to find herself famous and her mineral equaling her scenic wealth.

E. H. SCHAEFFLE.

THIS year 125,000 French Canadians have come to our side to get work. The amount of money they take to Canada on their return will count high up in the millions. If only $150 each, a moderate amount, for the Canadian French are a prudent, saving people, they will deplete the United States of nearly nineteen millions of dollars.

A Californian in British Columbia.

EDITORS PRESS:—On the 18th of September myself and wife took our departure from San Francisco for Victoria and Port Vancouver, B. C., on the Canadian Pacific steamer Pueblo. The voyage was a pleasant one to Victoria, which place we reached in two days. The accommodations on the steamer were first-class. The officers and servants on the boat were pleasant and polite in their intercourse with the passengers. At Victoria we had to wait till 4 o'clock next morning for a steamer to convey us to Port Vancouver, the western terminus of the Canadian Pacific, which point we reached about 10 o'clock the next morning. The voyage on the sound was most delightful and picturesque. The water was smooth as a mill-pond, disturbed by no ocean swell—nothing to cause nausea to the most susceptible to seasickness. Our way over the waters of the sound was encompassed by numerous islands covered from shore to summit with a dense growth of pines and cedars clothed in living green.

Victoria

Is a well-built city of about 30,000 inhabitants. It contains many fine structures, mostly of brick, among which are the Government buildings, erected in the center of spacious and well-kept grounds. It has a large park, well laid out, shaded with noble forest trees, well trimmed up, but sedulously preserved. Its streets are wide and well kept, and its surroundings are pleasant. But unfortunately for its future growth and commercial prosperity, its site was not well chosen. Located as it is upon an island surrounded on all sides by deep water, it can never be reached by railways, those great arteries of modern commerce. In the future, it must depend for its prosperity on its local trade in lumber and on its fisheries. Its Frazer River trade, heretofore its chief source of prosperity, is now being rapidly extinguished, by reason of the superior facilities for trade offered by Port Vancouver, distant from New Westminster, at the mouth of Frazer river, only 12 miles, with good water communications and soon to be connected with Vancouver by railway. Other places will soon grow in commercial importance, but Victoria must in the nature of things remain stationary.

Port Vancouver

Is the Pacific terminus of the Canadian Pacific railway. Located on the sound, its harbor is among the best on the Pacific Coast. It is easy of approach by sea—no bar to obstruct the passage of vessels of any draft into port. It is three days nearer by steamship to Asiatic ports than is San Francisco. It offers great advantages as a commercial emporium for the Pacific ocean commerce. The Canadian Pacific Railway Co. has a line of steamers plying between Vancouver and China and Japan. The natural condition is such that this great transportation company can, it seems to me, successfully compete with any other company for the Asiatic trade. The company own their coal mines wherewith to coal their steamers, then the three days less time required to make the voyage from China to Vancouver than to San Francisco reduces the coal consumption immensely and freedom from port charges, so that on the whole "the blarsted Britisher" holds the winning card, and holding it, as I think he does, I am confident he has sense enough to play it to the best advantage.

The site of Vancouver is elevated ground and well adapted for health and activity. The place is new yet, scarcely four years old, and the present population about four thousand. I am told it is underlaid with a stratum of coal; certain it is, the pine and cedar stumps are not yet all removed from its streets. Real estate is yet low in Vancouver. It is well situated for trade and commerce, with immense natural resources behind it of timber, coal and iron, to say nothing of the mines of gold and silver in British Columbia. It must in a few years grow to be a city, large and prosperous.

After a stop of some two hours, we took the train for

Winnipeg,

Some 1400 miles to the eastward from Vancouver. The first 500 miles or thereabout is mountainous, and densely covered with a heavy growth of pine, fir and cedar, overlying immense beds of coal in some places. The mountains in places are very picturesque. On the highest peaks glaciers are seen from which numerous little streams of water were continually trickling down the mountain-sides.

After taking leave of the mountains, the railway traverses the great plains of Manitoba for 800 or 900 miles to and beyond Winnipeg. On this part of our journey there is but little worthy of note other than the continuous rich prairie soil traversed by the railway—a soil and a climate peculiarly adapted to the production of wheat. There are few settlements as yet commenced on these great plains. The winters are long and rigorous. Still such is the fertility of the soil and the general healthfulness of the climate that ere long these plains will be occupied by a hardy, vigorous, liberty-loving people. This whole vast region and the Dakotas and Minnesota can never become, beyond the production of a few berries, a fruit-producing country. West of the mountains of British Columbia, apples and plums, and perhaps cherries, may be grown, but peaches will not amount to much. I saw good, fair-looking apples in the gardens of Victoria.

On Wednesday, just one week after leaving San Francisco, we reached Winnipeg. And now of the Canadian Pacific railway. I regard it as among the best constructed roads on the continent. The trains move on it without jolt or jar. The coaches on the road are first class. Every ordinary coach has one end fitted up with lavatories and towels for the convenience of passengers, and also a separate room, into which passengers may retire to change and adjust their linen—conveniences for promoting the comfort of passengers that I have never seen provided on any of our American roads. The officers are polite and obliging. The company are restricted by law to 20 miles an hour, hence rapid time cannot be made on the road. This restriction, I am told, will expire in 1892, by which time it is thought the roadbed will become so solidified that rapid running of the cars will not injure it.

I will give further notes of our trip later.

Haywards. WM. C. BLACKWOOD.

Storm Winds.

A Student's Composition.

EDITORS PRESS:—Inject a spray of cold water or cold air into a cylinder filled with steam or watery vapor, and the result is a rapid condensation of the same. As a familiar illustration: Low-pressure engines are run upon this principle. The partial vacuum produced by the condensation causes the piston to plunge into the cylinder by atmospheric pressure.

The sudden or gradual condensation of moisture in the air operates in the same manner, and thunder-showers and storms, where great local condensation occurs, draw in air from all sides to fill the partial vacuum, and winds are the result. A great storm may start as a local shower caused by an uprising of warm, moist air into the higher cold regions of the atmosphere. The condensation creates a vacuum which draws upon the surrounding lower air charged with moisture, and also draws the cold air down at the same time. The action once set up, continues as long as warm, moist air and the upper cold air continue to pour in upon each other. The motion of storms is circular and toward the supply of warm air, and of course against the lower or warm, moist wind. And this condition continues till the moisture is mostly condensed in rain, or an equilibrium of temperature is brought about.

It sometimes happens that one storm follows upon the heel of another, causing a conflicting wind in certain localities. The cold wind felt right after the passage of a storm is drawn down and is following the storm and condensing the moisture drawn into the same from the warmer quarter.

No wonder there are terrific winds when the condensation is rapid over a large area of surface, for "nature abhors a vacuum," and it takes an immense deal of air to fill the void thus created. A single storm of but a few hundred miles in extent will draw upon the air and produce winds many hundreds of miles distant. But there is another principal cause of winds besides the vacuum produced by condensation. This is the primitive formation of vapor, and it acts with a *push*, while the condensation acts with a *pull*. This *push* wind may be observed locally about the Bay of San Francisco when the moist air pushes in through the Golden Gate and over the low hills thereabout. And it may happen, and often does, that the moist wind is pushed as well as pulled toward a storm at its inception, and this may account for an especially violent wind. The barometer shows the condition of the atmosphere in any special locality, and whether the wind is pushed or pulled. A vacuum lowers the mercury in the tube, while any extra pressure raises it above the normal level of atmospheric weight.

As to the cause of the expansion of the air and vapor, if it is heat or caloric, then must heat be a substance instead of a condition and enter chemically or mechanically into combination admixture with the air and water to produce vapor (at certain temperatures) and be set free or escape at a lower one; else why the expansion and contraction? Either this, or each particle or minute bubble of moisture must surround a vacuum, and when this breaks, air must replace it. This takes us into deep water, and philosophers must find out the truth, for there is evidently no truth past finding out which it is the province of the mind of man to come in contact with sooner or later.

The primal cause of all life and motion (winds included) on this earth is the sun, from which we get heat, light, electricity and the subtile somethings which impel the crudities of Nature into use for man's promotion and Nature's evolutions. The rising of heated air causes local drafts of wind, particularly near mountain ranges, and the falling of the cool air down the slopes of mountains at night may condense the moisture in valleys and aid local disturbances. But these are minor causes, although the rising of local warm, moist air up a mountain into the cold stratum may cause showers, winds and storms resulting.

The circular motion of storms, as well as the general direction of winds, are greatly influenced by the local formation of the mountain ranges, valleys, etc., as everybody knows. And many severe "atmospheric disturbances" at a long distance from storms may be traced to the distant vacuity drawing upon air currents set in motion by the expansion of vapor at some other distant quarter. Los Gatos.

Lessons from Australian Planting.

EDITORS PRESS:—I have just received the report of the Forest Department of South Australia for the season of 1888 89. It is interesting to us in California as coming from a country of similar climate, of recent settlement, and otherwise reminding us of our own conditions.

Our tree-planting season now upon us makes it worth while to look into this report, because we can learn what trees are now most favored by the strongly established and long experienced forest department of South Australia.

One thing about these reports is rather unsatisfactory. It is that there is nothing in them to indicate the location or climate of any of the eight forest reserves and planting stations. The majority, however, are in the interior and have a small rainfall.

The season covered by the report was a dry one in Australia and unfavorable to tree planting. In spite of this the department set out nearly a million trees, distributed to private persons about 250,000 trees, and by protecting the forest reserves, from which the ripe timber had been cut from fire and sheep, secured a healthy natural growth of 1,100,000 trees.

A great variety of trees were planted, but only a few kinds in large numbers for economic purposes. All the varieties planted for returns had an established reputation from previous experiments, consequently these Australian plantings give California tree-growers a valuable lot of information.

The trees planted in Australia during the last season in quantities of 10,000 and over were as follows:

Eucalyptus Corynocalyx (Sugar gum)	291,067
" globulus (blue gum)	195,960
" Viminalis (Manna gum)	155,079
" rostrata, S. A. red gum	72,500
" leucoxylon, S. A. blue gum	30,049
" Gunnii (white swamp gum)	16,000
Pinus insignis, Monterey pine	23 533
" pinaster, cluster pine	10,225

Of the other eucalypti, there were planted of the

E. gomphocephala (Tooart gum)	5,338
E. cornuta, Yate	4 750
E. Stuartiana, Stuart	8,500

The large planting of sugar and manna gums justified themselves by their endurance of the dry season. All the other varieties showed a much lighter death rate than these. Of the 236,000 trees distributed, 109 154 were sugar gums, 17,038 blue gums, 47,566 Monterey pine, and the rest in small lots.

Of the 1,100,000 protected on the reserves, 1,000,000 were sugar gums, 60,000 red gums (E. rostrata), and 40,000 redbox (E. polyanthena).

These facts show us the opinion of the forest department of Australia as to the best trees to plant in that country, and also the trees that reproduce themselves by seeding when the ripe timber is cut. The blue gum, it will be noted, is not one of these.

Those persons who planted in our drier sections sugar gums, manna gums and Monterey pine on my advice when chairman of the California Board of Forestry, may now gather courage and confidence from these Australian figures.

One of the troubles tree-planters have to contend with here is the difficulty of obtaining seeds true to name. Thus it frequently happens that after we have studied the climate and soil of some particular situation, and picked out a tree for it, we purchase seed, plant the seedlings and find out in the end that it is not the tree we ordered. As soon as one goes off the beaten track of blue gum and Monterey cypress seed, certainty ceases except with the most reliable houses; consequently a tree-planter seeking new things should stick to the old reliables.

Recently I ordered quite a quantity of seed of the Eucalyptus rostrata (red gum) from a San Francisco seed firm. The seed on coming up proved to be Eucalyptus viminalis (manna gum). This is a very good tree, but the red gum seed was ordered for a special situation, and it is not a little to lose a year's time in planting with the cost of germinating and care of seeds, not to speak of the risk of having planted manna gums where red gums should go.

From the information at my command, I believe that there will be more trees planted in California this season than in any two previous ones. The missionary work of the foresters is commencing to tell, and we may hope that our annual devastating forest fires will soon be a thing of the past through an increased intelligence on forest affairs and an increased efficiency in the forest officers. ABBOT KINNEY.

Santa Monica, Nov. 29, '89.

[The selling of *viminalis* seed as red gum, instead of *rostrata*, is an old mistake of seedsmen, and it is time that it were done away.—EDS. PRESS]

American Capitalists and Mines.

EDITORS PRESS:—In your efforts in aiding the development of the natural resources of this coast, through the columns of the PRESS, and especially her mineral resources, do you not notice, and is it not singularly strange, that a large majority of our best and most productive mines seem to find their way readily into the hands of English capitalists? And is it not an *exception* rather than the rule, when *large* mining operations are undertaken by a co-operation of American capitalists? In most instances, if I mistake not, the American capitalist and *so-called* mining man thinks more of milking the public through some system of stock jobbery, than he does of legitimately working and developing a mine.

I cannot refrain from imposing on your crowded columns in expressing an opinion in the manner I do, because to me it seems a self-evident fact, the truth of which, to my mind, cannot be denied. The natural result is, that all new and important discoveries of mineral deposits on this coast seem to seek foreign capital in preference to home or American capital, from the fact as above stated, that there is no co-operation on the part of our mining capitalists in the legitimate development of the mineral wealth of this coast.

As an illustration, we learn of an English company being formed with $15,000,000 capital to work and develop the tin deposits in the Black Hills. We also hear of negotiations for extensive lead and silver mining properties in Alaska Territory by English capitalists. These properties have been known of and brought to the attention of our local capitalists and mining men for some years, yet the enterprise and spirit of industry for legitimate mining does not seem to strike our mining capitalists.

I will ask, Mr. Editor, if my views as above expressed are not correct, please let me have an expression of opinion from you on the subject, and by so doing a further discussion may be had and a comparison reached as to the amount of foreign and American capital actually invested in mining on this coast, and the relative value of the product from the two systems of management.

AMERICAN MINER.

San Francisco, Dec. 17, 1889.

JAMES CONCANNON of Livermore valley has signed a contract with the Mexican Government to deliver at El Paso 1,000,000 grape cuttings. They will be sent in carload lots, whence an agent will distribute them among the different States.

Lower Springs Mining District.

EDITORS PRESS:—This camp keeps up vigorous prospecting and some good ore is being discovered almost daily. The Gem mine, the most important property of the camp, is being developed in a most beneficial way. They are having the stopes fixed in good shape, preparatory to taking out ore for crushing, as they have an abundance of water for milling purposes. A few men are employed at the Hartman mine, running a tunnel to tap the ledge. The Kempton mill on Salt creek is running steady on ore from the district. The Ottawa Mill Co. is placing a Frisbee wet-crusher in its works, and will be able then to work all ores up to a good percentage. A San Francisco party has purchased a group of mines near Shasta, and they intend erecting a ten-stamp mill immediately after the storm abates. The roads are now in a very bad condition, and almost impassable.

It is conceded now by expert mining men that our mines are good and promise permanency. Individual mine-holders here and elsewhere have misrepresented their mining property in an ignorant and willful manner in order to bring men with capital in their midst, claiming that they have found at last a most wonderfully rich ledge, while the fact is it proves to be almost non-productive of the precious metal. All of these wild reports ought to come under the head of "Misdemeanor." Bogus reports and false pretense cause many failures in mining and milling, and most of these failures are really due to ignorance and rascality.

J. C. FRICK.

Lower Springs, Shasta Co., Cal

YOUR OWN PHOTOGRAPHER.—The latest fad is a nickel-in-the-slot photograph device in which the lens is so placed that it comes directly in front of the face of a person of ordinary hight. If the subject is too tall to get a reflection he can sit down on the screw-stool that is provided with each machine, and if too short he may attain the required elevation by mounting a pair of adjustable steps, which are also included in the patent. Back of the lens is the plate chamber, containing about 400 plates, on which the photographs are printed. After the person to be photographed has tickled the neck of the machine with the necessary quarter, he is required to pull a cord. Instantly the shutter in front of the lens opens automatically, and at the same time a flash of powder throws the necessary light on the face. The lens prints a likeness of the face on the first plate back of it. This is rolled over two small wheels to the bottom of the chamber, where it is taken by a pair of rubber tapes, which, in their turn, conduct the picture through the developing, fixing and washing fluids, and finally push it out of the machine a complete photograph. The likeness is made instantaneously, and the process is completed in less than two minutes.

CHARACTERISTIC VEGETATION OF ARID LANDS IN ARIZONA.

The Giant Cereus.

Our engraving herewith gives a good idea of the form of one of the chief features of the desert flora of the Pacific Coast, the giant cactus, or, as the botanists have named it, *Cereus giganteus*. A recent writer gives the following characterization of the family to which it belongs:

The *cacti* are plants having the central parts woody, around which are overlaid thick masses of cellular tissue; that is, made up of very small cells that connect with each other. The outside skin is tough and leathery, which enables the plant to retain its juice and to thrive on the rocks and barren places of tropical countries. The *cacti* grow in various forms and of different sizes, and are generally covered with bunches of hair and thorns instead of leaves. The tufts of hair show where the flowering buds originate, although but few of these develop. This family belongs almost entirely to the New World, and thriving, as it does, where scarcely anything else will grow, it seems as if it were a provision of nature for the support of men and animals who inhabit this region of country; for the fruit, as a general thing, is not only good for food, but is agreeable to the taste. Some of the *Opuntia* cactuses have become very generally distributed over some portions of Europe, particularly upon the shores of the Mediterranean and among the volcanoes of Italy.

The engraving gives the easily-recognized *Opuntia* or prickly pear on the right, but towering far above it is the giant cereus to which we wish to call special attention. One of the most interesting descriptions of it is given by John A. Spring in an article on "Arizona Flora" in the *Arizona Enterprise* of Nov. 23 1 as follows:

The valleys, sandy plains, mesa lands and sunny mountain-sides of Central, and especially Southern Arizona, are covered by innumerable species of the Cactaceæ, among which the most conspicuous is the giant cactus (Cereus giganteus). It attains its greatest hight on dry, sandy lowlands, where quite a number of them have been found to attain from 50 to 54, and a few even to 60 feet by actual measurement. When well proportioned they look like the tall, majestic fluted columns of the temples of the ancients, and again when surrounded by branches arranged in a circle around the mother-trunk, they resemble a gigantic candelabra. The ridges from top to bottom are covered by thorns which contain a resinous substance, so that by applying a lighted match to the bottom of the plant the entire cactus will in a few seconds become a pillar of fire. The Apaches have, to my knowledge, quite frequently made use of this circumstance in their warfare to exchange signals by night from one war party to another. When, by reason of old age, lightning or other causes, the outer pulp of the cereus begins to peel off and decay, there appears below a skeleton of long poles held together by the fibers of the plant, forming a circle around the circumference about two inches inside of the outer skin. These poles, when dry, are separated (their weight is exceedingly light) and are used by the natives in their roofing, forming a layer upon the rafters which receives the mud and dirt, of which the roof proper consists. The mass of the cereus, as of all other cacti, is a whitish pulp, which has not, to my knowledge, been put to any use as yet, but I have every reason to believe that ere long the pulp of all the bulky cacti will find its utility in the manufacture of paper, while the fibers of some will be extensively employed in other industries. The flower of the cereus, which generally stands in a ring around the top or near the tops of the mother trunk or branches, is of a creamy color and very beautiful, though odorless. The fruit, which is nearly egg-shaped, contains a very palatable pulp of, when ripe, a dark purple, and in it are imbedded thousands of tiny black seeds highly prized by all the feathered tribes. The Indians cook this pulp into preserves which they keep and peddle about in earthen jars of their own manufacture.

The picture also gives intimation of the character of some of the low-growing shrubbery of the desert and of the arid landscape stretching to the distant mountains. The group of Indians in the foreground must, however, be acknowledged to be somewhat idealized, as is the wont with artists who delight in giving the Aborigines rather more nobility and picturesqueness than they can justly claim.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Dec. 14: Operations at the Lincoln have come to a standstill for some time, owing to the heavy rains. Ore was taken out of a tunnel. This tunnel is full of water to the mouth, and the tools left therein are under water. There seems to be no other way to drain the tunnel except to bail the water out, and this will take time, besides being a very disagreeable task. As soon as the rain ceases Mr. Stewart will put everything in running order again. At the Sutter Creek mine they are running a crosscut to tap a vein with ore above, and the mill has stopped temporarily in consequence. Several gravel claims are running full blast about five miles above here, which are said to be paying well. The heavy rains have given them plenty of water to work ground they never could get at before.

HARDENBURG.—It is reported that Hayward and Hobart are interested in operations at the Hardenburg mine, at Middle Bar. A short bond of the property has been secured, for the purpose of cleaning out the shaft and ascertaining whether the condition of affairs at the bottom as regards size and quality of the rock is as reported; and if found to be as represented a large amount of money will be expended in its development. Little has been done so far, as the roads are in such a condition as to render the hauling of material to repair the shaft next to impossible.

AMADOR GOLD MINE.—The rock-crusher for the Amador mine arrived at the Ione depot last week. The largest piece weighs 12,000 pounds. In the present condition of the roads it is impracticable to haul such an immense weight. The weight of this one piece is twice as much as the teamsters have been hauling of late. It is likely that the machinery will have to remain at Ione until the weather improves, and the roads dry up somewhat.

KENNEDY.—It is expected that the mill will be started the last of the present week. Only a portion of the stamps will be started at first, but will drop more stamps as the new ground is opened up until the 40 stamps are at work pounding out the precious metal. The new level at the depth of 1150 feet looks encouraging, with every indication of a strong ledge at a greater depth. The rock is of a good quality, and is estimated to mill better than the average of ore from this mine. An idea has prevailed in some quarters that the Kennedy is a mere surface mine, but the developments all tend to dissipate this notion.

MISCELLANEOUS.—It is reported that two parties from below, Edwards and Irons, have leased or bought the Cluff ranch near Pine Grove, and intend taking out a crushing from one of the ledges, and test the same through the Dane mill, after the mill has been repaired. H. D. Emerson commenced crushing on 125 tons of ore at his mill, at Pine Grove.

Calaveras.

A GOOD MINE.—*Prospect*, Dec. 12: The Plymouth Rock mine, situated on the Calaveras river, near Jenny Lind, has proved to be a valuable piece of property in the last two months. The mine has lain idle for years because the parties that owned it failed to procure the proper facilities for working the ore. Quite recently the property changed hands and Capt. Eby and C. E. Philes, both practical mining and milling men, took charge of the mine, and under their able management it has paid handsomely from the start. The mine is very easily worked—quarried out—and a very large amount of it is free gold that assays well. There is a Huntington crusher with a capacity of 20 tons in 24 hours running night and day on the mine. We were informed by Mr. Philes they were going to increase their crushing power so they can handle 100 tons of ore in 24 hours. The mine is an immense one, and to a casual observer it looks as if there was rock enough in sight to run a crusher for 10 years.

THE ANGELS MINE. — Angels *Record*, Dec. 12: Mining is largely increasing in and around Angels and the present stimulus arises from the positive character of the ore bodies together with their magnitude and increased valuation. Leading the van in this particular is the Angels mine, Geo. Fox superintendent. The exploitation work still goes on, and the leads under process of development are becoming larger and more valuable. On the 400-foot level of the Angels mine one of the lodes is over 20 feet in thickness and still widening. This and similar results have added much to the already abundant satisfaction of the management, which is largely attested in the erection of a splendid 40-stamp quartz-mill, the timbers of which are already on the ground. The chlorination works are to be erected in close proximity to the mill, thus greatly expediting manual and mechanical labor. Mr. Buckminster has charge of the entire plant and has furnished the designs.

SHEEP RANCH.—The Sheep Ranch mine is fast increasing in water at the lower levels, and it will be no surprise to soon hear that operations are suspended owing to the great surplus. The water cannot now be manipulated as it formerly was, as the shaft has attained a great depth and the machinery is wholly inadequate to keep up the severe strain of days of continual rapid and heavy hoisting. Supt. Cleary informed your reporter that he feared that the mine might have to be shut down if the storm continued. There will be dull days for our villagers if this proves to be true.

GOOD YIELD.—*Mountain Echo*, Dec. 12: Some weeks ago, Otto Dolling of this town sent to the Selby Smelting works 786 pounds of ore, taken from his mine near Albany Flat, the returns from which were received the other day. The yield, though not so high as anticipated by many who examined the ore, is yet sufficiently rich to justify an outlay of many thousand dollars toward the more thorough development of the mine. The yield is as follows: Gold per ton, $222.50; silver, $8.50. The shaft on this mine is only a little over 20 feet deep and the vein is nearly four feet in width.

El Dorado.

KELLEY MINES.—Georgetown *Gazette*, Dec. 12: Three new Huntington mills have been ordered for the Kelley mine at Kelsey. Mr. Pearson and his company mean business, and as soon as their electric plant is in position active operations will begin.

SLUICING.—Many of our miners are busy sluicing, and we anticipate some rich cleanups.

QUARTZ.—Placerville *Observer*, Dec. 14: Dr. W. W. Stone has make a quartz discovery on his lead, near Steele's, ranch that promises to be of importance. The ledge, so far as developed, is two feet wide and prospects for high-grade ore. The doctor is now prospecting to ascertain the length of the ore chute, which he thinks is 500 feet.

GREENWOOD.—Mining news is very encouraging in the vicinity of Greenwood. Reports are coming in every day of mines being opened and large forces being put on those that are now running.

QUITE A STRIKE has been made lately in the Bassett mine at Weaver Hill, in blue cement gravel. One man while prospecting in a new drift just started panned out as high as $13 a day. The gravel seems to hold out about the same as the drift progresses. This old mine has paid enormously rich in early days, and there is a large amount of ground yet untouched, only the front rim having been worked.

Fresno.

TO THE MINARETS.—Fresno *Expositor*, Dec. 11: For seven years C. S. Beck has spent his time and a great deal of money in an effort to develop mining property in the region of the Minarets. He is the owner of a large number of mines in that section which have proven rich in gold and silver. For many years prospectors who have traversed the mountains near Minaret peaks have reported that they were pregnant with minerals. A large number of claims have been taken up by gentlemen from Fresno who have been waiting for something to "turn up" in order that they might be able to get the products of their mines to the market. The Minarets are located just 73 miles north from the courthouse of this city. There is no portion of the Sierras so inaccessible. For years it was almost impossible to lead a pack mule nearer than six miles of the iron mountain on the southern slope of the Minarets. About six months ago Mr. Beck, knowing the richness thereof, placed a large number of specimens of ore on exhibition at the Bureau of Mineralogy at Chicago. This was a means which brought Mr. Beck in communication with several capitalists of that city. Mr. Beck wrote in detail telling the Chicago men how inaccessible the mines were to any railroad, and the great advantages of a line to the Minarets. They were finally prevailed upon to send an expert to report upon the mines. On last Saturday, Mr. Beck came down from the mines, and received a letter from the Chicago man stating that his proposition had been accepted, and a party would be sent out at once to survey the proposed line of the road, which will commence at the iron mountain on the southern slope of the Minarets and extend to Fresno.

Kern.

AT HAVILAH.—Inyo *Independent*, Dec. 14: It is reported that a rich vein of ore has been found at Havilah. Two tons of the ore were sent to San Francisco, and after all expenses were paid left a profit of $700. Havilah was at one time a very prosperous camp, but for a few years past not much was done there. The recent find gives promise of more prosperous days than ever for the place.

Mariposa.

THE CHAMPION MINE.—*News*, Dec. 14: The preliminary work that has been done on this mine during the past six months more than justifies the expectations of the Chicago Co., that own part of it and represented here by Col. Dunbar and Mr. Hay. Free gold has been taken out of the different levels and the assays of rock showing no free gold are very good. Messrs. Hay, Dunbar and Ridgway are fully satisfied that they have a good mine, and are in favor of putting up a mill at once. They will possibly put in about five stamps at first and increase the number as the mine develops.

Nevada.

GRAVEL MINING WORKS.—Grass Valley *Union*, Dec. 15: Work on the gravel mining works at Mooney Flat has been suspended for several weeks on account of the unfavorable weather, but Orlando Stoddard, who is doing the work, will go down early in the week to resume operations. When the works are completed, the gravel, which is raised through a shaft, will be handled with much greater facility than heretofore, and with more profit to the owners. The gallows-frame will be 40 feet in hight, which will give better opportunity for dumping, as the plant is situated on level ground, and more of the work done by machinery than heretofore. The new structure will contain four arastras for washing the gravel.

MORE WATER THAN DESIRED.—The ground is full of water from the long-continued rains, and is giving the machinery of several of our local mines about all the work it can do to keep the water in control, and were it not that several of them have drain tunnels that carry off a large amount of surface water, by this time the lower levels of several of them would have been drowned. When it is considered that over 31 inches of rain has fallen in less than two months it will be understood that the mining pumps have had to do extraordinary work by being run at a much higher speed than usual.

Placer.

THE BRYAN MILL. — Placer *Herald*, Dec. 14: Theodore Kuply, superintendent of the Horman mine, Iowa City, writes as follows: I notice a statement in your paper that it is rumored that stamps will be used on the Horman mine as the Bryan mill does not work satisfactorily. This is a mistake. We are running two Bryan mills with a capacity of 20 stamps—power to run them, that of 10 stamps—and saving nearly all the gold in the mills and on the aprons. The sluices below the mill do not pay for the time it takes to clean up. Columbus Waterhouse, principal owner, was here a few days ago and is highly pleased with the mills, and says they are by far the best mill in use.

OPHIR.—*Argus*, Dec. 10: There hasn't been a season for years that looked so favorable for our mining industries as the present. At Ophir there is hardly a mine, old or newly developed, that is not yielding, or being placed in a condition to become a live property for its owners. The Hathaway mine with its new machinery is settling down to a steady paying mine, and great expectations are entertained of its future. The Eclipse mine, under the skillful management of Patterson & Erwin, is being thrown into shape for thorough development, and its good previous record will be eclipsed by its present management. A. Shurtleff keeps at work on the old St. Patrick and Doeg, and assures us that they pay. The fabulous richness of the Doeg in the past is prospectively soon to be repeated by the diligent work of Shurtleff and his assistants. Mr. B. F. Hartley has his Huntington roller in place on the Almond mine, and hopes shortly to commence work at the Three Stars.

IOWA HILL.—At Iowa Hill the outlook is the best for years. The Drummond mine on Owl creek, now owned by Hon. C. F. Reed, is proving rich. Mr. Reed finding that one Huntington roller with a capacity of 20 tons was not enough, is now putting up another to double the capacity. Specimens shown from there are fabulously rich. The Horman mine, now in the hands of Mr. Waterhouse, of the firm of Waterhouse & Lester, is being worked systematically and to profit. The Morning Star mine, lately bonded from the original owners, is maintaining its reputation for good pay. The Mountain Gate mine at Damascus, lately bonded by the Golden River Mining Co., is in good hands. The company have the means, and will either put in pumping machinery for drainage, or if justified, tap the channel with a new tunnel that will afford drainage for the entire mine. There is still enough of the old channel to justify an extended outlay, but the original stock-owners were not in a condition to do this. The Red Point gravel mine, under the control of Chas. F. Hoffman, with A. J. Snyder as assistant, is the property of the Golden River M. Co., and may safely be said to be one of the best mines in the State. When the branch tunnel, just completed, was begun, the mine was paying splendid dividends. The branch tunnel was completed to work the mine at better advantage and furnish a larger surface for breasting. They are now ready to resume washing, and to work on a much larger and more profitable scale. At the Hogsback mine the new tunnel is being pushed forward with all possible rapidity, and early in the opening year we may expect that the channel will be reached, and the mine become bullion-bearing. For steady product and systematic working the Hidden Treasure mine at Sunny South is one of the best. With Harold T. Power at the head, we may expect a continuance of its admirable record.

FOREST HILL.—The November product of the Mayflower mine was $34,000, making a yield of $330,000 from Dec. 11, 1888, to Dec. 10, 1889. Mr. Chappellet is still acting as superintendent, though the company gave him a Mr. Beach as assistant. The mine is perhaps, all things considered, the best equipped in the State. The Breece & Wheeler mine at Bath was never paying better than at present—it has always paid. There have been intervals when this mine has been slacked up to open new ground, but when open the gravel has been very generally of a uniform richness, and the yield has been princely. The two partners are both residing in San Francisco, in affluent circumstances. W. H. Grinnell has charge of the mine at present. The Live Oak mine, near the Mayflower, is so situated that during the process of its development the gravel may be worked at the Mayflower mill. It will no doubt become remunerative in time, as it is in a rich district with plenty of channel gravel ahead. The Gray Eagle mine near Butcher ranch is being reached by a tunnel, placed low enough for drainage, and their gravel, which was reached by a shaft, has every indication of being excellent. The Dam claim above Hidden Treasure, the Hermit mine of A. C. Bowen & Son, Dr. Schnabel's mine at Last Chance, and other old-time and steady-paying mines, both there and at Deadwood, will be mentioned hereafter. Near Danetown is the famous Whisky Diggings copper mine. This mine must have a great future. Native copper ore and copper in solution is produced. The Purdy Bros. expect to induce a syndicate of capitalists to take hold of this mine, and as the native ore is so abundant and of such a straight percentage of the pure article, it must prove a profitable investment. Enough is now known to prove that the Forest Hill divide, with the main Damascus channel and the lateral drifts, is by odds the richest in the State, and that for years to come the precious metals will continue with an increasing volume to pour in from our great drift mines.

San Bernardino.

TO OPEN THE CLAIMS.—Los Angeles *Herald*, Dec. 12: Some time ago an article was published in the *Herald*, describing a number of mineral ledges that had been discovered in San Bernardino county. They were located about 40 miles below the Needles, on the Colorado river, and the specimens brought to the city at that time were pronounced to be very good. The owners of the ledges received a number of offers for interests in their claims, but these were refused, and a few weeks ago Mr. Liddell and Mr. Hoey started for the Colorado with the intention of opening the ledges, preparatory to working them. A letter was received last week from them stating that they had tunneled 25 feet into the Attica claim and that the vein widened as they proceeded. Where the tunnel started the vein bearing free gold was only about six inches wide, but 25 feet from the surface it had widened to two feet and six inches, and appeared to grow richer. The vein is visible for a distance of nearly 600 feet on the bank of the river, and it is estimated that it will produce enough to keep a smelter going continuously. The owners of the several mines in this group will ship a concentrator to the spot early in the spring. So far none of the ore taken out assays less than $100 per ton.

Siskiyou.

RIVER MINES.—Yreka *Journal*, Dec. 11: The heavy rainstorms lately have caused high freshets in the Klamath river at and below Oak bar, obliging most of the miners to pull out their machinery for the season. There are probably not more than one or two companies now at work. All have had poorer luck this season than usual, owing to disastrous cloud-bursts during mid-summer, and earlier and heavier rainstorms prior to December. Still they have realized more than expenses, some undoubtedly taking out considerable dust.

QUARTZ.—Spencer & Co., of the Good Enough quartz mine on Humbug creek, are down in their shaft nearly 100 feet where the ledge is three feet wide and pays about $100 to the ton. This ledge has paid handsomely from the surface down, and gives every indication of being a permanent ledge that will average $100 a ton for all quartz taken out.

GRAVEL.—A correspondent of the Ashland *Record* says W. H. Smith at Cottonwood creek in this county is at present piping off about 40 feet of pipe clay and adobe mud. He has uncovered from four to five feet of fine blue gravel, and it prospects splendidly. He is undoubtedly located on the old blue lead that traverses this county from north to south, and he is working on the east rim.

HYDRAULIC.—The miners of Oro Fino, Quartz valley, Pinery, Patterson, Indian, McAdams, Cherry and Deadwood creeks feel jubilant over the great amount of rainfall lately, and more particularly the snowfall on the mountains, which will enable them to prosecute mining more extensively than they have been able to do for a number of years past. The hydraulic miners will soon start up work with their giants, and parties holding claims in the dry gulches and ravines will have sufficient free water to begin ground-sluicing this week, if the weather continues cloudy and warm as at present.

GRAVEL.—Yreka *Journal*, Dec. 18: The miners at Spring, Humbug, Portuguese and Greenhorn gulches, west of town, are all getting ready for washing gravel soon, in view of running water from the great amount of snowfall on the Humbug range during past ten days.

QUARTZ.—Parties engaged in prospecting quartz ledges on Spring, Portuguese and Humbug gulches in the hills, on west side of Yreka, are meeting with good success, and will soon have considerable quartz on hand for crushing at the Warren quartz-mill on Yreka Flats. The late rains caused a freshet in the Klamath river of sufficient extent to flood all the claims and oblige a suspension of river-mining until next spring. The miners cannot complain about lack of snow in the mountains this winter, as there is an average supply already, with the winter season hardly commenced, at least, during most winters, our heaviest storms seldom commencing before the middle of December.

Trinity.

CANYON CREEK. — *Journal*, Dec. 14: "Nix" writing from Canyon Creek, under date of Dec. 1, says: "The quartz mines of this district have made a small start. The Grigsby & Shock arastra is completed and running at the present time with good prospects for a successful run which will cause others to follow suit. The hydraulic claims on the creek are running, except Bartlett & Taylor, who, after two days' run, met with quite a loss by a slide coming in their ditch which will take a week to repair."

Tuolumne.

NEW MACHINERY.—Sonora *Democrat*, Dec. 14: This week there passed through town a big smokestack for the large new boiler now being put in place on the Hyde mine, and a quantity of air and water pipes. At the Sonora foundry a new V gearing has been ordered for the hoisting works, much larger than the one now in use. This mine will soon be equipped with a powerful plant for extensive work.

NOTES.—*Independent*, Dec. 11: The Tibbits mine, above Columbia, has every indication of immense wealth. The Kelly-Munn mine has been shut down during the week on account of too much water. The Dead Horse mine at Summersville is prospering, and employing about 35 men. The Dutch mine at Quartz mountain continues to improve, and the work of development goes rapidly on. The new hoisting works on the Stockton mine are now in working condition, and the work of sinking the shaft commenced. The Golden Gate mine is slowly but surely increasing its force of men, and now has about 20 names on the pay-roll. The New Albany mine, owing to inclement weather, is making headway slowly but surely, with about 15 employes. John Stevenson, lessee of the Smith mine, is at work in the old tunnel where E. J. Richards, deceased, years ago worked and got $20,000. The Buchanan has virtually closed down for the winter, only eight miners being employed, and 12 men all told on the works. The Black Oak is still inoperative, and the men not yet paid. Supt. Scott is in St. Louis attending a meeting of the Board of Directors. Work on the Bonanza shaft is progressing slowly, the ground being very hard. The contractors are getting $13 per foot, and at that price will have to work hard to make wages.

NEVADA.

Washoe District.

SEG. BELCHER. — Virginia *Enterprise*, Dec. 14: The winze down from the 1200 level has connected with the raise from the 1300 level. This gives a good circulation of air and will greatly facilitate operations.

NORTHWESTERN.—The main shaft of the Northwestern mine, near the Utah, is down 54 feet in soft vein matter.

YELLOW JACKET.—The usual amount of ore, assaying $21 a ton, is extracted and shipped.

ALPHA.—Drifting from the 600 level shaft station. The 500 level west crosscut continues in quartz and clay.

EXCHEQUER.—The 382 level east crosscut is still in vein matter and the 500 level north line west crosscut continues in quartz.

WARD COMBINATION SHAFT. — The 1800 level west drift is advanced 81 feet.

OVERMAN.—Shipped 234 tons of ore to the Vivian mill during the week.

CROWN POINT.—Have started a drift on the 600 level, seventh floor, to connect with 600 level old stopes. Are out 38 feet in porphyry and low-grade quartz. Are opening the 300 level south stopes on the fifth floor, which looks well. Shipped to the mill during the week 1778 tons of ore, the average battery sample of which was $16.58 per ton. The yield of bullion for November was valued at $33,939.60.

BELCHER.—Are running exploring drifts on the 200, 850, 1000 and 1200 levels. In all the drifts vein material is found that carries more or less metal.

CHALLENGE CON.—The west crosscut on the 300 level is passing into low-grade quartz. On the 800 level good progress is making.

CON. IMPERIAL.—The usual prospecting operations are in progress on the 300 and 500 levels, and the drifts are showing much vein material and low-grade quartz.

ALTA.—Are crushing over 300 tons of ore a week, the average assay of which is $25 a ton.

JUSTICE.—Are reducing about 300 tons a week; average assay, $28. The ore-producing sections of the mine are looking well.

CALEDONIA. — South drift is extended a total length of 313 feet. No change in the formation.

SAVAGE.—Are crushing at the Rock Point mil

about 400 tons a week, the average assay of which is $25 a ton. Bullion on hand, $7632.40. The mine continues to look well, and are extracting ore from the 400, 500 and 750 levels.

NEW YORK CON.—The raise above the 800 level west crosscut continues in fair-grade quartz.

BEST AND BELCHER.—The usual progress is making in the exploring drifts on the 625 and 1000 levels. There is no change of formation worthy of note.

POTOSI.—The 800 level drift is still stripping low-grade quartz.

HALE AND NORCROSS.—The usual amount of ore is being reduced at the Nevada mill. The average of the battery assay is about $25. Bullion on hand, $21,500.

CHOLLAR.—The usual amount of ore is being extracted and reduced at the Nevada mill. On the 500 level quartz is being found that carries some metal.

SILVER HILL.—Usual progress made in the 160 and 260 level explorations, without any change in formation.

GOULD AND CURRY.—The usual work is doing in the drifts on the 200 and 400 levels. The formation on both levels is a mixture of quartz and porphyry carrying some metal.

CON. CALIFORNIA AND VIRGINIA.—From the stopes on the 1300, 1435, 1500, 1600 and 1650 levels continue to extract ore sufficient to supply the Morgan and Eureka mills. Ore is showing at several points in the prospecting drifts on the 1650 level, and from some of these material is being extracted for reduction. The average of the pulp assays will be about the same as last week.

UTAH.—The southeast drift on the 600 level continues to show clay and porphyry in the face and is somewhat wet.

OCCIDENTAL CON.—Work has been temporarily discontinued, pending a run on ore from the North Occidental.

NORTH OCCIDENTAL.—Extracting ore from the 300 and 400 levels.

HENDRICKS.—Repairs to the shaft timbering in progress.

SIERRA NEVADA.—The east drift from the south drift run from the main east drift is being advanced in a mixture of clay and porphyry.

UNION CON.—West crosscut No. 3 on the 1465 level is in a vein porphyry that shows slips and seams of clay.

MEXICAN.—West crosscut on 1465 level is still in a mixture of quartz, clay and porphyry. The ground presents a promising appearance.

OPHIR.—The south drift on the 1300 level is making good progress and is passing through a formation composed of porphyry and quartz.

Comet District.

PROSPECTING THE MINES.—Pioche *Record*, Dec. 7: E. A. Shear came in from Salt Lake last Tuesday accompanied by J. H. Mitchell, whom he brought down to inspect the mines at Comet district which he has under bond. Mr. Mitchell returned on yesterday's stage. Mr. Shear remains with us, and will soon begin development work at Comet.

Eureka District.

FOR TRIBUTE.—Eureka *Sentinel*, Dec. 14: The men who have been thrown out of employment by the closing down of the Richmond reduction works talk of going to mining, and will look for tribute pitches in some of the mines.

AT MINERAL HILL.—It is reported that Joe Flynn has struck a big bonanza at Mineral Hill of a ledge ten feet thick, assaying $65 per ton. This is the year of big bonanzas evidently, as we are hearing of big strikes now all over the country. If silver comes up we will have a great boom in mining.

Tuscarora District.

ELKO CON.—*Times-Review*, Dec. 13: The crosscut at the foot of the incline has been extended 4 feet.

DIANA.—The south drift from the east crosscut, 300-foot level North Belle Isle, has been extended 16 feet in low-grade ore.

NEVADA QUEEN.—South drift from joint crosscut has been extended 19 feet, showing some good ore in the face, having improved since starting work.

GRAND PRIZE.—Winze in the south 400 drift sunk 14 feet, showing a good-sized vein of concentrating ore.

BELLE ISLE.—South drift from west crosscut, 250-foot level, extended 18 feet, the face looking more favorable.

NAVAJO.—Work in the mine has been confined to the stopes above the 150-foot level, which are looking fair. The tubes have been removed from the north boiler and a new set is being put in.

NORTH BELLE ISLE.—The crosscut from the 300-foot station extended 27 feet, face looking favorable. The stopes near the Queen line, same level, are looking fair. Coucentrator running as usual.

DEL MONTE.—100-foot level: No. 2 east crosscut has been advanced 20 feet. Have started cutting out station for second level. 225-level: East crosscut from north drift has been extended 5 feet, in favorable looking rock. Joint crosscut has been advanced 7 feet, cutting into good ore.

NORTH COMMONWEALTH.—A station is being opened from which to develop the second level. Joint crosscut has been extended 7 feet, the whole face being in ore, some of which is high grade, assaying $397 per ton. Some water coming through the face.

COMMONWEALTH.—100-foot level: No. 1 east crosscut extended 20 feet in vein formation, showing bunches of ore. An upraise has been started from No. 1 west crosscut up 10 ft. through spar. No. 3 upraise, following the ore, is up 20 feet, exposing high-grade ore all the way. South, intermediate from No. 4 chute extended 15 feet and is opening a fine stope of ore. No. 5 upraise from near the face of north drift, has been extended up 12 feet. There have been 435 tons of ore worked at the concentrating plant; battery assay, $19.82 per ton; average assay of the concentrates, $301.08 per ton. All first-class hoisted is being run into the mill.

ARIZONA.

BLACK HORSE.—Prescott *Journal-Miner*, Dec. 11: Mr. David Boaz has just closed a trade for the Black Horse mine, eight miles from Prescott, on the Peck road. The mine is situated half-way between the Kansas City M. & M. Co. property (Groom creek) and the Senator mines, which were recently purchased by Phelps, Dodge & Co. Mr. Boaz has forwarded articles of incorporation to Kansas City, Kansas, to be signed by N. Mc Alpine and others who are interested with him in this property. This mine has produced some very rich ore. There is a shaft down 60 feet. Mr. Boaz has now on the ground a new steam hoist, which will be ready to start up in three or four days. This is the fifth mining company organized and put in operation by Mr. Boaz in this county in the last 18 months. The Dixie mill, which has been idle for want of water, will be started up again in a few days. Supt. Helm, of the Oro Bella Co., has gone to the Bradshaws to start up that company's mill, which has been lying idle for several months for want of water. The new pump for the Hackberry Co. has been delayed for some cause or other, but is expected soon. The new owners of the Senator will start the pump up shortly and pump the water from the mine, and probably do some other work on the property during the winter.

PLACERS.—Placer miners have commenced washing gravel in Copper basin, where there is said to be some very rich ground. Preparations were completed some time since and the owners of claims have been waiting patiently for water, of which they now have an abundance.

NOTES.—The incessant rain and muddy roads have caused a very perceptible falling off in the quantity of ore arriving from the mountains, but milmen are rejoicing over the rainfall, which is already ample to furnish water during the entire winter. The Lynx creek hydraulic works have been started up with a full head of water, having previously been put in first-class shape for a successful run. Chas. A. Girdler brought in a big bar of gold bullion from the Etta mill yesterday. He was having a very successful run when he was knocked out by the flood. Twelve thousand pounds of ore were received at the sampling works yesterday, from Turkey creek and Lynx creek. H. N. Palmer and Jack Martin have bought two-thirds interest in Alex. Goodfellow's Highland Mary mine, located about six miles from the Congress, and will commence to work it at once. The ore is gold sulphurets, assaying as high as $300 per ton. H. C. McDonald and Joe Mayer have filed the location notice of the "Self Cocker" mining claim, in Big Bug district.

NEW FIND.—Mohave *Miner*, Dec. 14: Thos. Woods is highly elated over his new find in the Wallapai mountains. As work progresses the ore increases, and as the quality is high grade, Tom has a right to smile and look pleasant.

CUPEL.—The recent strike in the Cupel still holds out wonderfully, and it shows every indication of a continuous vein. Supt. Mackenzie has 20 men at work and is prospecting the mine with the hope of making other discoveries. The differences heretofore existing between the stockholders of what is known here as the Gold Mining Co. of Washington, D. C., have been settled, and it is said that they will commence operations in a few months. J. B. Shipman, of Washington, has been here several weeks, and W. F. Grounds was in Kingman last Saturday and made the final arrangements of the settlement.

BISBEE.—Cor. Florence *Enterprise*, Dec. 16: Some 40 miles from Fairbank is the town of Bisbee, where is located the well-known Copper Queen. The property is owned by five gentlemen in the East, who operate it in a practical manner. Very little is known on the outside about the output of bullion. A visit to the mine and smelters shows that an increase of power is to be added in the way of engines and other machinery, showing that this property is growing in value as the mines are opened up. The capacity of the smelters is about 300 tons per day, and, at a rough estimate, they turn out about 35,000 to 40,000 pounds of bullion every 24 hours. Large quantities of it were piled up waiting shipment, which, owing to the scarcity of cars, had to lie there. Everything in connection with the mine shows that there is a master hand at the wheel. It does not take an expert to observe the regularity and smoothness with which every branch is operated. It is said that over 300 men are employed here. Twenty-four cords of wood are consumed daily at a cost of $6 a cord. Most of the wood comes from the Chiricahua side. The timber, similar to that of the King, is supplied from the Chiricahuas. A sawmill is kept steadily at work supplying the mine and settlements. The lagging comes from the Huachucas and is hauled by teams.

DAKOTA.

MARIPOSA AND BOSCA BOY.—Deadwood *Pioneer*, Dec. 14: Henry Lundt and Louis Toney have an excellent quality of ore good enough to ship exposed in three different tunnels on the Mariposa and Bosca Boy claims. The boys are working the property steadily and are confident of great things.

UNCLE SAM BULLION.—Bullion from the Uncle Sam mine, secured from cleanup at the mill for November's run, was brought in Wednesday and went East by express yesterday. The brick was valued at very nearly $20,000.

CORA.—Report is current that a good body of high-grade galena ore was struck in the 400-foot tunnel on the Cora mine day before yesterday. The mine is at present under the superintendency of Alex Huyett, who is working quite a force of men. One ton of ore taken from the newly discovered body gave an assay return of $85.

RUBY BASIN.—It is reported that the Hartford M. Co., which has just completed assessment work in driving a 30-foot tunnel, will levy another assessment shortly and continue work on their tunnel. Dick Richards is reported as having formed a company in Rapid City on his South Ruby mining claims. The group is of some magnitude, and work this summer exhibited some good ore.

STRUCK SHIPPING ORE.—Geo. Inman, working property adjoining the Equitable at Bald mountain, has struck a large body of excellent ore. A quantity has already been taken out and will be shipped to Omaha.

IRON HILL.—The Iron Hill smeltery blows in again to-day, but whether for a run on lead ore as previously stated, or on dry ores from Bald mountain, using pyrites for flux, is a very vexed question which will probably be settled only when the blast commences. The company has been hauling ore from the Double Standard, Harmony, Calumet and John Delaney's mine, the Granite Mountain, situated on Squaw creek.

BOUGHT SOME ORE.—The Golden Reward M. Co. yesterday sold 100 tons of ore to the Syndicate smeltery, and gave the latter institution option for 1000 additional tons. Eight dollars per ton was the price paid for that sold yesterday and to be paid for the greater quantity if taken by the smelting company. This is just about what the ore would net the Golden Reward if shipped to Omaha or Kansas City. The smelting company takes its purchase from the dump at reduction works, where some 2400 of the 3500 tons hauled down last fall and winter still remains.

COLORADO.

AN UNEQUALED RECORD.—There has been only one mine in the long history of mining in Clear Creek county that has never closed down from the day of its location stake to the present time—and that is the famous Pay Rock mine, with its record of $1,800,000. All other mines where opened, yielded fabulously, were sold to corporations, extravagantly managed, run in debt, finally sold out and again resumed operations under business management. Not so with the Pay Rock. It was a bonanza from the first blow of the pick—from grass roots to its present depths. During all the extravagant times of its management, the famous Silver Bank and Pay Rock levels put forth such a stream of riches that it not only developed the mine, but it paid ruinous interest on an ill-advised issue of bonds, paid enormous salaries to a president, vice-president, secretary, treasurer and full contingent of ornamental officers, and yet under the quarrelings and bickerings and cross purposes of the management, the magnificent property put out so continuously of its ores that never in the whole course of 18 years has its workings been closed. And now that the present management have spent $250,000 in betterments and manage it with such economy that the saving of a few cents in mine cost per ton is an object, the mine will put forth its riches unabated. The present company has spent in Georgetown and Silver Plume for labor alone $85,000 and $20,000 paid out for supplies, while it has brought in and erected over $40,000 worth of machinery, all within the last two years. That is a management that is worthy of the mine,

IDAHO.

SMELTER AT MINERAL.—Idaho *World*, Dec. 7: The porphyrite smelter at Mineral City started up a short time ago, and, with the exception of a short stoppage rendered necessary by repairs to the apparatus, has run continuously since with great success. The extraction of silver and gold is most complete. This is the first matting furnace ever introduced in the Pacific Northwest, and as far as results go proves equal at least to the ordinary lead smelting process, and in its adaptability to the conditions of mining in the Northwest, is infinitely superior to a dry lead smelting plant, however extensive. The works have a capacity of 30 tons per day, and can be easily and quickly enlarged to twice that amount. It is highly probable that such an increase in the capacity will soon be made for the quantity of ore now in sight in the Porphyrite Co.'s mines. They struck recently, in the Black Maria mine, four feet of solid galena ore, samples of which run as high as 500 ounces to the ton.

THE TIP TOP MILL.—Wood River *Times*, Dec. 11: Ole Rorem, superintendent of the Tip Top mine and mill, was in town to-day. He said that he had no doubt but that he would be ready to start his mill for a trial run in about 10 days, and he is very confident of scoring a success.

ALMA & NELLIE WOOD.—Wardner *News*, Dec. 7: Interest in the Elk creek region of Yreka district centers at present in the Nellie Wood mine, where work progresses with earnestness and vigor. The force of men employed has been increased to 40 and the mill is dropping 10 stamps day and night. A period of renewed activity has set in, and before another season is at end the Elk creek gold belt will be as widely known as the silver girdle is that surrounds Wardner.

EMMA & LAST CHANCE.—The hoisting plant for the Last Chance mine is being put in place as rapidly as possible. Supt. Chas. Sweeny expects to have it in working order in two weeks.

STEMWINDER.—The wire for the Stemwinder tramway arrived on Wednesday from the works of Lescher & Sons, St. Louis, Mo. A. Denaugh has taken the contract for putting it up and his work commences to-day. In about three weeks we may expect to see the buckets wending their way from mine to mill.

PLACER CENTER DISTRICT.—From present indication the resources of the Granite present the appearance of being everlasting. The vein is of mammoth proportions and the ore averages rich; the mine has a world of wealth and keeps 80 men constantly employed in bringing it to light. The concentrator runs uninterruptedly and the shipments are up to the usual standard.

STEMWINDER.—Wardner *News*, Dec. 14: The work of putting up the wire tramway for the Stemwinder company is progressing rapidly.

SIERRA NEVADA.—A number of men were discharged this week at the Sierra Nevada mine in consequence of a change of arrangements made by the company in shipping ore. In future, sacking will be dispensed with and the ore shipped in bulk. A new bin has been erected at the mine, and another will be built immediately at the new siding.

LOWER CALIFORNIA.

ALAMO.—San Diego *Sun*, Dec. 16: Mr. Reed, who has been spending several months at the Alamo mines, has just returned from there and reports everything as progressing slowly but under the most favorable prospects. He says that the shaft on the Princessa is now down 106 feet and the crosscut at that depth had cut the vein and been sent into the vein four feet, when he left. The ore taken out at that depth is richer than anything found above it. The shaft on the Ulysses is down 100 feet. Some very rich ore has been taken out of the lowest depths in this great mine. The famous Scorpion mine had struck the richest ore ever found in camp. The owners, McGrath and Joseph, commenced their working shaft a short distance away from the possession shaft, where they found the ledge much wider and the ore much richer than in either of the former shafts on the vein. By those disinterested this is considered one of the most promising mines in camp. Governor Torres' mine, which is believed to be 12 feet wide, Mr. Reed tried in the Butler mill, making a cut clear across the vein for 12 feet. He took all of the broken ore in the cut, so as to get a general average, and it yielded $21 per ton. He says that the ore from the Elsinore has paid from $40 to $80 per ton. Judge A. J. Reeves and I. McWhister of London have bought one-half interest in the Lucas Mining Co.'s mill and will at once start the mill. They will put in a Wiswell mill in addition to the five stamps they have, also a rock-breaker and self-feeder. Their mill is near the Visnagre mine in the Santa Clara basin. L. Wiswell's mill has given universal satisfaction. The recent rains at Alamo have made water abundant everywhere, and many miners are now making money washing out gold from the canyons.

MONTANA.

MOUNTAIN VIEW.—*Inter-Mountain*, Dec. 9: The Mountain View, probably the richest copper mine on earth so far discovered, is sinking the main shaft for the 1000-foot level. The present depth of the shaft is 965 feet and sinking continues. The ground run through is perfectly stratified with stringers of copper glance, the richest of copper ore. Crosscuts are being run on the 900, the stations being completed, and no doubt arises but that when the lead is encountered in the crosscuts both the north and south leads will present a body of ore sufficient in quantity and quality to make an old miner's eye sparkle. The Mountain View mine ever since coming into the possession of the Boston and Montana Copper company has been continually on the increase in regard to the richness and quantity of ores. The old Lexington mine has had to lay off pending the arrival of Mr. R. B. Wallace, there not being enough ores to mix with the tailings now being put through the mill. Col. John Doyle reports a strike today in the Bonanza. The strike was made in an upraise from the bottom level and its extent has not yet been determined. Samples of the rock show it to be high grade. W. B. Sparkman reports a strike of fine-looking ore in the Keystone in the Oro Fino district. The shaft ran into the main ledge just below the 100-foot level. The lead appears to have about eight feet of quartz.

GRANITE MOUNTAIN.—Phillipsburg *Mail*, Dec. 12: The output for the week ending Dec. 12 was 53 bars of bullion, containing 77,500 ounces fine silver and 174.4 ounces fine gold.

A GOOD STRIKE.—Messrs. Sprague and Nettle have recently struck a 9-foot lead of ore on their claim near the Two-Per-Cent, at Tower. The ore is not very high grade, but with the quantity that is in sight it will pay well.

THE SILVER CHEST.—A contract has been let to run a crosscut of 200 feet on the Silver Chest, one of the claims now under the control of the Clark Syndicate. This action most certainly indicates that Mr. Clark is well pleased with the property, and a purchase will most likely follow.

THE ELIZABETH.—The work of sinking the 500-foot shaft on the (West Granite) Elizabeth was begun the latter part of last week.

NEW MEXICO.

NEW PRODUCERS OF ORE.—Rio Grande *Republican*, Dec. 7: The people of Las Cruces do not as yet realize the era of prosperity which is dawning upon the Organ mining camp, yet it is a fact that gradually, by the result of the incessant labor of a few faithful miners, the camp is proving to be one of the best in the Territory. It will not be many days until the long train of ox wagons now lining the road between the base of the mountains and Las Cruces, will be supplemented by many more, as other producing mines than the Bennett add their quota to the production. Next to the Bennett, the Comstock is now ranking as a producer. Over four carloads of ore are on the dump and the mine is now producing a carload a week of a fine carbonate ore which is valued at the smelters for its fluxing qualities. As depth is reached the grade grows better and the body larger. John Thompson has fairly "lived with" the Eureka for the past five years, working single-handed. He has a 200-foot incline which has exposed good ore, and the mine is now a little bank on which he can draw when he needs it. Twelve men took 600 tons of ore out of the Bennett in the month of November, an average of 50 tons to the man. John Shryock and Chas. Bouy have put the Excelsior shaft down to a depth of 100 feet and have just opened a new vein in which they have four feet of mineral.

UTAH.

SNAKE CREEK DISTRICT.—*Park Record*, Dec. 14: This district comprises a large area of country lying east and south of Blue Ledge and Uintah mining districts. Considerable work has been done in the district during the year now drawing to a close, though not on a very large scale. Many of the poor miners who have heretofore given much of their time to opening up their Snake Creek properties now find it to their advantage to pay more attention to developing their claims elsewhere and which are contiguous to recently found bonanzas. It is to be regretted that little or no capital has lately been invested in this undoubtedly rich district. The dead of winter now pervades there. There are many natural advantages for mining, notably the adaptability to tunnels, which is a comparatively and yet generally effective method of making developments. It has any quantity of rich ore reserves laid deep, and the float and croppings are encouraging signs for operations to be carried on in comparatively new ground, while the many claims that are already partly opened up will eventually be made extensive ore-producers. Considerable prospecting has been done the past season in the vicinity of Dutch canyon, and those who have worked there believe that lots of good ore will be mined there yet. It is a significant fact that the Anchor Company owns a vast area of ground along Pioneer ridge and the Bonanza flat country and have lately made purchases of several contiguous claims. Among the claims lying west of the Anchor and along Pioneer ridge which will ultimately make good records as ore-producers are George Pierson's, Smith Ehenger's and the Silas Reed estate's ground. The Montreal group, situated in the lower part of the district, is exploited by a 400-foot tunnel and two crosscuts. The Silver Bell, Columbia, Blue Bird and Natural Arch properties have had more or less work done on them the past season. They each have a fine vein and assays have been obtained from these claims running well in gold and silver and fair in lead and copper.

MECHANICAL PROGRESS.

Casting Plate Glass.

The recent establishment of plate-glass manufacture in this country may give interest to the following brief detail of the mode of such manufacture:

The casting tables, the most important piece of apparatus in a plate-glass works, are 19 feet long, 14 feet wide and 7 inches thick. Each is provided with an iron roller, 30 inches in diameter and 15 feet long. Strips of iron on each side of the table afford a bearing for the rollers and determine the thickness of the plate of glass to be cast. The rough plate is commonly nine-sixteenths of an inch in thickness; after polishing, it is reduced to six or seven sixteenths. The casting tables are mounted on wheels, and run on a track that reaches every furnace and annealing-oven in the building. The table having been wheeled as near as possible to the melting furnace, the pot of molten glass is lifted by means of a crane, and its contents quickly poured on the table. The heavy roller is then passed from end to end, spreading the glass into a layer of uniform thickness. The whole operation of casting scarcely occupies more time than it takes to describe it. Each movement is made with almost nervous rapidity. Few industries offer such fine scenic display as the pouring of molten glass. One feels like crying "encore!" it is so very brilliant. In contact with the cold metal of the table, the glass cools rapidly. As soon as possible, the door of the annealing-oven is opened and the plate of glass introduced. The floor of the oven is on the same level as the casting-table, so that the transfer can be conveniently and quickly made. When, after several days, the glass is taken out of the oven, its surface is found to be decidedly rough and uneven. A small quantity is used in this condition for skylights and other purposes where strength is required without transparency. It is known in the market as rough plate. The greater part of the glass, however, is ground, smoothed and polished before it leaves the establishment.

MACHINES FOR VENEERING.—The largest machine for cutting veneers yet constructed is said to be in operation in California, and is said to shave up logs 10 feet 8 inches in length with the greatest ease. The shavings which come from these machines are great, long sheets, in each of which is almost the entire wood of a big log, and from a single shaving is frequently made a mass of 2000 to 5000 berry-boxes. The logs are first cut into the desired length, then placed in a large steam-box and left for 12 hours subjected to the effects of exhaust steam, which so softens the wood that it can be cut into the thin sheets desired without checking or splitting into fragments; when sufficiently softened, the log is pushed into an immense lathe and revolves in front of the great blade exactly as a strip of wood in a turner's lathe revolves toward the chisel. After the water-soaked outer portions of the log have been trimmed off, a number of small, chisel-like instruments are adjusted, with the sharp-cutting edges pressing against the log, which make parallel lines partly cut through the whole length of the great white streaming shaving; these lines are the points of bending when the boxes are formed, and make that operation nothing more than a simple mechanical movement, as the wood bends readily at the partial cuts and forms the angles of the boxes. All but the core of the log is turned off into this long shaving, one-twentieth of an inch in thickness and nearly 1000 feet long, which is folded and broken into convenient lengths or strips, and of the proper width for a box. The last step in the manufacture is the fastening of the bottom and side strips together by an instrument called a stapler.—*Ex.*

A PERFECTLY ROUND CAR WHEEL is certainly very desirable, and as such perfection is not found in cast-iron wheels, as they come from the foundry, the device for grinding them to a perfectly true shape, which was introduced a few years ago and has been quite largely applied, would seem to be a very great advantage. But the objections to the use of grinding machines are becoming more evident than formerly and some companies believe that they outweigh the advantages. The Chicago, Rock Island & Pacific, after having employed wheel-grinding machines for several years, has decided to stop the practice, having found that a large proportion of its wheels when ground are reduced in mileage something like 20,000 miles. This is the result of their being cast irregular and not properly centered on the axle, so that in grinding much more material is removed from one side than the other. Of course, the wheel-makers are at fault; but it is doubtful whether perfection in the casting and mounting of iron wheels can ever be reached.—*Ex.*

"COLD SHORT" IRON DESCRIBED.—During litigation in a boiler explosion case in Toronto, Ont., recently, a number of experts were examined on "cold shortness" of iron. A broken rivet from the exploded boiler was shown in the court, and from the appearance of the fracture the experts said, under oath, that the iron in the rivet was "cold short." Mr. W. Raub, an eminent mechanical engineer, who was employed by the defense, stated before the court that no person could tell the quality of iron by the fracture unless he saw the fracture. Mr. Raub secured a bar of best brand of Lowmoor iron, took it to a blacksmith shop, cut a nick about one-eighth of an inch thick all around it, tapped it gently with a small hammer for about an hour, and then hit it hard with a sledge. It broke off "as short as a carrot." He then turned the other end over, after nicking it, and of course, the edge showed a beautiful fiber. The "short" end of the bar was first shown to the experts, who one and all said it was "cold short," but when the other end of the same bar was shown to them, they were dumbfounded. Mr. Raub had by his light tapping completely crystallized the one end of the bar, and had left the other intact.—*The Iron Industry Gazette.*

IRON AND STEEL are fast taking the places of wood for structural uses, and it appears possible that the growth of consumption in that respect will fully compensate for the lessening demand by builders of new lines of railroad in this country. But even in the railroad business there is room for a large consumption in the future, if only for the purpose of replacing old rails by new ones, and meeting the demand for fresh rolling stock to take the place of that worn out in the service. Still there is one important fact which may alter conditions to an extent now little thought of. It is that wood once worn out is a total loss, except for fuel, while only a moderate percentage of the other is lost in the wearing process. There is a constant tendency to increase the ratio which the old used over again bears to the total quantity in use, and it may be less than 20 years from now when the old will form much more than half of all the nominally new production in any given year. Of course, this would not obviate the necessity of employing labor in effecting the conversion, but it would make a great difference in the quantity of ore required to be taken from the mines, and still later along in the ages leave them comparatively little to do in furnishing new material. It may be rather early to speculate on this phase of economic science, but there is no more harm in now and then trying to look ahead than in the writing of whole books about "looking backward."—*Ex.*

WHAT IS THE LIFE OF CORRUGATED IRON? At a recent meeting of the Connecticut Association of Engineers, a paper by Mr. C. M. Jarvis was presented on "Iron Roofs." In the discussion which followed, Mr. Field was asked the question: "What is the ordinary life of corrugated iron?" He replied: "The life of a corrugated iron roof depends on what gauge of iron you use or whether you use it galvanized. You can put it on to last 100 years, but ordinarily it will not. Iron near the seashore will go faster than inland. There are instances where that iron has lasted 20 to 25 years; other times it has gone in 5 or 6. There is no repair except to put a new sheet on. You can take off any one sheet and renew it. We have had roofs on our place 17 years, and they do not leak very badly now. We keep them painted. A good many places where they have lost corrugated iron roofs they have not painted them. We use metallic paint. Those that last the longest are galvanized iron. Many people put on 26 iron, which is not much better than paper. If they will put on 18 or 20 galvanized, they will have a roof to last, practically, forever. They put on 26 frequently. There are three or four gauges—standard, Birmingham and others—and you must be posted on what gauge you are buying, for 26 in one might be 28 in another man's. You gauge it by the weight per foot."

AN INGENIOUS MACHINE.—Asa and Walter Pettengill have invented a machine for cutting up round or flat iron and steel, and much needed in mill work. It cuts round iron or steel from one-quarter to one-half inch, and flat up to quarter inch, as easy as one cuts a piece of card with pocket scissors. There is an opening for each size of round, while a drawing-shear cuts the flat. There are several unique movements and points in connection with the machine which must be seen to be appreciated, especially the return of the blade after a cut has been made, and which is made without any springs to offer any resistance to the cutting motion. A great advantage and saving of time results from the finished manner in which the work is left after the cutting.—*Rockville (Conn.) Journal.*

HONORING THE MECHANIC.—The first statue erected in this country to a workingman has been unveiled in Sacramento. It is in honor of E. J. Stevens, late master mechanic of the Southern Pacific, who had for years been in charge of immense railroad shops in Sacramento. The funds for the monument were contributed entirely by workingmen.

ENGLISH STOVE FOUNDRIES are away behind us in machinery. Holland has no stove works; their stoves are of thin sheet iron, and are made by blacksmiths. The English stove is a "warming stove," ours for heating. At Carron the molding, wheeling and packing is done by women suitably dressed, and the work does not look too hard.

ORGAN SPRINGS.—An industry of considerable note at Montpelier, Vt., is the manufacture of organ springs which are shipped to different organ manufacturers in the country. Last year over 90,000 of these springs were shipped. The buildings of the factory plant are substantial ones and are run to full capacity at present.

SCIENTIFIC PROGRESS.

Both Oil and Gas Solidified.

We have already alluded to a recently invented process for solidifying petroleum oil. This has been done by Mr. I. C. Hatch of Santa Cruz. The Santa Cruz *Surf* says: "He solidifies the crude petroleum oil by a chemical process and molds it into small bricks. A *Surf* reporter was shown several of the bricks, and also witnessed a trial of them, in which they were placed in a stove having a grate, and in which the solidified petroleum oil burned finely, giving forth a great heat. The bricks, however, will not be a success as fixed at present in some stoves, as they would, after partially burning, run together in one mass and cover the bottom of the stove, leaving no place for a draught, which is imperatively necessary. But this, like all other obstacles in other inventions, will probably be removed when Mr. Hatch has fully perfected his new method of preparing the oil, and can then adapt it to circumstances as required."

Natural Gas Solidified.

And now comes our contemporary *Light and Heat*, which informs us that a process of condensing natural gas has been invented and patented in Anderson, Ind., and is attracting widespread attention. The great possibilities of it have attracted the attention of the Standard Oil Company, and representatives of that corporation from Cleveland and New York have made the inventor flattering propositions should the plan prove a success. According to *Light and Heat*, the inventor states that there can be no doubt as to the possibility of his process. He is now engaged in the construction of the necessary apparatus, and will shortly give a practical exhibition by reducing a quantity of natural gas into solid substance. The process itself, as well as the machinery needed to carry it out, is very simple. Gas when transformed into solid matter is not dangerous to handle. Its expansive force is very great, and when the substance becomes heated above a certain degree it will become very volatile and will burst an ordinary cask or can, but the effect is gradual and it does not explode. The inventor claims that with a ten-horse power engine he can reduce enough gas in one day to supply a city of 50,000 inhabitants with fuel for 24 hours. These two inventions, if they can be carried out as set forth, must prove of almost incalculable value to the world.

The Astronomy of the Future Will be Largely Photographic.

Professor Schaeberle of Lick Observatory, en route to French Guiana to observe the total solar eclipse of Dec. 21st, said to a Chicago *Times* reporter:

"It is not the spectrum of the corona that astronomers are now interested in, but actual photographic images of it. Indeed, the astronomy of the future will be largely photographic.

"Here, for instance, is a plate of the great nebula in Andromeda, greatly magnified. Our best telescopes have heretofore shown it to be merely a blur of light. This plate shows you that it is really a spiral.

"This spiral formation runs through all the heavens, and we come upon it when we least suspect it. Here is a plate of a section of the Milky Way, which shows some of the stars arrayed after the same fashion. It is a curious fact that in that plate in your hand Prof. Burnham seems to have found a starless black hole in the Milky Way. With the longest exposure he could give there was not a gleam of a star in that point right there, while all about it was a mass of stars."

The latest report states that 21 observatories are now engaged in the international undertaking of photographing the entire heavens. Each observatory will have to take about 700 photographs in the zone assigned to it, and it is hoped to finish the work in three or four years.

ELECTRO-DYNAMICS AND GRAVITY.—While the laws of gravity are, no doubt, sufficient to explain the movements of the celestial bodies with respect to each other, says the *Electrical World*, other obscure actions have long been investigated, and the electro-dynamic theory is one which has often been suggested to account for them. It is, indeed, gaining ground for more than one reason. In the light of recent experiments, and in connection with the material properties of the electric current as now advocated principally by Dr. Lodge, it would seem that the ether is not to be considered, as heretofore, the medium through which the force binding the celestial bodies to one another acts, but that it is the actual binding element itself, fulfilling all the properties of an incompressible highly elastic fluid.

ANTHRACITE COAL.—A new and most important discovery of anthracite coal has been reported in Pennsylvania. The deposit is said to be 200 feet thick, and confirmative of the life-long dream of many old anthracite miners. They have believed steadfastly that underlying the region, at some depth, buried, there was a great basin of pure anthracite, representing the deepest bottom of the peat bog in which the anthracite was found. They argued that it would not only be of a thickness beside which a 16-foot vein, now considered an exceptional find, would be but as a streak, but that, being free from the faults and irregularities due to crust movements during its formation, it must be of even and flawless quality. The reported discovery seems to fill out these predictions so exactly that it is almost past belief. The fear of an early exhaustion of the anthracite coal field, which has been indulged in by many, may now be safely set aside; for, in addition to this new mammoth find, indications are rapidly multiplying which go to show that Pennsylvania has not the world's only anthracite beds. There is good reason to believe that anthracite exists in Colorado, Canada, Russia, France, and probably in Wales, to say nothing of the many and vast unexplored regions of other parts of the world.

THE ELECTRIC LIGHT ON PLANTS.—Fresh experiments have lately been carried out at the Winter Palace, St. Petersburg, which tend to show the fatal influence of the electric light on plants. It was observed that a single night's lighting was sufficient to cause the plants to become yellow and desiccated, which was followed by a fall of the leaves. The sudden passing of northern plants, used to sunless days and the weak light of the conservatory, into the dazzling light of drawing-rooms, must be regarded as the principal cause of this phenomenon. The rapidity and intensity of the pernicious influence of the electric light increase with the brightness of that light; the plants which are not attacked directly by the luminous rays do not appear to suffer. The foregoing facts agree absolutely with those which were observed in the experimental conservatory at the exhibition of electricity in 1881. It is also remarked that the effects vary much with the nature of the electrical apparatus employed. If arc lamps be used, which give a light much charged with violet radiations, the injurious effects will be quickly observed; if, on the contrary, incandescent lamps, which give a more yellow light, be employed, it is probable that the hurtful influence will be small, or not noticeable.—*Electrical Review.*

THE FOSSIL HORSE, as is quite generally known, differs from the existing species in having his hoofs divided, and is supposed to have become extinct many ages since; but Mr. C. B Williams has called attention to a quotation from Suetonius, which seems to imply quite a recent existence of this type of the horse wherein that writer says that "Cæsar made use of a remarkable horse, with feet almost human and hoofs divided in the manner of toes." Cæsar's horse might have been a possible example of what evolutionists term reversion of the modern to the fossil type.

A MECHANICAL TELEPHONE.—Intelligence from Glasgow states that an attempt is about to be made to introduce a purely mechanical telephone, styled "The Pulsion," there. No electrical current is used, and the instrument is exceedingly simple in construction, merely consisting of a steel india-rubber-lined button, to which the annealed steel wire is attached, a copper diaphragm, and sound-conducting springs. Experiments on a line about a third of a mile in length showed that the sounds transmitted were clearer than those sent by the most perfect telephones at present in use.

A NEW FLASH LIGHT.—Dr. Thomas Taylor, the veteran microscopist of the Department of Agriculture, Washington, has just invented a new flash light which promises to be quite valuable in ordnance practice. The inventor terms it the pyro-flash light. It is said to possess some very peculiar properties, and may be made to burn with any degree of rapidity, from very slow burning like a train to instantaneous flash. Its smoke is thin and light and quickly dissipated.

A NEW IMITATION OF GOLD.—An Englishman is now said to have invented a metal that can hardly be distinguished from gold. It is like the precious metal in all its best points, can be hammered and drawn equally well, and presents a good wearing surface. It is not a compound and gains its gold color from the action of a chemical. The inventor has placed samples of his discovery on the market and expects to begin its manufacture soon. It can be made for 60 cents a pound, and may be used extensively in the manufacture of cheap jewelry.

PARAFFINE FROM PEAT.—Paraffine distilled from a peculiar kind of peat is the object of a new industry which has sprung up in Brazil. About ten peat-beds are being worked at Marslin, and though the diggings have reached a depth of 150 feet, there is no sign of the supply being exhausted. The paraffine obtained is used in the manufacture of candles.

A BOTANICAL GARDEN OF ALPINE GROWTHS. A botanical garden in the Alps of Valais is situated on a cone-shaped knoll about 200 feet high, at an altitude above sea level of more than 5600 feet. Plants from all the Alpine regions of the globe will be cultivated.

LIGHT WITHOUT HEAT.—An inventor named O. L. McClellan, of Philadelphia, has succeeded in reproducing artificially the light of the glow-worm. The production of this illuminant means the utilization of energy without material waste and without heat.

GOOD HEALTH.

Health of the State.

The November report of the State Board of Health makes the following showing:

Reports from 104 localities, with an estimated population of 884,400, give the number of deaths at 902, which is a percentage of annual mortality at the rate of 14 04, which is a remarkably small death rate, and indicates a most favorable condition of the public health.

Consumption is credited with causing 156 deaths during November, or little less than one-sixth of the total mortality of the State for the month. Pneumonia, being quite prevalent, caused 63 deaths, which is an increase over last report. Bronchitis shows an increase, 38 deaths.

Diphtheria and croup, collectively, caused 49 deaths, which is a large increase from last report. Of these, 18 occurred in San Francisco.

During the earlier part of the month disorders of the bowels seemed generally to prevail, but after the excessive rainfall in the latter part of November, diarrheal disorders were not noticed so frequently as diseases of the respiratory system, which prevailed in quite a number of localities.

Diphtheria and croup were reported in Downey, Anaheim, Monrovia, Los Angeles, Santa Cruz, Jolon, Truckee, Gold Run, Redding, Mariposa, Salinas, Soledad, Ontario, Lockeford, College City, Fresno, Santa Barbara, El Monte, Gonzales, Santa Ana, Oakland, Sacramento, Benicia, Needles and San Francisco.

In Gold Run, Placer county, there has been quite an epidemic of diphtheria and croup, which Dr. Miner attributes to the bad sanitary condition of the town and the neglect of sanitary precautions in isolating those attacked. It is very evident to all right-thinking people that if we desire to limit the spread of contagious and infectious diseases, such as diphtheria, scarlet fever, smallpox, typhoid fever, etc., a law upon the statute-book will be necessary, making it compulsory upon all physicians, nurses or householders to notify the health authorities of the presence of infectious or contagious disease wherever it occurs within their knowledge.

If we had such a law, and the failure to notify was punished by fine and imprisonment, we would, by timely notification, be enabled to confine the disease to its place of origin by isolation, and subsequently, by disinfection, to destroy the contagion before it had time to get abroad. We will grant that with measles and whooping-cough this would be most difficult, as their most infectious stage is just before the outbreak of the eruption in one case and of the typical cough in the other. In these cases the contagion would be almost sure to have been diffused to a greater or less extent before the diagnosis of the diseases could have been made. But one of the most useful results of a law making the notification of infectious diseases compulsory would be the fact that it would enable health officers to give timely warning of infected families to the school-teachers and trustees, so that the children of such families could be excluded, for the time being, from the public school, and the spread of infection stayed. From the culpable carelessness with which children from infected premises, or even with the first symptoms of illness upon them, are allowed to attend school, we cannot wonder that diphtheria and scarlet fever are spread. Of course, a great deal of this is through ignorance of the dangerous nature of the infecting disease, and because it is generally unknown that the mildest attack in one child may produce the most malignant disease in another. Sanitary education will in time remove this difficulty, especially when the fact is fully recognized that these infectious diseases can be wholly controlled by timely precaution and proper quarantine measures.

KEEP WARM.—Rose Terry Cooke says: "If you want to be happy, keep warm. Women are eaten up with neuralgia, say the doctors. No wonder. They sit still all the morning by a hot register, then tie the five or six-inch strip of bonnet over their back hair, a bit of lace film over their bangs, put on kid boots, with silk or thread stockings underneath, and dawdle along the pave with bitter winds of winter smiting their temples, their delicate ears, their throats, and the bases of what should be their brain. Their outraged nerves shrink and quiver under this barbarous exposure. But no matter; their chest is well covered with fur cloaks and sacques, but cold feet, the numb ears, the reddened temples, the exposed neck, will have their own story to tell. Then you won't wear flannel next the skin. Why? Because your waists will look too large, and it is the style to be as near in shapeliness to that delightful and lovely insect, the wasp, as humanity can be forced. Do you really like to ache and groan and to be laid aside every few days with agonizing headaches or panting laboring hearts? Strange, if true!"

WHAT PRODUCES DEATH.—Some one says that few men die of age. Almost all persons die of disappointment, personal, mental or bodily toil, or accident. The passions kill men sometimes even suddenly. The common expression, "choked with passion," has little exaggeration in it, for even though not suddenly fatal, strong passions shorten life. Strong-bodied men often die young—weak men live longer than the strong, for the strong use their strength and the weak have none to use. The latter take care of themselves, the former do not. As it is with the body, so it is with the mind and temper. The strong are apt to break, or like the candle, run; the weak burn out. The inferior animals, which live temperate lives, have generally their prescribed term of years. The horse lives 25 years, the ox 15 or 20, the lion about 20, the hog 10 or 12, the rabbit 8, the guinea-pig 6 or 7. The numbers all bear proportion to the time the animal takes to grow to its full size. But man, of all animals, is one that seldom comes up to the average. He ought to live a hundred years, according to the physiological law, for five times 20 are 100; but instead of that he scarcely reaches an average of four times the growing period. The reason is obvious—man is not only the most irregular and most intemperate, but the most laborious and hard-working of all animals. He is always the most irritable of all animals, and there is reason to believe, though we cannot tell what an animal secretly feels, that, more than any other animal, man cherishes wrath to keep it warm, and consumes himself with the fire of his own reflections.

TO PREVENT COLDS.—A lady correspondent of the *Call* writes to that journal as follows: Every one knows how wet the backs of shoes and hose get by the bottoms of the skirts hitting them. More colds are caused this way than any other. Rubbers protect only the bottoms of the feet. Rubber boots cost but little more and will outlast a dozen pair of ordinary rubbers. The writer wears a pair of woolen socks over her hose, in the boots, an old dress skirt that water and mud will not hurt, a good gossamer and an umbrella, and goes perfectly dry in the heaviest rain, has no skirts to hold up, and carries her shoes or slippers if going to stay anywhere. Of course, white skirts are left at home, or carried with the shoes and another dress if desired. If anybody has one less cold by adopting the above, the writer will be sufficiently repaid.

RELIEF OF DEAFNESS IN OLD AGE.—Sapolini of Milan has described a method of his which he states has been successfully employed in 62 cases of deafness of old age. It consists in mopping the membrana tympani with a weak oleaginous solution of phosphorus. He claims that the treatment diminishes the opacity of the membrane, increases the circulation and improves the hearing.—*Kansas City Medical Index.*

USEFUL INFORMATION.

A Lesson from the Late Paris Exposition.

The thorough way in which statistics of all kinds are collected in Paris, says an exchange, makes the Exposition which has just closed particularly instructive, especially as an indication of how much weight should be attached to *resident* as distinguished from *non resident* population, something which it is very difficult—in fact impossible—to determine from the records of our own Philadelphia Exposition. The only definite fact obtainable in regard to the latter is, that out of nearly 10,000,000 admissions, only 24 per cent came by rail direct from exterior points and 35 per cent more came by rail from the city. How many of the city visitors were temporary residents who were in Philadelphia only to attend the Exposition it would now be hard to determine, even approximately. It is probable that somewhat less than two-thirds and certainly more than one-half of the visitors were from the 1,000,000 or so residents of Philadelphia and its vicinity, and only the remaining one-third to one-half represented the rest of mankind.

The Paris statistics make a still stronger case in favor of holding the exhibition in a city of the largest possible population if it is to be a financial success. The full official statistics are not yet at hand, but from the unofficial ones reported, it is quite certain that out of the 25,400,000 visitors at the Exposition, at least 68 per cent is to be credited to the permanent residents of the city of Paris.

Taking the above two instances as evidence, it would appear that to make a paying success of an exhibition, a city of large population must be selected. On this ground the probable comparative attendance at an equally good exhibition held in Chicago and New York, we would have in Chicago, with an approximate population of 1,000,000, a resident attendance of not more than 5,000,000, while New York and its immediate environs, with an approximate population of 3,000,000, would furnish 15,000,000 visitors. The outside visitors would vary but little in numbers from either city. Taking this view of the case, New York would seem to have a decided advantage as the place for the coming Exposition.

MICA IN STOVES.—It is stated that of two stoves, otherwise alike, one with clear mica around the upper part will radiate more heat through the mica than would be radiated through iron. Iron gives out most heat by the circulation of air over its surface, and is a stronger radiant than mica, but the latter has the advantage of being transparent to the direct radiation of a red-hot fire,

Wood Fiber for Spinning.

A new process by which wood fiber may be easily prepared for spinning has recently been devised. It is the "sulphite process." A party of gentlemen, among whom were Daniel Lamont, ex-Secretary Whitney of New York, Senator McMillan and Don M. Dickinson of Michigan, have been visiting Rumford Falls, Me., where they have been to look over the water privilege with a view to building a sulphite pulp mill.

The *modus operandi* of this process is quite simple and is said to be very practical. It is a German invention, and its application for reducing wood to a fiber which can be spun like cotton or wool, will, it is thought, lead to an important industry. The process of reduction is described by an Eastern cotemporary as follows:

Thin boards or laths, free from knots, and of any width preferred, are cut into strips in the direction parallel with the grain, and are boiled in a boiler containing a solution of sulphurous acid or bisulphite, this boiling producing disintegration without requiring the strips of wood to be reduced to very small pieces, the wood after boiling being dried in the open air or in specially constructed drying-rooms. By thus drying the product, the fiber, though originally weak, and tending to break at a slight strain, becomes comparatively strong, not resuming its very breakable condition on the addition of water.

Briefly, the damp masses on the frame are transferred to a traveling endless cloth, which leads them to a pair of rollers which may be plain or provided with corrugations in the direction of their length, the ribs of the one roller being made to gear into the recesses of the other one, resulting in a simultaneous strong bending and squeezing of the masses; the cutting of the material in passing through the corrugated rollers is avoided by causing the endless cloth to pass over the lower roller and by placing a canvas covering around the upper roller—the pressed masses fall from these rollers on to a second endless cloth, which conveys them to a second pair of rollers, from which they are conveyed to a third pair, and so on, say six times. These processes produce loose, coarse filaments, but to obtain the necessary thin long fiber, the boiled and pressed masses are completely dried, then combed in the direction parallel with the fibers by means of devices provided with pins or teeth of great strength; the separation of the extractable matter from the fiber produced by boiling the gums and soluble organic matter, is best effected after the fiber has been spun into threads.

AMERICA is "great" on big things if she is young. The longest suspension bridge in the world is the one between New York and Brooklyn, 5989 feet in length. The largest single fortification in the world is Fortress Monroe, cost over $3,000,000. The loftiest active volcano is Popocatapetl, in Mexico, 17,784 feet above the sea level. The largest park in the world is the National Park (Yellowstone) beyond the Rocky mountains. The largest body of fresh water in the world is Lake Superior, with an area of 32,000 square miles. The largest cavern in the world is Mammoth Cave, in Kentucky. The largest trees in the world are the mammoth trees of California, some of them 376 feet high and 34 feet in diameter at the base, indicating an age of about 2500 years. The largest auditorium in the world is said to be the one just opened for an opera-house in Chicago.

TO PREVENT THE FADING OF GOODS IN SHOW WINDOWS.—A Continental exchange, referring to the evil of fading or bleaching of many kinds of colored articles when exposed in the store windows, says that this fading or bleaching is brought about only by the white rays of the sun's light, and, where it occurs, it shows that the glass is more or less perfectly colorless. It is found that if, instead of such colorless glass, the window panes consist of glass which is slightly yellow, the bleaching or fading process is prevented. Where the glass is colorless and cannot be replaced by slightly yellowish tinted glass, the desired effect may, it is said, be produced by simply giving the panes a coating of copal varnish.

WATERPROOF WHITEWASH.—A waterproof whitewash is in use in Germany. The powder from three parts silicious rock (quartz), three parts broken marble and sandstone, two parts of burned porcelain clay, and two parts freshly slacked lime, still warm, are mixed together. This forms a silicate, if often wetted, and becomes after awhile almost like stone. It is applied quite thickly to a wall or other surface, and allowed to dry one day. The next day it is covered frequently with water, which makes it waterproof.

BLUE SOAP.—To produce a blue soap, the use of which renders the subsequent employment of blue in laundry work unnecessary, incorporate with ordinary soap a solution of aniline green in strong acetic acid. By the action of the alkali of the soap, the green is converted into blue, uniformly coloring the mass.

AN INGENIOUS automatic machine has been invented by Mr. J. Hope, mechanical engineer of Liverpool. The machine receives the cash, places it to the depositor's credit, and gives a receipt for the amount lodged.

ENGINEERING NOTES.

A Stupendous Scheme.

There has been set on foot a scheme to construct a ship railway between the St. Lawrence river and the Bay of Fundy. The Dominion Government has undertaken the work which will reduce the 500-mile trip around Nova Scotia to 17 miles. It will be called Chignecto Marine Transport Railway and will cost over $6,000,000. The track weighs 110 pounds to the yard. It will take two locomotives to draw a car holding a vessel. The trip will occupy a little over two hours' time. The tariff will be 50 cents per ton on cargoes and 25 cents per ton on the vessel. Hydraulic jacks of immense power will be used to raise the vessel on the car, which can be accomplished in half an hour. This is specially applicable for purposes of war, the car being large enough to transport the largest war-ship.

In addition to the above the Dominion Government is constructing a three-million dollar canal at Sault Ste. Marie, to be known as the "Soo Canal." This canal will be a triumph of engineering skill. It has been clamored for by politicians for two generations. The Government admits that no pressing necessity for the canal exists; but in the completion of the last link in this Canadian route they all see an evidence of the determination of Canada to work out her own destiny on the American continent.

The "Soo" Canal will rank with its namesake on the American side. The engineers are overcoming great obstacles and deserve no ordinary praise for the boldness of their design. The canal is to extend across St. Marie island, in St. Mary's river.

Canada will soon have an independent and greatly shortened route from the head of Lake Superior to the Atlantic sea-board. The United States cannot enjoy the same advantage, because American vessels sailing from Lake Erie to Lake Ontario ports are dependent on the Welland Canal, a water-way traversing Canadian territory.

MAKING THE SUN WORK.—One of the most notable inventions displayed at the Paris exhibition was an apparatus for transforming the heat of the sun into motive-power for pumping water and other mechanical uses, says the Goldsboro *News*. It is the device of a French inventor named Charles Tellier. The apparatus is of great interest as foreshadowing the time when solar heat, in combination with electric transmission of force, will be made to furnish motive-power for all engines and take the place of coal and steam, a change which will vastly cheapen manufactures and travel and greatly enhance human comfort the world over. The heat which comes to the earth in the sun's beams is, as has long been known, the equivalent of from one to five or more horse-power for every square yard of the earth's surface, according to the latitude and the season of the year.

ROME TO BE MADE A SEAPORT.—A great scheme for making Rome a seaport is under the serious consideration of the authorities, and appears likely to be undertaken at no distant date. It is proposed to cut a canal 80 metres wide and 10 metres deep from the Tiber, near the church of St. Paul, outside the wall, to the seashore at Castel-Fusano, a distance of 18 kilometres, or 11¼ miles. An American company would assume the construction of the works, and the estimated expense is 60,000,000f. The enormous impetus which will be given to industry and commerce in the capital and in the whole province if this scheme can be carried out can hardly be over-estimated.

A RUSSIAN ENGINEER. — Count Antonsie Zdzairski is visiting this country in behalf of his government to inspect with a number of other engineers the railroads of the U. S. The government of Russia is building a railroad across Siberia to the Pacific ocean. There will be 4000 miles of track and 2500 miles of river transportation. Count Zdzairski's mission is to inspect the Canadian Pacific, as the climatic conditions of Canada are much the same as those in Siberia.

A NEW BRIDGE. — M. Effel, the builder of the great tower in Paris, has recently invented a bridge which promises to "fill a long-felt want" of the railroad companies. It is to be used temporarily in the place of the ordinary bridges when they have been damaged. It is made of steel, carries a track, and weighs, with a length of 150 feet, about 86 tons. It can be put in position from either end without the aid of machinery or any preparation, simply by human hands.

COMPARATIVE COST.—The cost of running street railways with horse-power and with electricity has been carefully estimated, and for the purpose of comparison a line running 50 cars is taken. Such a line, operated with horses, costs $303.75 per day, and with electricity, $68 50. The difference in favor of electricity is $231.25, or $4.62 per day saved on each car.

THIN IRON.—Iron is rolled so thin at the Pittsburg Iron mills that 12,000 sheets are required to make a single inch in thickness. Light shines through one of these sheets as readily as it does through greased tissue paper,

TABLE OF CONTENTS.

ILLUSTRATIONS.—Steam Schooner for the Coasting Trade; Triple-Expansion Marine Engine; Compound Tandem Engine, 465. Bauman's Ticket-Holder for Piece Goods; Victor Leading Wire Reel; Standard Electric Fuse and Blast Tester; Regenerative Hot-Blast Stove; "Pull Up" Magneto Blasting Machine, 473.
EDITORIALS.—Engines for Steam Schooners, 465. Passing Events; The Folsom Dam and Debris; Annual Expenditures; Silver-Mine Owners and Silver; The Old Alder Gulch; An Iron-Frame Battery; Academy of Sciences, 472. Regenerative Hot-Blast Stoves; Ticket-Holder for Piece Goods; Electric Blasting Apparatus; Our Naturalization Laws, 473.
CORRESPONDENCE.—Mariposa County; A Californian in British Columbia; Storm Winds, 466. Lessons from Australian Planting; American Capitalists and Mines; Lower Springs Mining District, 467.
MISCELLANEOUS.—The Giant Cereus; Your Own Photographer, 467.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 468-9.
MECHANICAL PROGRESS.—Casting Plate Glass; Machines for Veneering; "Cold Short" Iron Described; What is the Life of Corrugated Iron; An Ingenious Machine, 470.
SCIENTIFIC PROGRESS.—Both Oil and Gas Solidified; The Astronomy of the Future Will be Largely Photographic; Electro-Dynamics and Gravity; Anthracite Coal; The Electric Light on Plants; A Mechanical Telephone; A New Flash Light; A New Imitation of Gold; Paraffine from Peat, 470.
GOOD HEALTH.—Health of the State; Keep Warm; What Produces Death; To Prevent Colds; Relief of Deafness in Old Age, 471.
USEFUL INFORMATION.—A Lesson from the Late Paris Exposition; Mica in Stoves; Wood Fiber for Spinning; To Prevent the Fading of Goods in Show Windows; Waterproof Whitewash, 471.
ENGINEERING NOTES.—A Stupendous Scheme; Making the Sun Work; Rome to be Made a Seaport; A Russian Engineer; A New Bridge; Comparative Cost; Thin Iron, 471.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 476.

Passing Events.

The continuous rainy weather has been felt all over the State, and in some portions damage has been done by the flood of water pouring down from the mountains. The rainfall for this period of the year is unprecedented, and still it continues to rain.

Gov. Waterman has telegraphed to Senator Stanford that as hydraulic mining has ceased, the $250,000 appropriated and in the hands of the War Department should now be used to save the navigation of the Sacramento river.

Before the PRESS is printed next week Christmas will have come and gone; so it behooves us to take time by the forelock and wish our patrons "the compliments of the season."

Judge Sawyer's decision in the Francœur-Newhouse case, referred to last week, is loudly condemned by mining men, and it is thought it will not stand in the United States Supreme Court. The miners on railroad land will now have to obtain title from the railroad company and pay for it.

THE ALL-AMERICANS.—Marcus D. Boruck says the Governor is about to notify all commercial bodies on the coast to make preparations for the reception of the delegates to the Congress of American nations, who will arrive here in about six weeks.

PROF. GEO. DAVIDSON has returned to San Francisco from the International Geodetic Conference at Paris.

The Folsom Dam and Debris.

Although not intended for any such purpose, the dam built by the State at Folsom will very probably serve a purpose from an engineering point of view, which will have a decided bearing on the much-vexed debris question in California. It is pretty certain that it will catch a large amount of debris, as well as water, and although measures have been taken to get rid, as occasion demands, of that which lodges near the dam itself, the backing up of the water will cause a deposit for some distance back.

The unprecedented early storms and resultant floods filling all the water-courses of the mountains bankfull, will bring down this winter an enormous amount of debris—more than has been the case for years past. There will be no way of telling how much until the water gets low, but it is pretty certain that there will be an immense quantity. The private debris dams in the side canyons made to catch the material from any one mine will not give any such illustration as the dam built by the State on a main stream.

The water now pours several feet deep over the edge of the Folsom dam, which has stood the pressure well. It is just possible, however, that after the floods subside the bottom will be found nearer the top than was expected. In other words, it will perhaps serve for just such a debris dam as the hydraulic miners wanted to see built by the Government or State to test the efficiency of dams for holding back detritus from the mines.

Annual Expenditures.

Only one more week remains in which to commence the work of performing the labor or making the expenditures on mining claims required by the U. S. mining laws. Those who have not already complied with the law will now realize how foolish they have been since the stormy weather of this month all over the coast has greatly increased the difficulty. Earlier in the year, when weather is pleasant, the work could be done with no discomfort. Doubtless, the weather will have much to do with the number of relocations this year, since many men who are at all doubtful of their claims will let the time pass by and take the chances of any "jumping" being done.

It is very probable that the projected law to change the date on which claims are forfeited will be passed at this session of Congress. In fact, it should have become a law at the session when introduced. It will be much better to have the date fixed at some other time than the dead of winter, for there are certain people who will put off the work until the last moment, anyhow, and these must now risk the mountain storms.

During the past two months, while miners have been performing this assessment work in various camps, we have noted that a number of strikes have been made. The men have gone to work rather to comply with the law and hold their claims than in the expectation of making any actual development. Yet in a number of instances good ore has been found and mines made out of prospects by this enforced labor.

Silver-Mine Owners and Silver.

The Granite Mountain mine of Montana, a famous silver mine, disbursed in dividends to stockholders the last fiscal year the sum of $1,900,000. They mined 37,248 tons of ore and milled 35,711 tons at an average cost for milling of $10.61 per ton. Of the average cost of treating a ton of ore, $2.73 goes for salt, $1.90 for fuel, and 74 cents for quicksilver. They used 5123 tons of salt last year. It will be seen that the mine is a pretty big one, and that it is paying well; but it ought to pay better. To show the interest silver-mine owners have in the free coinage of silver, the case of this single mine may be cited:

Up to the close of the last fiscal year the company had paid 55 dividends, amounting to $6,700,000. Since then four more have been paid, including the one on the 9th of November, making $7,600,000, or $19 per share. Tools were first sent to the mine October 8, 1880. Expenditures of all kinds up to July 31, 1889, were $4,052,512. This includes the cost and working of the property and all kinds of expense. During that period the mine produced 10,989,859 ounces pure silver and 6521½ ounces pure gold, realizing the gross sum of $10,938,-800. Under the free-coinage law in operation prior to February, 1873, this product would have netted the sum of $14,335,135, showing that the company has lost $3,334,335, or 30 per cent of its gross income, because of the inability to get the silver coined on the same terms as the gold. Had there been free-silver coinage during this interval, instead of $6,700,-000 in dividends, stockholders would have received over $10,000,000. And yet the "gold bugs" cannot see why the Western mine-owners should make such a fuss over the silver question.

The Old Alder Gulch.

Mr. L. A. Fenner of Alder Gulch, Montana, an old subscriber of the PRESS, is in San Francisco on a visit with his family. Mr. Fenner has been mining in Montana for 25 years, and this is his first visit to the metropolis. In fact, he says he never saw an electric light until he got to Ogden the other day. Mr. Fenner has lived in the Territories all his life and never had a chance yet to vote for a President of the U. S. He is going to Nevada and Placer counties to look at the mines and may invest in some land in that section for his boys.

Mr. Fenner says about 120 men are working over the old ground in the famous Alder gulch which yielded about $75,000,000 in gold in 1863-4-5. The early-day work was done by sluicing, but the miners then were good judges of ground, for the men now make more out of the old worked ground than the patches which were left. The gulch was originally divided up into 100-foot claims, but now many claims are owned by one person. Some companies own a mile, and Mr. Fenner himself owns half a mile of the gulch.

He says they ought to have a company with half a million of capital to bring in water from the Madison river, and it would be a good investment. Thus far the miners have failed to interest any one, and the claims are only worked by flumes and primitive methods. The gulch has been worked for 15 miles. At the upper end the gold is coarse, and some nuggets worth $600 to $700 have been found. The lower eight miles of the gulch yield gold that is comparatively fine, a nugget of $7 or $8 being a rarity.

Mr. Fenner is the inventor of a machine well adapted for working this class of ground, since it removes all the rocks, carrying them out of the way. He uses it on his claim, and has done better than any of the other miners this year. It does not require very much water to operate it, and would be a useful device in portions of this State. Mr. Fenner will spend the winter in California.

Academy of Sciences.

At the meeting of the California Academy of Sciences on Monday evening, Dr. Harkness presided. The librarian reported an addition of 50 books to the library. The following additions were made to the museum: A large number of birds, eggs, nests and rodents, collected by the society's expedition sent to Lower California during the present year; a variety of birds' eggs donated by R. W. Price, A. A. Caldwell, R. N. Jones, Robert Taylor and James B. Kent, and 204 specimens of lepidoptera, donated by Dr. H. H. Behr.

Walter E. Bryant read an interesting paper upon the birds of the peninsula of Lower California, Mexico. The paper was originally written as a report upon a collection made by Mr. Bryant in the vicinity of Magdalena Bay in 1888, and now includes the results of his field work of 1889 and embraces the known avi-fauna of the entire peninsula and adjacent islands. The peninsula of Lower California, the speaker said, has lately attracted considerable attention as an ornithological field. Previous to 1888 the studies of Lower California had been confined to Gerros and Guadalupe islands. Through the courtesy of J. P. Hale, Mr. Bryant made researches on Magdalena and Santa Marguerita islands. He gave a description of the islands and his journey thence to San Jorge, a distance of 120 miles, and from there across the peninsula to the Gulf of California, referring to the plains of San Julio and San Pedro and the Comondu Canyon which he traversed on the way. From Comondu Mr. Bryant traveled overland 597 miles to San Quintin. His observations on the way will be set forth in his work to be published on the birds of Lower California. The paper was illustrated by stereopticon slides.

Dr. H. H. Behr read a brief paper on "The economy of nature as exemplified by vegetable and animal parasites."

W. C. Burnett of the Committee on Nominations presented the following list of names that had been selected by them to be offered for election as officers of the Society for the ensuing term: President, Harvey W. Harkness; First Vice-President, H. Herman Behr; Second Vice-President, George Hewston; Recording Secretary, J. R. Scupham; Corresponding Secretary, Fred Gutzkow; Treasurer, I. E. Thayer; Librarian, Carlos Troyer; Director of Museum, J. G. Cooper.

Ex-Judge Currey presented the following opposition ticket: President, Joseph Le Conte; First Vice-President, H. H. Behr; Second Vice-President, George Hewston; Recording Secretary, J. R. Scupham; Corresponding Secretary, Fred Gutzkow; Treasurer, I. E. Thayer; Librarian, E. S. Clark; Director of Museum, J. G. Cooper. Trustees, the same as the regular ticket.

An Iron-Frame Battery.

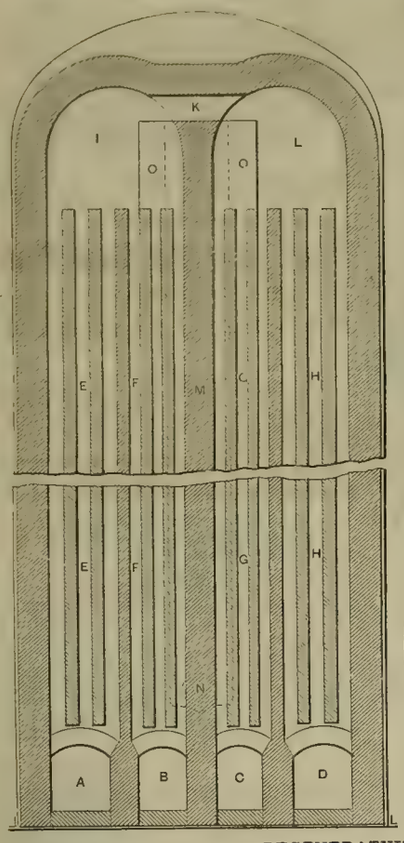
M. P. Boss, the well-known millman, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency an improved form of iron-frame stamp battery. In the ordinary form of iron-frame batteries the frame is directly secured to and built up from the mortar. The jar of the stamps is, therefore, carried directly to the frame and there is considerable strain and racking thus put upon it.

The improvement made in construction by Mr. Boss is that the frame and the mortar are not directly connected, but are both bolted to the sole plate, and the jar of the stamps in the mortar is communicated to the frame indirectly through the sole plate and is, therefore, materially reduced. In the frame itself a novelty is to be noted, which results in simplicity of construction, involving a minimum number of parts, thereby reducing the number of joints and materially increasing the rigidity of the entire structure.

The boxes in which the cam-shaft is mounted are formed directly in and are integral with the side castings of the iron frame. These boxes are made semi-circular, entrance for the shaft being gained through wide-open fronts made in the castings. There are no tops for the boxes, the shaft lying directly in them and is held therein by its own weight and the weight of the stamps on which its cams operate. An inwardly and downwardly inclined flange on the inner front side of the mortar better receives and directs the splash to the screen, for, on account of its inclination, any pulp striking it must rebound directly upon the screen.

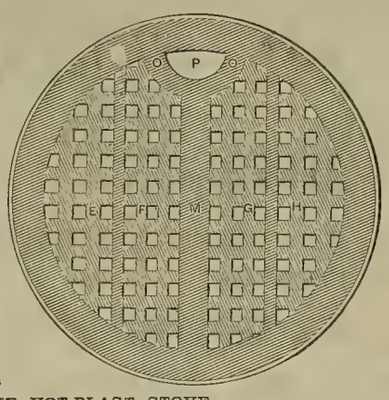
In stamp-mills of this class, where the stamps drop only by their own weight, unassisted by any acceleration, they cannot be driven beyond a certain speed, for the cams will, if rotated too rapidly, catch the tappets before the stamps have delivered their blow. Accordingly, springs have been used to accelerate the drop of the stamps, so as to provide for a more rapid operation. The feature in this regard in this battery lies in the arrangement of the accelerators, whereby they are adapted to be readily thrown into action or out of use, according as a more rapid drop or a normal operation is required. Mr. Boss also provides an easily-operated means for hanging up the stamps. The hanging-up fingers are mounted on eccentrics and these eccentrics are rocked by bar-levers, so that the fingers can be easily raised when under the tappets to elevate the stamps.

CHAS. P. SHEFFIELD of the Pacific Saw Manufacturing Co. died in this city last Saturday. This firm was the first to manufacture saws on this coast. In 1865 the firm made at their shops two 12-foot mill saws, the first ever made here.



ANY ONE in want of machinery for sampling works should look at the advertisement in another column concerning the Daggett sampling works. A full description will be given to applicants for information.

SENATOR WILSON of Washington has introduced a bill for the establishment of an assay office at Spokane Falls.



Regenerative Hot-Blast Stoves.

As a means for increasing the efficiency in modern blast furnaces by supplying to them blast of a much higher temperature than is now possible, J. T. Wainwright of Pittsburg, Pa., offers as a suggestion a modification in the construction of regenerative hot-blast stoves. Stated briefly before the American Institute of Mining Engineers, the plan proposed is to pre-heat both the gas and the air for its combustion in a manner similar to that generally adopted in Siemens open-hearth furnaces. After thus carrying the temperature of the stove to a point much higher than that common in hot-blast stoves, the cold blast passes through it. Without entering into the details relating to the reversing valves and the system of flues, the general plan may be outlined as follows, referring to the accompanying drawings: The valves are so placed in heating up the stove that the blast-furnace gas enters at *B*, Fig. 1, and the cold air for combustion at *A*. Ascending in flues, *F* and *E*, respectively, combustible gas and air meet and mix in the combustion chamber, *I*. Flowing through *K*, they descend through the flues, *G* and *H*, escaping through the chimney. In this manner the walls of the combustion chambers, *I* and *L*, are highly heated, and the right-hand side of the stove is carried to a higher temperature. By reversing the valves, blast-furnace gas enters at *C* and cold air from combustion at *D*. Both are pre-heated in their ascent through the flues *G* and *H*. They burn in the combustion chamber, *L*, and the hot gases of combustion, flowing through *K*, *I*, *E* and *F* to *A* and *B*, heat the left-hand side of the stove. In this manner the stove is carried to a temperature greater than that of those now generally in use, in which air and gas are burned without preliminary pre-heating. In the plan proposed, that side of the stove will of course be relatively cooler through which cold air and furnace gas last passed in its ascent to the combustion chamber.

VERTICAL SECTION.

HORIZONTAL SECTION.

REGENERATIVE HOT-BLAST STOVE.

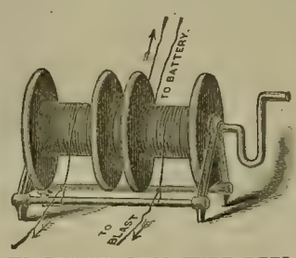
After having sufficiently heated the stove in the manner outlined, the cold blast is admitted through all the flues, *A*, *B*, *C* and *D*. It ascends through the highly heated regenerative material to the chambers at the top and descends through the flue, *P*, Fig. 2 (dotted in Fig. 1), through *N*, Fig. 1, through the open hot-blast valve into the cold-blast main.

A desirable feature of the design suggested is that the highest temperature is maintained at the top of the stove, so that the material in the lower parts, which supports the greater weight, is thus protected against the effects of excessive heat.

Ticket-Holder for Piece Goods.

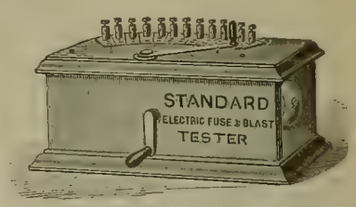
Samuel Bauman of Santa Cruz has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a device for marking goods in dry-goods stores, such as are known as piece goods. He terms the device a ticket-holder, and it consists of a plate folded to fit the end of the board on which the goods are rolled, and having a slot in which the ticket or card may be slipped. The device is shown in a cut on this page.

BAUMAN'S TICKET-HOLDER FOR PIECE GOODS.



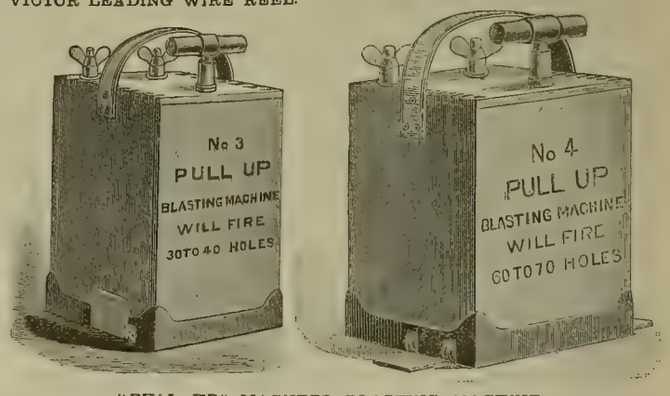
What are known as piece goods are usually rolled upon boards, and being laid upon the shelf with the ends presented to the front, it is difficult to properly mark the goods so that their price, number, etc., may be seen at a glance. The plate devised by Mr. Bauman has its sides triangular in shape and folded so as to just slip over the end of the board on which the goods are to be rolled. The plate is secured to the board by spurs which engage with the wood. At the point where the plate is folded over the end of the board, slots are made, forming tongues which are raised from the surface of the end of the plate so as to admit the ticket or slip upon which the necessary figures and words are printed. The ticket slips into the space beneath the strips. Upon these slips are printed the matter that is necessary to identify the goods, giving number, price-mark, etc., and the slips are easily introduced and removed at will. When the goods lie upon the shelves these slips are permanently exposed, so that they can be easily read at a glance. The plate also prevents the end of the board from splitting.

Electric Blasting Apparatus.



The "Pull-Up" magneto-blasting machines illustrated on this page are specially constructed to meet the requirements of those who desire to fire a large number of shots at one time. These machines are strong and durable. The iron base and bottom will be found a great improvement and protection against wear and dampness; the operating device is new and simple in construction; the operating bar after being pulled up to fire, will fall back into its place of its own weight, and is ready to be used again. These machines will fire any make of electric platinum fuse.

In electric-blasting, leading wire forms a very important part, and great care should be taken to have it in good condition and in a convenient form to use. The Victor reel, shown on this page, is a simple and practical device to keep the leading wire on. The reel is made so as to have a continuous wire from battery to blast. Both wires are separated on the reels, and can be run off to any required length. There are no loose joints or bare connections. The reel will hold over 1000 feet of wire, 500 feet on each end and five to ten feet in the middle to reach the battery.



Leading wire is very liable to crack and split from constant bending and jarring, and should occasionally be tested. For this purpose a machine herewith illustrated, is used, called the Standard electric fuse and blast tester. This machine is intended only to test electric fuses or exploders before placing them in the charge holes to blast, to make sure they are all right and perfect, so as to avoid the expense, trouble and danger of a miss fire or an unexploded hole, or to make doubly sure. With the same machine the charge can be tested before firing it to make sure all connections are perfect before putting the leading wire to the battery. If the blast fails after such testing, the trouble must be with the battery. All blasters know the trouble and danger caused by a bad fuse in the charge; it necessitates the drawing of the charge hole or redrilling another hole, and many accidents and deaths have occurred in performing these dangerous operations. In all electric machines there must be a complete circuit. The same rule applies to this machine. Its size is 5 inches x 6 inches x 10½ inches, and weighs 10 lbs. It will test from one to 12 fuses at a time; it has 13 binding posts on top of box, with a brass switch for completing the circuit. A small handle in front to operate with, and the sounding bells on the right-hand end. The mechanism is inside the box.

VICTOR LEADING WIRE REEL.

STANDARD ELECTRIC FUSE AND BLAST TESTER.

"PULL UP" MAGNETO BLASTING MACHINE.

To test the entire blast before firing, it is only necessary to place the ends of the leading wire in the right and left binding posts, turn the handle, when the bell will ring. Leading wire should often be tested separately, as it is liable to crack and break in bending and have imperfect joints. Its heavy insulation makes it difficult to find these defects without the standard tester. The Parke & Lacy Co. of this city are agents for these appliances.

A. D. WILCOX has sold the Sunrise and Moonshine mines in Winnemucca mountain to McMannis & Gunter, who have been engaged in mining in Lewis district, Lander county, Nev., for some years.

Our Naturalization Laws.

President Harrison in his recent message gives utterance to the following:

> Our naturalization laws should be so revised as to make the inquiry into the character and good disposition toward our Government of the persons applying for citizenship more thorough. This can only be done by taking fuller control of the examinations, by fixing the time for hearing each application and by requiring the presence of some one who shall represent the Government in the inquiry. Those who are the enemies of social order, or who come to our shores to swell the injurious influence and to extend the evil practices of any association that defies our laws, should not only be denied citizenship, but a domicile.

This is perhaps the most radical deliverance on this subject that has emanated from so high a public functionary, and may be regarded as a sort of weather-vane on top of the political barn indicating the current of popular opinion.

It is certainly growing more evident every day that our naturalization laws need modification, at least in one particular. A foreigner who seeks the privilege of becoming a citizen of the United States is required to renounce under oath all allegiance and fealty to any foreign prince, potentate, State or sovereignty, and particularly the State or sovereignty of which he may have lately been a citizen or subject. This is well enough, provided it is his honest intention to become a peaceful and law-abiding citizen. But it is obvious that a large number of foreigners have been coming, and are still coming to this country, who are anxious to be clothed with American citizenship merely to protect them in their mischievous and revolutionary schemes against the Government they profess to have abandoned. There is danger of this class embroiling our Government with nations that we are on friendly terms with. Already there has been a deal of unpleasant diplomatic strife growing out of this source of irritation.

But this is not the worst feature of the case. It is a well-known fact that there are large numbers of professed Socialists, Nihilists, Anarchists flocking to our shores who acknowledge allegiance to no form or system of government. They do not believe in the existing order of things. They would resolve the whole social fabric back into chaos and night. Monarchies and Republics are equally obnoxious to them. If they had their way, they would confiscate all property and turn all government into a vast commune. When such people as these take the oath of allegiance, they swear falsely, for if their power were equal to their will they would overthrow the whole social framework of the world. Now, a man who avows such political sentiments should, in the language of President Harrison, "not only be denied citizenship, but a domicile."

Another phase of this question that is more and more attracting public attention is the evils of unrestricted and promiscuous immigration. Those who long hung on the sentiment that America is the refuge of the oppressed of all nations have been reconsidering the matter in

the light of recent events, and judging from the number of bills that have already been introduced into Congress, the leaders of all parties are impressed that the time has come for more thorough and rigid legislation on this subject. The investigation of the Ford Committee, while it merely skimmed the surface of this great and pervading evil, amassed a pile of evidence, which shows that something should be done, and that promptly, not only in the name of patriotism, but of humanity. For Americans are not only injured by indiscriminate immigration, but the poor immigrants are often cruelly and bitterly deceived, betrayed, enslaved and robbed.

Now this matter is one that both the native-born and naturalized citizens are equally interested in, for it is certain that no people, no matter how ingenious, industrious and thrifty, can long stand such blood-poisoning as has been going on. Already the pyæmia has widely spread through our body politic, corrupting politics, filling our cities with ignorance, vice and wretchedness, and hospitals, prisons and asylums with disease, crime and beggary, largely increasing the burden of taxation.

If Congress has any sense or courage left, we may expect this session such a modification of the naturalization laws as will eliminate undesirable citizenship from our politics, and such restrictive legislation as will well guard the gates of our harbors at least against paupers, anarchists, ignorance, ticket-of-leave men and the like.

Wastage of the Precious Metals.

EDITORS PRESS:—In several editorials of your recent issues I note your distrust in the present system of saving gold. To quote your language, "very much remains to be done before it can be said that this branch of the science of mining has been placed in a satisfactory condition." Here I wish to say that the MINING AND SCIENTIFIC PRESS for many years has more clearly realized the truth of these ideas than the great majority of working miners, as your articles from time to time have shown. You, and possibly many of your old subscribers, are well aware that for 15 years I wrote more or less on the "Wastage of the Precious Metals;" besides, I published over 10,000 pamphlets, giving much important data on the subject. Save the compliment of being quoted by foreign journals and mining works of recent issue, I found one might as well save time and paper, as the quartz miner generally is content with looking at the stamps rise and fall, and concludes that what he gets is all the value obtainable, and for the reason "that gold is the heaviest of metals" and that "silver plates do all that can be done toward saving the smallest atom of gold."

This, I think, is the first article I have written on this subject for six years, and to write this I know is lost time, as no one seconds the ideas excepting possibly yourselves and a few who have taken the time to closely investigate the loss. Every year advances the advantages of increasing the per cent of gold-saving, but here I will say, with all the new appliances, that the stamp-mills are not saving near what should and could be saved.

Did I choose to give public the data I have from actual practical working in the past several years, they will be pleased to read it, but there it would end. I have wasted time enough that way already.

You speak of the Mining Bureau bringing available matter together. What the Mining Bureau should do, and this is the main purpose of this article, would be to have an especial milling expert, who would have the duty of testing the working of mills and their percentage of loss of gold. The mere telling of millmen that they are not getting over 40 per cent of the value of their metal (and many are not) amounts to nothing; but prove it by showing him the metal from the ore he has washed off, and he begins to squirm and is willing to listen. California realizes about $14,000,000 from her quartz mines; half as much more might be added to this amount from the rock already mined, if millmen more clearly realized the loss and saved the per cent that they should.

One single season's testing of mills and the making the millman more clearly realize the loss, would be of more value to the State in every single year than the cost of maintenance of the Bureau from its commencement and for ten years to come.

I am well aware that my idea of so much loss will be ridiculed by many, who will assert that they "are saving 80 and 90 per cent." All right, gentlemen. I am content while you are happy in the belief. I hope not to gain the displeasure of my fellow-millmen, but it matters not a whit to me what they think of my views. I have "stubborn facts," and the future mining age will prove my position. But I would like to see more heed taken as to the loss. It is their gain and the State's gain.

Merry Christmas.

It would seem that with each passing year this day dawns more gloriously than ever before; perhaps it is owing to the fact that the Song of the Angels is becoming better understood. Under the influence of a cold and frosty creed, that hated merriment and joy, this day was long neglected. It was always dear to the people of Germany, but in the dissenting regions of Great Britain and in our colonial days Christmas was a day regarded as partly wicked and largely a piece of superstitious stupidity. But as religion became more and more imbued with the spirit of love, the Church has been more ready to find happy days in the year. Days of gloom fell into neglect; days of happiness came into a new popularity. Thanksgiving has superseded fasting. The floral emblems we see in special profusion in all the churches during the Christmas and Easter festivals show that religion has moved into a more genial and tropical clime; that it has ceased to throw stones and prefers to gather the sweet lilies. Religion now finds in flowers, evergreens and music its most appropriate voice and litany. And the result has been that from year to year there is poured into our holiday sermons more of the spirit of gladness, laughter and song.

Christmas is pre-eminently the festival of unselfishness. More than any other day, the hearts of the people are stirred by the angel anthem of peace and good-will. For the most part, those who observe other holidays propose to have a good time, but the true spirit of this day is to help others to have a good time. It is to all, old and young, rich and poor, the happy season of making and receiving gifts. What a pleasant spectacle it is to see the bulk of the population a few days before Christmas out on the streets, thronging shops and stores, purchasing gifts and keepsakes. Then the dignified President quits work and goes out shopping with his wife. Then Congress adjourns and grave Senators and distinguished members forget the Tariff and Silver bills and all other bills, and turn their attention to gift-making and other acts of kindness. The North and South cordially shake hands, and even capital and labor, wealth and poverty stop making faces at each other. In short, everybody is happy, or tries to be, and the business of the day is to give to every man and woman and child, however bowed down with cares, burdens and pain, a glimpse of the blue sky.

Let us be glad this is so. Life is full enough of sorrow and trouble at the best. Happy they who can even for a few fleeting moments dream, idealize, recall sweet memories and revel in rosy hopes. Surely it is good for us all to have a season when we may forget toil and strife, money and ambition, and yield to the fragrant influence of nobler and better sentiments. The American people are specially in need of such times of rest and recreation. They are a sad, nervous race upon whom work has come as a fate, and hangs as a pall over everything; the spontaneous joy and bubble of the heart is almost unknown, that well is fast drying up, and the wind that blows off the desert white with the bones of Mammon, poverty and insatiable thirst for more, has spread so far over our life, church and religion that a really happy man would be a curiosity.

But we should make it a point to remember Christmas, with its religious suggestions, its lessons of charity and brotherhood, its dear memories of long ago, its prophecies of the good time coming when the human race will reach the long-expected goal of happiness. Such thoughts may soften the asperities of life, sweeten the cup of affliction, and tend to restore the fading picture of innocence and ideal blessedness that have been withering in our arctic realism. Coming as Christmas does at the close of the year, when we are about to post the books of our successes or failures, it may serve to remind us that wealth and position are not all of life; that both combined may prove a curse, if not accompanied by the happiness that is the odorous flower of duty alone. In this spirit the PRESS tries to close the year, and wishes to its all patrons, friends, and enemies, if it has any, a Merry Christmas.

The Sacramento.

The merchants of Sacramento have become seriously alarmed over the danger to the Sacramento river. Yesterday Governor Waterman sent the following dispatch:

Hon. Leland Stanford, United States Senator, Washington, D. C.: The Sacramento river is in danger of changing its channel. There is a break two miles below the bridge which is 1000 feet wide. An immense bar is forming below the break across the river. As hydraulic mining has ceased, the appropriation of $250,000 in the hands of the War Department is available and ought to be used now to save the navigation of the river.

R. W. WATERMAN,
Sacramento, Dec. 18, 1889. Governor.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING DEC. 10, 1889.

417,208.—ADJUSTABLE STOVE GRATE—H. W. Bodeman, S. F.

416,893.—STAMP BATTERY—M. P. Boss, S. F.

417,143.—VEHICLE—S. P. Burdick, Oakland, Cal.

417,165.—PAPER FASTENER—H. A. Free, Vacaville, Cal.

417,180.—DRAFT HOOK—Geo. Harvey, Forrestville, Cal.

416,916.—GRAIN-CLEANER—Benj. Holt, Stockton, Cal.

417,185.—DREDGING APPARATUS — W. P. Humphreys, S. F.

417,186.—DREDGING APPARATUS — W. P. Humphreys, S. F.

417,187.—SUPPORT FOR DREDGING CONDUITS—W. P. Humphreys, S. F.

416,943.—CARRYING PULLEY—A. McLean, S. F.

417,197.—WATER-HEATER FOR GAS STOVES—J. H. McNutt, Alameda, Cal.

416,939.—OIL CAN—P. J. Moore, S. F.

416,942.—SUSPENDER BUCKLE—J. Myers, Eureka, Cal.

416,848.—ADVERTISING DEVICE FOR SHOW WINDOWS—C. E. Naylor, S. F.

416,950.—CONCRETE MIXER—E. L. Ransome, S. F.

416,863.—HOSE REEL—W. T. V. Schenck, S. F.

417,212.—CABLE-GRIP TURN TABLE—C. Scholz, Merced, Cal.

416,864.—HAIR-CLIPPING BENCH—E. Schroeder, S. F.

416,956.—COFFIN-FASTENER—J. H. Scott, S. F.

416,700.—EXTINGUISHING MERCURY—A. Sommer, Berkeley, Cal.

416,963.—SICKLE BAR—J. A. Sowell, Wheatland, Cal.

416,972.—SURF-POWER MACHINE — H. E. Thomas, S. F.

17,270.—TRADE-MARK — Pelton Water-Whee Co., S. F.

The following brief list by telegraph, for Dec. 18, will appear more complete on receipt of mail advices:

California—Grove S. Bartholomew, Garvanza, wellboring machine; John Bean, Los Angeles, spray nozzle; Augustus S. Cooper, Santa Barbara, electric stenographic pen; Willis G. Dodd, San Francisco, steam boiler furnace; Miles B. Dodge, San Francisco, dry-ore concentrator; Oscar H. Donley, San Jose, windmill; Patrick F. Donnlon, San Francisco, guard for cable-cars; Calvin Ewing, San Francisco, collar-stuffing machine; Samuel Guthrie, San Francisco, air compressor; Peter D. Horton, Nevada City, mail-pouch fastener; George E. Hoyt, San Francisco, collar-stuffing machine; Artemus A. Kent, assignor of half to H. C. Pfister and J. D. Stewart, San Jose, bit stock; Egmond B. Knapp and J. H. Cresmer, assignors to said Knapp, H. Cresmer and T. J. Brintos, San Jacinto, buckles; Leonard Leavin, San Francisco, tricycle; Henry L. Norton, Ukiah, and F. W. Cook, San Francisco, watchman's electric time detector, Henry Trenton, Oakland, machine for making slat and wire fencing; Joseph A. Stitch, Los Angeles, spoke socket; Gustave A. strueber, Oakland, assignor to himself and D. Rutherford, San Francisco, filter.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CASKET FASTENERS.—Joseph H. Scott, S. F. No. 416,956. Dated Dec. 10, 1889. This is one of those clasps or fasteners for coffins or caskets which are adapted for use in clamping and screwing the lid of the metallic shell which fits within the coffin or casket proper. The invention consists in the novel arrangement and construction of the fastener.

CONCRETE MIXING MACHINE. — Ernest L. Ransome, S. F. No. 416,950. Dated Dec. 10, 1889. This apparatus is designed to automatically measure and mix the ingredients which are employed in making concrete, and for other similar purposes, without the necessity of handling or considerable manual labor. The proportions may be graduated as nicely as desired and the whole work is done automatically.

GRAIN-CLEANER.—Benjamin Holt, Stockton. No. 416,916. Dated Dec. 10, 1889. This is an improved grain-cleaner, which is specially applicable for use upon thrashing machines, but may also be used for a separate and independent cleaner when necessary. It consists essentially of a device for producing a shaking motion of the shoes which carry the screens and a means for regulating and adjusting the shake.

SICKLE BAR FOR HARVESTERS. — John A. Sowell, Wheatland, Yuba Co. No. 416,963. Dated Dec. 10, 1889. The object of this attachment is to provide a simple attachment of the sickle guards or fingers to the bar—one which will not work loose and may readily be applied. The shanks or stems of the guards are made much heavier than if they had to pass through holes in the bar, for in the form adopted they can project from their seats as much as may be required for the proper strength, and, being underneath, they will not be in the way.

CARRYING PULLEY.—Anthony McLean, S. F. No. 416,943. Dated Dec. 10, 1889. This improved construction of pulleys is specially adapted to pulleys which are employed to carry a rope in the tube or channel of a cable railway and for other similar purposes. The peripheries of these pulleys are rapidly worn by the friction of the traveling rope, and when they are worn through it is necessary to throw away the whole of the pulley. As a great number of these pulleys are used on cable-railway lines, the loss is considerable. This invention, which is designed to remedy this difficulty, consists in the casting of the rim of the pulley of chilled or white iron, and the spider or center and hub may be made separately and removable, so as to be placed in a new rim when the old one is worn out.

AIR-BRAKE RELIEF VALVE.—Abbie P. Hanscom, S. F., executrix of W. W. Hanscom, deceased, assignor of H. D. Bacon, Oakland. No. 416,603. Dated Dec. 3, 1889. This invention relates to certain improvements in air-brake mechanism for railway trains, and it consists of a relief valve in connection with each of the brake-cylinders, whereby the air which is released from one end of the brake-cylinder when the brakes are to be put on, is allowed to escape instantly without passing back through the train-pipe to the engine. The present invention is especially applicable to a brake-mechanism in which no storage or train-reservoirs are used, and for which a patent was issued to W. W. Hanscom, Sept. 22, 1885.

GRAIN SEPARATOR AND CLEANER.—Michael N. Laufenburg, Stockton. No. 416,464. Dated Dec. 10, 1889. This is an apparatus for more perfectly operating and cleaning grain, and it consists of an oscillating-shoe with screens upon which the grain is delivered by the carrier, which transmits it from the thrashing-cylinder, a superposed carrier by which the principal part of the straw is separated from the grain and carried away, and, in combination with the screens, of a blast and a series of backwardly inclined plates or shutters by which the chaff and straw are prevented from falling through the grain and through which the blast from the fan is directed so as to discharge the chaff and straw and assist in separating them from the grain.

AUTOMATIC PRESSURE RETAINING VALVE FOR AIR BRAKES.—Thos. P. Sweeney, Sacramento. No. 416 516. Dated Dec. 3, 1889. This is an automatic pressure-retaining valve for air-brakes which may be operated in connection with the reservoir of an automatic brake-mechanism and with connecting pipes of the same so that in running down heavy grades the brakes can remain applied while the reservoir is being replenished. In the employment of automatic car brakes an auxiliary reservoir is fixed on each car having a valve mechanism which is called a triple valve through which air is admitted to the reservoir and by which it is also admitted from the reservoir to the brake cylinder by the reduction of pressure in the train pipe; but when it is necessary to replenish the auxiliary reservoir it is necessary to temporarily cut off the communication between this reservoir and the brake cylinder so that the latter is without pressure while the reservoir is being replenished and the movement of the valves to connect the reservoir with the train pipe allows the air to escape from the cylinder. When this occurs upon heavy downgrades, it is a dangerous thing, because the train will gain such great momentum in a short distance that it will be almost impossible to handle it and again check it. This invention is designed to overcome this difficulty and it consists in the employment of what the inventor terms a "pressure-retaining valve," which regulates or prevents the escape of air from the brake cylinder while the train reservoir is being replenished.

Meetings and Elections.

Annual meetings and elections have been held by the following mining companies:

GOULD AND CURRY M. CO., Dec. 16. Directors—G. R. Wells (president), C. H. Fish (vice-president); Morris Hoeflich, George Frier, Robert Sherwood and H. Zadig, trustees; A. K. Durbrow, secretary; Nevada bank, treasurer; and P. Kerwin, Sup't. The financial statement showed that there was $20 006 on hand. Sup't Kerwin's annual report showed that there has been worked at the Thompson mill 250 tons of ore at a cost of $600 per ton, which yielded bullion of a total value of $3381.39, or an average yield of $13.52½ per ton. The bullion carried $1039.17 in go.d and $2342.22 in silver.

MT. DIABLO M. CO., Dec. 17. The trustees and officers were re-elected as follows: W. E. Norwood, president; J. M. Shotwell and J. N. Knowles, vice-presidents; with G. W. Grayson and R. W. Heath forming the board of trustees; R. W. Heath, secretary; and W. H. Shockley, Sup't. The financial statement showed an overdraft of $3976.47, against which there is unsold bullion on hand valued at $10,708.25.

LOCOMOTIVE M. CO., Dec. 7. H. B. Havens, president; T. F. Fish, vice-president; David Hunter, L. C. Frazer, trustees; A. H. Fish, secretary; Pacific bank, treasurer; and Isaac D. Smith, Sup't. The financial statement showed a balance on hand of $1935.35.

ANDES M. CO., Dec. 18. J. W. Brown, president; M. W. Fox, vice-president; and William A. Lyle, M. P. Hall and Walter Turnbull, directors. J. J. E. Hawkins was re-elected secretary, and his financial report showed a credit of $14,728. The receipts and disbursements for the year showed a gain over 1888 of $12,947.

OPHIR M. CO., Dec. 18. Charles H. Fish, president; A. W. Havens, vice-president; Morris Hoeflich, Con O'Connor, Wm. S. Lyle, George R. Wells and Herman Zadig, directors. E. B. Holmes was re-elected secretary, and D. B. Lyman Sup't. The secretary's financial statement showed a credit of $8946.

THE big sugar refinery of Claus Spreckels in Philadelphia has been started up.

The Benton Consolidated Mine.

EDITORS PRESS:—What was the last annual dividend of the "Benton"? The PRESS did not give the amount at the time of publication. By giving me this information, you will place me under obligations. A. H. K.

Barstow, Inyo.

The Benton Consolidated never paid a dividend, but it has levied several assessments, the last one on October 29, 1888, being $1 per share. The mine has money on hand, but is doing nothing as yet to develop the property. They are evidently waiting development work going on in adjoining mines.

The company this week began suit against R. N. Graves, W. S. Wood, Wm. M. Hoag, W. F. Myerd, W. H. Watson, E. Miller, C. Darby and W. S. Wood as executor of the estate of Seth Cook, deceased, praying that defendants be adjudged guilty of fraud and to recover $500,000 with interest from July 25, 1886. The action is based upon a claim of the company against the estate of Cook for alleged fraudulent conversion of 56,735 shares of the stock of the plaintiff corporation, which shares were duly bid in by the corporation on the 21st of October, 1885, for assessment No. 14 of 10 cents per share of the value of $340,000, to which add $79,333 interest, makes a total of $419.333. Also, for the fraudulent conversion of 26,865 shares of the corporation stock bid in by the corporation March 30, 1886, for assessment No. 15 of 10 cents per share of the value of $160,000, to which add $37,333 interest, making a total of $197,444. It is charged that this stock, aggregating 83,600 shares, through a fraudulent combination between the defendant members of the Board of Directors of the corporation and said Cook, and with intent to defraud and cheat the corporation and stockholders thereof, was fraudulently transferred and delivered by the said directors between May 1, 1886, and July 25, 1886, to said Cook, or his order, and which he appropriated to his own use and benefit, to the damage of the corporation, in the sum of $500 000, together with interest, making a total of $616,666.

The Pelton Water-Wheel Company.

The business of the Pelton Water-Wheel Co. has increased so rapidly during the past year that their resources have been severely taxed to fill orders with any degree of promptness. The necessity, therefore, of larger and more commodious quarters has for some time been apparent. A new and substantial brick shop, with some 7000 feet of floor space, has recently been constructed by this company, and equipped with the best grade of tools and most modern appliances for their work, giving them great facility for meeting the demands of a trade that has already assumed large proportions.

The popularity of the Pelton wheel is based upon extraordinary merit and wide adaptation to varying conditions, and the rapidly increasing demand for them from all parts of the world indicates that this will soon become one of the large industrial establishments of the country. Their present address is 121–123 Main street, San Francisco, Cal.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

CONSUMERS' ICE CO., Dec. 17. Capital stock, $100 000. Directors—E. J. Baldwin, R. G. Sneath, N. P. Williams, F. H. Green and F. Dillingham.

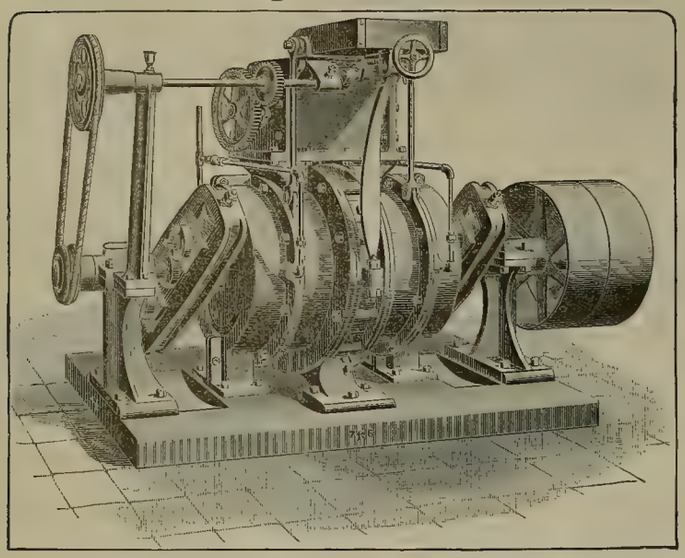
CALIFORNIA EDUCATIONAL ASS'N, Dec. 17. Object, to establish an educational library. Capital stock, $250.000. Directors—Ira G. Hoitt, James Denman, J. B. McChesney, Jas. T. Hamilton, Ira Moore, Geo. R. Kleeberger, Jas. W. Anderson, Fred M. Campbell and Horace Davis.

ROSEDALE RAISIN VINEYARD CO,, Dec. 17. Capital stock, $32,000. Directors—Jas. L. Barker, S. W. Fergusson, M. M. O'Shaughnessy, R. Friselle and N. J. Bird.

PACIFIC TIMBER, RAFT & MILL CO., Dec. 17. Object, to construct timber rafts in the waters of Puget Sound and tow them to favorable points on the Pacific Coast for sale. Capital stock, $2,000,000. Directors—H. R. Robertson, Chas. J. Haggerty, H. C. Wyman, Wm. Madden and W. B. Wilshire.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.



J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
M. D. SHRADER—Santa Clara Co.
W. W. THEOBALDS—Los Angeles Co.
E. FISCHER—Central California.
GEO. WILSON—Sacramento Co.
E. H. SCHABFFLE—Fresno Co
C. EDWARD ROBERTSON—Humboldt Co.
FRANK S. CHAPIN—Butte and Yuba Cos.
WM. H. HILLEARY—Oregon.
E. E. DEMING—Oregon.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

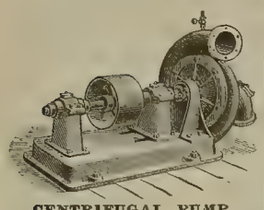
And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, - - 59 & 61 First Street, San Francisco

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.



SAN FRANCISCO TOOL CO.,

MANUFACTURERS OF

IRRIGATING PUMPS

—AND—

Machinery of all Kinds.

CENTRIFUGAL PUMP.

—PACIFIC COAST AGENTS—

BABCOCK & WILCOX

Patent Water Tube Steam Boilers.

Estimates Furnished on Application.

Send for Catalogues.

WORKS:

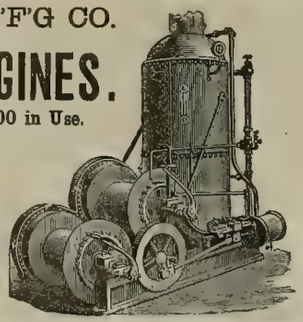
FIRST and STEVENSON STS., S. F.

LIDGERWOOD M'F'G CO.

MANUFACTURERS OF

HOISTING ENGINES.

300 Styles and Sizes. 5000 in Use.



96 Liberty St., New York.

34 & 36 West Monroe St., Chicago.

197 to 203 Congress St., Boston.

PARKE & LACY CO., Agents, San Francisco, Cal.

Send for Catalogue.

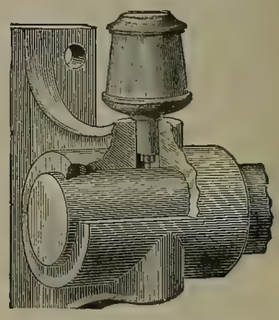
I. S. VAN WINKLE & CO.,

Importers and Dealers in

IRON, STEEL, HEAVY HARDWARE, CUMBERLAND COAL, PERKINS AND BURDENS

Horse and Mule Shoes, Putnam, Globe and Northwestern Horseshoe Nails, HARDWOOD LUMBER AND WAGON MATERIALS, Blacksmith and Carriage Makers' Supplies.

SOLE AGENTS FOR THE WELLS RUSTLESS PIPE AND FITTINGS,



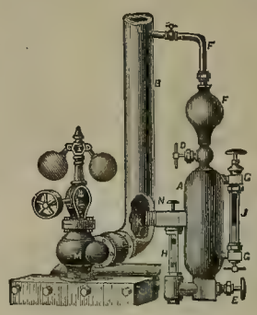
Specially manufactured for use in Artesian Wells, and for conveying water charged with Salts and Minerals, Acids, Gases or other substances of a corrosive nature. In building it takes the place of either black or galvanized piping or gas, water-waste, etc. Catalogues and testimonials, from large users in the United States, sent on application.

413-415 MARKET STREET, SAN FRANCISCO.

ALBANY

Lubricating Compound and Cups.

1868.



Manufacture commenced a Albany, New York.

1876.

Introduced by us on Pacific Coast.

1889.

Cheap imitations having had time to show that they are the most expensive in the end, the **Sales of the Genuine Albany Compound are Larger than ever before.**

England, Belgium, France,

And other Foreign Countries are now Large Consumers.

We are also Sole Agents for the

Albany Cylinder Oils, Albany Spindle Oils, Etc.

FOR SALE ONLY BY

TATUM & BOWEN,

Sole Agents for the Pacific Coast,

Dealers in Improved Woodworking Machinery,

Sawmill Machinery, Engines, Boilers, Ironworking Machinery, Supplies, Etc.

Sole Agents for Hoe Chisel-Tooth Saw, Gardner Governor, Schultz Leather Belting, Etc.

34 AND 36 FREMONT STREET, SAN FRANCISCO.

85 FRONT STREET, PORTLAND, OR.

SAVE MONEY

— BY USING —

WATER POWER TRANSMITTED BY ELECTRICITY

To Run your Mills, Hoists and Trams.

For Circular giving particulars send to

KEITH ELECTRIC CO.,

— MANUFACTURERS OF —

Apparatus for Electric Light and Electric Power,

OFFICE, 40 NEVADA BLOCK,

Factory, Stevenson St., bet. First and Ecker, SAN FRANCISCO, CAL.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

THE RUSSELL PROCESS COMP'Y.

TALCOTT H. RUSSELL, Secretary,

NEW HAVEN CONN.

P. O. Box 496.

California Inventors Should consult DEWEY & CO AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS No. 220 Market S., San Francisco. Elevator, 12 Front St.

AMALGAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

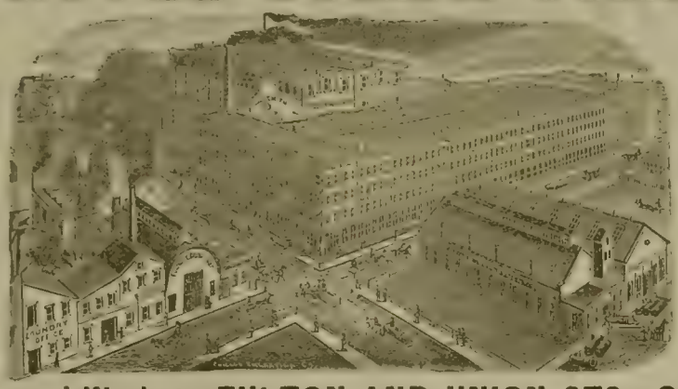
FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❖ BOILERS HORIZONTAL, VERTICAL AND SECTIONAL.

IMPROVED STEAM STAMPS



Hoisting Engines, Safety Cages, Safety Hooks,

ORE CARS, WATER & ORE BUCKETS,

Air Compressors, Rock Drills, Etc.

GENERAL MILL AND MINING SUPPLIES, ETC.

Sectional Machinery FOR MULE-BACK TRANSPORTATION.

Pumping Engines and Cornish Pumping Machinery,

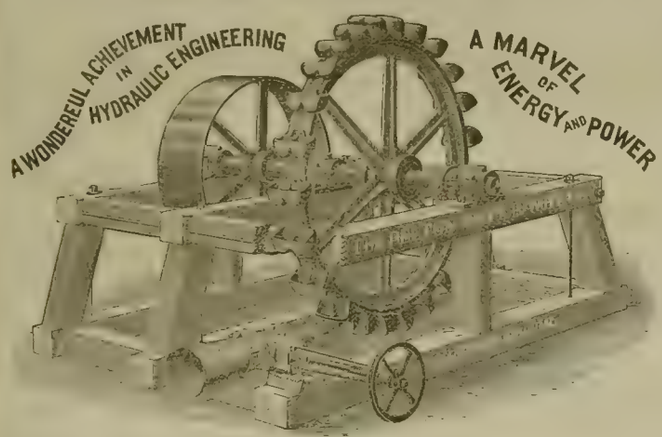
IMPROVED WATER JACKET

Blast Furnaces for Galena & Copper Ores,

SLAG CARS AND POTS,

Roots & Baker Pressure Blowers,

SUSPENDED TRAMWAYS.



General Offices and Works: FULTON AND UNION STS., CHICAGO, ILL.

BRANCH OFFICES: NEW YORK, Room 43, No. 2 Wall St. DENVER, COLO., 1316 Eighteenth St. SALT LAKE CITY, UTAH, 7 W. Second South St. LONDON, ENG., 23 Bucklersbury, E. C. CHIHUAHUA CITY, MEXICO, No. 11 Calle de Juarez. LIMA, PERU, South America. JOHANNESBURG, TRANSVAAL, South Africa.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.

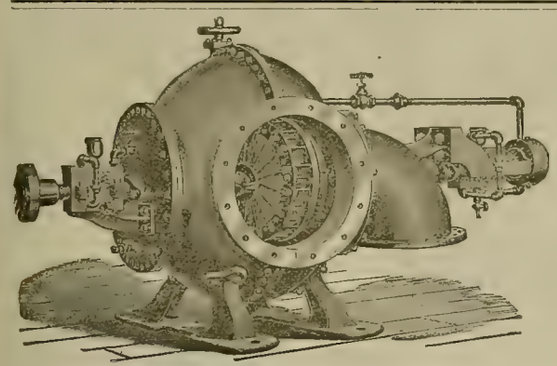
Adapted to heads running from 20 up to 2,000 feet.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS



Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,

Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

CALIFORNIA IRON YARD.

HENRY J. ROGERS & CO.

Successors to CHAS. CALLAHAN

IMPORTERS AND DEALERS IN

CAST and WROUGHT IRON SCRAP

SECOND-HAND BOILERS AND OLD MACHINERY

Of every description.

The Highest Price paid for all kinds of Metals.

OFFICE AND YARD: 128 and 130 Folsom St., S. F. Telephone No. 67.

FOR SALE

Hydraulic Mining Property in Southern Oregon. Good, Extensive. For particulars (Principals only) address,

"A. M.," Box 77, Grants Pass, Oregon.

THOMAS PRICE & SON,

Assay Office, Chemical Laboratory,

BULLION ROOMS and ORE FLOORS,

524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Metallurgy and Ores.

SELBY SMELTING and LEAD CO.,

416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

—MANUFACTURERS OF—

BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, Etc., Etc.

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges,

Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the **Morgan Crucible Co.**, London, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1869

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for the most suitable Process for Working Ores.

Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,

(Formerly Huhn & Luckhardt,

Mining Engineers and Metallurgists

J. KUSTEL. H. KUSTEL.

METALLURGICAL WORKS.

318 Pine St. (Basement.,

Corner of Leidesdorff Street, - - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my Process.

Assaying and Analysis of Ores, Minerals and Waters, Mines Examined and Reported on.

Practical Instruction given in Treating Ores by improved processes.

G. KUSTEL & CO.,

Mining Engineers and Metallurgists.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut or burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

21 & 223 First St., San Francisco, Cal.

JOHN W. QUICK, Proprietor.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St., S. F.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 19, 1889.

General trade the past week was good for the season of the year. Among machinists and foundrymen, fair orders are being executed. The general feeling is quite hopeful for the coming year.

The local money market is unusually close, much more so than at the close of 1888. It is claimed by some that it is purposely done for stock speculative purposes. Taxes and other payments both in this and the succeeding month are arranged for, so that with the remittances coming in, the artificial tightness ought to give way.

The foreign commerce of the United States for the first ten months of the year compares as follows:

	1888.	1889.
Exports merchandise	$529,624,851	$636,332,533
Exports specie	44,918,335	83,088,916
Total exports, 10 months	$574,543,186	$719,421,449
Imports merchandise	$610,947,684	$650,950,094
Imports specie	20,098,700	24,164 509
Total imports, 10 months	$631,046,388	$675,114,603
Balance of trade	$ 56,503,202	$ 44,306,846

This shows a balance of trade in favor of this country for the current year up to the 1st of November of over forty-four millions, against an adverse balance of over fifty-six millions for the same period of the previous year.

The steamer Gaelic hence for Hongkong on last Saturday took out the following treasure: Silver bullion for Calcutta, $139,000; for Hiogo, $101,000; total, $240,000. Mexican dollars for Hong Kong, $194,393; gold-dust, $16; and gold coin, $7434.

MEXICAN DOLLARS—The market has ruled more quiet and at easier prices. Closed at 77c bid and 77¼@77¾c asked.

SILVER—The market abroad has eased off, causing a weaker feeling and lower prices with us. English exchanges coming to hand warrant the assertion that President Harrison's adverse silver views have had considerable to do in depressing values. To this has been added the early adjournment of Congress and there not being a possibility of any action being taken on the silver question prior to next March or April. The balance of trade, as given above, is also against silver, for it shows that it is growing in favor of this country, which means low exchange and the importation of coin. Of necessity Europe will have to draw silver, but in the absence of any active, commercial demand for exchange purposes there will not be that keen buying competition which would otherwise obtain. We still adhere to the opinion that silver is good property, for its production in this country and in the world at large is not increasing; whereas the production of gold is increasing quite rapidly. Sales in our market have fallen from 96¼c last Thursday to a nominal quotation of 95¼c yesterday, with buyers indifferent. London cables came through to-day 1-16d higher.

QUICKSILVER—The market is without any particular change. The large deposits of snow assure a liberal supply of water in the mining districts which encourages the opinion of a large demand in 1890 for quicksilver. There was shipped in last month by the Southern Pacific railroad 151,730 lbs.

Receipts of quicksilver the past week aggregate 296 flasks.

BORAX—Receipts the past week aggregate 1235 ctls. In last month there was shipped Eastward by the Southern Pacific railroad 325,390 lbs. The market continues steady under a free inquiry from the East.

LIME—Receipts the past week aggregate 1727 bbls. The market is still dull and easy.

TIN—The market is heavy for spot, with $5 being the last quoted sale for plate. For prompt shipment it is impossible to execute orders below $5.50.

COPPER—Notwithstanding we are large producers of copper, yet 24 ingots came to hand the past week from New York. The market has been gradually settling abroad under free offerings and consumers asking for concessions. The situation is strong for the holding interest, provided prices are not unduly inflated so as to encourage larger production, as the visible supplies are being steadily reduced.

IRON—From Irondale 274 tons came to hand the past week. The higher market has stimulated the production on this coast. The market is dull and inactive, but holders are not willing to make concessions with foreign markets so active and strong.

COKE—Imports the past week aggregate 517 tons from Newcastle, England. The market appears to be well stocked, with no demand of any moment reported. To sell, concessions would have to be made.

COAL—Imports the past week aggregate as follows: From Seattle, 545 tons; Departure Bay, 2260; Nanaimo, 1113; Overland, 40; Coos Bay, 450; Irondale, 235; total, 4643 tons. The spot market is barely steady. Two cargoes of Australian on spot were closed out at $7, their buyers agreeing to have the vessels unloaded quickly and within a certain stipulated time, so as to save the vessels' outward charters. For cargoes near at hand the demand is light, but for prompt shipment there is some inquiry; but shippers' high views do not lead to much business. The high rates for outward charters from Australian ports are against buyers of coals. In coast coals the market is essentially unchanged.

LEAD—In lead there is nothing new to report.

THE secretary of the Caledonia mine of Dakota gives as a reason for the suspension of dividends the fact that the ore on the 400 foot level has fallen from an average of $4 to $3 per ton. Comstock companies cease paying dividends when the grade of ore falls below $25 per ton.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Dec. 19, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	44 1-16	95½	$13 90	$3 90	$21 35
Friday	44	95½	14 00	3 90	21 35
Saturday	44	95⅝	14 00	3 90	21 35.
Monday	44	95½	13 90	3 85	21 30
Tuesday	43⅞	95½	13 75	3 90	21 25
Wednesday	43⅞	95	13 75	3 87½	21 25

NEW YORK, Dec. 18.—California refined borax is quoted at 8⅝@9c. Quicksilver is barely steady. Copper less animated; prices regarded above the free consumptive. Buying too high for speculation. Lake Ingot, $14@$14.50; sold well ahead. Electro grades, $13@13.25; common casting, $12.75. London spot bars, £49 17s 6d; future, £49 10s. Pig lead, no movement of note. Free offering, $3.85 @3.90.

STANDARD HOISTING MACHINERY. — Mr. F. E. Rainier, General Manager of the Western Branch House of the Lidgerwood Manufacturing Company, N. Y., which is located at 34 and 36 West Monroe street, Chicago, Ill., reports a brisk demand throughout the West for the company's Standard hoisting machinery. Business with this pushing concern has been universally good for some time past, and there is every prospect of it continuing so.

Mining Share Market.

The mining share market has been quite active, but with prices on the down grade up to Tuesday, when a steadier tone set in, resulting in a slight recovery on yesterday (Wednesday). The decline in the Comstocks was most admirably engineered by at first destroying confidence by false reports, both printed and circulated from mouth to mouth. Patrons of this paper were prepared for the low prices, but while being advised of it they were also given correct information from the mines which did not warrant the low prices, but, on the contrary, a much higher range. It is to be feared that when outside buyers are induced to again come into the market so as to take the cheaply bought stock off insiders, they will, under keen buying, run prices up higher than the situation will warrant, which will, if done, entail heavy losses. In outside stocks the trading was light up to yesterday, when the Tuscaroras and Quijotoas showed more activity at better prices. In the Bodies, Mono broke to 5 cents, Bulwer to 10, but Bodie was unchanged.

The decline in the market the past week brought in large lines of margined stock, besides considerable paid-up stock thrown out by frightened outsiders. Not an opportunity has been missed or "a stone left unturned" to frighten holders into letting go of their stock. So bad did the market look that some brokers refused to carry stock on a margin.

Several large brokers in the San Francisco Board have recently refused to give proxies for election purposes. They very properly think that mine-managers should own a majority of the stock. This is the right view to take and outside holders will do well by confining their trading with the brokers who believe that the control of a mine should only be vested in those who own the majority of the stock. If this is done in the future there will be less need for the cry of "steals."

Present indications point to Crown Point's bullion production for this month aggregating over $60,000; Chollar's over $40,000, Savage's about $40,000, and Hale and Norcross' about $80,000. The financial standing of the above and other bullion-producing mines on the first Monday in next month will be the best for several months, but the standing of several of the other mines will be very bad.

A correspondent is informed that because Captain John Kelly is here about all the time it is no reason for supposing that the Bodie mines are located in this city, for the Captain may find the climate healthier here than is that with miners who may be disappointed over present results. In this connection it may not be amiss to remind the managers of the Comstock mines that salaried superintendents could put in their time to better advantage on the Comstock than either in looking after mines elsewhere or having a good time in this city.

The stock market opened this (Thursday) morning barely steady, with outsiders either realizing or else selling some of their holdings so as to prepare themselves against a reported break in the market. The outside stocks were steady.

Reliable private information from the mines is hard to get, but all that is obtainable confirms previous advices of the important character of the work going on in the North End and Gold Hill mines. Unless work is stopped, development ought to be made soon in one or two of the Gold Hill mines. A report is current in well-informed circles of a strike in Mexican, and an improvement in Ophir. Official letters received to-day from several of the Gold Hill mines are not of much importance outside of Crown Point's, in which mine, on the 300-foot level, they report still being in good ore, but the extent is not yet known. This same ore was reported in last week's official letter. The pumping out of the Gold Hill mines will be started at an early day in next month. At the annual election of Opbir and Andes the superintendents of the two mines spoke very encouragingly of the prospects of finding a body of good paying ore. A great deal of active and interesting work has been done in Andes. From the outside mines nothing is obtainable outside of official advices.

THE *Central Nevadan* says the Blanco Mining Co. at Galena, Nev., whose mill was burned last fall, has decided to build a new mill. A. G. Higbee left for New York Wednesday to consult with the directors regarding the matter.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS, 123 California St., San Francisco,

Assessment Notices.

Booth Gold Mining Company. Location of principal place of business, San Francisco, California.

Location of Works, Auburn, Placer Co., Cal.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 23d day of November, 1889, an Assessment, No 4, of Two(2) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room No. 28, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of January, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. R SPINNEY, Secretary,

Office, No. 310 Pine Street, Room No. 28, San Francisco, California.

DELINQUENT SALE NOTICE.

Books on Assaying.

BY C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes where he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr Aaron's former publications ("Testing and Working Silver Ores," "Teaching Gold and Silver Ores") that have been "successfully peculiar," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balances; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge, Mixing and Charging, Assay Litharge, Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucible; Scorification; Cupellation, Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal. Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Xanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers. No. 220 Market St., S. F.

AMERICAN MINING AND STOCK CODE

PRICE, $5. Forwarded postpaid on receipt of price by

DEWEY & CO.,

220 MARKET STREET, SAN FRANCISCO.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

ATTENTION, MILLWRIGHTS!

A BOOK YOU ALL WANT.

Leffel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.

A STANDARD WORK.

This practical work of 288 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Pains have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill-owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.

Price 50 cents, post-paid. For sale by DEWEY & CO. 220 Market St., San Francisco, Cal.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap, do us the favor to write again.

A Great Repository of Practical and Scientific Information.

One of the Fullest, Freshest and Most Valuable Hand-Books of the Age.

Indispensable to Every Practical Man.

PACIFIC IRON WORKS

1850. 1888.

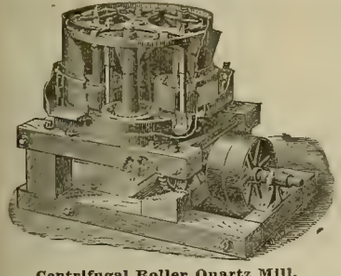
BUILDERS OF

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

SEND FOR CIRCULAR.

BUTTE, MONTANA,

The railroad, mining and commercial center of the new State, offers some of the best inducements for investments in

Real Estate, Mines & Mining Stock

of any locality in the Northwest. For particulars address The Evans-Terry-Claussen Brokerage Co., 41 E. Broadway, Butte, Montana.

FOR SALE.

One 10x13 inch Clayton Belt Air Compressor.
One 3-inch Sergeant Drill.
One 5-ft. Double Screw Drifting Column with Arms.
One 4-ft. Single Screw Stoping Bar.
One 3½x13 ft. Air Receiver.

The above are in first-class condition and will be cheap. For price apply to the PAYMASTER MINING CO., Yuma, Arizona Territory

Smelter For Sale or Exchange.

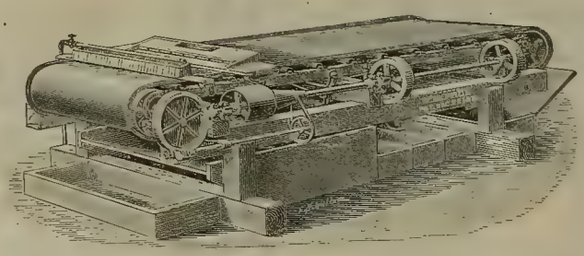
One 50-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.



611 & 613 Front St., San Francisco, Cal

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials [illegible] rmation apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for $150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make TWO, FOUR and EIGHT Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

☞ Come and see one at our works in operation, or send for circular.

Three Dollars per Annum.
Single Copies, 10 Cts.

Rope Haulage in Mines.

In Fig. 1 of the accompanying cuts is shown the arrangement in use in mines where wire rope haulage is adopted. The rope varies somewhat in length on account of changes of temperature and elongation due to working under tension, and this device of a counterweight running over a pulley, and attached to a car carrying the main pulley, permits such variations without detriment to the tractive force or to the rope. A similar device is used on cable railways.

In all applications of wire rope, except vertical hoists, it is necessary to support the rope at frequent intervals by rollers. A cheap and efficient roller (shown in Fig. 2) is constructed of gum wood of as large a diameter as is consistent with the location and from 12 to 24 inches in length. The axles are 1 inch or 1¼ inch round iron, running in simple cast-iron bearings. The much-discussed question of comparative detrimental effect upon wire rope of wooden and iron rollers is doubtless to be answered in favor of the former; but whatever the advantage may be, it is so slight that it is hardly worth consideration, since, in a properly constructed plane, the rope simply rests upon the rollers.

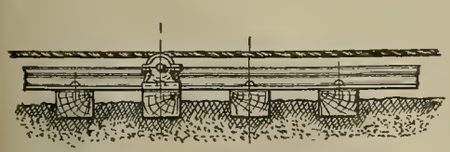

Fig. 2.—ROLLERS FOR MINE ROPES.

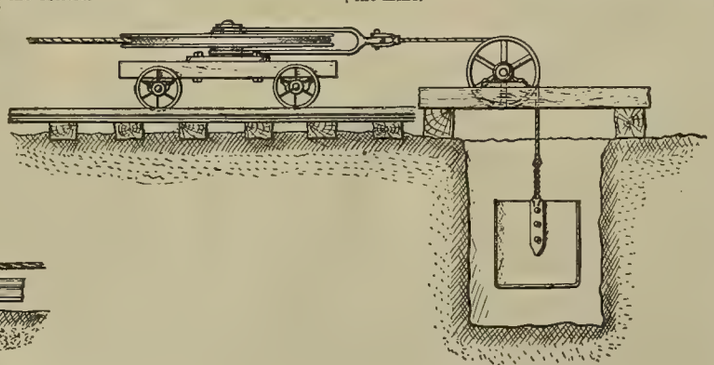

Fig. 1.—DEVICE FOR KEEPING ROPES TAUT IN MINES.

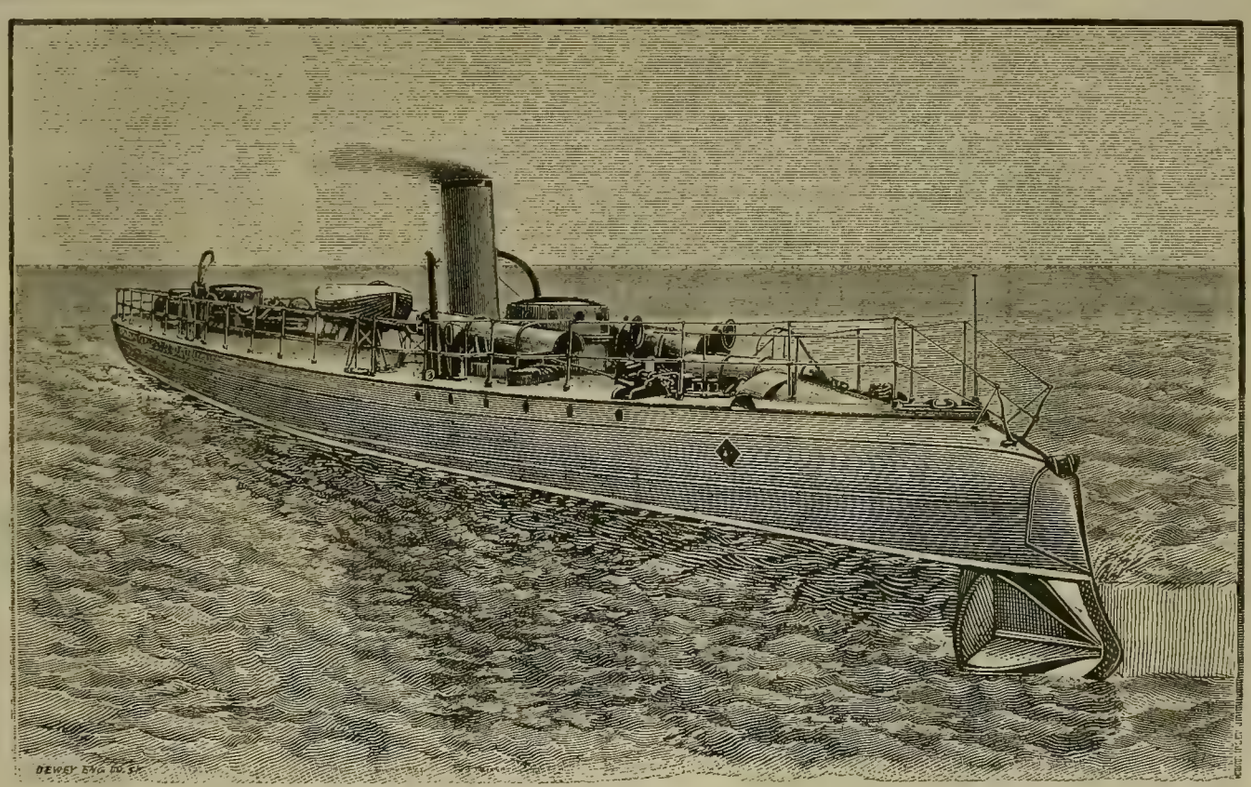

THE surplus in the treasury of Con. Cal. and Virginia Mining Company, after paying the December dividend and the November operating expenses, was given at $78,000. The bullion yield of the current month will probably exceed $280,000, which, added to the surplus, will leave a balance of $30,000 in the treasury, after paying December operating expenses and a January dividend.

AT the carbonate camps of San Pedro, N. M., the Copper Co.'s new 100-ton furnace is completed. The new cable tramway has been tested. It has 10,000 feet of wire rope and carries 100 ore and 20 water-buckets between the mine and smelter.

THE work of erecting another furnace at the Eureka Con. has been begun, and very soon both furnaces will be started up on ore from the mine.

The Centrifugal Auxiliary Propeller.

This patented auxiliary propeller has been invented by an English engineer resident on this coast. Its shape and construction is similar to that of a long-pointed fan, as shown in the engraving, with radial blades tapering to a point in front and increasing in diameter as it approaches the hull of the vessel to which it is attached. The cut shows the application of Stevenson's centrifugal auxiliary propeller to a torpedo boat, from which 50 knots per hour on an even keel is expected.

STEVENSON'S CENTRIFUGAL AUXILIARY PROPELLER APPLIED TO A TORPEDO BOAT.

It can be applied to existing ships by cutting away a portion of the stem of the vessel from the water-line down and backward as far as is necessary, according to the diameter of fan required; but in constructing vessels to use this apparatus, it would not be necessary to construct a fixed stem, as the fan would take the place of the stem as a rotary snow-plow takes the place of the old-fashioned one.

This movable stem or auxiliary propeller is not a screw, but simply a fan to clear away the water and the resistance it causes ahead of the hull of a ship moving at a high speed. It is only on high-speed vessels that it can be used to advantage (where the speed is over 15 knots per hour), such as torpedoes, torpedo boats, yachts and steamboats. In speeds above 18 knots per hour, the inventor is confident that this auxiliary fan will give more efficiency than can be accomplished by increasing the size and horse-power of engines and screw-propellers. Take the case of the steamships City of Paris or Teutonic: Each of those steamships, at a speed of 19 knots per hour, develops 18,000-horse power.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Notes of Travel in Nevada.

[From Our Own Correspondent.]

Reno.

As your correspondent visited Reno after an absence from the city of several years, he was surprised at the improved appearance of this important town. It has a clean-cut, thrifty look. The business property along the principal streets is kept in good shape, and does not straggle on from one block to another in rickety, ramshackle structures, but presents a solid, substantial frontage. The effects of a great conflagration some months previous were apparent, but it was astonishing to notice the vigor and enterprise that are being evinced in rebuilding everything in better style than before. The large Depot hotel and several other fine structures were consumed during the last fire. All but the Railroad hotel are rebuilt by this time. Except for a stringency in money matters with the railroad company, their hotel would also have been rebuilt at once. For two long blocks near the railroad track, on the south, there is a compact frontage, every store being occupied and thriving. A cross street, for two blocks south, is similarly lined. Then there are several large stores on the opposite side of the track, and business places to a considerable number are found on two other cross streets. Thus the heart of Reno is getting large, and it throbs with a vigor equaled by few towns or cities in the Sierra Nevada region.

In casting about to ascertain the causes for Reno's growth, and the basis for its future stability, we see, first, that it is in the center of one of the richest agricultural portions of the State. The "Truckee Meadows," which produce the finest alfalfa, and which nourish vast herds of cattle, lie adjacent to the city. This is a great stock and dairy country. Then Reno is something of a railroad center. The Virginia & Truckee railroad has its northern terminus here, running hence to Virginia City, through Carson, the capital of the State. The Nevada & California railroad, a narrow-gauge concern of growing importance, extends from Reno northward and penetrates as far as Lassen county, Cal. The Central Pacific, of course, gives Reno connection with the world to the east and west. Reno is 154 miles from Sacramento and 244 miles from San Francisco. It has two flouring-mills, planing-mills, three nurseries, a soap factory and other industries. It is said that a great woolen-mill, and a sash, door, blind and box factory are about to be established. It has two banks—one with $300,000 capital, the other with $200,000 capital. It has two fine newspapers, both daily.

Reno has a population of town and surroundings of 7000. It has always been an extensive shipping point for goods, machinery, etc., for all parts of Storey, Lyon, Ormsby and Douglas counties, and for Susanville and the Honey Lake valley. It has always been a progressive town. Its residents are active, energetic and prosperous. It has fine water-power, and will undoubtedly become a manufacturing center in the near future. Here is located the Nevada Insane Asylum, the building and grounds of which do credit to the town and State. The State University is also now located at Reno (having been removed from Elko), and is in a more flourishing condition than ever before. This institution has recently been made an Agricultural Experiment Station. Here is located Bishop Whitaker's excellent school for young ladies, and also a similar school, first-class, in charge of the Sisters of Charity. There are, besides, five public schools. The town is well supplied with churches and public buildings of all kinds adequate to present requirements. The city contains many first-class, fire-proof business houses, depots and railroad buildings, many attractive retail stores, excellent and commodious hotels, and handsome and comfortable private residences.

The wheat, potatoes and small fruits raised near Reno are equal to any in the country. The State Fair is always held at Reno, and a fine building for exhibition purposes has been erected. The city is the county seat of Washoe, probably the wealthiest county in the State. One of the local papers says:

"Reno is the City of Homes. There is not a house to rent. New buildings are occupied as fast as erected. Reno has advantages which no other town can equal. The climate is mild and genial in winter, and even and healthful in summer. There are no excessively heated or severely cold terms, and while the days may be warm in summer, the nights are deliciously cool. In winter, sleigh-riding is the exception and not the rule." Facilities for irrigating surpass any in the State, and there is no failure of crops. The Reno Water Co. furnishes ample pure, cold water for all purposes. The Electric Light Co.'s electric-light system, already well established, is being augmented. The Gas Co. supplies gas for all purposes. The streets of Reno are lighted by electricity.

Among the hotels, your correspondent cannot refrain from commending the excellent Riverside House, kept by mine host Chamberlain. A more comfortable hotel in which to sojourn cannot be found in Nevada. The surroundings of the house are pleasant, and the internal arrangements past criticism.

Virginia & Truckee Railroad.

This is one of the most wonderfully constructed roads in the world. It diverges southward from Reno toward Carson and Virginia City to the great Comstock lode, where more gold and silver have been produced than from any other deposits in the world. The road is 52 miles long, and winds among the mountains, so crooked that its curves put together are equivalent to 17 complete circles. The distance from Reno to Virginia City in an air line is only 16 miles, and by the wagon-road over the mountains 21 miles; but, as the difference in elevation is 1645 feet, the railroad is made longer to obtain a "grade." On this road, 11 miles from Reno, are the famous Steamboat Springs, which issue from the hillside at temperatures varying from 60 to 212 degrees, though 4500 feet above the sea. They are so named because they puff their steam in volumes. At Mound House diverges the Carson & Colorado railroad, with a three-feet gauge, which extends to Keeler, 293 miles, in a southerly direction and accommodates the traffic of Bodie with its gold mines; Columbus, with its borax deposits, Cerro Gordo, Owen's lake and vicinity. It is also the nearest station to the outlet of the famous Sutro Tunnel, 19,790 feet long, and built at a cost of $4,500,000. Thus by this line comes and goes the traffic of such thriving places as Carson, Lake Tahoe, Virginia City, Washoe, Steamboat Springs, Bodie and Columbus, as well as scores of smaller towns.

Carson City.

Carson City is the capital of the State of Nevada, the county seat of Ormsby county, and was founded as a town in 1858 by Major Ormsby, a man of sterling worth and energy, who was killed during the early Indian war. Carson City is beautifully laid out on the plains of Eagle valley, immediately east of the high-timbered hills forming the eastern base of the main range of the Sierra Nevada mountains. It has a population of 4000. The people are entertaining, generous and energetic. Carson contains some fine and costly buildings, both public and private. The pride of the city is the State Capitol. The building has a very substantial appearance, being constructed of stone from the quarries at the State Prison, located only a mile and a half from the city. The Capitol occupies the center of a square several acres in extent. The square is inclosed with a handsome iron fence. The grounds are laid out and well kept. They are well swarded and contain a variety of shade and ornamental trees, shrubbery and flowering plants. The U. S. Branch Mint building is a large and imposing structure. It is also of stone from the State Prison quarry. The building was completed in July, 1869. It has done and is still doing a great deal of work. The new postoffice building, located in the heart of the business portion of the town, is another magnificent structure just completed, and is undoubtedly one of the finest edifices in the State. The cost was $300,000. The State Orphans' Home is a large and well-arranged building with a small farm in connection therewith. In this institution a great number of orphan children from all sections of the State are well cared for.

The business part of Carson extends for several blocks along the main street upon which the Capitol fronts. Aside from the buildings above mentioned, the most conspicuous structures are the two hotels—the Ormsby House and the Arlington. Each is a good house. Your correspondent was hospitably entertained by D. Kaiser of the Ormsby, who is as pleasant a landlord as one will find in many a day's travel. The prevailing character of the business structures is that of buildings for use—not ornament. As is known by well-informed readers, the mining interests of the State of Nevada have not advanced to any great extent during late years. This is emphatically a mining State, and in consequence of the stationary condition of its most prominent industry, Carson, as the capital city, if not as the representative city, has failed to show any decided growth or improvement since the days of '75–'76, when the great mining boom pushed everything forward with a rush. Still, there is great solidity to Carson. A somewhat extensive agricultural and grazing country lies contiguous to it, and this, with the still continued work in mines in all directions, gives the business interests of the city a steady support. I presume there are few cities in the State in which the merchants are so uniformly satisfied with their regular trade. The railroad shops of the Virginia & Truckee railroad, which are located here, and which give employment to nearly 100 workmen, are an important business feature. The U. S. Branch Mint also employs a goodly force. One can greatly enjoy a stroll along the resident streets of Carson. There is a quiet, homelike appearance about the residences that is attractive. There is a profusion of shade trees, most of which show age and size, indicating that the first settlers planted as well as builded for the future. The tourist or traveler can pass the time pleasantly and profitably if he visits Carson. It is a city which has seen livelier days, but it is a city of solid foundations, and one which will expand in character and dimensions as the State of Nevada increases the diversity of its industries. This it is continually doing. Mining is yet paramount, but agriculture, grazing and the development of hitherto unknown resources will keep the State abreast of the other less populous States of the Union.

Virginia City

Is the county seat of Storey county, and is located on the eastern side of Mount Davidson at an elevation of 6000 feet above the level of the sea. It is indeed a mountain city, the streets running one above the other. Owing to the steep slope of the mountain, the site of the town was by no means favorable; but, at great cost for grading, many fine, level streets were constructed. The principal streets were then filled in to the depth of a yard with waste quartz and other hard, flinty rock from the mines. This work was so well done that to this day the streets are hard, smooth and dry. In 1875 Virginia City began to take on the appearance of a real "city" not only in the number and substantial character of the buildings and swarms of people it contained, but also in the number of conveniences it afforded, its many societies, churches, schools, theaters, clubs, Orders and organizations, usually considered the necessary adjuncts and requirements of civilized and intelligent communities. There were also several daily and weekly newspapers, telegraph, express and all other similar offices required by business and mining men, and by the people at large. Indeed, in 1875 the area of the city was as great as at present, and much more populous, as at that time it was estimated to contain 20,000 people. Hundreds and thousands of these, however, were mere birds of passage, being neither business men nor owners of property. The men who made millions were those who came after the mines had been pretty well prospected, as Mackay, Fair, Sharon, Jones and others. Out of the first "bonanzas," great fortunes were taken. The bonanza of the Ophir, into which the first discoverers of silver—O'Riley and McLaughlin—accidentally dug, yielded about $20,000,000 before it was exhausted; the Savage, $16,500,000; Hale & Norcross, $11,000,000; Chollar & Potosi, $16,000,000; Gould & Curry, $15,500,000; Yellow Jacket, $16,500,000; Crown Point, $22,000,000; Belcher, $26,000,000; Overman, $3,250,000; Imperial, $2,750,000; with Sierra Nevada, Justice, Kentuck and many other mines running from thousands to millions. In all, the yield of the famous Comstock lode has amounted to over *Four Hundred Millions* up to the present time. The total yield of the great ore deposit known as the Consolidated California & Virginia, from the time of its discovery to the end of December, 1888 (under both incorporations), was $119,977,618.34; and the total amount of dividends to the same date was $76,690,800.

Virginia City has now a population of about 9000—an active, industrious, wide-awake people. The mill and mines support a large body of men, $300,000 being paid out for labor and expense every month. There has been much said during recent years about the collapse of the bonanza mines at Virginia City, and the uninformed might presume that little work was being done in the depths of the great properties which have produced the millions above enumerated. There certainly was a great diminution of work in the deep mines when the conjoined mine-owners decided to cease operations in the lower levels. The oppressive heat, and the work of pumping water up to the level of the Sutro tunnel, made mining in these depths so expensive that the ore had to be phenomenally rich to cover the cost of its extraction. During the past summer and fall (1889), this decrease in the extent of work on the Comstock has been made more noticeable on account of a scarcity of water in the Carson river, along whose banks were located many of the mills which should reduce the ores that are hauled to them from Virginia City. These mills are nearly all run by water-power, and there being no water in the stream, the mills have had to close down. Cessation of that work caused a cessation of the work of extracting ore. Notwithstanding all this, the visitor to Virginia City would be surprised to notice the hundreds of miners who still find employment at mill or shaft. In the evening, the principal business street of the city is made busy and is fairly thronged with these sturdy workmen, who are then "off shift," and during the day they are seen going in all directions with lunch-pail in hand, ready to take their turn in the great work which is constantly going on. Virginia City is still a mining camp with few equals in the country. Probably Butte City and Leadville are the only rivals it has. With the rains of fall and winter, water will again flow in Carson river, and an increased force of men will at once be put to work.

There is a rather metropolitan look to many of the mercantile establishments of Virginia City. Some of the stores carry immense stocks of goods, and the leading lines are tastefully displayed in show-windows. Most of the trading in the city is done upon C street, which extends from one end of the city to the other. In fact, the street is continued a good part of the distance to Gold Hill, or reaches fully a mile in length. Upon the side of Mount Davidson, above and below C street, are the homes of miners and business men. All of the mines are lower down the mountain. It is one of the really picturesque cities in the country, and taken in connection with the vast field for observation in the line of mining by the most approved methods and appliances of the age, it presents attractions to visitors unequaled by any other locality on the Pacific Coast. Your correspondent enjoyed his visit here, and can speak words of hearty praise for the liberal and whole-souled people who reside in this great mining city.

Gold Hill, Silver City, Dayton.

The former of these towns is really a suburb of Virginia City. The confines of each touch upon the "Divide," which separates the two places. Being only 1½ miles apart, from center to center, the workmen at one town may and do reside in the other. The alliance is made closer by a few large mine-owners being interested in properties in both places. The Yellow Jacket and the Overman are the two leading mines in Gold Hill, while the Belcher is not far distant; also the Kentuck.

Gold Hill has the same characteristics as Virginia City, only in smaller degree. The manner in which some of its homes are perched upon the sides of the cañon lead one to think that the eyrie of the eagle has almost a parallel in the abode of man. The stores of the place are all grouped together near the largest mines. There is a splendid school and school building at Gold Hill, but it is hardly necessary to say that the playground of the pupils is neither sufficiently extensive nor level to make an ideal baseball field for the lively youths who congregate at the school. Gold Hill is the nominal home of Senator John P. Jones, and his residence and yard are quite attractive. He has, of course, large mine interests here, and with his family spends a few months in town every year or so.

Silver City lies three miles down the cañon, below Gold Hill. In the Bonanza days there were three or four extensive mills here, which were engaged in crushing rock from the big mines. But all of these mills have been burned down, or the machinery has been removed and the buildings have been demolished. It seems almost sad to notice the decline in activity around Silver City in contrast with the appearance of the place as your correspondent remembers it in 1876. There are a few active mines in the hills back from Silver City, but in the town itself there is little to suggest the lively mining camp of former years. I understand there is considerable mining in a small way all about the town, but there are few ambitious efforts in this line. There is still a very good hotel at Silver City, a general merchandise store, livery stable, church, school, and many very comfortable homes.

Dayton being the county seat of Lyon county, it has held its own as to business importance, notwithstanding the gradual decline of some of the mining interests in the vicinity—especially between this place and Silver City. There are two or three important enterprises at Dayton. Being on the Carson river, it has an extensive quartz-mill, ore for which is brought by the narrow-gauge Carson & Colorado railroad from its connecting point with the V. & T. at the Mound House. Dayton is on the line of the C. & C. railroad.

H. G. P.

A Californian in Italy.

EDITORS PRESS:—In my last letter I described our experiences and observations in the Alps. We left Interlaken at 8.35 A. M. and arrived at Lucerne at 2:30 P. M. We took cars for a few miles, then boat for about ten miles; then cars again up a nice little fertile valley for 8 or 10 miles, when we divided our train into two sections and went up a very steep grade over the divide of high mountains by the cog-wheel system, or rack and pinion.

The center track is raised up about one foot and has rack-teeth, while there is a pinion or cog-wheel on the axle of the engine. The raised track and cog-wheel is so nicely adjusted that the engine gets full benefit of traction without sliding. It was a beautiful sight to look down upon the valley. The center track being raised, it left the cog-wheel free to work where there was no track and no grade. The cogs had to be used to get down the mountain into the valley on the other side.

Lucerne.

Lucerne is a beautiful place, fine lake, high hills, old buildings, old wooden bridges built in 1600 to 1789. A large lion chiseled out of a solid ledge of rock, shady walks, good hotels, and stores full of all kinds of native carving. We made arrangements to go on top of Riggi, a high mountain, where there is a magnificent view of six or seven lakes and the Alps for miles. The ascent is made by railroad. It began to rain before breakfast and looked cloudy and gloomy, and we gave it up and put out for Milan.

The wild mountain scenery through which we passed on this trip seems to me must surpass anything men ever attempted to traverse with rails before. We became entirely bewildered, not knowing which way we were going, seeing tracks passing up and down the mountain, supposing them to be another road, and away down at the bottom was a tunnel under the mountain, which we had just come out of. Here is the great Saint Gothard tunnel, which took 18 minutes to pass and is nine miles long. I saw a map of the road and it looked like throwing down a whip-lash on a table. I will not state how many times it crosses its own track, but will try and get a map of the road, so that I may have the correct account of it. I believe men have to be born for such an enterprise, not educated. It seems as though they delighted to make tunnels through the solid rock, there were so many of them. I believe the road is owned jointly by Switzerland and Italy.

Soon after leaving Lucerne the wooden houses turned into stone. We passed a good many small old villages. In the valley there would be a small village and church; one-half mile up the steep mountain another village and another church. The fir tree would grow wherever it could get a foothold, and would be seen clinging to a rock with just enough earth apparently to cover the roots.

Lake Como.

At Chiasso, on the border, all the baggage had to be taken from the cars into the depot or "station," as they are called here, and be examined. We passed the celebrated Lake Como, but did not have a very good view of it. We passed a good many old forts and ruined castles.

After getting fairly out of the hills, we were in a fine level country, which reminded me of the Sacramento valley, except that it was more thickly populated and there were more trees. Mulberry trees are growing on nearly every acre of land in this valley, where I expected to see the olive and orange, but did not see a solitary tree. A great deal of corn is growing in this valley. The climate is rather warm. August is not the busy season, as tourists come here to spend the winter, the season beginning about the first of September.

Milan.

Milan is a very old city, has the old Italian walls left yet, with its several gates. The Cathedral is a great piece of work, far surpassing anything seen yet, and stands third of its kind in the world. I cannot attempt its description; it would take too much time. The Arcade is another famous modern building in the form of a Greek cross, with glass-covered roof over a hundred feet from the ground. Splendid stores and cafes are underneath. It is put down at 300,000 inhabitants, but the streets do not indicate it. It has a very fine opera-house and other buildings that we have no time to visit.

Venice.

There are but a very few persons who can read and see but who know something about wonderful Venice—a city in the sea, whose vehicles of communication are gondolas, and whose highways are canals of water. It is hard to realize that all the buildings are built in the water and have stairs where persons and freight are landed from the boats the same as from your wagon. Persons who lived in Sacramento during the flood of 1862-3 know something of the situation of Venice. I shall not attempt a description. I will mention some things I see and confirm what others have said.

The railroad has a communication with Venice by a stone and iron bridge two miles long and containing 220 stone piers. We had to take a gondola to get to our hotel. It was a great novelty to us to see as many gondolas around the station for a job as there are hacks around stations and ferries at San Francisco. How can I write or describe anything when there are hundreds of gondolas coming and going, with their queer shapes and way of propelling, and a band of musicians with Chinese lanterns at the stairs of our hotel putting forth their best music for what small change they can collect. The houses or buildings do not look very inviting from the outside. The marble is smoky, or turns black, but they are clean and white inside.

The mazes of little narrow streets are wonderful. They do not deserve the name of street, for plenty of them are not over six or eight feet wide, and the tops of the houses nearly touch, and I cannot see over 50 yards ahead of me. Every little distance there will be an arch or bridge across the canal. These arches are always made high enough in the center to admit a boat going under them.

I do not think the city is in a thrifty condition from all the signs that I can see. Tourists come here for the novelty and romance of the present and former times, the novelty of riding in the gondolas and listening to the romantic charm of the music of the gondolier with his guitar. I cannot see what other attractions this city offers. The stench of some of the streets and stores is unbearable. The ceilings are very low, and most everybody sleeps in the second or third story. At every place where there are a pair of stairs, there will be plenty of boats for service.

FLORIDA'S NEW PALM—Pseudophœnix Sargenti.

Thursday morning we procured a splendid, patient, intelligent young, good-looking guide, who showed us more in one day than we could have found by ourselves in two or three, and then could not have fully understood the sights.

We first went through St. Mark's church, which was a bewildering sight of mosaic work, sculpture, columns, crucifixes, paintings, tall Roman candles, priests and beggars. I have seen several waiting around the confession-box to take their turn to relieve their troubled consciences.

The Doges' palace is a place of great interest, especially to the artist and historian, and unless a person is well versed in the two accomplishments, it will be impossible to fully appreciate the sights at this building. It was one of the ancient Capitols of Venice, and especially when the Doges were the presidents of the Republic. We were shown the room in which the presidents were elected, and stood leaning against the rail on the balcony where it was proclaimed to the people, as they had no newspapers in those days. We saw scores of masterpieces by the old masters, grand beyond conception to the untrained eye, and our guide went into the details with the nicety of a vender. It would seem from what they have left of their former lives, all the ancients did was to build stone walls, sculpture and paint.

We can plainly see that the political matters of Italy for the last few hundred years have been in a very unsettled state. There is a little hole in the wall called the "Lion's Mouth." Formerly it had a lion's head on it, but it has been knocked off. This hole leads into an iron box with two or three keys. Spies were employed to see if any one was talking about the Government. If so, a slip of paper with name was put into the lion's mouth, and found its way into the box. Each of the head authorities had a key to the box, which could not be opened until all were present; then no favoritism could be shown. If significant, the party was arrested and thrust into prison.

The Doges' palace is on one side of a narrow canal and the prison on the other, and connected with a narrow, arched, closed bridge, called the "Bridge of Sighs," which has become so well known by Byron's poem of the same name, which was written in one of these dungeons.

With torch in hand the guide bade us follow him down the cold, granite narrow stairs into a dark dungeon with a low door, where many a poor fellow passed his moments between hope and fear, and where Byron took the odd streak to write the poem. I looked around to see what gave him the inspiration. I could not repeat two lines where the terminal word would harmonize with anything, whether sacred, profane, ancient, modern or original. When the prisoner was tried, he passed up these same narrow, damp stairs over the bridge, to the court-room. There are a few narrow openings in the center of the bridge, and as the condemned was being hurried on by the guard he looked wistfully through these openings and cast a sigh for his fate. We went into another dungeon where men were sent for 20 years, and never saw daylight again. A small hole was cut through the wall to put in food and water, and a little niche was cut on the opposite side to put in a lamp during the daytime. Many of these atrocious things could be related, but is it not better to let some rest with the past?

Water is expensive, and not of the best, as it is brought from the mainland. Women pack water in copper kettles of about two gallons each on hooks at the end of a pole, like a Chinaman. Men pack buckets of water round the street for drinking, with a little wooden stand for glasses and with bottles mixed with decoctions to put in the glass. One favorite ingredient is anise. They claim it neutralizes the effect of the water. They call with loud voice: *aqua, aqua.*

We took steamer and went over to an island that faces out into the Adriatic sea where there is a bathing-place. The water was very shallow and muddy, and the day being hot and feeling unwell, I did not test its buoyant qualities. I have tested the Adriatic water enough to certify that it has very strong saline qualities in it.

The Rialto bridge, the highest and longest in the city, is of arched stone and has 24 stores, 12 each side from center. Wood is sold to the poorer class by tying half-a-dozen pieces like hop-poles with strong grass for a few pennies.

Moonlight Ride in Venice.

It is 10 P. M., and we have just returned from a gondola ride by full moon and Jupiter's full orb glistening at us. This ride has been our dream for years. We started at 8 o'clock in one of the largest gondolas and the same one we had our pictures taken in this morning.

We went on the main canal under the Rialto bridge and down as far as the station and railroad bridge. Men and boys were in and going in swimming everywhere. We could see something sticking out of the water looking like a pumpkin floating. The little fellows seemed to have more pleasure than any of them. There would be a gathering of 15 or 20 mothers and older people at the edge of the water on the steps, while in the water it would look like a school of frogs playing and sporting. We sang and talked and rowed and thought of all kinds of romantic and sentimental things before we could fully realize that we were on the canals of Venice, being propelled by a gondolier in the light of the moon. Some few stores were lit up, but most of them were gloomy. It was a beautiful and bewitching ride, and all were sorry when our time was up. D. FLINT.

Florida's New Palm.

[Written for the PRESS by E. N. REASONER.]

Your engraving shows Florida's newly-discovered palm, *Pseudophœnix Sargenti*, which was discovered in the summer of '86, on Elliott's Key, by Prof. A. H. Curtiss and Prof. C. S. Sargent, and named (as it was sufficiently distinct to constitute both a new species and a new genus) in honor of the latter, by Prof. Wendland of Germany. It is known nowhere else in the world, and in but two small groves on the Keys—containing in all not over two hundred specimens. It is a half-dwarf species, never exceeding 20 feet in hight. The palm is pinnate-leaved, and somewhat resembles some species of *Phœnix*. The leaf-stalks drop off as soon as the leaves die, leaving a free, clean-looking trunk, the upper part marked with alternate rings of green and brown. It is perhaps the rarest palm in cultivation, and destined to be so for years, as the trees rarely perfect seeds.

This palm is eminently suitable for house or outdoor decoration, where the temperature does not range below 45°. It will stand occasionally a low temperature, and not be harmed, where the soil is moderately dry. Young plants transplanted from the natural habitat require careful cultivation for several years, until a perfect crown of leaves is formed. Plants thus treated are the only specimens now available. The seeds are carefully gathered, and in a few seasons there may be young plants suitable for transplanting,

Royal Palm Nurseries, Manatee, Fla.

Mine Drainage.

The Pumping Association at the Comstock.

The original agreement between the Gold Hill and South-end Comstock mining companies for draining the flooded levels of those mines has been signed by all of the companies included in the agreement.

The agreement has been ratified by the companies and signed by the presidents and secretaries of each in the following order: Belcher, Crown Point, Kentuck, Seg. Belcher and Mides Con., Overman, Caledonia, Alpha Con. Mill and Mining Co., Exchequer, Con. Imperial, Confidence, Challenge, Justice and Yellow Jacket.

R. F. Morrow, Hon. W. E. Sharon and S. L. Jones compose the executive board, in whom is vested the authority "to take all steps, ways and means which said board, or a majority thereof, shall deem necessary, convenient or expedient, to free from water the said mines. * *

"That said board, or a majority thereof, may from time to time determine what sum of money will be needed for the purpose of drainage."

Of the sum required, the Crown Point, Belcher and Yellow Jacket agree to pay 17½ per cent each; the Kentuck, 7½ per cent; the Seg. Belcher and Mides Con., Overman, Alpha Con., and Exchequer, 5 per cent each; the Caledonia and Justice, 3 per cent each; the Confidence and Challenge, 4 per cent each; and the Con. Imperial, 6 per cent.

The parties to the agreement shall be known as the Pumping Association, and all contracts made and debts incurred by the Executive Board shall be in that name.

Any of the mining companies, parties to the agreement, desiring to withdraw therefrom, must give six months' written notice, at the expiration of which they will not be bound by any contract made by the Executive Board.

The signing of the above agreement signifies an era of renewed prosperity for the Comstock lode, as the opening of the flooded levels of the above-named mines will necessitate the employment of a large force of miners. It is a well-known fact that large ore resources are located on the 1700 and 1800 levels of the Crown Point and Belcher—where the vein has a breadth of above 200 feet—the extraction of ore from which was suspended on account of the flooding of those mines below the 1500 level. In several of the mines included in the "Pumping Association" there are large areas of unexplored ground, from the 1400 down to the 2500 level, where favorable indications of the presence of ore were passed by in the haste to attain greater depths prior to the abandonment of deep mining.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE, LD.—*Ledger*, Dec. 21: The rains have seriously interfered with the plans of the companys by making the roads impassable for heavy teams, thereby preventing the delivery of the machinery to complete the mill. The Gates crusher is now at Ione, and as the total weight is 26,000 pounds, and the heaviest single piece is estimated to weigh 12,000 pounds, it is likely to remain there for some time. No teamster would care to undertake its delivery while the roads are so bad. The rainy weather has interfered with the outside work, but about 65 men are employed in the development work, principally on the 550 and 650 levels. The west vein is being opened by drifts north and south on the hanging-wall, and by an upraise and winze to connect with crosscuts on the 550 and 650 levels. The vein continues as good as where first struck. In a few days the winze sunk from the 250 level will connect with the north drift from the south shaft at the 550 level, thereby ventilating the lower workings. This winze is sunk on the middle vein, close to where the rich ore was found a year or so ago, on the 250 level. When connection is made the vein will be prospected at the 550 level for the rich ore.

SUTTER CREEK.—The rainfall to Dec. 19th is 25.83 inches, and no sign of abatement. The tunnel at the Lincoln, which is full of water, is to be drained by digging an open cut which will tap the end of the tunnel. Mr. Stewart is satisfied this can be done, and has put a force of men at work on it. It will require a cut 100 yards long. The mill of the Sutter Creek mine, after an idleness of a few weeks, to enable the men to get through some barren ground, is expected to start up Monday, and a long and prosperous run is anticipated. At the North Star, the nature of the ground has changed considerably of late, getting much softer and of a slaty nature.

KENNEDY. — Twenty stamps of the Kennedy mill were started this week. The other 20 stamps will not be started until sinking the shaft is finished, which will take three or four months yet. The ore in the lower level is of fine grade, but the ledge is small—from two to four feet wide.

Calaveras.

A RICH STRIKE.—*Mountain Echo*, Dec. 19: H. S. Messer & Son of Altaville made a rich strike the other day in the old Davis mine near Bald Hill. We were shown some of the specimens taken out of the mine that are immensely rich, being about one-third gold. They have taken out several hundred dollars during the past few days, and have frequently got as high as $50 to the pan. The Davis mine is famous for pockets.

THE Gold Cliff mine and mill are kept in operation day and night. A cleanup was made recently, and we understand that the yield was entirely satisfactory.

El Dorado.

QUARTZ.—Placerville *Observer*, Dec. 19: Dr. W. W. Stone has made a quartz discovery on his lead near Steele's ranch that promises to be of importance. The ledge so far as developed is two feet wide and prospects for high-grade ore. The Dr. is prospecting to ascertain the length of the ore chute, which he thinks is 500 feet. Mining news is very encouraging in the vicinity of Greenwood. Reports are coming in every day of mines being opened, and large forces being put on those that are now running.

KELSEY.—Georgetown *Gazette*, Dec. 18: Owing to the recent heavy rain, work had to be suspended on the Big Sandy mine, but will be resumed with full force as soon as the weather permits. This mine, under the management of Beatty & Norton of Toledo, O., has proved itself to be an excellent investment to the owners, besides being a great benefit to this neighborhood, in the way of giving steady employment to many. Nat Dryden was the lucky finder of a $60 nugget a few days ago. It was a fine specimen of quartz gold, and was found on the Old Judge, a well-defined quartz ledge, owned by J. C. Murphy. H. D. Tefft is reported to have struck a $20-to-the-pan diggings on his seam claim, where recently he found a pocket of several hundred.

SEAM DIGGINGS.—Placerville *Observer*, Dec. 21: H. D. Tefft is reported to have struck a twenty-dollar-to-the-pan diggings on his seam claim, near Kelsey, where recently he found a pocket of several hundred.

PACIFIC.—Prof. Thos. Price is with us again looking after Pacific mine affairs, and report has it that a force of men will soon again be put to work.

Inyo.

NEW PROSPECTS.—*Independent*, Dec. 20: Several good prospects of recent discovery are reported from Big Pine. Well up in the Sierras ledges have been opened and the ore yields $70 to $80 per ton in gold. Over in Deep Spring district some good ledges are also opened. Recently George Turney took out enough ore in three weeks to leave him a profit of $700. Such is the report given by a citizen of Big Pine.

DARWIN.—Mr. C. Anthony started up the mill at Darwin on the 18th of November. Recently a few days' loss of time was caused by rains that prevented fuel from being hauled. That difficulty was overcome and the mill started up again. The run is now nearly completed.

AT CERRO GORDO Mr. Farrington is timbering the Union shaft. A drift is also being run from the old Omega tunnel to connect with the old Union workings. Till both of these jobs are completed it is not likely that much actual mining will be done.

Plumas.

INDIAN VALLEY MINE.—Cor. Plumas *National*, Dec. 21: This valuable mine is now under the management of its owner, S. R. Prentiss, with John Taylor as foreman. Mr. Prentiss has been under a heavy expense this summer getting ready to crush, and is now running in full blast with 26 men employed. The Union tunnel is now in 3400 feet and is still driving ahead. Good rock is being taken out of the main shaft in the 300-foot level and the shaft is to be sunk 100 feet deeper. The mining men are rejoicing over the prospects of a good water season the coming summer, and without a doubt this will be the liveliest section of Plumas county. There are many valuable mines around here which only need energy and push to accomplish large results, and with the outlook now we expect to soon see a boom in this section.

Nevada.

FINE ORE IN THE OMAHA.—Grass Valley *Union*, Dec. 21: The Omaha mine is coming to the front as a valuable property owing to the recent developments on the ninth and tenth levels, where fine bodies of ore have been uncovered, which have the appearance of being very extensive, as the lode has been making constant improvement of late. The managers do not say how good the ore is and are disposed to be conservative as to statements, but at the same time say the appearance of the mine is much better now than at any previous time in its history.

Trinity.

EAST FORK.—Cor. Trinity *Journal*, Dec. 21: We differ from the placer miners in one respect—we don't need more water than enough to give us water-power for our mills, and the past month we have had more than enough. The Enterprise has had to shorten their working force on account of superabundance of water; there was too much of it in the mine. The Enterprise mill is running on good rock, and soon there will be a good cleanup from that reliable old mine. The company has two good ledges—the Enterprise and the Lone Jack—and they deserve the success they have met with for the pluck they showed in taking hold of and developing the property. They have one of the best pieces of property in the northern part of the State. The mill on the Yellowstone mine has been completed and probably will be running by the time this letter reaches you. The company undoubtedly has a good mine and will send out considerable bullion this winter. There was some trouble a few weeks ago with the hands, but everything is running smoothly now. Mr. Paxton, the efficient manager, is one of the best quartz miners in the State. This mine is bound to make a good showing, and I think W. T. Coleman will be sorry that he parted with it. The North Star mill is nearing completion and will make, when finished, the fifth mill on East Fork. The company has a large ledge of low-grade ore, and are now running a tunnel to tap it at considerable depth. When the vein is cut they will have enough quartz in sight to last them a long time. When the stamps begin to drop on their ore, a good paying property will be developed, and much will be added to the permanency of the camp. They have a splendid showing for a valuable mine. It is a great pity that the Golden Chest mine is tied up in litigation, as it is one of the best showings in camp for a fine paying investment. The ledge stands straight up and the rock speaks for itself. It has not been managed to the best advantage in the past, but whenever it is worked on a business basis, it will prove a dividend-yielding property. Frank Peterson has shut down his mill for awhile, but will probably start it as soon as the necessary development work has been done. There are a number of other good mines in camp, some of which are being worked by arastras that would pay handsomely if they could be worked with the necessary capital. The prospects of the camp for the winter are most flattering, and before spring I expect to see East Fork sending forth a stream of bullion for the benefit of the camp and the county, too.

Tuolumne.

A SPECIMEN.—Stockton *Independent*, Dec. 20: W. E. Garrett of Ripon, who owns a nice pocket mine on Bald Mountain, one mile north of Sonora, which in the last 10 or 12 years has yielded half a million of dollars, yesterday deposited in the San Joaquin Valley Bank the most valuable gold specimen ever shown in this city. The chunk is about the size of a man's hand, and is worth for the gold in it about $800, but as a specimen it has far greater value. It is composed of rough-shaped gold clinging to crystallized quartz and is beautiful in shape and color. The mine was first opened in 1857 and in early days was known as the Turner mine. In late years it has been leased on shares, Mr. Garrett making large sums out of it without cost to himself.

CLOSED DOWN.—*Union-Democrat*, Dec. 21: The Golden Gate mine closed Saturday evening last, and all hands laid off. The ore of this mine assays high, and it is evidently a good property. The frequent ceasing of operations on the mine of late are wholly attributed to the bad working of the machinery.

NEVADA.

Washoe District.

SIERRA NEVADA.—Virginia *Chronicle*, Dec. 21: On the 520 level at a point in the south drift from the east drift, 275 feet from the main east drift, an east drift is advanced 256 feet, the face continuing in porphyry and showing streaks of quartz.

UNION CON.—On the 1465 level, in the north lateral drift 100 feet south of the north line of the mine, west crosscut No. 4 is advanced 22 feet and is in hard porphyry.

MEXICAN.—On the 1465 level from the north drift from west crosscut No. 1, 50 feet in from the lateral drift face, west crosscut No. 2 is advanced 29 feet.

OPHIR.—On the 1300 level from the end of the east crosscut from the shaft station a south drift is advanced 152 feet from the end of the east crosscut, 316 feet from the shaft station, continuing in porphyry and quartz.

HENDRICKS.—Repairs to the shaft timbering still in progress.

SAVAGE.—Shipped 466 tons of ore, battery sample assays showing an average value of $20.90 per ton. Have bullion on hand valued at $15,586.

CON. CALIFORNIA & VIRGINIA.—From the stopes on the 1300, 1435, 1500, 1600 and 1650 levels continue to extract ore sufficient to supply the Morgan and Eureka mills. On the 1650 level, from points heretofore designated, continue to extract ore. The north drift from the winze bottom, 60 feet below this level, is extended 451 feet, continuing in low-grade quartz. From upraise No. 7 above the west drift from the C. & C. shaft, about the center of the California ground, a north drift is advanced 55 feet in ore and porphyry. During the week 1113 tons 1540 pounds of ore were shipped to the Morgan mill, 1827 tons and 710 pounds to the Eureka mill. The average assay value of all the ore worked at these mills during the week, according to battery samples, was $26.73. Bullion valued at about $28,000 now on hand in the assay office. Shipped to the Carson mint during the week bullion valued at $52,524.16 by assay.

BEST & BELCHER.—On the 625 level from the top of the upraise east crosscut No. 1 is advanced 40 feet. Formation, soft porphyry with streaks of quartz. On the 1000 level east crosscut No. 1 is extended 55 feet. Formation hard porphyry.

GOULD & CURRY. — On the 200 level the southwest drift is extended 230 feet. Formation soft porphyry with streaks of quartz showing some value. On the 400 level west crosscut No. 2 is extended 97 feet. Formation quartz showing some value.

HALE & NORCROSS. — Shipped to the Nevada mill during the week 1102 tons of ore showing an average value of $22 per ton, by pulp assays. Bullion on hand valued at $36,638.30.

CHOLLAR. — Crushed 340 tons of ore during the week showing a pulp assay value of $21 per ton. The usual progress is made in 930, 850 and 750 level explorations with no important change in formation.

POTOSI.—The 800 and 750 level drifts are in vein matter.

NORTH GOULD & CURRY AND EAST BEST & BELCHER.—The west drift from the northwest drift is out 200 feet and has entered quartz.

IMPERIAL.—West crosscut No. 1 from the 500 level joint Confidence-Challenge drift is in low-grade quartz. The joint east crosscut continues in quartz and porphyry. West crosscut No. 2 on the 300 level is in quartz and porphyry. The north raise is in low-grade quartz.

YELLOW JACKET. — Daily ore shipments average 76 tons, battery samples showing an average assay value of $20.50 per ton.

CONFIDENCE & CHALLENGE.—The joint 300 level east crosscut is in quartz and porphyry.

ALPHA.—The west drift from the 600 level station is in porphyry. The north drift is in low-grade quartz.

EXCHEQUER. — The 382 level east crosscut is in clay and porphyry and the 500 level north line west crosscut is in porphyry.

WARD COMBINATION SHAFT. — The 1800 level west drift is advanced 100 feet.

OVERMAN.—Shipped 205 tons of ore to the Vivian mill during the week.

NEW YORK CON.—The 700 level drifts from the top of the raise above the 1300 level are still showing quartz.

EAST SIERRA NEVADA.—The 520 level south drift is out 580 feet.

CALEDONIA.—Have begun crosscutting from the southeast drift.

CROWN POINT.—Shipped to the Mexican mill 847 tons of ore showing a value of $17 67 per ton by pulp assays. Shipped to the Carson mint December 19th bullion valued at $8482.82.

BELCHER.—No. 2 east crosscut on the 1200 level has reached the hanging-wall. An east crosscut from the end of the south drift has entered quartz assaying from $6 to $15 per ton.

SEG. BELCHER.—The winze sunk below the 1200 level east crosscut has connected with the top of the raise above the 1300 level.

NORTHWESTERN CON.—Sinking the shaft to the 100 level.

SILVER HILL.—Usual progress made in 160 and 260 level explorations without change in formation.

ALTA.—Crushed 340 tons of ore showing an average pulp assay value of $25 per ton.

JUSTICE.—Crushed 314 tons of ore showing a value of $22 62 per ton by battery sample assays.

UTAH.—On the 600 level the southeast drift is advanced 546 feet from the shaft station. Formation porphyry.

OCCIDENTAL CON. — Repairs to track and ore chutes in progress. Shipped concentrates valued at $6434.

NORTH OCCIDENTAL.—During the week run out to the Occidental Con. mill 320 tons of ore.

WEST CHOLLAR. — Drifting west to cut the vein at a depth of 200 feet.

WEST COMSTOCK.—Advancing lower tunnel to connect with winze sunk below the floor of the upper tunnel.

Columbus District.

THE MT DIABLO.—Walker Lake *Bulletin*, Dec. 19: Following is Supt. Shockley's weekly report: The south crosscut from the east drift on the 6th level is in 17 feet. The east drift between the 5th and 6th levels is in 15 feet and shows a little low-grade ore in the face. The raise from the east drift in this intermediate is up 22 feet and shows some ore of fair grade in the top. We are starting an upraise from the east drift on the 5th level on some low-grade ore. In the intermediate between the 4th and 5th levels we have a raise that is up 23 feet and shows some $40 ore in the top. The stope near No. 1 winze between the 3d and 4th levels is giving a small amount of low-grade ore. The east intermediate drift between the 2d and 3d levels shows 8 inches of $150 ore in the face. There is no special change to report from any of the stopes. The mill has been running steadily during the week and doing good work.

New Pass District.

TO SELL.—*Silver State*, Dec. 19: A year or so ago, through the efforts of Captain C. B. Dahlgren, operations were resumed in the New Pass mines, which are located just south of this county near the Lander and Churchill line. The Steritt Brothers acquired an interest in the mines, which had been lying idle for many years, and now they have opportunity to sell their interest for $20.000, which will pay them handsomely for their year's work.

Reveille District.

ANOTHER STRIKE.—Eureka *Sentinel*, Dec. 21: Mr. Clark has made another rich strike in Reveille district, Nye county. The new find is supposed to be a continuation of the old Gila ledge which proved so rich in early days. There were at least three good fortunes made out of the Gila. Mr. Clark, Harry Barnes and John B. Magee realized each about $250,000 from the working of the high-grade ores. Ex-Governor Adams is now the owner of the Gila mine and mill. We are glad to hear that Mr. Clark has again struck it rich. He deserves it. He has stuck to the old camp for many weary years. There is any amount of good mineral territory south of Eureka, which the new railroad will render accessible.

Robinson District.

A FINE SHOWING.—White Pine *News*, Dec. 21: The Joanna bonanza continues to loom up bigger and richer with every day's work that is done upon it. The bad weather of the past two weeks made it necessary to have the small working force transferred from the surface to underground, where the work being done is daily exposing higher grade ore without limit as to extent. The roads too have been bad and the hauling of ore to the mill has been impeded. We wish to call the attention of capitalists and mining men to the many other promising mining claims in this district, some of which are adjacent to and look far more promising than did the Joanna six months ago. The owners of many of these claims are poor men who are hampered in developing their claims for the want of means, but who would gladly give men of money an interest in their mines for a working capital, or sell out to them at a reasonable price. There are a dozen or more claim-owners in Robinson district who can offer like inducements to capitalists, but they must abide their time. The time will come, and the properties that capitalists could now invest in for a few thousand dollars will go up into the hundreds of thousands.

PROBABLY A SALE.—Eureka *Sentinel*, Dec. 21: There is a well-authenticated rumor in mining circles to the effect that the Watson gold mine at Robinson has been sold to an English Co. Capt. Plummer of Montana is said to have negotiated the purchase. The figure we hear most frequently mentioned is $250,000. As the story runs, Mr. Watson refused to bond the property, but gave Captain Plummer the refusal of it, provided he came with so much money in a certain number of days. It is believed the Captain will "get there" on time. The claim set up by Mrs. Walcott of San Francisco to a half interest in the property may exert a discouraging influence and defeat the sale.

Pioche District.

BLACK LEDGE WINZE.—*Record*, Dec. 14: The greater the depth attained the more difficult becomes the work of pumping out the Black Ledge winze at the Raymond shaft. Last Sunday the men in the winze attempted to renew some of the packing about the pumps, and not being thoroughly prepared, a mishap occurred which made the work of repairs so difficult as to occupy several hours, during which time the water raised 27 feet in the winze. On Tuesday another accident occurred and a further rise of 15 feet in the water resulted. Before these accidents, water was out for 167 feet and it will take some time to recover the ground thus lost.

Tuscarora District.

ELKO CON.—*Times-Review*, Dec. 20: The drift at the foot of the incline has been extended six feet; rock very hard.

DIANA.—South drift from the crosscut from North Belle Isle 300-foot level, has been extended 10 feet. Face shows bunches of ore.

NEVADA QUEEN —South drift from Commonwealth has been advanced 15 feet, and is developing well. Face is all in ore, two feet of which assays $210 per ton.

NAVAJO.—The stopes above the 150-foot level are without material change and are producing some very good ore. Both boilers are now in good repair.

BELLE ISLE.—West crosscut, 350-foot level, extended nine feet, total 35 feet. South drift from west crosscut, 250-foot level, extended four feet, and the crosscut therefrom extended 13 feet.

NORTH BELLE ISLE.—North gangway, 600-foot level, extended 21 feet. Rock hard but breaks well. The crosscut from the 300 station extended 25 feet; total 244. The stopes near the Queen line are looking very well.

GRAND PRIZE.—400-foot level: Winze from south drift extended downward 21 feet. West drift from north crosscut extended 14 feet, and face of north crosscut on the 500-foot level advanced 12 feet.

NORTH COMMONWEALTH.—Second level: Will finish cutting out station in about three days, and start drift from same. Joint crosscut east has been extended 9 feet, exposing high-grade ore. The flow of water has increased, but does not interfere with the work. East crosscut from south drift extended 12 feet in low-grade ore.

DEL MONTE.—1st level: No. 2 east crosscut from south drift has reached the wall, and have started to crosscut west from same point. 2d level: Good progress is being made in cutting out for station, and will start drift in about three days. 3d level: Joint crosscut has been extended 9 feet, still showing high-grade ore. Quite a flow of water is coming in through the face.

COMMONWEALTH.—100-foot level: No. 1 east crosscut extended 15 feet, all in vein formation. North drift from No. 3 chute advanced 10 feet, opening up good ore. South drift from No. 4 chute extended 10 feet. North drift from the same chute advanced 10 feet; total length of drift, 35 feet; fine ore entire distance. Car samples assay $275 per ton. No. 5 chute has been extended up 12 feet; is getting into same ore as that of No. 4 chute. No. 6 upraise extended upward 15 feet in the vein, giving low assays. South drift started from No. 1 east crosscut is in 6 feet; face all in first-class ore. 150-foot level: No. 11 upraise is up 20 feet, following good ore. North drift from north intermediate extended 12 feet—about 4 feet more to go to connect with No. 1 east crosscut. East upraise is up 22 feet, in vein showing some low-grade ore. The stopes where any work has been done look first-rate. Ore crushed at concentrator, 420 tons; average battery, $16 per ton; 132,000 pounds concentrates average assay $305.11 per ton.

ARIZONA.

THE RED ROCK.—Florence *Enterprise*, Dec. 21: The Red Rock M. Co. is progressing most favorably. The well which is being sunk by John Gardiner is being put down rapidly. It is the intention to sink it to a depth of 450 or 500 feet; this well is located about one-fourth of a mile from Friday's well. It is the intention to sink the Atlas well 200 feet deeper. It is now 500 feet deep and nearly filled with water, but a larger flow is desired. The Atlas smelter is being put in repair. A new jacket is now in transit. It will be put in place and the smelter running by the middle of January. It will have a capacity of 40 to 50 tons per day. The ore will be taken from the Red Rock mines. The Atlas ore will at present be used to furnish flux. There are 32 men now employed by the company. This force, however, will be necessarily increased soon. Mr. H. K. Cole is general manager, and Dr. Alex. Trippel is consulting engineer and will give part of his time to the company; he will superintend the erection of the

smelter. E. L. White is the superintendent. The prospect of the future for the company is good. The Red Rock Co. have started out with a temperance camp and they say it works well.

BULLION.—Prescott *Courier*, Dec. 16: Ten bars of gold bullion, worth about $18,000, were brought to the store of Bashford & Burmister, recently, from the Crowned King mill, Bradshaw district. This amount was taken out of Crowned King ore in 20 days, by the company's 10-stamp mill. J. D. Helm, superintendent of the Oro Bella mill and mine, arrived here recently. From him we learn that the Oro Bella, Crowned King, Ryland and Del Pasco mills were running when he left. Mr. Helm has about 20 men employed at mine and mill.

ORO BONITO.—Prescott *Journal-Miner*, Dec. 18. Messrs. Dougherty & Cooper sent out several men, with supplies, to the Oro Bonito mining district this morning. They go to do required assessment work on several locations owned by these gentlemen.

COPPER BASIN.—G. K. W. McNary was in town yesterday with samples of ore from his new discovery near Copper basin. Samples of the ore sent to the State mineralogist of California elicited a very flattering acknowledgment from that official, with a request for additional samples and full particulars as to the location of the claim. He says the specimens sent contain cinnabar in iron ore. The samples brought in yesterday showed richer than anything heretofore obtained. The claims are owned by G. W. K. McNary and his son, R. C. McNary, who say the ore can be traced for a width of 400 feet on the surface by one mile and a half in length. J. C. Hartin left this morning with a camping outfit, and an assistant, for Bell's canyon, to do assessment work on a mining claim there. He expects to be absent until Jan. 2d. The new steam hoist for the Black Horse mine has been placed in position, and was started up this afternoon. This is a mine recently sold by D. Boaz to Kansas City parties. The Dosoris people have five tons of ore ready for shipment. The water has all been taken out of the shaft of the Black Horse mine, and work will be resumed again on the property. Samples of black sulphurets taken from the bottom of the shaft assay as high as $300 per ton. Miners from the southern part of this county, who thought they could do better by shipping their ore direct to smelters via Phœnix, have found their mistake, and are again selling the product of their mines to the samp'ing works.

FROM OTHER COUNTIES.—The Arizona Copper Co. is averaging eight tons of copper bullion per day. It is estimated that for 1889 the output will amount to over 250,000,000 pounds. The Arizona Co. has now expended over $5,000,000 on its mines, railroads and improvements. It has 36 miles of 36-inch track, connecting Clifton with Lordsburg, and 14 miles up the canyon. The Copper King Co. has at last got to work after eight years of litigation. They have put up a furnace and have over 20 men employed. They have working capital of $50,000. It has been a good mine from the first.

COLORADO.

THE LAST DOLLAR.—Aspen *Times*, Dec. 18: The Last Dollar mine in Tourtelotte park is now regarded as one of the most valuable properties in this district. There has recently been developed in the mine a second ore chute that is fully as large and as rich as that which first gave the property its reputation. This second chute lies north of the first body of ore that was struck, and is being worked at a point about northeast from the old workings. The ore in the Dollar is of a very superior character. It runs from 14 to 30 per cent lead, and from 80 to 100 ounces silver per ton. Manager Frank Everett has just made a contract with the Driver Public Sampling Works for the output of the property for six months, at very favorable figures. During December, he expects to accumulate sufficient surplus to enable him to sink the shaft some 200 feet deeper, in order to work the mine more directly and economically.

MINING NOTES.—The water in the Bushwhacker is making some trouble. The sump has had to be bailed out twice in the past ten days. Solid formation has been reached in the big Smuggler mountain tunnel. The air drills will be in operation next week. A small shipment was made yesterday from the second level of the Little Annie mine. It is rumored that a strike has been made in the Deane group on Porphyry mountain. Dr. Paul, who has just returned from Denver, states that he feels confident that he will be able to start up the Aspen mine again with full force by the 1st of January. He has not yet closed his ore contracts, but it is possible they will be arranged in time to start before the first of the year. Judge Herrick is following a small streak of very good ore in the Oakley No. 2, with a splendid prospect of opening a bonanza. He ships from 6 to 15 tons per month that runs from 120 to 175 ounces per ton in silver and about 10 per cent lead.

DAKOTA.

IRON HILL.—Deadwood *Pioneer*, Dec. 15: The Iron Hill smeltery closes down to-day after an eight days' run on pyritic smelting. Seth Bullock, president of the company, whose confidence in the process has been manifested from the first, stated to a *Pioneer* reporter last night that he is perfectly satisfied with results. The run proves that Bald mountain refractory ores can be treated here at a low cost as in Omaha—$10 per ton. This, too, with the present exorbitant price of fuel. There is no further necessity to ship ores; railroad companies in the future will be kept busy bringing in coke and taking out matte instead. During the run to be completed this morning, two carloads of matte have been turned out, a quantity greater than ever before produced in the United States. The plant will be given a thorough overhauling and be blown in again in about two weeks. In reply to the question how long will be the next run, Mr. Bullock stated: "There is no reason why we shouldn't run a year." In the Iron Hill mine itself a large amount of ore is in sight. Most of it, however, is of low grade, about $15 per ton. The mine is at present being worked on the 160, 200 and 300 levels.

GENERAL MERRITT.—Deadwood *Pioneer*, Dec. 21: Jiggers to concentrate ore from the General Merritt mine are now being placed in the Richmond mill, Galena. It is thought that all will be in readiness for ore concentrating to begin by January 1st. The method, though new in the hills, was employed successfully in Nevada and Idaho for several years by Mr. Havens.

TOURMALINE.—H. B. Young has on exhibition in his office a specimen of rock carrying black tourmaline crystals. It was presented by William Wilson, who obtained it from a location he is now developing in the southern hills.

RUBY.—Considerable activity is going on in the above camp. The North Star is working a force of ten men under Steve Mahoney. The Emmett is working two men. The Comstock and Belfast are about to continue sinking their shaft and the Thanksgiving group are about to commence operations. Prospectors are abundant in the district, opening up their properties.

LOWER CALIFORNIA.

A GOOD SHOWING.—Alamo *Nugget*, Dec. 10: Ever since this district was discovered last spring general statements have been made favorable to the mines, and it must be gratifying to the friends of the camp that their favorable opinions can now be substantiated with facts and gold bricks. They often maintained their opinions in the face of slanderous and prejudiced reports concerning this district. To show what we have here, let us take for example the following figures, copied from the official report of Mr. Sutherland, superintendent of the mines belonging to the International Company, kindly furnished us by Mr. Crenshaw. The quartzmill is a 20-ton Huntington mill, which crushed an average of 16 tons per day, and the following figures cover a period of 44 days—the whole run up to November 30:

Name.	Tons ore.	Per ton.	Amount.
Princesa	120	$36	$4320
Telemaco	29.5	26	767.0
Ulises	163.50	31 56	5334.51
Cocinero	74 25	28.05	2082.72
San David	21	26	546
Grandissima	13.75	26	357
Totals	693.5		$20,314.73

This is only a starter, but it is a good showing. None of the mines are deeper than 100 feet and only two have reached that depth. There are other mines here undoubtedly as rich as those above mentioned, but concerning which it is not yet possible to give figures.

EL PASO.—Major Zimpleman states that the new hoisting and pumping machinery for the El Paso Company was expected in Ensenada by Monday's steamer and will be brought here and placed in position within two weeks. Sinking on all their mines will then be pushed forward vigorously. Mr. Dobler, formerly of the Oro Grande mine at Daggett, will arrive about the 20th from San Francisco to operate the mill, which will start up about Christmas with 600 tons of ore ahead.

MONTANA.

WORK GOING ON.—*Inter-Mountain*, Dec. 17: A small new hoist has been completed on the old Bell mine, now one of the properties of the Chambers syndicate. The engine is fed with steam from the boilers of the High ore. Considerable ore is being taken out from the old workings on the 300 and 400 foot levels. The old dumps of the Mountain View, that have been formerly let to leasers, will be worked entirely by the company on the completion of the contemplated mammoth smelter and concentrator at Great Falls. Johnny Rowe is working one of the dumps of the Stevens and Geo. Waters the other. Mr. Waters made a shipment of ore yesterday. The manipulators of steam at the West Colusa are three in number, Bonnie Orcutt, Geo. Waters and William Deal. Those directing the work under ground are Thomas Gilbert and Thomas S. Quinn. At the East Colusa, the engineers are P. Kelly, John Martin and Pete Peters; the shift bosses are Thos. Williams and Thos. Treloar. A trip to the Anaconda mine yesterday afternoon resulted in the finding of nothing of any particular interest to chronicle unless it be the presence of four able-bodied miners protecting the property from the intrusion of outsiders. On being asked when it was thought the company would be able to open the shafts they stated that it was impossible to tell. The main shaft is heavily bulkheaded at the 40-foot landing and steam is being injected into the burning mine by six of the large boilers at the works. At the St. Lawrence where the bulkhead is put in at the collar of the shaft the dirt is so warm that it is almost impossible for one to stand on it for any great length of time. The company is using three of the boilers also at these works injecting steam into the St. Lawrence. The smell of gases is still prevalent throughout the atmosphere, still indicating the presence of fire.

UPPER BASIN MINES.—Montana *Mining Review*, Dec. 20: The mines of the Upper Basin District are going to make a record for themselves, and that right away. Genuine active operations commenced in this particular locality about a year ago, since which time work has rapidly progressed on not only nearly every known mine in the upper basin district, but the contagion has spread to all the other districts within easy striking distance. On the Kleinschmidt property, adjoining the Riall mines, work has been actively prosecuted for the past six months, and regular shipments of ore of good grade are now being made with the probability of these shipments being kept up all winter. Probably no other mine of the district gives better promise of future greatness than the Little Alma, on Shoofly mountain, and upon which property there is just now displayed greater activity in the way of development than upon any other mine in the district. The mine is being worked under bond to Cleveland, Ohio, and St. Paul parties, by a force of 12 or 14 men, who are engaged in driving a tunnel to cut the vein at a depth of 80 or 90 feet below the upper workings on the property. Work is progressing rapidly upon the Crescent, upon a spur of the northeastern slope of Bald Mountain. So far as developed this mine shows immense bodies of good concentrating ore, and the recent developments made within the past five weeks have demonstrated the fact that shipping ore of an excellent quality can be obtained with depth. There are many other valuable and prominent mines of this particular locality deserving of special mention, chief among which may be mentioned the Josephine, Dunleith and its several extensions, the Barbara and other mines and prospects in its vicinity, Morning Star, Robert Burns, Montana, Little Charlotte and many others. On the Copper Belle, located between the junction of Eureka creek with the Basin, and the Morning Star mine, owned by Winter Brothers and others, work is also being actively prosecuted and a hoist will be shipped in and put up at once.

GRANITE MOUNTAIN.—Phillipsburg *Mail*, Dec. 19: The output for the week ending Dec. 19th was 54 bars of bullion, containing 76,988 ounces fine silver and 176.2 ounces fine gold.

THE ELIZABETH.—The sinking of the Elizabeth (West Granite) shaft progresses at the rate of 12 feet per week. It will take nearly a year to sink the 500 feet.

THE MONTANA.—In the Red Lion district sinking on the Montana proceeds through a rich vein of gold quartz, all of which is retained for shipment. Whiting & Co. are confident of its richness, and propose to establish a mill on the property some time next year.

THE BELL FLOWER.—Operations have been temporarily suspended at the Bell Flower mine, near Black Pine, on account of the water that has been coming in so freely of late. They could not dispose of it with the facilities at hand and the company will be obliged to purchase a pump before the work can proceed.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City *Enterprise*, Dec. 20: A carload of zinc ore was shipped by M. W. Neff to La Salle, Illinois, on Monday. Should this shipment prove successful, Mr. Neff will soon be shipping several cars per day. The Pacific Company, it is learned, has started up with a light force, and the Deep Down has made slight additions to its working force. A new strike has been made at Carlisle, about a half-mile nearer Carlisle than the Bailey strike, by Chas. Vernon and Wm. Thomas. It is reported to be of even more importance than the Bailey strike. Some Eastern parties are now investigating the alum deposits near the Gila hot spring, with a view of purchasing. John Knight, one of the pioneers of Georgetown, who owns a number of claims of merit in the camp, has about completed the organization of a company with sufficient capital to open up the mines in good shape. The mines of the Mimbres Company join this property, and good pay ore has been taken out by the company up to the line of the Knight property. The Confidence group of mines on Silver creek is now the cynosure to which the eyes of the mining world are now being directed. The attention of Mr. Leavig, a prominent mining operator of Denver, Colorado, was directed to this property early in the summer, and after careful and repeated examinations, negotiations, having in view the purchase of the property, were instituted and were virtually consummated last Tuesday. The Confidence and the Blackbird, measuring 2500 feet in length, show an unbroken line of croppings the entire distance, and at no point along the strike of the lode is the pay or milling rock less than five feet in width and frequently measures 16 feet in width. The developments consist of tunnels, shafts and open cuts. The workings have yielded from about 800 to 1000 tons of ore, worth, as it is mined, $50 per ton, and in this connection it will be understood that the ore is not assorted and is absolutely free from any waste material whatever. The Bluebird, belonging to the group, is noted for producing rich ores, having a milling value of $120 per ton. The ores carry sulphides of silver and copper glance and free gold. Thirty-five hundred tons are on the dump ready for treatment.

SMELTING PLANT.—Silver City *Enterprise*, Dec. 21: The probabilities are that a smelting plant, which will treat custom ores, will soon be erected in this city, drawing its principal support from the concentrates of the Pinos Altos mines. A desirable quality of iron exists here in inexhaustible quantities, while the mountains are full of lime. The only class of metal which it would be necessary to import would be lead, and even this may be produced in abundance in a short time from the west side of Pinos Altos. A smelting plant, under the proposed management, would certainly be a success here, and would open up a market for the dry ores at the very door of the mines. There is no question as to the amount of ore and concentrates which can be produced by the mines of Pinos Altos, and the expense of shipping in coal would be much lighter than the cost of transporting the concentrates to smelters in other sections. If the plant is erected, mining in general in this section will receive an impetus which can be considered little less than a "boom."

THE CHARM.—Kingston *Shaft*, Dec. 21: Last Tuesday the body of galena in the east shaft suddenly turned into pyrites of copper and silver glance. An average assay of a 34-inch streak gave a return of over 600 ounces silver. This is the most important discovery made this year on the North Percha.

HILLSBOROUGH MINES.—The Empire mine, owned by Messrs. Dickinson & Co., has a tunnel run in on the vein something over 100 feet. Mr. Dickinson has over 20 tons of fine ore on the dump, that he is satisfied will run over $100 per ton in gold. He has recently struck some splendid looking ore in the face of the tunnel that is rich in silver. The Golden Era is bonded. There are tons of fine looking ore on the dump, of the same general character as the other ores of the district. The Rachael mine, owned by Martin & Co., situated north of the Mamie Richmond, is an excellent prospect.

THE GYPSY.—This great property still increases its production and value by development, and it now has in sight one of the largest bodies of ore ever seen in this section.

THE U. S.—The main tunnel will cut the old workings and drain them of the water which has kept the mine from being worked for the past year; although the drifts were in pay ore that averaged 230 ounces per ton by the carload.

OREGON.

THE NEW MILL AT WORK.—Baker City *Democrat*, Dec. 19: At Cracker Creek, on the 11th the first run of ore from the Eureka & Excelsior mines passed through the rock-breaker and began its journey down through the long line of dryers, roasters, stamps, pans, and settlers, on to the retort, where it is hoped the residue may be what every one confidently expects it will be, and what will prove on its first run of this newly completed mill, that which will demonstrate that the Eureka & Excelsior Con. G. M. Co. are the possessors of a veritable bonanza, not equaled by anything on the Pacific Coast. Those who have not visited the works, little conceive the vastness of this plant or of its importance to this district. From the boiler floor to the upper floor the elevation is 105 feet, and over 2,000,000 cubic feet are contained within its walls. Numerous other buildings outside the main structure complete the plant. The machinery is all of the very latest design and best make, and under the steady stroke of a 150-horse power Corliss engine moves without a tremor or strain. A ditch conveying water from up the canyon will relieve this engine and furnish power during the water season, being conveyed from the ditch to the mill through pipes and with a fall of 625 feet, and working on Pelton water wheels will furnish sufficient power for both mill and air compressor. This feature of the plant is an important one, and for six months in the year will save the company the entire cost of steam. The mine is developed to the extent of over 200,000 tons of uniform and high-grade ore in sight, and prospect work still going on, with ore in the face of either drift. The mine is connected with the mill by means of a tramway over which the ore is carried direct from the mine to the mill in cars and dumped over grizzlies into the ore-room, where it is shoveled into a Blake rock-breaker of 125 tons capacity. From here it drops into a rotary dryer where all the moisture is driven out and then falls from there into self-feeders to the battery below of 20 stamps of 950 pounds each. Here it is pulverized, and passing a 45-mesh screen is conveyed automatically to an elevator and raised 62 feet in blankets arranged on an endless chain to a White & Howell roaster. The pulp now partly freed is dumped into a bin, where salt is introduced, the roasting completed and chloridizing begun. We next find the pulp on the cooling floor below where chloridizing is completed, and it is now ready for the pans and is conveyed down chutes to cars and taken to the pans on that level ready for charging. The pans are eight in number, capable of treating two tons each, every four hours. The machinery is in charge of Mr. E. F. Farnham, late of the Drumlummon, Montana. Mr. K. M. Reeves is his assistant. The mines will still be in charge of Robt. Cunning, as foreman, and with the new Burleigh drills in operation such progress will be made in one week as has heretofore occupied months of the most patient and persistent toil.

ITS VALUE ESTABLISHED.—*East Oregonian*, Dec. 14: The stockholders of the Buffalo M. Co., who have been at work for two years past developing its property in the Granite creek country, are beginning to receive returns on their investment. Some months since they began running a tunnel 500 feet in length, and recently came across a vein of ore rich in ruby silver. To test its value they shipped a carload to a sampling company in Denver, and to-day they are in receipt of $1081.49 clear of all expenses. This makes the property worth a very large amount of money.

UTAH.

PROSPEROUS EUREKA.—Salt Lake *Advertiser*, Dec. 20: Among the growing mining camps of Utah is the prosperous and picturesque little city on the west side of Utah lake among the hills of the Oquirrh range of mountains. Since the completion of the railroad to Eureka, this rich and famous camp is being more widely known than heretofore. Eureka is talking of incorporating as a city of the third class, and not long ago raised quite a sum of money by subscription for the purpose of building a public schoolhouse. While the railroad may possibly hurt the business of teaming, all the ore being formerly hauled to Ironton for transportation, yet the increased travel and business will more than equal the loss so incurred. Reports from Eureka state that new prospects and developments are constantly being made, and the outlook for the future is bright indeed.

PROVO'S NEW STRIKE.—While an *Advertiser* representative was at Provo this week he had the pleasure of examining some specimens of gold ore taken from the newly discovered mine a mile and a half from Provo, by F. W. C. Hathenbuck. The new find promises to be exceedingly valuable, and Mr. Hathenbuck and the people of Provo are rejoiced over the discovery. Samples of the ore near the surface assay over $3 to the ton, and it is easily mined. The mine is also increased in value as it contains fine strata of roofing slate and building stone.

PARK NOTES.—*Record*, Dec. 21: A few days ago the south drift on the 1300-foot level of the Ontario mine, in No. 2 shaft, crosscut the vein at a distance of some 200 feet from the shaft. The distance between the walls proper is about 50 feet, but of course it is not all ore between the walls. However, the ore vein is very wide and is of high grade. In fact, the vein on this level shows up better than it did on the 9th, 10th or 12th levels. It is being demonstrated that as deep as the Ontario workings go the ore body maintains its magnitude and rich character.

THE NEVADA-NORTHLAND.—The leasers of the Nevada-Northland situated up Woodside gulch have struck it rich. After sinking their shaft to a depth of 300 feet they drifted on the vein and have driven it about 60 feet, and it is still being run ahead. The early part of the week the pay streak widened from a small seam to about 18 inches, and since then it has continued to widen until it is now over two feet. The ore is rich, assaying from 30 to 180 odd ounces silver and from 30 to 76 per cent lead to the ton. A 50-ton lot of the ore is being made up for shipment, and the leasers believe it will easily net them $100 a ton.

THE CREOLE NO. 2.—The leasers of the Creole No. 2 have a carload of ore sampled and ready to be shipped to the smelters. The ore will probably yield $50 a ton.

CAMP CROSSCUTS.—Owing to the heavy snow storm ore shipments were very light this week. The Union concentrator has been closed for the winter. The trial lot of Anchor second-class ore yielded satisfactory results. The Apex is reported as having got into a body of ore, larger and richer than any strike it has yet made.

ORE AND BULLION SHIPMENTS.—The Ontario bullion shipment for the week was 32 bars, containing 16 909.26 fine ounces silver. During the week the Mackintosh sampler received and forwarded 112,760 pounds of Mayflower No. 7 leasers' ore; 55,550 of Alliance; 29,170 of Woodside; 19,280 of Daly, and 17,250 of Creole No. 2 leasers' ore; total, 234,010 pounds.

MECHANICAL PROGRESS.

Converting Crude Metal into Steel.

The Latest Improvements in the Art.

The invention of converters has greatly increased the safety and safe rapidity of railway travel. Through the cheapness of this process, the wrought-iron rail has been entirely superseded by the stronger and more perfect steel rail. This process was introduced by Bessemer in 1856. It consists in burning out the carbon, silicon, sulphur and other ingredients contained in crude iron, by means of the intense heat and violent stirring derived from a blast of hot air blown with a great pressure through the incandescent mass of iron; this has been melted in a cupola and run into the converter, converting it into a homogeneous malleable metal. When the proper state is reached, which moment is ascertained by spectroscopic observation of the flame, the converter is supplied with melted iron, called spiegeleisen, which contains a certain uniform portion of manganese; it causes the steel to be less brittle and promotes sound casting. The melted mass is poured into large ingots. The operation of blowing the converter produces a most brilliant pyrotechnic display. It can be seen at the works of forty different establishments throughout the United States. After this process is gone through, there is still left phosphorus, which decreases ductility and promotes brittleness. In this country we have comparatively little phosphoric iron; but in England immense quantities of Cornwall ore were rendered valueless by the fact of their containing this substance, which rendered them unfit for conversion. Two young Americans, Thomas and Gilchrist, came to the rescue with their invention of a basic lining to the converter, which, with the addition of a certain percentage of lime, causes the phosphorus to leave the metal and unite with the slag.

Different ways of applying the blast to the converter have been the subject of other inventions. In the Roberts process the body of metal in the converter is acted upon by a blast which divides it into small portions and imparts a gyratory motion to the mass, which brings every portion in succession in position to be acted upon by it.

But there are certain variable conditions which render the result variable unless provision is made to counteract them. The carbon and silicon, as they are burned out, do not use up all the oxygen of the blast, which has then a greater tendency to unite with the iron. This can be partially avoided by reducing the blast as the fluidity of the metal increases, and the quantity of carbon and silicon decreases. But this is not a perfect remedy.

The Latest Improvement,

For which two patents were granted Sept. 24, 1889, is due to the ingenious mind of John W. Bookwalter of Springfield, Ohio (one of the largest manufacturers of steam engines in the world). Mr. Bookwalter's improvement is designed to regulate the quantity of oxygen to suit these varying conditions, and thus avoid the production of oxide of iron, the latter being, of all the impurities generated in the process of conversion, the most injurious to the quality of the metal. To this end two blasts are introduced; one blows directly into the metal and the other blast passes through a charcoal fire in the furnace and this burns out the oxygen. This blast enters through the hollow trunnion.

These blasts may be alternated and regulated so that the volume of the blast may be maintained or the oxidizing agent reduced as the process proceeds. The action of the deoxygenized blast, after the converting blast is cut off, violently agitates the separated portions of the metal and washes out the impurities, while maintaining a gyratory motion which brings every portion of it under its influence.

IRON AND STEEL IN BUILDING.—Iron is rapidly increasing in its use for houses. You can buy a complete iron house at the manufacturer's in England and have it set up anywhere in pieces. A large number of iron villas have been sent from England to the Riviera and put up there on plats of land purchased or leased, with the provision that when the lease expires the house can be taken away. A very favorable account is also given in the French papers of the new system of building houses of steel plates, introduced some time ago by M. Danley, manager of the Societe de Chateneau, who has satisfactorily ascertained that corrugated sheets, of no more than a millimeter in thickness, are sufficiently strong for building houses several stories high, and the material used allows of quite a variety of architectural ornamentation. The plates thus employed are of the finest quality, and as they are galvanized after they have been cut to the sizes and shapes required, no portion is left exposed to the atmosphere. It is asserted that houses constructed in this manner are very sanitary, and heating arrangements can readily be carried out.

DRILLING CAST IRON.—Mr. L. B. Breckenridge, the instructor in mechanical engineering in the Lehigh University, has lately been making some experiments for the determination of the pressure exerted in drilling cast iron. He made a cylinder in which was a plunger having an area of ten square inches. Three small grooves were turned in the plunger near its lower end, so as to prevent any leakage of the oil with which the cylinder was partly filled. Two holes were drilled in the cylinder near the bottom, and a steam gauge and an indicator were attached. The indicator cord was attached to the hub on the shaft of the quick-return motion lever in order to obtain diagrams of considerable length. When the piece to be drilled was resting on the plunger, a diagram could be taken which would show the pressure exerted in forcing the drill through the work. With ¼-inch twist drills the greatest downward pressure was 400 pounds; with ½-inch, 900 pounds; with ¾-inch, 1100 pounds; with 1-inch, 1450 pounds; and with 1¼-inch, 1800 pounds.

EXPERIMENTS IN MAKING RUSTLESS IRON ARE COMPLETELY SUCCESSFUL.—The rustless process, which has been until lately an experiment, has now demonstrated that great economy can be used, not only in ice-pipes, but in every article where iron is used. In the past year over 2,000,000 kettles have been subjected to this process in Pittsburg. The method is very peculiar. After the article is made, it is put into a furnace about 3½ feet high, 15 feet long and 8 feet broad. The furnace is made in an oval shape, air tight. After the iron has been in the furnace for two hours, and it has attained almost a white heat, the air that comes through the regenerators and air-valves is shut securely off, and the furnace is made air-tight. After the air has been shut off, the superheater, which is located in the combustion-chamber at the rear of the furnace, and at right angles from the air-valves, is opened and the furnace is filled with steam and kept in this condition for eight hours. At short intervals a small valve is opened, so as to allow an exodus of steam in the furnace, allowing fresh steam to be put into the furnace. When the articles have been ten hours in the furnace, there has been accomplished the formation of magnetic oxide upon the iron surface. They are then put into an acid-well, which is the last treatment.

CAST IRON BRICKS.—Hollow, cast-iron bricks, if we may so term them, says the *Engineering and Building Record*, form the subject of a recent German patent granted to August Bockel of Erfurt. As the name implies, they are made of regular brick form and size, the walls being 0.12 inches thick. No mortar or other binding material is to enter in their use, the fastening being effected as follows: The upper and lower sides of the bricks are provided with grooves and projecting ribs which fit into one another. There are, further, two large circular openings in the upper side of each brick, arranged to receive properly formed projections on the lower side of the brick above. One of these projections is hook-shaped so as to give a more secure hold. A fluid is applied to the surfaces of the bricks with a brush, to make the joints air and water tight. The non-conducting air-spaces in the bricks, and the ease with which they may be put together and taken apart without injuring them, are cited as special advantages. The question of cost is not considered.

ZERCON—WHAT IS IT?—Zercon is a metal not found pure. In fact, no use for the pure metal has ever been found; therefore it has not been reduced. An oxide of this metal, called zerconia, is the most infusible of all the known oxides. The oxide is reduced to a fine powder. A common cotton wick is thoroughly filled with the powdered oxide, then the cotton is burned out. The wick is all consumed excepting a thin, delicate, snow-white column of the zerconia, which is left exactly the shape of the wick. As the burning gas impinges upon this column of oxide, the latter becomes heated white hot, and glows with a soft incandescence, second only to the electric light. A mechanic may not know the name of this burner from the above description, but it is named the Welsbach, and by that name will be readily recognized.—*Northwestern Mechanic.*

BAD POLICY—GOVERNMENT ORDERING MACHINERY FROM ENGLAND.—It is a matter of no little surprise to learn that the United States navy-yard, at Washington, has ordered from Messrs. Greenwood & Battey, in England, a band-sawing machine for cold metal, to cost $16,000, on what grounds, says *Industries*, we do not know, because there are a dozen firms in this country that can construct such a machine quite as well as it can be done in England. A metal-cutting saw is a simple apparatus; moreover, some of the machines in use in England are from American designs. Some we have seen there for heavy work were faulty in some of their details, the feed, for example, and supporting the back of the saws with rollers. We think our tool-makers should see that the duty is paid on the machine when it is imported.

SHARPENING KNIVES.—A dealer in cutlery expresses the opinion that not one man in 50 knows how to sharpen a pocket-knife. "A razor," he says, "must be laid flat on the hone, being hollow ground, and requiring a fine edge. But a pocket-knife requires a stiff edge, and the moment you lay it flat on a stone, so as to touch the polished side, you ruin the edge. The blade must be held at an angle of 20 or 25°, and have an edge similar to a chisel. This is technically called the 'camel,' and is marked on all new knives by a fine white line which does not remove or touch the polished surface. Knives improperly whetted are often condemned as too hard or too soft without reason."

SCIENTIFIC PROGRESS.

Saccharin—The Concentration of Sweets.

It is perhaps not generally known that the sweet substance, known as saccharin, is really an American discovery. According to the *Scientific American*, it was discovered accidentally in the Johns Hopkins University at Baltimore, by Professor Ira Remsen, who was making some investigations into the nature of some of the higher derivatives of carbon compounds. The professor was assisted at the time by one of his students, Dr. C. Fahlberg. The compound upon which Fahlberg happened then to be engaged was found by chance to be intensely sweet, and was subsequently named saccharin. It was shown to be from 280 to 300 times as sweet as cane sugar, and was deemed especially valuable in medicine. Sufferers with *diabetes mellitus*, by using very much diluted solutions of the chemical in their food, could once more enjoy the "sweets of life." It came highly recommended by doctors, because it was known to pass in quantitative amounts through the human body without any apparent effect on its various processes.

Dr. Fahlberg shortly thereafter went to Germany and undertook the manufacture of this substance on a commercial scale, and gave it its name, saccharin. At once it found quite extensive use as a medicinal preparation, as an adulterant, a substitute for sugar, both in Europe and in this country. The impure product for sale in the markets sells at about $15 per pound.

Prof. Remsen, who still continues work in the same series, states in a recent article in the *American Chemical Journal* that the commercial form of saccharine is more than one-half impure, and estimates its sweetness as but 125 times that of sugar. It dissolves readily in boiling water, and has several interesting derivatives with sweetening power.

One of these has been found to be intensely sweet in the front part of the tongue, neutral in the middle, and exceedingly bitter in the posterior portion near the soft palate. The investigation with this compound is the best single proof that there exist in the tongue two sets of specific nerve fibers, corresponding to these two kinds of sensation.

Its Deleterious Effects.

But this has been more than compensated by the train of evil that everywhere follows in its path. Authorities differ somewhat on this, but the weight of evidence lies both in the number and the reputation of those who condemn its use. Pflugge has shown that it prevents the action of the ptyalin ferment of the saliva, whose function is to change the undialyzable starch into soluble grape sugar; that it disturbs the gastric digestion, so that egg albumen is dissolved in its presence only after four days; that it has a deleterious influence on the pancreatic and intestinal digestion. He concludes that the substance is not a fit substitute for sugar, and must be especially injurious to diabetic patients, in whom so much depends on a good and healthy digestion.

Other opinions differ slightly from this, but a variety of charges are made against it, for interference in varying degrees, with the many kinds of fermentation and the putrefactive processes that constantly go on in the human system, most of which are connected with digestion and all of which are beneficial. Brewers have found a use for saccharin, not as a sweetener, but more as a preventive of diastatic fermentation, the like of which is performed in certain parts of the digestive tract in man. These are, therefore, likely to be hindered by the adulterant in this favorite beverage.

Its use has been made the subject of legislative action in Belgium, Spain and France. The Belgian Academy proclaims that it is not a food stuff, as it does not represent the nutritious value of sugar, since it seems to pass unchanged through the body; that its application as a sweetener in food preparations and drinks appears to be followed by injury to the health; and that manufacturers are therefore warned that they must give ample notice to the consumer of its presence in articles of food. In Madrid it is called an adulterant; foods containing it are forbidden to be sold under penalty, while the article itself is heavily taxed. The French Government, some time ago, put saccharin under a temporary ban as a substance possibly injurious to the health. Now it has definitely pronounced against it as a drug, food product and adulterant, and has put an almost prohibitory tariff on its importation.

Little has as yet been heard from this saccharin in public here in America, save as a chemical curiosity. But there seems to be a disposition among chemists to believe that it is extensively used. Our medical experts in the various laboratories of cities and States where adulterated articles and harmful drugs are sought out and the criminal processes of indictment begun, should direct their attention to this, which is undoubtedly a deleterious substance. The good of the country, says the journal from which we quote, should also be consulted by the specialists in the Chemical Division of the United States Agricultural Department at Washington. Let them ascertain if the charges against saccharin be true, and, if so, let them advise that measures be taken to prevent its coming into more general use than has hitherto fortunately been the case. And if these charges should be proved, Congress should, like the authorities in France, put such a high tax on it as will prevent its importation. Dr. Fahlberg has a patent on the method of making his product in this country, and thus we shall be spared the danger altogether.

It is stated by another journal that its presence is beginning to be felt by the beet-sugar factories in Germany, where already so much saccharin has been made as to render 5000 tons of beet-sugar superfluous. It is principally employed there in the preparation of fruits and the production of sweet *liqueurs*. It is not a food stuff; indeed, it has been condemned by eminent medical authorities as directly prejudicial to health. The sugar manufacturers are of the opinion that saccharin should only be sold by chemists. France, Italy and Portugal are already contemplating imposing a tax upon it.

A Remarkable Comet.

Prof. E. E. Barnard of the Lick Observatory, under date of Dec. 7th, furnishes the *Chronicle* of this city with some very interesting facts, noted by Prof. Chandler of Cambridge, in regard to what is now generally known as the "Brooks Comet," facts which Prof. Barnard terms an "extremely important theoretical discovery in cometary astronomy."

Prof. Chandler, upon investigating some peculiarities in the orbit of the comet which was rediscovered last July by Mr. Brooks, and which is still under observation, found that it had made a remarkably close approach to the planet Jupiter in 1886, and that its path had then been entirely changed, the comet being thrown into its present small ellipse, with a period of seven years.

Stimulated by this to find out what the path of the comet was previous to 1886, he was led to the discovery that it was identical with the famous Lexell's "lost comet" of 1770. The comet of 1770 was found by Lexell to be revolving in an orbit whose perihelion was near Venus and the aphelion near Jupiter, with a periodic time of five and a half years. The shortness of this period was singular, as the comet had never been seen previous to 1770, though in that year it was visible to the naked eye.

A further investigation, however, showed Lexell that in 1767 the comet had made a singularly close approach to Jupiter, at which time the great attraction of that planet caused a complete change in the comet's orbit, it being thrown into the small ellipse of 1770. Previous to this approach to Jupiter, in 1767, the comet was moving in a very large orbit, with the perihelion near Jupiter and its aphelion beyond the orbit of Saturn. In this orbit the comet was always too distant to be seen from the earth.

In 1779 the comet again passed still closer to Jupiter, and the attraction of the planet, outweighing that of the sun by over 200 times, kept the comet under its influence for a number of months and again completely transformed the orbit, the perihelion once more becoming so great that the comet could not be seen from the earth.

At its appearance in 1770 this comet approached within less than 1,500,000 miles of the earth, a remarkably close approach—so much so, indeed, that La Place calculated that if the comet's mass had been equal to that of the earth it would have seriously affected the motion of the earth, and would have lengthened our year by about three hours. As no sensible disturbance was experienced, La Place concluded that the mass of the comet must have been less than 1-3000 part of the mass of the earth. It was doubtless vastly smaller than that.

A Companion Comet.

The comet at its present return has attracted a widespread interest through the discovery at the Lick Observatory of the small companion comets that attend it in its motion through space. Mr. Chandler suggests that these may owe their existence to the encounter with Jupiter in 1886, the unequal strain from the opposing attractions of the planet and its satellite system having probably caused a disruption of the cometary matter sufficient to produce the companions.

Carrying the investigation back to 1886, Mr. Chandler found that the comet remained under the influence of the planet for more than eight months, and that previous to then it was revolving about the sun in 27 years' time in an orbit whose perihelion lay near Jupiter. He also deduced the path that the comet moved in about the planet at the appulse, and found it to be a hyperbola with an eccentricity very slightly greater than unity, so that "the comet narrowly escaped being drawn into a closed orbit as a satellite of Jupiter." The nearest approach to the planet in this path was on May 20, 1886, the distance being about 900,000 miles.

At present we cannot tell what have been the changes and vicissitudes of this comet since 1770, through the disturbing actions of Jupiter. It is now, however, free from the influence of that planet until 1921, when it will again suffer great perturbation that may once more whisk it out of sight for 100 years or more. It will in the meantime return under favorable circumstances of observation in 1896, 1903, 1910 and 1917.

It is hardly possible, says Prof. Barnard, to estimate the importance of the discovery of Mr. Chandler, as it presents to us one of the greatest physical and mathematical problems that astronomers have had to deal with.

GOOD HEALTH.

The Russian Influenza.

The epidemic influenza, which first made its appearance in Russia, has already swept over Europe, raged with much virulence in London, Paris and Berlin, and has now made its appearance in New York. At the last accounts it was estimated that 28,000 people were suffering from it in St. Petersburg alone.

The first case which occurred in New York made its appearance on December 11th. It occurred in a Russian family. No cause for the attack was apparent; none of the family have recently arrived from Europe or had associated or been thrown in contact with recent arrivals, or any one suffering from the disease. A couple of them, however, recently received letters from Russia. The ages of those attacked ranged from 50 to 4 years.

On the 17th of December 12 cases were reported in Boston, and there is good reason to believe that it will soon spread throughout this continent. Such is the opinion of Dr. Edson, Health Officer of New York. The attacks are not confined to rich or poor, high or low. The family of the Czar has been attacked, and Von Moltke has been one of the sufferers in Berlin. The fast through trains will soon bring the bacilli which produce it to San Francisco.

Its Characteristics.

A cotemporary says: Influenza is a fancy name which was given long ago to a form of catarrh of the respiratory passage and alimentary canal, when it assumed the proportions of an epidemic. The symptoms are just like those of a cold in the head. The patient suffers from wheezing, sneezing, watering from the eyes and nose, and these are usually accompanied by slight headache, increased temperature and accelerated pulse. It is said that the term of the disease is three days, after which convalescence sets in and is generally quite slow. Deaths from influenza are rare. Occasionally an infant or an old person whose vital power has been exhausted succumbs to the malady, but, as a rule, it is annoying rather than dangerous.

It is easily distinguished from incipient diphtheria by its being unaccompanied by high fever.

The medical books make mention of a number of epidemics of influenza which attracted attention rather by the number of persons who were attacked than by the severity of the disease. When it once gets domiciled in a city, hardly any one escapes.

Like other epidemics, influenza is said to be caused by a bacillus in the air which is inhaled. Thus no permanent relief can be expected from the old treatment, which used to consist of sudorifics, the inhalation of the vapor of ammonia or turpentine, confinement in a warm room, etc. Still, these remedies are harmless, and they may divert the patient's mind from the condition of his mucous membrane. In point of fact, in the present state of medical science, there is no known remedy for the ravages of a microbe which is invisible and which permeates the air in such numbers that its annihilation is impossible.

The First Symptoms of the Disease

In New York were sudden faintness, a chill and marked prostration; then succeeded headache and a general feeling of malaria, followed by acute coryza, pharyngitis and slight laryngitis, winding up with bronchitis. The examination showed that the patients were about as sick as persons are with a bad cold. The duration of the attack was two days and upward. Health Officer Edson says that he has no doubt that it is real Russian influenza.

THE PROCESS OF DISINFECTING CLOTHING.—Clothing which requires disinfecting should be submitted for about three hours to a temperature of 250 degrees in a chamber charged with sulphuric fumes from a large quantity of sulphur. The chamber should be so constructed as to prevent the fumes from passing out. No germs can stand this. After a room has been used by a person sick with any contagious disease it becomes necessary to disinfect it before it is fit to be used again. This is done by removing and burning the paper on the walls, removing the bedsteads and other furniture and exposing them to the air and wind, and giving them a fresh coat of varnish; by having the mattress made over new and the hair boiled; by burning in the room three pounds of sulphur, and by whitewashing, painting and papering the room anew.

THE SUN CURE.—Mrs. Mona Caird, the woman who distinguished herself by trying to get at the world's family affairs through asking if marriage is a failure, is now in Austrian Tyrol undergoing what is called "sun cure." This sun cure has been described as a very pleasing remedy for whatever ails you. It consists in drinking grape wine with a bead on it until you don't know whether you are a sick man or an inflated balloon. Then you sleep it off in the sun, and when you wake up and ask for a monkey-wrench to screw your hat on with, they give you another treatment. We have it from persons who have tried it that next to taking dinner with Chauncey M. Depew it is, for the time being, the most effective cure that has been devised since the good old days of Medford rum in New England.—*Washington Post.*

BACILLI IN NEW-LAID EGGS.—New-laid eggs are supposed to form the perfection of food both for invalids and persons in good health, the former especially. But even they are liable to be invaded by bacilli. A writer in a foreign science weekly has discovered that the red coloring sometimes, although rarely, found outside the white of a fresh hard-boiled chicken's egg, after taking off the shell, is due to a microorganism. He tried to cultivate it, and succeeded. A potato substratum was in a short time covered by an intense growth of *Bacillus prodigiosus*. We thus have here a bacillus inside a fresh egg, which withstood being boiled for a certain time without its vitality being in the least impaired. The lesson to be drawn from this experience is never to eat an egg, however fresh, which has a reddish tinge in its white.

SALT-WATER BATH GOOD FOR THE EYES.—Once or twice a week, at least, bathe the eyes in salt and water; and occasionally, where the eyes are dull, a little orange-peel juice squeezed in them at night will give them brilliancy without injury. Belladonna only as a beautifier should be absolutely avoided. It gives a large brilliant look to the eyes for a time at the expense of every healthful function. Oculists are occasionally compelled to use it, but except when under the care of a specialist it should never be touched. Never strain the eyes on rising. Do not read before eating. Tired eyes may be bathed in a solution of alum and rose-water, and an early sleep be taken to restore their brilliancy.

A NEW MEDICINE SCRUB.—It has been ascertained that the berry grown on the Florida scrub palmetto has medicinal qualities. It has a soothing effect on the mucous membrane, producing pleasing sensations in the throat, and relieving soreness, coughs, catarrh and cold in the head. It is also beneficial in kidney trouble.

THE FRUIT OF INTELLIGENT OBSERVATION.—While strolling through the Paris Exhibition, it is said Mr. Edison accidentally hit upon a tool that he calculates will save him something like $6000 a year. It is a chisel worked by hydraulic pressure and will enable him to reduce his labor by 18 hands.

USEFUL INFORMATION.

WOOLEN GOODS RUSTLING LIKE SILK.—There is a little Yankee dressmaker in an Eastern city, who, according to a local paper, has just evolved a new and lucky idea, and is thriving on it already. When ladies come to her with the goods to make up an ordinary worsted dress, she asks: "Will you have it made to feel like silk or wool?" Then the owner of the dress naturally inquires into the meaning of the question. "It's all in the lining. I can give you a lining that will rustle like silk when you walk along the street, and that will make you think whenever you touch it that it is silk, and it will only cost you 30 cents a yard." "Oh, no," the economical dresser says, "I cannot afford it." "Then you will have a lining at six cents a yard without any frou frou?" the little dressmaker despot says in disapproving tones. But the fancy of the patron is caught by the alluring prospect of having her woolen dress rustle like silk, and she leaves an order for this cloud of silver lining. And the catchy little device is a success of the art.

A BEET-SUGAR FACTORY FOR SAN BERNARDINO COUNTY.—According to the Los Angeles *Herald*, arrangements have been completed to put up a large beet-sugar factory at Chino, San Bernardino county. The main building will be 350 feet long by 100 feet wide, and six stories high. The plant will cost $300,000. The American Sugar Co. of this city is backing the scheme. It is to be a crude-sugar factory and refinery combined. The same authority says that another crude-sugar factory will be built at Anaheim, and a third at some other convenient point, both in Los Angeles county, to furnish the crude material for the Chino refinery. The sugar-beet industry of this State is no longer problematical, and no part of the State possesses greater facilities in the way of soil, climate and facilities of transportation than do Los Angeles and San Diego counties.

COVERING TUBERS AND ROOTS IN PILES.—M. J. Byrne writes us that he finds the old-fashioned way of storing potatoes, turnips, mangolds, etc., as practiced in Ireland, succeeds well here. The vegetables should be dug, allowed to lie a few hours, not a few days, as is too often done here, which results in injury to the vegetable by prolonged exposure to the sun. Pile in long piles, four feet at the base and tapering to the top. Cover with straw or rushes and then with a foot of earth. Sometimes openings are made at the sides to allow access of air to prevent heating. The leaves are removed from the beets and turnips except that those on the outside rows are sometimes allowed to retain the leaves. Roots thus buried, keep well from October to February.

YOUR OWN WEATHER PROPHET.—When a storm is advancing, the wind blows to meet it. Thus a wind blowing from the east or southeast indicates a storm from the west. When the storm center has passed, however, the wind changes and follows the storm. If a person has a good barometer and a wind-gauge he can tell pretty correctly when a storm is coming. Without the instruments the clouds may be watched, and when seen to be moving rapidly from the southeast, and there are indications of the presence of much moisture in the air, a storm is not far away.

COTTON DUCK FLOUR BARRELS.—Telegraphic advices from Atlanta, Ga., speak of a possible revolution in flour-barrel making growing out of the granting of a patent for the making of barrels out of cotton duck instead of wood. According to the telegraphed account, "the new material is impervious to water and resists fire for a long time. It weighs to the barrel about 15 pounds less than wood, and can be manufactured 10 per cent cheaper. The cotton duck barrel can be rolled up into small space and returned to the mill for frequent use. The barrels can be thus returned as solid goods, and thus save space."

WHAT CANNED GOODS HAVE DONE.—Furnished the masses with cheap and healthy articles of food; helped the grocer to increase his business and add to the appearance of his store as well as to his profits; increased the pleasure of the table in seasons when fresh fruits and vegetables are unobtainable; it has lessened the labor of the housewife, as canned goods need but little preparation to serve them ready for the table. It has given labor to thousands interested in their manufacture, and rich and poor alike enjoy at moderate cost these productions.

HAND GRENADES for the extinction of incipient fires are now found in corners and corridors of many public and private buildings, and their efficiency if used with promptness is generally admitted. There is no necessity, however, for paying fancy prices for them, as ordinary bottles filled with the solution will answer every purpose. The solution is composed of one pound of common salt, one-half pound of sal-ammoniac, dissolved in about two quarts of water, and so such simple means of fire prevention may readily be made by any one.

HOW TO DETECT COUNTERFEIT BILLS.—Take a United States bill of any denomination and hold it up to the light, and you will see two lines running across it lengthwise. Upon examination you will find these to consist of a silk thread, a red and a blue one. Every genuine bill has this mark of genuineness. Without these marks a bill may be put down as counterfeit, no matter how good the engraving on it. No paper-mill dare make that sort of paper, and that is the Government's only protection on its currency.

A NEW THING ON RATS.—A Nashville druggist prepared a rat paint made of a preparation of phosphorus. Catching a rat, he painted him with the preparation, and after dark, when the rodent was gleaming like a fireball, he turned him loose to mingle with fellow-rats. Dire consternation came upon them when he appeared, and they incontinently fled, the phosphorescent rat bringing up the rear. Would it not work equally well with squirrels and gophers?

AFRICAN IVORY.—Stanley brought with his expedition to the coast 31 tons of ivory from the Upper Congo region. A portion of that ivory has already reached Europe and been sold at Antwerp for parties in Sheffield, England. The large tusks are said to be very fine, and at the sale prices ranged from $325 to $425 per tusk. Thirty-one tons at the latter figure would amount to $263,500.

THE ENGLISH SPARROW.—"The day is not ten years distant," says a scientist, "when the United States will be damaged more by its English sparrows than by all the weevils, cutworms, crows, blackbirds, rabbits, hawks, fleas, bees, motar curculio, droughts or floods. He could not to-day be got rid of for $5 000.000 in cash. He damaged us last year $25,000,000."

CORN OIL is expressed from the germs of maize which are separated in making starch. They yield a sweet, non-drying, creamy oil which is excellent for liniments and other pharmaceutical uses. At Forestville, Ct., these germs are separated and canned, and make a delicious food which is sold under the name of "Kornlet."

SIX DYNAMITE GUNS are now being constructed by the New Jersey Steel & Iron Company of Trenton, N. J. The guns are to be 50 feet long, 11 inches in diameter, and will be made in three sections. The guns are to be completed by January 1st next.

A HEAVY CASTING.—An iron cylinder weighing 24,000 pounds and measuring 14 feet in length by 5½ feet in diameter was cast at the Fulton Iron Works in this city, on Tuesday, the 17th inst., for the North Pacific Railroad Co.'s new ferry-boat.

COPPER VESSELS which have become coated with black can be effectually cleaned by scrubbing with fine sand. Dilute nitric or oxalic acid is efficacious, but both are poisonous, and should be used with care.

WHERE PERFECT GLASS IS MADE.—The French factory of Mantois is the only one in the world where glass large and perfect enough for the lenses of a big telescope can be successfully cast.

ELECTRICITY.

Danger from Electricity.

That Boston should have been seriously scorched on Thanksgiving Day by the undue energy of crossed electrical wires argues nothing against the use of the electric fluid as an illuminator or mechanical motor. It simply indicates the imperfection which attends the introduction of all dangerous systems into social life, but which the age of improvement will in time render innocuous as their nature becomes better understood. Lives have been sacrificed and property burned, and there will be more of these disasters until the time arrives when proper safeguards, born of these rude experiences, will be adopted and life and property will be no longer jeopardized.

If all sorts of wires are run in all sorts of ways about a city, and by persons who are not thoroughly versed in the science of the business, and at a time, indeed, when the full knowledge of the full dangers of the business has not yet been learned by any one, it need not be thereby assumed that such use of electricity cannot be safely made. The headlong energy of the authorities of New York in cutting down poles and destroying wires at a time when the agents and owners are honestly and earnestly striving to remedy the evils and dangers of the wires, is not wise. A careful, candid study of the situation to trace the cause of the accidents, with a view to remedy the evil, would be much more to their credit. The very small number of such accidents in the whole world during the existence of these necessarily fatal systems certainly indicates that the problem is comparatively simple. By using high-class insulated wires such as are already largely in use, and by planning circuits so as to prevent such snarls as now exist, the danger can be almost entirely removed. Some accidents are bound to happen just the same as in other industries in our crowded cities.

As well might we make war against the use of gas because 15 people "persisted in absentmindedly blowing out the gas" in the city of Chicago in the year 1888. Fortunately the scarecrow articles of a few interested individuals cannot block such an industry in this country, and we may, therefore, look forward to the establishment in the near future of much larger and more numerous installations for the distribution and use of electricity. The first Atlantic voyage of Columbus was a hazardous and fearful adventure; a voyage to Europe is now a safe and pleasant pastime. "Time conquers all things" in more senses than one.

ELECTRICITY IN POWDER MILLS.—The German technical journals have recently published some instructions as to the precautions which ought to be observed in powder-mills to prevent explosions attributable to electricity. In a large powder-mill in Germany an explosion lately occurred in the press-room. A workman engaged in pressing powder into cakes between sheets of ebonite left his work during a thunder-storm. When the storm was over he loosened the press, and, on putting out his hand to remove the powder, a spark four inches long went through his body, igniting the powder and killing the man. The employment of insulating substances, such as gutta-percha, ebonite, etc., is therefore considered as liable to lead to accidents. In one of the principal powder-mills of Germany the sulphur-crushing machines are all put to earth; and since this precaution has been taken there has been no trouble from the mysterious explosions which had previously proven so troublesome.

AN ELECTRIC PENHOLDER has been devised which contains a thermo-pile, which means pairs of metals of the thermo-electric scale, such as copper and German silver. When the pen is in use the thumb and fingers form a connection, and the heat generated by the hand induces a current of electricity, as the inner joints of the elements of the pile will be cooler than those which are exposed. This current passes through the fingers and thumb, and is advantageous in preventing pen-paralysis. By sliding along the metallic ring, so that it will make contact with the exposed portions of the thermo-pile, a shunt is effected which prevents the current from passing through the hand. The device was invented by William C. Holmes of Waterbury, Connecticut.

ELECTRICITY TO PREVENT ACCIDENTS.—A very useful electrical invention, tending to lessen the possibility of accidents in factories, is now being extensively adopted in Leeds, Eng. The breaking of a glass, which is adjusted against the wall of every room in the mill, will at once stop the engine, an electric current being established between the room and the throttle-valve of the engine, shutting off steam in an instant. By this means the engine was stopped at one of the mills recently in a few seconds, and a young girl who had got her clothes entangled in an upright shaft was released uninjured.

ELECTRIC LIGHTING is said to be one of the hardest kinds of work for a steam engine. The continuous running and the work being thrown on and off instantaneously cause an immense strain.

Passing Events.

The heavy rains have continued all over the State, causing considerable damage to lowlands, railroads, bridges, etc. More rain has fallen for the season than has ever been experienced since the settlement of California.

The Government engineers have been examining the Sacramento river with a view to its immediate improvement, but if they are reported correctly, they think it wiser to wait for a low stage of water.

The starting up of the new $150,000 reduction plant of the Eureka & Excelsior mine at Cracker Creek, Oregon, marks an era in that section. The mill is a most complete one, as the brief description in our "Mining Summary" shows. The mine belongs to Eastern people who have invested a large amount of money in the property.

The Anti-Debris Association has passed a resolution, published in another column, asking the Secretary of War to expend the appropriation made some years since for the improvement of California rivers. The appropriation was withheld by the Secretary until hydraulic mining should cease. Congress has already passed a joint resolution ordering the expenditure.

The horrible accident by which 16 miners lost their lives in a mine at Angels, Calaveras county, is the worst that has ever occurred in the history of mining in this State.

This number of the PRESS marks the close of a volume—a very good time, by the way, for new subscribers to send in their names for the oldest mining paper in the United States.

Close of Volume LIX.

The MINING AND SCIENTIFIC PRESS is the only paper devoted to the mining industry in the United States which can truthfully put Vol. LIX in its heading, since it is by far the oldest of such publications. It has recorded the growth of the precious-metal industry in this country and progressed with it. When the first number of the PRESS appeared, gold and silver mining was confined to a few places in the Pacific States, while now the whole region has mining camps scattered over it.

Growing as it has with the mining interests, and devoted to practical mining matters, the PRESS is of every-day use to its subscribers, all of whom can gain from its columns more or less information to be applied to their work. Aside from this specialty, more or less mechanical, industrial and scientific news is to be found in its columns every week, and many miscellaneous subjects are treated, as the complete index on the last page will show.

During the past year the number of illustrations has been largely increased; 20 pages are printed weekly in place of 16, as formerly. This increase in size has been found necessary in order to make room for more reading matter.

While the end of the volume is a good time for old patrons to renew their subscriptions, it is also a suitable period for them to call the attention of others to the merits of this journal. The PRESS has always been devoted to the welfare of the practical mining community and publishes that which is useful and interesting to them. New methods, processes and machines are fully described or illustrated, so that each may know what others are doing. The publishers and editors spare no trouble in gathering information from all sources and presenting it in readable shape. It is their aim to constantly improve the paper and make it more valuable to its readers.

Before the next number of the PRESS appears, 1890 will have commenced, so that we may take this occasion to wish our patrons all a "Happy New Year."

More Mineral Land Gone.

A dispute involving mineral and pine lands in Northern Wisconsin, worth over $1,000,000, has been decided by the United States Land Office. The Cranberry Lumber Co. of Saginaw, Mich., the Musser Sauntry Land, Logging & Manufacturing Co. of Muscatine, Iowa, and the Superior Lumber Co. of Mason, Wis., filed notice of intention to offer final proof on certain lands aggregating 20,000 acres. F. M. Dudley, land attorney of the Northern Pacific railway, and W. F. Shea, attorney for the alleged settlers on the land, appeared and presented a protest. The land officials declared the lumber firms mentioned above had established their ownership and filed their final proof.

Among the lumbermen, the agricultural claimants and the railroad companies, if this sort of thing goes on, it will not be many years before most of the mineral lands belonging to the Government will be in private hands, and miners will have to buy their mining ground from lumbermen, farmers or railroad companies. It seems that in all these questions the miners are beaten, the corporations getting the best of it in most cases. The recent decision of Judge Sawyer of this city is a most unfortunate one for the miners of California, and though it must still be passed on in the U. S. Supreme Court, it looks as if the railroad company had the good end of the bargain.

LABOR REFORM AT HOME.—The N. Y. *Journal of Commerce* thinks that the labor reform really needed is the emancipation of the women of the laboring men's families from the slavery of 14 to 16 hours of daily work in the household, and that the demand for reducing the *men's* working time to eight hours has no justice in it where those men do not reduce the much longer working time of the women of their own households, and it calls upon all members of the Federation of Labor to begin a labor of reform in their own homes.

Important Suit.

Leading members of the Mining Stock Association of this city deserve more than passing credit for the persistent and efficient manner in which they have prosecuted the action brought by Smith et al., stockholders in the Kentuck Mining Co. of Gold Hill, Nev., against Palmer et al., including ex-Governor Stevenson of Nevada, for a full accounting under a contract made with Stevenson in 1882, for a royalty upon the ores of the Kentuck mine, situated in Storey county, Nev. Upon the result of this action probably more than upon any one thing else hinged the certainty that many of the abused stockholders in several of the mines on the Comstock lode, Virginia City, will, through the courts, have much of their money refunded. Not only will this be the case, but the badly abused mines can and doubtless will be made to be managed more upon a business basis. The way in which many of them have been conducted has been outrageous, and of such a character as to keep honest investors of large means from putting money into their shares. So flagrant have the abuses been carried on that it looked as if the officers of the companies have grown into the belief that they were above the law and that the rights of stockholders are in no way to be considered. It required just such an action as the one cited above to bring them to a realizing sense of their true position, so stockholders can have their interests looked after, and failing to do this, then the latter can put other and far more competent men into the management of the mines.

Lead Ores and Congress.

So much public attention has been called to the injustice of the ruling of the Secretary of the Treasury which admits lead ores free of duty into the United States from Mexico and Canada, that Congress is bound to take action this session. Mr. Bartine of Nevada has offered the following concurrent resolution in Congress:

WHEREAS, By paragraph 188 of the Tariff Act of March 3, 1883, it is provided that there shall be levied and collected on imported lead ores a duty of 1½ cents per pound; and

Whereas, The Secretary of the Treasury, in construing said paragraph, has ruled that when such ores contain a greater value in gold or silver, they shall be classified as gold and silver ores, as the case may be, and admitted without payment of any duty; and

Whereas, Under said ruling many thousand tons of lead contained in such ores are annually imported into the United States free of duty, whereby the Government is largely defrauded and the lead-producers of the country are deprived of that protection which the law was intended to give them, and are subjected to the injurious and great destructive competition of the peon labor of Mexico, in consequence of which the lead-mining industry of the United States is greatly depressed and in danger of utter ruin; therefore,

Resolved, That it is the sense of Congress that any ore which contains lead in sufficient quantities to make it valuable for commercial or industrial purposes is a lead ore within the meaning of said paragraph 188, and the Secretary of the Treasury is hereby requested to modify his said ruling accordingly.

Of course the great smelting companies of the Southwest, which have been making piles of money under the existing Treasury ruling, will try to prevent any legislation of this kind, and as they have great influence, it will be necessary for the miners and their friends to keep agitating the subject if they wish for any relief from the present situation.

Recording Mine Labor.

The mining laws of the U. S. do not require the recording of labor affidavits for annual work performed on unpatented locations, but it is customary, nevertheless, to do so as a matter of precaution. In case of a sale of the property the title is more easily proved and illegal relocations are easily beaten. As soon as the annual labor is completed, it is much better for those who have done it to make affidavit and record it with the recorder of the district. If the mine is in a region where there is no district recorder, the recorder of the county may be applied to.

It is just as well to comply not only with the letter of the law but the custom of the miners in such cases. It is a very simple matter to make record of the work done and involves only a trifling expense. Where men have partners who do not do their share of work, it is necessary to advertise the delinquents in order to get rid of them. While it is not necessary to advertise the completion of necessary annual expenditure work, it is the part of wisdom at least to make a record of the fact that it has been done.

The Mine Accident at Angels.

On Sunday evening last a disastrous cave occurred in the Utica mine, Angels, Calaveras county. A gang of nineteen men went down that evening to repair the timbering in the 400-foot level. They noticed that the side timbers were bulging considerably and had scarcely begun work when a cracking of the timbers gave notice of what was about to occur. The men made a dash for the shaft, but only three reached it. The rest were buried. A rescue party worked all night, but had succeeded in getting in only eight feet, and had not recovered any of the bodies. Superintendent Lane has written to Hayward & Hobart, owners of the mine, to the effect that the mine was considered unsafe on account of the spongy condition of the earth above the 330-foot level, and he had ordered the usual retimbering precautions taken. George Williams, the boss timberman, an old and very reliable man, went down to the 330-foot level on Sunday afternoon to retimber the portion of the mine in and about the stopes on that level. Suddenly, and without a moment's warning, the crash came, and the men were literally buried alive.

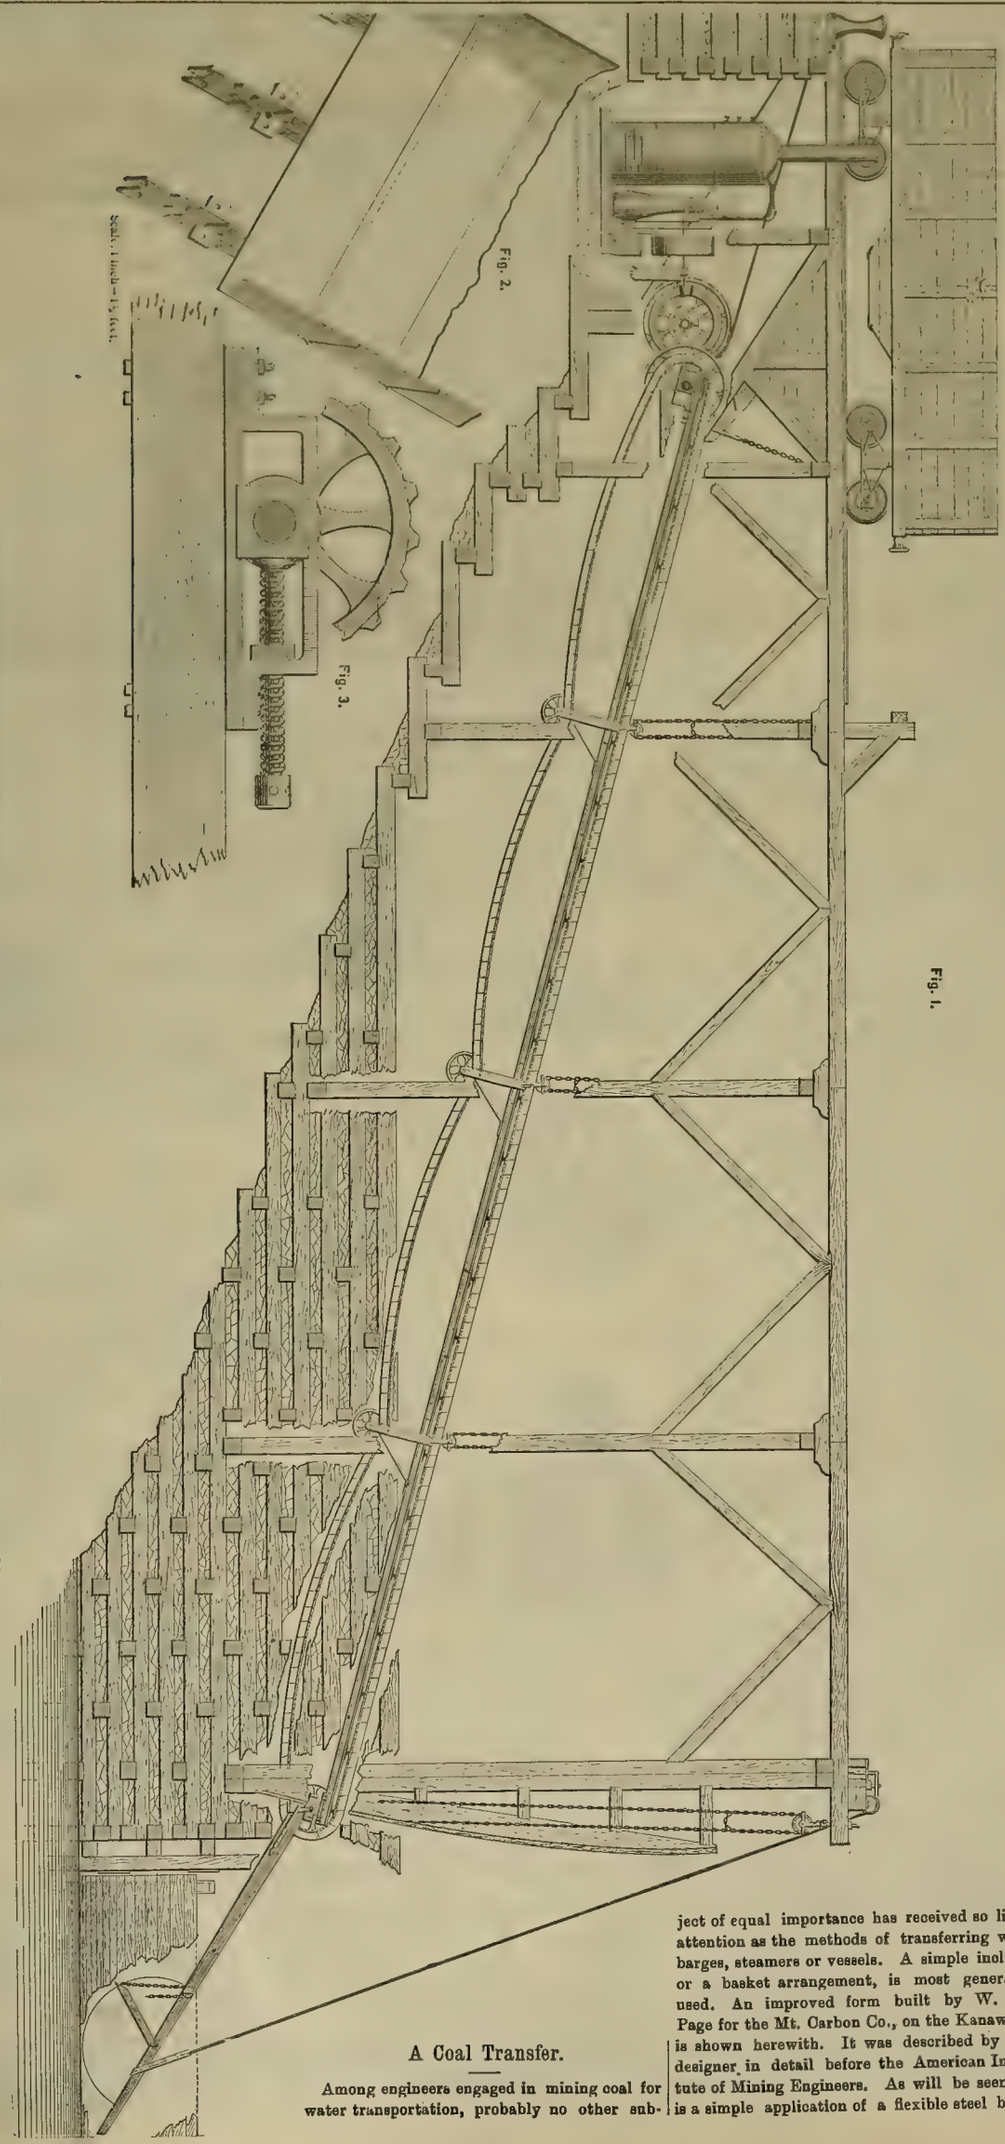
Immediately after the accident, men were lowered down the shaft, and entering the mouth of the drift, they commenced digging into the debris. They found the attempt almost useless, as the timbers seemed to have been woven together, as though the sides of the drift had fallen toward each other and had been covered by the roofing.

On the following Tuesday the surface of the mine caved down to a depth of 40 feet, and the cave extends along the vein from the north shaft to the south shaft, and is about 30 feet wide. No bodies have been recovered, and all work to recover them has stopped.

It is reported that another miner, named Carlo Duzzetti, is killed in the mine. If true, this makes the seventeenth victim. He leaves a wife and two children. Three of the other unfortunates were married.

The following is the list of the entombed miners: Tom Knuckey, who leaves a wife; Geo. Williams, who leaves a wife and four children; J. Brady, a married man whose family is not known; Nick Eucich, B. Segal, Peter Pernio, C. Bertro, Paul Owlovich, John Butoltto, John Tobocco, C. A. Pollard, Joseph Curnow, John Martin, Mitchell Brondwich, Jas. Casey, Wm. Vincent.

The names of the ones who escaped are: August Anderson, uninjured; Thomas Corwin, badly cut about the head, and Daniel Danielson, slightly injured.



Mr. Hayward says of the accident: "The timbers in the level where the men lost their lives were strong and stout, being from 20 to 30 inches through, and the only cause of the caving is to be attributed to the complete saturation of the soil, which is of a clayey and slaty character, increased thereby in weight, and making the timbers bulge out until, with the general crash, they came together. There was no possibility of saving the men three minutes after the drift caved in, and the escape of the three men in the drift at the time was miraculous. Even as it is, we cannot do anything while this weather continues, as almost any attempt to rescue the men will be attended with great danger. I think there is scarcely a chance to find one alive, if we find them at all.

"You will understand that the ground has caved down to the 330-foot level, and from there upward. Where the cave occurred it is 530 feet, and there are two levels below.

"The elevation of the mine is from 1100 to 1400 feet above the sea level, on a partly flat portion of the ground, which, in that vicinity, has a rise and fall. The reports to the effect that the drift was 12 feet wide are untrue. It was 35 feet wide. If it had been only 12 feet wide, the accident would not have occurred."

RICH silver ore has been struck by R. F. Cunningham and J. C. King on a ledge 20 miles from Oro Grande, in San Bernardino county.

A DEPTH of above eight feet of snow is reported on the mountain ranges forming the watershed of the Carson river.

ARRANGEMENT FOR TRANSFERRING COAL FROM CARS TO BARGES OR STEAMERS WITHOUT BREAKAGE.

A Coal Transfer.

Among engineers engaged in mining coal for water transportation, probably no other subject of equal importance has received so little attention as the methods of transferring with barges, steamers or vessels. A simple incline, or a basket arrangement, is most generally used. An improved form built by W. N. Page for the Mt. Carbon Co., on the Kanawha, is shown herewith. It was described by the designer in detail before the American Institute of Mining Engineers. As will be seen, it is a simple application of a flexible steel belt, four feet wide, with six-inch flanges, and 95 feet from center to center of sprocket shafts. The drawing is on a scale of one inch to ten feet. The three chains are made of steel bars. Each alternate link has a two-inch flange to which is bolted a segment of the belt, as shown in the detail drawing; consequently, every other link is an idler, which increases the flexibility of the link. The segments are made of No. 12 gauge soft steel, and lap three-fourths inch. The lower lap is curved downward, for which the idle link is notched.

The hopper under the car holds less than a ton, consequently, the belt practically draws the coal direct from the car after the hopper has been once filled. The feed apron is narrower than the belt and is adjustable so as to feed automatically, the coal on the belt regulating the change. The feed is regulated to any desired load, and no attendant is required. The links of the loaded chain run in small flanged rollers, placed every few feet on six-inch girders, 24 feet in length, with fish joints at every point of suspension. It will be seen that there are four such points within the 95 feet, for which have been used eight two-ton differential blocks, four on each side. Blocks were cheaper than counterweights.

The total weight of belt and attachments, exclusive of the upper or fixed shaft and sprockets, is five tons; and the level load is five tons; consequently, each revolution of the belt conveys a little more than ten tons. The arrangement for returning the empty portion of belt consists of three pulleys, 2 feet in diameter by 12 in face, set on the shaft so that each pulley supports a chain. To suit the different stages of water, the entire system can be readily raised or lowered at one end by one man, care being taken to have the girders in line when the proper elevation is reached. The guide on the movable end is an arc of the circle to which the belt is radius; though to cover any inequalities or spring in the timbers, the fixed ends of the girders are provided with movable connections to the main shaft, which is also provided with extension-boxes, to facilitate making the connections. The chute which distributes the load in the barge is built of light steel, arranged so as to convey the coal to both sides at the same time, the proportion delivered to either being regulated by the angle of inclination. It is adjusted so that the coal moves in it very slowly, and has a minimum drop into the barge. When the sides have been fully loaded the hinged apron is folded back, and the discharge falls in the center of the barge, which is thus loaded so as to require little or no leveling.

In describing this Mr. Page says: "It is apparent that the greatest inclination of the belt should not exceed the friction-angle of coal on iron; and that, within certain angles, gravity will revolve the belt, on the principle of an ordinary incline. Though I put a brake-wheel on the main shaft, intending at the time to use gravity-power, I determined later to make use of a small 6x8 inch engine, which was on hand to operate a capstan for handling the barges. I connected the belt with it and made the greatest angle of inclination only 15 degrees. The belt is speeded to 100 feet per minute—the engine making 150 revolutions—and makes a complete revolution in a little less than two minutes. In actual practice, the belt empties a 12-ton car in two minutes, or at the rate of 360 tons per hour. This capacity can be increased without additional expense by simply increasing the speed of the belt, or, at a very small additional cost, by increasing its width.

"As the belt has never been operated by gravity alone, I am not able to say exactly what the factor of friction is, but am satisfied that it will revolve between the angles of 10 and 20 degrees; or in other words, it can be operated by gravity alone."

The little engine mentioned will run the loaded belt without difficulty in a horizontal position. The total cost of this appliance was $5600, including engine, capstan and all gearing. In actual working, only two men are required to run this conveyor to its full capacity, an engineer, who also attends the capstan, and one man in the barge. The trainmen dump the cars. The tracks are arranged so the loads run in, and empties out, on down grades.

Apart from the advantages already named, it has been clearly demonstrated that both coal and coke can be put in barges with half the breakage of any other arrangement; that there

is nothing complicated to get out of order; that, as the barge sinks in proportion to the load, the belt has to be moved only for the different stages of water. Moreover, there is no danger to life or property from the breakage of any part, as is the case with the vertical system, in which the breaking of a rope may cause the loss of life, barge and car. With self-dumping cars, this machine could transfer 4000 tons in 12 hours, at a cost of about two-tenths of a cent a ton.

Fresno County Mines.

[From Our Own Correspondent.]

Grub Gulch.

Entering the county from Mariposa county via Grant's Springs, the first mines encountered are those at Grub Gulch. Here the Josephine is running 20 stamps on rock reported as averaging $10 to the ton. The Gambetta is running a roller-mill on rock that the owners claim will excel that of the Josephine. The Crystal Springs mine is idle. The ore here is free gold and sulphuret. Just over the hill at

Coarse Gold Gulch

Is the Flying Dutchman, with a 100-foot shaft on a four-foot vein of quartz carrying free gold and sulphurets of a value of from $8 to $70 a ton, by assay. There is a slate hanging and granite footwall. The mine is located on the south bank of the Fresno river, and, in consequence, free water for power can be secured for seven months in the year and water for batteries and boilers all of the year.

Texas Hill.

This mine is the property of J. B. Haggin & Co., and while it is known to be a valuable property by reason of over $40,000 having been expended on it in development, the owners content themselves, for the present, with keeping out the water. Once this mine is put in operation, Coarse Gold Gulch will soon come to the front in quartz mining.

Hawkeye.

Numerous tunnels up to 700 feet in length have been run on this mine, showing a vein 30 feet in width. The 5-stamp mill is idle at this time, but drifting is going on steadily.

Last Chance.

This mine has a 10-stamp mill, and the owners have drifted 500 feet on the vein. Mr. Hearst offered the owners $30,000 for the property.

Quartz Mountain.

Owing to the stupidity of a Portuguese, I did not get to see the superintendent, but learned from others on the mine that the company had expended some $80,000 on a ditch and a far larger amount in improvements, while the developments consist of a 60-foot tunnel. They have a fine class of improvements and a good 60-stamp mill. The property is owned by a French syndicate, and it is reported that a reorganization is about being effected, when the mine will be thoroughly developed, and this mountain of quartz made to give up its golden treasure.

Mt. Raymond.

The Shaw Mining and Reduction Co. of Helena, Montana, has a fine plant on their property, capable of reducing 120 tons a day, which is idle at this time. The plant will be reconstructed the coming season, so as to save a greater per cent of the value of the ore, which is silver, bearing a large percentage of galena.

Hildreth.

This camp "looks like one forsaken" at this time. The Abbey closed down on the 11th of September, and the miners closed out soon after. In the Abbey there is still 300 feet of backs above the upper level, which may be worked at some future time. In the time of her successful running the 10 stamp mill turned out $8000 to every stamp each 10 days. The mine has been developed to a depth of 700 feet. The vein holds its size, but its character changes from gold to silver as depth is attained.

Morrow Mine.

This property is owned and operated by the first owner of the Abbey, Mr. J. Morrow. On the Morrow an incline shaft has been put down 235 feet, on a vein of an average width of 14 inches, and an average milling value of $33 in free gold. The footwall is slate; hanging-wall, porphyry. A drift of 140 feet has been run on the 100-foot level. The 5-stamp mill is pounding away right merrily.

Auberry.

The old "Harron Mine" is astonishing its present owners by the character of its ore. This property was bought for $250 and shows in the two incline shafts of 103 and 115 feet an average width of four feet to the end of the 135-foot drift which carries a pay streak 18 inches in width that "arastras" $60 to the ton. The entire vein is good $40-rock. For want of sufficient water the present owners confine themselves to the two arastras. The vein is in granite, but is free on its walls. Numerous locations have recently been made on the course of the vein and all show free gold in paying quantities. I did not get into Fine Gold in consequence of the storm and almost impassable roads for which Fresno county is deservedly famous. At Kings Creek the snow was reported as being eight feet in depth, and I was compelled to pass that section by. From what I could learn of this much-boomed section, its safety lies in its being inaccessible. Reliable citizens state that the ores are base and of only moderate value.

In Fresno county the mines, as a rule, are owned by what the miners term "Alfalfa Miners," who are similar to the "Pumpkin Miners" of Colorado. These men, while very good citizens and, no doubt, successful farmers, are entirely out of their element in mining. They want the results first. In consequence, they gouge out a bunch or swell in a shoot and when the bunch gives out or the vein pinches, they stop. There is no development and no ore reserves, and in consequence a very small measure of success. That the mines do as well under the circumstances is to the credit of the mineral section of the county.

E. H. SCHAEFFLE.

Coast Industrial Notes.

THERE has been quite a falling off in the amount of lumber cut in the Truckee basin the past season. The causes of this were several. The low state of the water was a serious drawback to the millmen. For this reason the Truckee Lumber Co. was unable to drive many logs and the other mills could not flume lumber. This caused them to suspend operations early. Then the demand for lumber has not been as heavy as usual. The Verdi mill of the Truckee Lumber Company did not run, we understand, because of some litigation over the property. The cuts of the various mills are as follows:

Lewison & Smith	3,000,000
Truckee Lumber Co.	3,000,000
Elle Ellen	3,500,000
Geo. Schaffer	5,500,000
O. Lonkey	3,000,000
Boca Mill Co.	7,000,000
Pacific L. & W. Co.	5,000,000
Essex Mill Co.	2,500,000
Richardson Bros.	3,500,000
Total for season	36,000,000

AN IRON CYLINDER has recently been cast in the shops of the Fulton Iron Works, which is intended for a ferryboat to be constructed by the San Francisco & North Pacific Railroad Co. It has only one equal in size in use on the ferryboats on the coast. It is 14 feet in length, 5½ feet in diameter, and weighs 24,000 pounds. The machinery for the new boat is the largest ferryboat machinery ever manufactured in the shops of the Pacific. From the bottom of the bed-plate to the center of the beam is a distance of over 41 feet. The new boat will probably be ready for use some time in the spring.

A DISPATCH from Tacoma dated Dec. 16th says: The Ryan smelter, which is approaching completion beyond Oldtown, changed ownership to-day, being purchased by Denver and Tacoma capitalists. There has been some delay in completing the work, owing to negotiations for the purchase of the immense plant. Hearing this, and to further the project, President Thos. F. Oakes of the Northern Pacific Co. wired that it would be necessary to secure $50,000 of the required stock in Tacoma. Within half an hour after the telegram was received, the amount had been taken up here and the sale was closed. The work under the new management will be pushed as rapidly as possible, and it will not be long until the smelter is finished and at work.

IT is stated that Los Angeles capitalists have recently visited Stockton to purchase 300 acres of property outside of the city limits, the price to be about $250,000. Twenty-five thousand dollars has been paid down on the trade. The purchasers refuse to say what they will do with the tract, but it is believed that manufactories will be erected to use natural gas for fuel. Four Sacramento capitalists, with Civil Engineer Grunsky as expert, have visited the Stockton natural-gas well to gain information for a syndicate which was recently organized to bore for gas in Sacramento.

THE California State Co.'s quarry, Chili Bar, two miles from Placerville, El Dorado county, is now opened up in good shape, and they are taking out large quantities of slate daily. The first gallery (they work in galleries or benches) they opened is now so far advanced as to allow the working of the lower gallery. For this purpose they have run a tunnel 100 feet long, which is 80 feet lower than the gallery opened. This gives them a hight of 120 feet of solid slate, 80 feet wide at present and widening out every day. The slate is of the finest quality and texture, and is in great demand. They are now preparing to increase their force of slate men and fill some of the large orders on hand, some of which are as high as 700 squares. Mr. Bind has completed a large water-wheel to run the trimmers, saws, and other machinery which is now in course of erection.

IT is reported that the Sierra Lakes Ice Co. propose to put in an extensive electric plant at its works at Prosser Creek. There is an abundant water-power at that point which can be easily applied to the above purpose. We understand that the light will be used in connection with the ice business. When the ice harvest is in progress it is usual to work at night as well as day, and the light will be distributed so as to illuminate the ponds and houses. Wires will also be extended to Boca, and the company's works there will be similarly lighted.

R. A. PINROSE, Assistant State Geologist of Arkansas, has been examining the manganese deposits on O'Banion's place, Mark West Creek, Sonoma county, with a view to developing them.

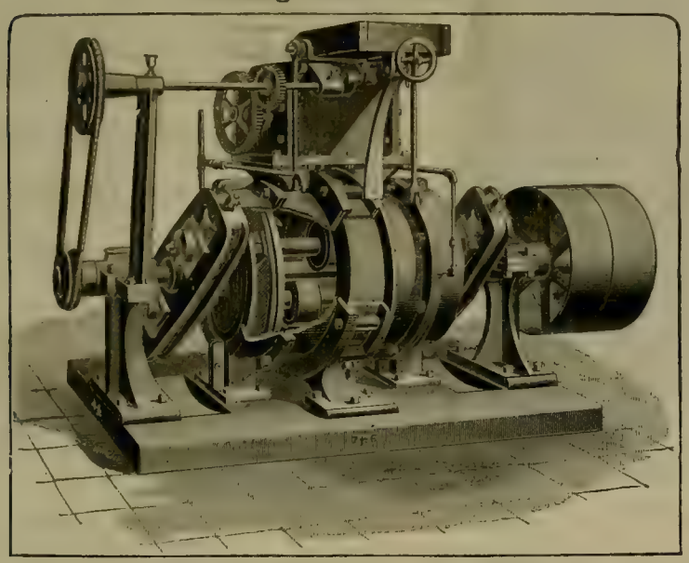
The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.



BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

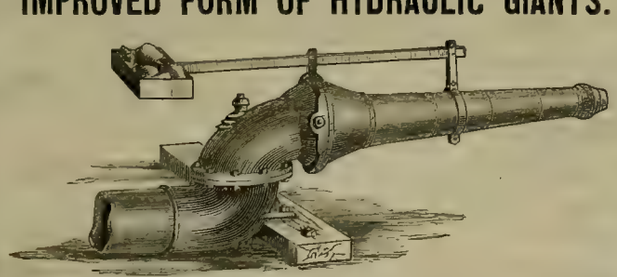
"WITTER'S SPRINGS." 16 miles from Lakeport, 20 miles east of Ukiah. Comfortable Hotel. Quiet Cabins. Lovely Scenery. Low Charges. Its waters are a sure cure for Dropsy, Scrofulous and Skin Diseases, Rheumatism, etc. Address H. L. DENIO, Upper Lake.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.



OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

The Pittsburgh Boiler Scale Resolvent.

☞This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one **is the only good thing we have ever used.** Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as **sulphate of lime, carbonate of lime, mud, and everything that is bad.** Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern; Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }

THE ROLLER ORE FEEDER
[Patented May 28, 1882.]

THIS is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.
Golden State and Miners' Iron Works,
Sole Manufacturers,

NATIONAL ROCKER QUARTZ MILL.
KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:
1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.
☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

PRACTICAL
Books on Mining
AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warnford Lock. 788 pages, with 8 plates and 271 engravings in the text. 8vo, cloth, $15.00, express prepaid.
IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Ross. This work embodies the information, collected during four and a half years, of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrages, flood protection, methods of regulation, locks, etc., have been treated in detail. 387 pages, large 8vo, with 26 plates and numerous engravings in the text. Price $15.00, express prepaid.
MEXICAN MINES.—Dahlgren's Historic Mines of Mexico, *only a few copies left;* price $25.00. Handbook to the Historic Mines of Mexico, price $1.00.

12 Cortlandt St., New York.

Books on Working Ores.
BY GUIDO KUSTEL, M. E.
ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.
This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 166 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco, Cal.

ATTENTION, MILLWRIGHTS!
A BOOK YOU ALL WANT.
Leffel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.
A STANDARD WORK.
This practical work of 288 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Pains have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill-owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.
Price 50 cents, post-paid. For sale by DEWEY & CO. 220 Market St., San Francisco, Cal.

The Centrifugal Auxiliary Propeller.

(Concluded from page 483.)

To give either of them two knots per hour extra speed with their present screw propellers would require 10,000 horse-power extra, or to give 21 knots per hour would require 28,000 horse-power.

Now, it is claimed for the Auxiliary patent propeller that its application to the stem of either of the above vessels, without altering the screw propellers, would give a speed of 22 knots per hour, without requiring any extra horse-power.

The inventor also claims that with an increase in horse-power in proportion to the cube of the velocity, this invention will increase the speed of either of those ships up to 50 knots per hour.

The scientific principles on which the invention is based are such as can only be required at high speeds. The purpose is to excavate the water ahead of the ship by the high velocity and keep it back by the centrifugal force of the revolving fan.

It has been demonstrated by the late William Froude and his son Edmund that in speeds up to seven knots per hour the principal, in fact almost the only, resistance to a vessel moving in still water is what he calls skin friction. That positive discovery led to improvements in the forms and rubbing surfaces of ships, and assisted greatly in making high speeds possible, but both they and every other naval architect who experimented on the subject of resistance to ships moving through water have acknowledged that at speeds beyond 10 knots per hour there is a resistance which is not skin friction, which increases at an enormous rate with the increase of speed, and the exact law of that increase of resistance is still a doubtful question. Sir William Thomson, the greatest authority of the day on moving forces and resistances of any kind, mechanical or electrical, has brought his great talents and all the vast powers of mathematical analysis to bear on the subject, and he still leaves it an open question: so that at present no living man can give the exact law of the increase of resistance to bodies either partially or wholly immersed in water, at speeds above 20 knots per hour.

The wave theory of resistance (due to the experiments of Scott Russel) for a long time held sway, but the Froudes and others have relocated that theory to its proper place. It is well known to every one that a vessel moving through water produces waves. Scott Russel's theory was that the waves due to displacement are of two kinds:

1st. Wave of translation or great wave, which William Froude called a diverging wave.

2d. Wave of oscillation, called also a transverse wave.

Of these two waves Scott Russel said the great wave was the only wave of resistance, but Froude by the most careful experiments has proven that the wave of oscillation or transverse wave, as he called it, produces in some cases even more resistance than the diverging waves.

Scott Russel's formula for resistance to bodies moving in a boundless ocean is the same as if the body was stationary and the ocean moving and is expressed thus:

$$P = f \frac{v^2}{2g} \triangle r$$

Where P = Hydraulic pressure or resistance.
f = Form of surface = 1 40 to 1.80.
v = Velocity.
g = Gravity.
$\triangle$ = Area.
r = Density of liquid.

The above formula is approximately correct for slow velocities up to eight knots per hour, but entirely out at high speeds, hence the failures of the steamship Great Eastern, which was engined by Scott Russel to give a high speed on the above formula.

Col. Beaufoy in his experiments under water shows that up to angles of 50° to 60° the resistance varies with the sine of the angle of incidence. His formula is oblique resistance = direct resistance $\times$ Sine θ^2.

Raleigh, on the other hand, gives the following formula:

Let P = Direct resistance,
And P_1 = Oblique resistance;

$$\text{Then } P_1 = \frac{2\pi \text{ Sin } a}{4 + \pi \text{ Sin } a} . P = \frac{\text{Sin } a}{.637 + .5 \text{ Sin } a} P$$

M. Joessel of the French navy gives a formula expressing total front resistance in terms of the back resistance or drag. Thus:

$$P_1 = \frac{\text{Sin } a}{.39 + .61 \text{ Sin } a} . P$$

Where P_1 = Total front pressure,
And P = Total back resistance.

It has been thought by Froude, White, Thomson, and apparently by Beaufoy in his experiments, that a body such as a torpedo, wholly immersed in water, will not have the same resistance to motion that a partially immersed body has.

But as the experiments of Col. Beaufoy were carried on with bodies moving very slow, they are not at all applicable to bodies moving at high speeds. In the case of vessels moving at a speed over 15 knots per hour, neither wave resistance nor skin friction accounts for the great resistance experienced, so that we have to add to these head pressure and back pressure, both of which are due to the inertia of water.

In the case of head pressure or impact, a certain mass of water at rest has to be displaced so quickly that it has not time to form a regular wave, and at very high velocities the water ahead of the ship has to be displaced bodily, as if it was a solid instead of a liquid mass. Even at velocities not exceeding 26 knots, which Thornecroft's torpedo boats have obtained, the resistance of the water is such as to cause ("steeple-chasing") the boat to rise almost to the surface of the water. In the case of the back pressure at high speeds, the inertia of the water prevents it from falling in behind the boat quick enough, and a partial vacancy is so formed, also causing resistance.

Now how to overcome these two kinds of resistances is the problem which the inventor of the auxiliary propeller has set before himself.

Mr. Robert Stevenson, the inventor, is an engineer of 20 years' standing, having been educated at Glasgow University under the late Prof. Rankine. He has been resident on this coast for six years. He has secured patents for Great Britain and this country, and hopes by the application of the auxiliary centrifugal propeller to be able to give steamships and torpedoes a speed of 50 knots per hour, and also hopes to see the time when six days will complete the voyage from San Francisco to New Zealand.

Mr. Stevenson's idea of the action of the centrifugal propeller is that it makes a partial vacuum in front of the hull of the ship and keeps the water back like solid walls until the hull has entered, and so takes away the head resistance due to the inertia of the water and causes the ship to be pushed from behind by the water which rushes in to fill up the partial vacuum so formed in front, so that back resistance is also done away with, and by that means the speed of the screw-propellers behind may be increased without the additional loss due to slip, as the screw-propellers will be moving more or less in a mill-race.

The invention is in good hands, and it is to be hoped that we shall shortly see the fastest steam yacht in the world steaming in San Francisco bay.

Fifty knots per hour is a very high speed, but if this invention can convert a 20-knot ship into a 30 knot speed without increasing the boiler-power or the amount of fuel used, the invention will be ranked as one of the greatest of the age. It is apparently based on correct and scientific principles and thoroughly original in its conception.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WATCHMAN'S ELECTRIC TIME DETECTOR.—Henry L. Norton, Ukiah, Mendocino Co., and Fred W. Cook, S. F. No. 417,501. Dated Dec. 17, 1889. This invention relates to that class of time-detectors for watchmen in which an alarm at a given point or central station is sounded by the closing of an electric circuit, said closing being effected by means of a circuit-closer located at the watchman's station or stations, and operated by means of a time-piece. The invention relates particularly to that class of these devices in which the sounding of the alarm is indicative of the failure of the watchman to attend to his duty at given times, said alarm being prevented by an act of the watchman when he is attending to his duty. The invention consists in the novel means for automatically closing the electric circuit to sound the alarm and of preventing the closing of said circuit by the act of the watchman in the course of his duty.

COLLAR-STUFFING MACHINE.—Geo. E. Hoyt, S. F. No. 417,560. Dated Dec. 17, 1889. This machine is intended to stuff the bodies of horse-collars with straw or filling, by which they are properly shaped. It consists of a vertical hopper, a rotary and reciprocating auger by which the filling material is forced into the collar, and a mechanism by which the double motion of the filling auger is produced, and by which the material is properly stirred and loosened up.

COLLAR-STUFFING MACHINE.—Calvin Ewing, S. F. No. 417,552. Dated Dec. 17, 1889. This is a machine for stuffing the rims of horse-collars with straw, and is an improvement on a machine patented by the same inventor Sept. 16, 1884.

STEAM BOILER FURNACE.—Willis G. Dodd, S. F. No. 417,475. Dated Dec. 17, 1889. This invention relates to that class of steam-boiler furnaces in which the fuel chamber is formed transversely of the furnace mouth, between inclined grate-bars and a grilling backing of vertical water-pipes communicating with the boiler. The objects of the improvements are to provide a furnace that will be almost automatic in its operation and obtain greater useful effect from the fuel consumed, with cheapness of construction, combined with simplicity, affording free access for repairs.

AIR-COMPRESSOR.—Samuel Guthrie, S. F. No. 417,482. Dated Dec. 17, 1889. This is an automatic apparatus for compressing air. The object is to employ a column of water under pressure to compress air from a compressing chamber into a receiver, the water being alternately admitted to and discharged from the chamber, so that when it is admitted it will force a body of air from this chamber into a receiver, and when discharged another body of air will be admitted to be again compressed, the operation being conducted automatically by the action of filling and discharging. By the plan employed the inventor is enabled to automatically compress air into large or small quantities and to any degree, limited only by the pressure of the column of water which is supplied to the compressing chamber.

DRY ORE CONCENTRATOR.—Miles B. Dodge, S. F. No. 417,476. Dated Dec. 17, 1889. This invention covers certain improvements in a machine for separating valuable heavy mineral or other substances from the lighter and worthless gangue. The present invention is an improvement upon one for which a patent was issued to the same inventor June 19, 1889.

WINDMILL.—Oscar H. Donley, San Jose. No. 417,549. Dated Dec. 17, 1889. The crank of the wheel-shaft is connected with a lever in the ordinary way; but this lever is curved so that each of its holes is equidistant from the axial center of the wheel-shaft, so that the link may be connected with any of the holes without changing the proper position of the piston in the pump, thereby rendering it practicable to vary the length of the stroke of the pump by setting the connecting-bolt in any of the holes. The connection of the lever with the pitman is such that this connection forms a sort of knuckle-joint permitting the oscillating movement of the lever and effecting the vertically reciprocating movement of the pitman, and also providing for the swiveling of the entire turntable about the pitman.

SPRAY NOZZLE.—John Bean, Los Gatos. No. 417,464. Dated Dec. 17, 1889. This is a nozzle or tip specially adapted for spraying and used in the treatment of infected trees, shrubs, vines, etc. It consists essentially in a novel imperforate packing-plate or sheet, controlling the nozzle passage and exit port. The object is to provide a spray nozzle capable of effective operation under a smaller pressure than usual and one which will not be affected injuriously in its adjustable or working parts by the liquid passing through it.

GUARD FOR CABLE CARS.—P. F. Dundon, S. F. No. 417,477. Dated Dec. 17, 1889. This is a novel device for guarding cars, motors or other vehicle and clearing obstructions from the tracks. Brushes are adjusted on the cars so as not to be more than an inch above the roadway. These brushes are preferably made of different lengths, the outer ones being longest and the rear ones somewhat shorter. Behind the brush is fixed a timber or bar so that the rear portion of the brush rests against this bar, and in case any heavy obstruction is encountered the bar supports the brush so that it becomes a rigid obstacle, and while being sufficiently flexible to accommodate itself to the body which may be struck and not injure it, it will be rigidly supported by the bar, which is placed near the track. Any small obstruction will be easily swept out of the way; but any large body or object projecting more than three inches above the roadbed will be struck by the flexible brush, which will meet it like a cushion and then, by aid of the bar behind the brush, which will prevent it from bending too far backward, the body will be pushed forward or to one side, depending on the shape of the brush-frame, and prevent it from passing beneath the wheels of the car.

ARID LANDS.—It is said that the new Arid Lands Committee of the House finds the problem of irrigating and reclaiming the vast tracts of Government land, now lying desert in the West, rather ponderous to handle; and there is talk of transferring the whole business to the Department of Agriculture.

THE November pay-roll of the Comstock Tunnel Company footed up a total of above $7000, which makes a total of $221,000 disbursed to employes of the Comstock lode for November services.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

DIVIDEND NOTICE.

The German Savings and Loan Society,

526 California Street.

For the half-year ending Dec. 31, 1889, a dividend has been declared at the rate of five and forty-hundredths (5 40-100) per cent per annum on Term Deposits, and four and one-half (4 1/2) per cent per annum on Ordinary Deposits. Payable on and after Thursday, Jan. 2, 1890.

GEO. TOURNY, Secretary.

DIVIDEND NOTICE.

SAN FRANCISCO SAVINGS UNION, 532 California St., cor. Webb. BRANCH, 1700 Market St., cor. Polk. For the half-year ending with the 31st of December, 1889, a dividend has been declared at the rate of Five and Four-Tenths (5 4-10) per cent per annum on term deposits and Four and One-Half (4½) per cent per annum on ordinary deposits, free of taxes, payable on and after Thursday, the 2d of January, 1890. LOYELL WHITE, Cashier.

1850. 1888.

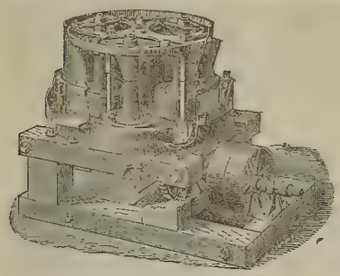
BUILDERS OF

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.



THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

SEND FOR CIRCULAR.

PACIFIC IRON WORKS,

NO. 127 FIRST STREET, - - - - SAN FRANCISCO, CAL.

Centrifugal Roller Quartz Mill.

F. A. HUNTINGTON,

MANUFACTURER OF

CENTRIFUGAL ROLLER QUARTZ MILLS,

Concentrators and Ore Crushers,

Mining Machinery of Every Description. Steam Engines and Shingle Machines.

SEND FOR CIRCULAR.

213 FIRST STREET, SAN FRANCISCO, CAL.

BUTTE, MONTANA,

The railroad, mining and commercial center of the new State, offers some of the best inducements for investments in

Real Estate, Mines & Mining Stock

of any locality in the Northwest. For particulars address The Evans-Terry-Claussen Brokerage Co., 41 E. Broadway, Butte, Montana.

FOR SALE.

One 10x18 inch Clayton Belt Air Compressor.
One 8-inch Sergeant Drill.
One 6-ft. Double Screw Drifting Column with Arms.
One 4-ft. Single Screw Stoping Bar.
One 8½x18 ft. Air Receiver.

The above are in first-class condition and will be cheap. For price apply to the PAYMASTER MINING CO., Yuma, Arizona Territory

Smelter For Sale or Exchange.

One 50-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 28, Elkhorn, Montana.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal

AMALCAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❋ BOILERS HORIZONTAL, VERTICAL ... AND SECTIONAL. ...

IMPROVED STEAM STAMPS

Hoisting Engines, Safety Cages, Safety Hooks,

ORE CARS, WATER & ORE BUCKETS,

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery.

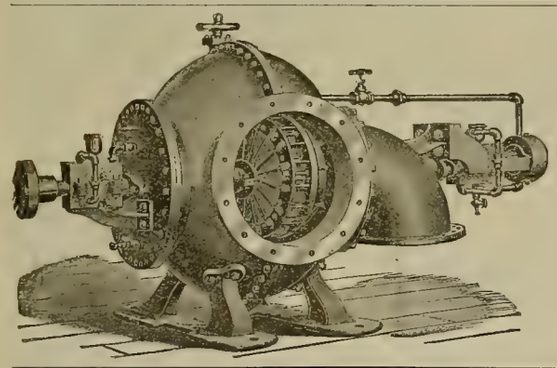
Adapted to heads running from 20 up to 2,000 feet.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS



Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. ☞ SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE. ☜

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 26, 1889.

Continued rains and bad roads interfere with general trade.

The local money market is closing the year very easy, causing the impression that after the turn of the year we will have a very easy market. Imports of coin by sea the past week aggregate $500,000 from Australia and about $100,000 from coast ports. Remittances from other points by rail are said to have also been quite free.

MEXICANS—The demand for shipment by the steamer leaving to-day (Thursday) for China was light. Prices ranged about 76¾ to 77 cts. The quotation given to-day is 76¾ cts. nominal.

SILVER—The market abroad has been gradually shading off throughout the week. The close money market abroad and inactive demand from India and elsewhere are against the market. The opinion still prevails that before the spring months a much higher range of values will obtain. The influences that will conspire to bring this about have been heretofore noted in these columns. The steamer leaving to-day for China took out very small shipments. The last sale reported to us was at a slight advance over 95¾ cts. The market closed dull at a nominal quotation of 95 cts.

QUICKSILVER—Receipts the past week aggregate 240 flasks. The market is reported quiet and easy.

BORAX—Receipts the past week aggregate 102 ctls., and exports by sea 444 ctls. to New York. The market is reported steady with a firm holding at pool prices.

LIME—Receipts the past week aggregate 1446 bbls., and exports by sea 500 bbls. to Honolulu. The market is quiet but steady at current quotations.

ANTIMONY—The market is easier, with buyers disposed to be offish.

LEAD—The market has a firm, strong closing under freer buying at the East. The strength of the market at the close of the year is a source of surprise to the many who do not look at the influences bome and abroad.

TIN—Imports the past week aggregate 3235 ingots from Australia. The market for plate for spot or near-by receipts is barely steady at quotations. For distant shipments or prompt shipment the market is very strong, but with no business doing, and late cables from London report as follows: The tin-plate market is steadier, with 15s. 9d. now considered a strictly inside price for cokes. Buyers experience difficulty in placing orders at this figure, as makers are full at present and confident that prices will go higher. It is stated that two-thirds of the entire available stock is stored at Swansea, The exports to the States last month were 315,000 tons, against 271,000 tons a year ago.

COPPER—The market after shading off closed stronger under advices from abroad. The New York *Iron Age's* London cable reports as follows: The movements of the holders of French syndicate stock are extremely difficult to follow, but the meager facts coming to the surface indicate that they realize quietly when favorably opportunity offers, avoiding the open market in London as much as possible. Calcining in Spain is again becoming seriously discussed in all its details by the Council of Ministers, who, it is reported, have decided that on January 1st the quantity of ore treated shall be reduced one-half from the present amount. A commission of engineers has been appointed to see that the law is carried out. The action is considered a serious matter for the Rio Tinto and other Spanish companies. General prospects in the copper trade are considered excellent.

IRON—The market is reported very strong, but business light. Puget sound iron has been advanced to $35. The company has shut down for three or four months so as to put in new furnaces.

COAL—Imports the past week aggregate as follows: From Newcastle, N. S. W., 3340 tons; Seattle, 810; Cornox, 4000; Departure Bay, 2300; Coos, 750; total, 10,200 tons. Australian for shipment is offering at lower prices owing to lower outward charters. With the lower offerings of Australian, coast coal for forward delivery is easier. The mild weather is against the market, and unless colder weather sets in soon it is not at all unlikely but some shading in prices will be in order. Large consumers do not appear disposed to anticipate their wants to any great extent unless offered inducements, and even then they do not care to stock up heavily.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Dec. 26, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	43 15-16	95½	$13 90	$3 90	$21 25
Friday	44	95¾	13 90	3 90	21 10
Saturday	43 15-16	95½	13 90	3 90	21 10
Monday	43⅞	95½	14 10	3 85	21 00
Tuesday	43 13 16	94⅞	14 10	3 90	21 00
Wednesday	....	...	.....	....	.....

NEW YORK, Dec. 24.—Copper holds firm at previous quotations. Borax continues steady with a good demand. Antimony under freer receipts and an offish demand is shading off. Tin is firmer, with an improved demand looked for. Quicksilver is easier. Lead is firm.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Mining Share Market.

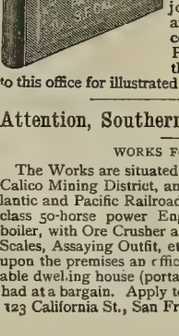
The Comstock shares gained in strength up to Monday afternoon under the leadership of Belcher and Seg. Belcher, after which they shaded off, but recovered only to shade off again. The closing under light business on Tuesday was fairly firm. The advance is said to be due to an improvement in the 1250-foot Belcher south drift, ore assays going up to $20. This is called low-grade ore and only to frighten the smaller shorts into filling would not otherwise be noticed much. The middle and North End stocks were stronger and slightly higher under fair trading. In outside stocks trading was light in the Tuscaroras, but more active in the Quijotoas under a reported improvement in Peerless and more active work in two of the others. The Bodies were lifeless.

The bear reports noted in last week's issue continue to be freely circulated. Letters received from Sacramento and other stock-trading points are confirmatory of bear points being put out with the assurance given that the Bonanza firm was not doing anything in the market, outside of selling stocks whenever an opportunity presented. To this was added the correct information of more assessments to be levied within the next 30 days. The majority of outside dealers either sold out entirely or else sold from one-quarter to three-quarters of their holdings. Who has bought the stocks? is a leading question, and as yet not at all satisfactorily answered. It is no reason because stocks have drifted into other hands that persons of limited means should overbuy, for we have seen prices go very low under strong buying, as to clean up every share either held on a margin or held by banks or capitalists against money accommodations, before much of an upward move set in.

The New York *Engineering and Mining Journal* says that the Eastern shareholders are combining to make a fight for the control of Silver King at the next annual election, with the view of securing a majority of the board of directors and elect H. H. Noble president. By electing Mr. Noble president they claim that the mine will be honestly run. We know nothing regarding the management of the Silver King mine, but we advise Eastern stockholders that they might consult their interest to good advantage by looking over the court record in Department 6, Superior Court of California, in the Kentuck mining suit lately decided in favor of Smith et al. vs. or Washington Smith et. al vs. Wales Palmer and the Kentuck Mining Company. In this action it was shown that H. H. Noble was treasurer and a director of the company at the time Governor Stevenson obtained a contract from the company to work the mine, which netted the contractor large sums of money.

The charge of the Nevada mill for crushing Crown Point ore is $6 a ton. This charge includes transportation, so the only milling company charging $7 a ton is said to be the mill running on Con. Virginia ore.

Private advices from the Comstock mines are still of a very flattering, hopeful character. They are confirmatory of previous information published by us, that the work going on in several of the mines ought to uncover a body of ore soon, but how rich or to what extent time can alone tell, but perhaps enough to make shorts fill and get the outside public to pay assessments along the line. By referring to back files of the PRESS more particulars of the work now going on can be had. In Ophir it is claimed that the work now going on is to tap a body of ore near the Con. Virginia line. From Con. Virginia a decided improvement is reported on the 1350-foot level. In Belcher, as work goes toward Seg. Belcher, an improvement is reported. Official letters from the Gold Hill mines have not been received up to this (Thursday) morning writing. From Hale & Norcross the advices are about as heretofore reported, with the grade of ore assaying still less. Here is a chance for the Mining Stock Association to make itself felt, as well as also in looking after the Savage assays. Private advices report the mine assays quite high. If correct, who gets away with the "boodle"? From the outside mines there is nothing new to report.



The mining share market opened this (Thursday) morning dull but higher, with Chollar and Potosi the leaders.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Butte and Boston, Dec. 18, $27,360; Moulton, 19, $8128; Eureka Con., 18, $15,000; Mt. Diablo, 18, $7938; Hanauer, 17, $6550; Germania, 17, $2701; Young America South, 17, $9300; Hanauer, 18, $2950; Ontario, 18, $20,323; Germania, 19, $2679; Hanauer, 20, $4750; Con. California and Virginia, 21, $52,524; Savage, 21, $15,586; Hale and Norcross, 21, $36,638; Crown Point, 21, $8482; Hanauer, 21, $2400; Crocker, 21, $12,580.

What Every Subscriber Should Have.

AN EASY BINDER.—A. T. Dewey's Patent Elastic Binder, for periodicals music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Publishing Co's. journals, Harper's Weekly and Scientific American, 85 cents; postage 10 cents. Postpaid to subscribers of this paper, 50 cents. Send to this office for illustrated circular. Agents wanted.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS 123 California St., San Francisco,

MINING SHAREHOLDERS' DIRECTORY.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements, Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present its power as an advertising medium is unsurpassed.

DEWEY & CO., Publishers,

Assessment Notices.

Booth Gold Mining Company. Location

of principal place of business, San Francisco, California.

Location of Works, Auburn, Placer Co., Cal.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 23d day of November, 1889, an Assessment, No. 4, of Two(2) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room No. 28, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 20th day of January, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. R SPINNEY, Secretary.

Office, No. 310 Pine Street, Room No. 28, San Francisco, California.

DELINQUENT SALE NOTICE.

SOLE AGENTS FOR THE WELLS RUSTLESS PIPE AND FITTINGS,

Specially manufactured for use in Artesian Wells, and for conveying water charged with Salts and Minerals, Acids, Gases or other substances of a corrosive nature. In building it takes the place of either black or galvanized piping or gas, water-waste, etc. Catalogues and testimonials, from large users in the United States, sent on application.

413-415 MARKET STREET, SAN FRANCISCO.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price $1.

SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes where of he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office, Preparation of the Ore, Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation, Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen, Tests for Ores, A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying - Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthat.; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F.

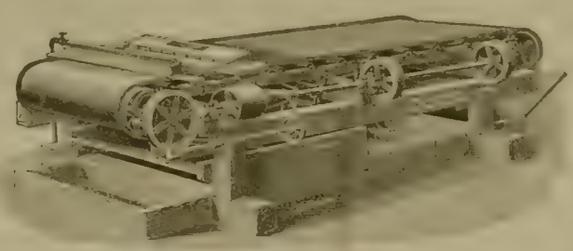
Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.



This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & CO., Publishers, 220 Market St., San Francisco.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $900, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

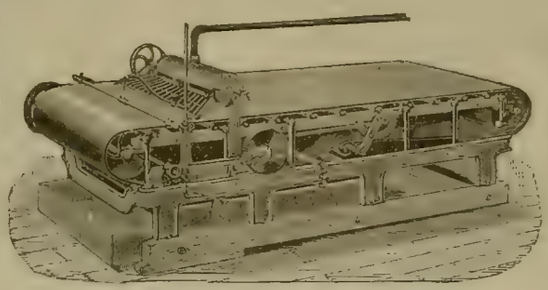
For Pamphlets, Testimonials and further information apply at office.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.



ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.
Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,

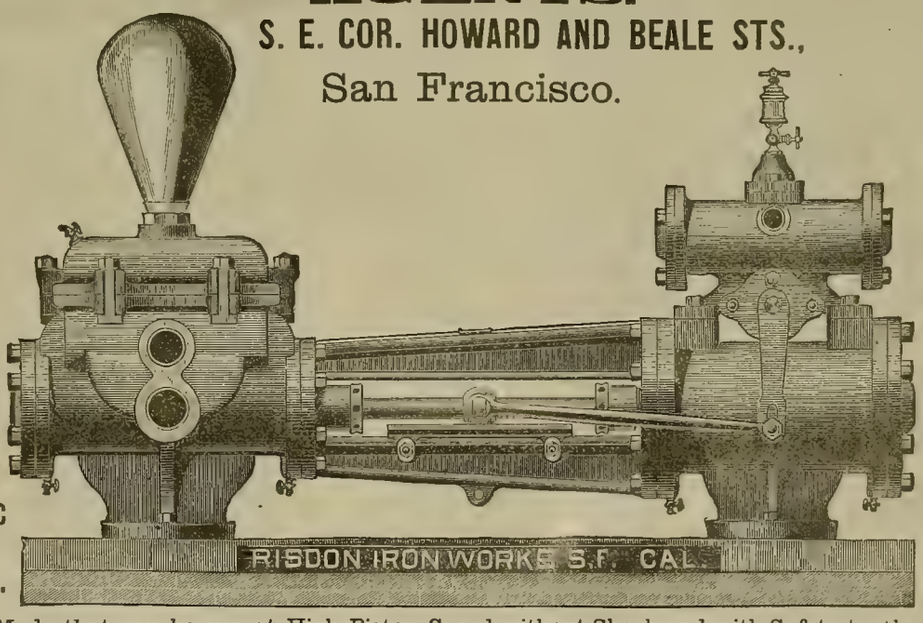
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanner or concentrating devices.



DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.
